NOTICE TO BE READ BY ALL USERS OF THIS PUBLICATION

Great care has been taken in the preparation of this work and, to the best knowledge of the Publisher and the Editors, the information contained herein is factual and accurate and the opinions expressed are those of qualified experts. The data are not to be taken as a warranty or representation for which the Publisher or Editors assumes legal responsibility. Furthermore, the Publisher does not assume any responsibility or liability for the accuracy or completeness of, or consequences from, such information. Data offered in this work are solely for your consideration, investigation, and verification. Mention of trade names or commercial products in the work does not constitute endorsement or recommendation for use by the Publisher or Editors.

This reference work is intended to provide information about chemical hazards and guidelines for those trained in the use and storage of hazardous materials, as well as those trained to respond to spills, leaks, and accidents involving those materials. The work is not intended as a primary source of research information. As with any reference, it cannot include all information or discuss all situations that might occur. It cannot be assumed that all necessary warnings and precautionary measures are contained in this work; other, or additional, information or assessments may be required. Most of all, it cannot replace the expertise and experience of trained professionals or qualified responders.

Because information may not be available for some chemicals, an absence of data does not necessarily mean that a substance is not hazardous. For major incidents, it will be necessary to obtain additional detailed information from other resources as well as more expertise from those with extensive training. Neither the Publisher nor the Editors assume any liability or responsibility for completeness or accuracy of the information presented or any damages of any kind alleged to result in connection with, or arising from, the use of this work.

Final determination of the suitability of any information for use contemplated by any user of this work, and the manner of that use, is the sole responsibility of the user. Any use of these data and information must be determined by the user to be in accordance with applicable federal, state, territory, and local laws and regulations. The Publisher and Editors recommend that anyone intending to use any toxic, hazardous chemical, and/or carcinogenic material mentioned in this work should satisfy themselves as to such suitability, and that the user can meet all applicable safety and health standards. The Publisher and Editors strongly encourage all readers, and users of chemicals, to adhere to and follow the manufacturers' or suppliers' current instructions, technical bulletins, and material safety data sheets (MSDSs) for specific use, handling, protection (including the use of personal protective equipment and eye protection), and storage of all chemical materials. The Publisher and Editors also strongly recommend that users obtain expert advice before implementing procedures involving any hazardous chemicals, materials, or carcinogens.

Preface

For more than a quarter century, *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has continued to gather an ever-widening audience of users because it has been proven to be among the most reliable, easy to use, and essential reference works on hazardous materials. The 6th edition has been updated and expanded to keep pace with world events and to answer continuing and expanded need for information.

The 4th edition of *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* was published in 2001, shortly before the tragic events of the morning of September 11, 2001. Following 9/11, the United States established the Department of Homeland Security and enacted laws such as the *Chemical Facilities Security Act of 2003* and released the DHS list of Chemicals of Concern, *Appendix to Chemical Facility Antiterrorism Standards; Final Rule, November 20, 2007.* These actions were prompted by concerns about infrastructure protection and the anticipation of another attack, possibly on the nation's chemical facilities or by using trucks or tank cars that transport highly dangerous and possibly lethal chemicals.

These facilities are found around the country in industrial parks, in seaports, and near the major population centers. Dangerous chemicals routinely travel along our highways, inland waterways, and on railcars that pass through the heart of major cities including Washington, D.C., just a short distance from Capitol Hill. Terrorist attacks on the US chemical industry have the potential to kill tens of thousands of Americans and seriously injure many more. In many instances, these attacks hold the potential for having a cascading effect across other infrastructures, particularly in the energy and transportation sectors. This is both because of the damage that can be caused by the attack, and the enormous expense and effort associated with the clean-up to an affected area in its aftermath.[83]

To put it more simply, using the same low tech/high concept approach that turned passenger planes into missiles, terrorists do not need to produce or amass chemical weapons or smuggle them into the United States in order to produce great damage.

"Commercial chemical incidents occur tens of thousands of times each year, often with devastating and exorbitantly expensive consequences. They are indiscriminate in their effects. Workers, companies, the public, emergency response organizations, and all levels of government pay the figurative and literal price. Yet, until now and with few exceptions, chemical incidents have been invisible. Perhaps it is due to their pervasiveness, or to the common tendency to overlook what is taken for granted."[84] This quote is from the highly publicized *600K Report* prepared by the Chemical Safety and Hazard Investigation Board (CSB), an independent, nonpartisan, quasi-legislative US government agency. The CSB described our nation's lack of definitive knowledge of the "big picture" surrounding chemical incidents as "... the industrial equivalent of two 737 airplanes 'crashing' year after year, killing all passengers (256 people) without anyone seeming to notice."[84]

More than 30 years ago, the United States Government Accounting Office (GAO) estimated that 62,000 chemicals were in commercial use. Today, that number has grown to beyond 82,000.

Each year, in the United States, over 2 billion tons of hazardous and toxic chemicals are manufactured. Including imports, more than 3 billion tons are transported employing 800,000 shipments each day. It is estimated that 1.3 billion tons are moved by truck and hundreds of billions of pounds of these hazardous materials are transported through populated areas. The average American household generates approximately 15 lb of hazardous waste per year. Nearly 5 million poisonings occur in the United States annually, resulting in thousands of deaths. Based on 2004, TRI data (publically released April 2006), over 4 billion pounds of toxic chemicals are released into the nation's environment each year, including 72 million pounds of recognized carcinogens from nearly 24,000 industrial facilities. The toxic chemicals problem in the United States; and, indeed, in all the world is frightening to many people. And, over the years, these fears are heightened by news stories about an oil field explosion in Mississippi (2006), a 48,000-lb chlorine release in Missouri (2002), Love Canal in New York, the Valley of the Drums in Kentucky, the Valley of Death in Brazil, major chemical spills, including Bhopal, India, terrorist attacks in Japan...and the like. All of these incidents generate emotional responses, often from people uninformed about science or technology. On the other hand, one encounters some industrialists who tell us that toxic chemicals are present in nature and that industrial contributions are just the price we have to pay for progress. There is little argument about the chemical industry's critical place in the nation's economy. The United States is the number one chemical producer in the world, generating more than $550 billion a year and employing more than 5 million people. So somewhere in between lies the truth—or at least an area in which we can function. Information is vital in a world where virtually every aspect of our lives is touched by chemical hazards.

Given the reality of problems related to chemical hazards, including accidents and spills, the advent of new threats to our way of life, and the challenges of communicating complex data, it is the goal of this book to provide data so that responsible decisions can be made by all who may have contact with chemicals in this reference work. With this in mind, the work can be used by those in the following professions:

- Chemicals manufacturers
- Emergency response personnel
- Protective safety equipment producers
- Environmental management
- Transportation managers
- Toxicologists
- Industrial hygienists
- Industrial safety engineers
- Lawyers
- Occupational doctors and nurses
- Chemists
- Industrial waste disposal operators
- Enforcement officials
- Special, technical, and university librarians
- Legislators
- Homeland security planners

The chemicals chosen for inclusion are officially recognized substances, defined as carcinogens, as belonging to some designated category of hazardous or toxic materials, with numerically defined safe limits in air in the workplace, ambient air, water, waste effluents. For the most part, these are materials of commerce that are heavily used and many are transported in bulk.

The 6th edition contains more regulated chemicals and expanded data on each material. Some material and appendices from the previous edition has been eliminated or moved to more appropriate sections. This was done to limit the work to a pair of handy volumes.

All of this has been done to make the work more relevant, more inclusive, and easier to use. The utility of the work has been enhanced by the addition of three appendices. Additionally there is a table that cross indexes the materials by chemical and trade names and CAS Registry Number.

Appendix 1: the list of oxidizing materials has been expanded. Appendix 2 contains many new confirmed and suspected carcinogens. Also, this edition allows the user to search the carcinogen list by name or CAS Number. Appendix 3 is a glossary of chemical, health, safety, medical, and environmental terms used in the handbook. The glossary was completely reviewed and many narrow interest medical terms were removed. More and new germane terms were added. The Introduction was replaced with the more accurate title, *How to Use this Book.* Following the use section is a revised *Key to the Abbreviations and Acronyms* used in the handbook.

In keeping with the broad changes originally initiated with the 4th edition, contents of the 6th edition are focused on the concept of "regulated chemicals." The carcinogen potential of each chemical was compared to listings and reports from eminent authorities as the International Agency for Research on Cancer (IARC) and the National Toxicology Progam (NTP).

The "Regulatory Authority and Advisory Bodies" section contains new items including, where available, EPA Gene-Tox Program findings, and many of the individual listings now contain useful advice sought after by the regulated community. As a result, the new volume should be even more practical for those users of specific chemicals and to those concerned with both adherence to and enforcement of regulations.

Data is furnished, to the extent currently available, in a uniform multisection uniform format to make it easy for users who must find information quickly and/or compare the data contained within records, in any or all of these important categories:

Chemical Description
Code Numbers (including CAS, DOT, RTECS, EC)
Synonyms
Regulatory Authority and Advisory Bodies (summary)
Description
Potential Exposure
Incompatibilities
Permissible Exposure Limits in Air
Determination in Air
Permissible Concentration in Water
Determination in Water
Routes of Entry
Short Term Exposure
Long Term Exposure
Points of Attack
Medical Surveillance
Decontamination (selected records)
First Aid
Decontamination (CWAs or WMDs)
Personal Protective Methods
Respirator Selection
Storage
Shipping
Spill Handling
Fire Extinguishing
Disposal Method Suggested
References
The 6th edition of Sittig has new and updated information in nearly every section, including the following: Synonyms, CAS Numbers, UN/NA & ERG (Emergency Response Guide) Number, EC Numbers (Annex I Index Numbers

added where assigned), Regulatory Authority and Advisory Bodies (added Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)]; List of Stockholm Convention POPs: Annex A; European/International Hazard Symbol, Risk phrases, Safety phrases; WGK (German Aquatic Hazard Class); Annex II Rotterdam Convention List information; hundreds of Department of the US Homeland Security Chemicals of Interest along with their Screening Threshold Quantities (STQs) [from the US Code of Federal regulations (6CFR Part 27 Appendix A]; California Proposition 65 Carcinogen and Reproduction Toxins; Description, Incompatibilities, Exposure Limits [now includes US Department of Energy (DOE) Protection Action Criteria (PACs)]. Short Term Exposure, Long Term Exposure, First Aid, Decontamination (especially, chemical warfare agents and weapons of mass destruction), Personal Protective Methods, Respirator Selection, Storage, Shipping, Spill Handling [more and updated Initial Isolation and Protective Distances (including both Imperial and Metric) from the *US DOT Emergency Response Guide*], Fire Extinguishing, Disposal. Specifically, additions include regulatory information, identifiers, chemical and physical properties, including explosive limits, NFPA (National Fire Protection Association)-type hazard ratings (based on NFPA-704 M Rating System), water solubility and hazard levels, exposure limits, odor thresholds, DOT isolation and protective distances, and full text of NIOSH respirator recommendations. Many records contain special warnings, including notes and reminders to Emergency Management Service (EMS) personnel, and other health-care professionals.

Although every effort has been made to produce an accurate and highly useful handbook, the author appreciates the need for constant improvement. Any comments, corrections, or advice from users of this book are welcomed by the author who asks that all correspondence be submitted in writing and mailed to the publisher who maintains a file for reprints and future editions.

A Brief history of this work

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens was first published 30 years ago. This work continues to provide first responders and occupational and environmental health and safety professionals with an accessible and portable reference source. The 6th edition of his handbook contains data on more than 2200 toxic and hazardous chemicals (up from nearly 600 in the first edition, nearly 800 in the second edition, nearly 1300 in the third edition, and 1500 in the 4th edition).

According to the Library of Congress, the history of the project is as follows: 1st edition published in 1981; 2nd edition published in 1985; 3rd edition published in 1991; 4th edition published in 2001; 5th edition published in 2008; 6th edition published in 2011.

Acknowledgments

The author would like to thank some individuals and institutions, without whose expertise and generous help, the 6th edition would not have been possible. In particular, the author wants to acknowledge the good work of the scientists and contract employees associated with NIOSH, US EPA, OSHA, ATSDR, ACGIH, IARC, DFG, CDC, TOXNET, NTP, AIHA, and many others who developed the various documents and databases that provided so much of the data that were compiled for this work. To each, the author is indebted. At the US Coast Guard Headquarters, the author wishes to thank the recently retired Alan Schneider, D.Sc., of the Marine Technical and Hazardous Materials Division.

How to Use This Book

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens focuses on critical data for more than 2200 commercially important and/or regulated and monitored substances, and many associated substances. Many of these chemicals or substances are found in the workplace; a few are found in the medical and research fields. Importance is defined by inclusion in official, regulatory, and advisory listings. Much of this information, found in US government sources, has been supplemented by a careful search of publications from various countries and other sources including United Nations and World Health Organization (WHO) publications.

This handbook is becoming more encyclopedic in nature. When one looks at most handbooks, one simply expects to find numerical data. Here, we have tried, wherever possible, to provide literature references to review documents which hopefully opens the door for users to a much broader field of published materials. It is recommended that this book be used as a guide. This book is not meant to be a substitute for workplace hazard communication programs required by regulatory bodies such as OSHA, and/or any other US, foreign, or international government agencies. If data are required for legal purposes, the original source documents and appropriate agencies, which are referenced, should be consulted.

In the pages which follow, the following categories of information will be discussed with reference to scope, sources, nomenclature employed, and the like. Omission of a category indicates a lack of available information.

Chemical name: Each record is arranged alphabetically by a chemical name used by regulatory and advisory bodies. In a very few cases the name may be a product name or trade name.

Formula: Generally, this has been limited to a commonly used one-line empirical or atomic formula. In the *Molecular Formula* field, the Hill system has been used showing number of carbons (if present), number of hydrogens (if present), and then alphabetically by element. Multiple carbon−carbon (double and triple) bonds have been displayed where appropriate.

Synonyms: This section contains scientific, product, trade, and other synonym names that are commonly used for each hazardous substance. Some of these names are registered trade names. Some are provided in other major languages other than English, including Spanish, French, and German. In some cases, "trivial" and nicknames (such as MEK for methyl ethyl ketone) have been included because they are commonly used in general communications and in the workplace. This section is important because the various "regulatory" lists published by federal, state, international, and advisory bodies and agencies do not always use the same name for a specific hazardous substance. Every attempt has been made to ensure the accuracy of the synonyms and trade names found in this volume, but errors are inevitable in compilations of this magnitude. Please note that this volume may not include the names of all products currently in commerce, particularly mixtures that may contain regulated chemicals.

The synonym index contains all synonym names listed in alphabetical order. It should be noted that organic chemical prefixes and interpolations, such as (α-) alpha-, (β-) beta-, (γ-) gamma-, delta- (δ-), (*o*-) *ortho*-, (*m*-) *meta*-; (*p*-) *para*-; *sec*- (*secondary*-), *trans*-, *cis*-, (*n*-) *normal*-, and numbers (1-; 1,2-), are not used when searching for a chemical name. In other words, these prefixes are not treated as part of the chemical name for the purposes of alphabetization. Users should use the substance name without the prefix. For example, to locate *n*-Butane, search for Butane; to locate 3,3′-Dichlorobenzidine, search for Dichlorobenzidine; and to locate α-Cyanotoluene or alpha-Cyanotoluene, search for Cyanotoluene.

CAS Number: The CAS number is a unique identifier assigned to each chemical registered with the Chemical Abstracts Service (CAS) of the American Chemical Society. This number is used to identify chemicals on the basis of their molecular structure. CAS numbers are given in the format nnn (...)-nn-n [two or more numeric characters (dash) two numeric characters (dash) followed by a single numeric check digit]. CAS numbers should always be used in conjunction with substance names to insure positive identification and avoid confusion with like-sounding names, i.e., benzene (71-43-2) and benzine (8032-32-4). This 6th edition contains some alternate CAS numbers that may now be considered related, retired, obsolete, and/or widely and incorrectly used in the literature. In this section, the first CAS number(s), before the word "alternate," is considered (based on several sources) to be the correct CAS number(s). Ultimately, it is the responsibility of the user to find and use the correct number.

RTECS®Number: The RTECS® numbers (Registry of Toxic Effects of Chemical Substances) are unique identifiers assigned and published by NIOSH. The RTECS® number in the format "AAnnnnnnn" (two alphabetic characters followed by seven numeric characters) may be useful for online searching for additional toxicologic information on specific substances. It can, for example, be used to provide access to the MEDLARS® computerized literature retrieval services of the National Library of Medicine (NLM) in Washington, DC. The RTECS number and the CAS number can serve to narrow down online searches.

DOT ID: The DOT hazard ID number is assigned to the substance by the US Department of Transportation (DOT). The DOT ID number format is "UNnnnn" or "NA nnnn." This ID number identifies substances regulated by DOT and must appear on shipping documents, the exterior of packages, and on specified containers. Identification numbers containing a UN prefix are also known as United Nations numbers and are authorized for use with all international shipments of hazardous materials. The "NA" prefix is used for shipments between Canada and the United States only, and may not be used for other international shipments.

EC Number: The European Commission number is a 7-digit identification code used by the European Union (EU) for commercially available chemical substances within the EU. An identification number from *European Inventory of Existing Commercial Chemical Substances*, published by the European Environment Agency, Copenhagen, Denmark. Use of these identification numbers for hazardous materials will (a) serve to verify descriptions of chemicals; (b) provide for rapid identification of materials when it might be inappropriate or confusing to require the display of lengthy chemical names on vehicles; (c) aid in speeding communication of information on materials from accident scenes and in the receipt of more accurate emergency response information; and (d) provide a means for quick access to immediate emergency response information in the "*North American Emergency Response Guidebook*."[31] In this latter volume, the various compounds have assigned "ID" numbers (or identification numbers) which correspond closely, but not always precisely, to the UN listing.[20] The EC number supercedes the outmoded EINECS, ELINCS, and NLP numbers. This section also includes Annex I, Index number for the Export and Import of Dangerous Chemicals found in Annex I of Regulation (EC) No. 689/2008.

Regulatory Authority and Advisory Bodies:

This section contains a listing of major regulatory and advisory lists containing the chemical of concern, including OSHA, US EPA, DFG, US DOT, ACGIH, IARC, NTP, WHMIS (Canada), and the EEC. Many law or regulatory references in this work have been abbreviated. For example, Title 40 of the Code of Federal Regulations, Part 261, subpart 32 has been abbreviated as 40CFR261.32. The symbol "§" may be used as well to designate a "section" or "part."

- European/International Hazard Symbols, Risk Phrases, and Safety Phrases. Explanation of these symbols and phrases can be found in the new Appendix 4. In the interim between the 6th and 7th edition, it is expected that the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) will be phased in by many countries. Hazard statements are an essential element under the GHS, and will eventually replace the risk phrases (R-phrases) described earlier in the paragraph. In addition to hazard statements, containers and Material Safety Data Sheets (MSDS) will contain, where necessary, one or multiple pictograms, a signal word such as "Warning" or "Danger," and precautionary statements. The precautionary statements will indicate proper handling procedures aimed at protecting the user and other people who might come in contact with the substance during an accident or in the environment. The container and MSDS will also contain the name of the supplier, manufacturer, or importer. Each hazard statement contains a four-digit code, starting with the letter H (in the form Hxxx). Statements appear under various headings grouped together by code number. The purpose of the four-digit code is for reference only; however, following the code is exact *phrase* as it should appear on labels and MSDS.
- A carcinogen (the agency making such a determination, the nature of the carcinogenicity—whether human or animal and whether positive or suspected, are given in each case). These are frequently cited by IARC (International Agency for Research on Cancer),[12] and are classified as to their carcinogenic risk to humans by IARC as follows: Group 1: Human Carcinogen; Group 2A: Probable Human Carcinogen; Group 2B: Possible Human Carcinogen. Chemicals are classified as to their carcinogenic risk to humans by NTP as follows: Group K: Known Human Carcinogens; Group R: Reasonably Anticipated Human Carcinogens, or the NTP (US National Toxicology Programs).[10] It should be noted that the DFG have designated some substances as carcinogens not so classified by other agencies.
- A banned or severely restricted product as designated by the United Nations[13] or by the US EPA Office of Pesticide Programs under FIFRA (The Federal Insecticide, Fungicide, and Rodenticide Act).[14]
- A substance cited by the World Bank.[15]
- A substance with an air pollutant standard set or recommended by OSHA and/or NIOSH,[58] ACGIH,[1] DFG,[3] or HSE.[33] The OSHA limits are the enforceable pre-1989 PELs. The transitional limits that were vacated by court order have not been included. The NIOSH and ACGIH airborne limits are recommendations that do not carry the force of law.
- A substance whose allowable concentrations in workplace air are adopted or proposed by the American Conference of Government Industrial Hygienists (ACGIH),[1] DFG [Deutsche Forschungsgemeinschaft (German Research Society)].[3] Substances whose allowable concentrations in air and other safety considerations have been considered by OSHA and NIOSH.[2] Substances which have limits set in work-place air, in residential air, in water for domestic purposes, or in water for fishery purposes as set forth by the former USSRUNEP/IRPTC Project.[43]
- Substances that are specifically regulated by OSHA under 29CFR1910.1001 to 29CFR1910.1050.
- Highly hazardous chemicals, toxics, and reactives regulated by OSHA's "*Process Safety Management of Highly Hazardous Chemicals*" under 29CFR1910.119, Appendix A. Substances that are Hazardous Air Pollutants (Title I, Part A, § 112) as amended under 42USC7412. This list provided for regulating at least 189 specific substances using technology-based

standards that employ Maximum Achievable Control Technology (MACT) standards; and, possibly health-based standards if required at a later time. § 112 of the Clean Air Act (CAA) requires emission control by the EPA on a source-by-source basis. Therefore, the emission of substances on this list does not necessarily mean that a firm is subject to regulation.

- Regulated Toxic Substances and Threshold Quantities for Accidental Release Prevention. These appear as Accidental Release Prevention/Flammable Substances, Clean Air Act (CAA) §112(r), Table 3, TQ (threshold quantity) in pounds and kilograms under 40 CFR68.130. The accidental release prevention regulations applies to stationary sources that have present more than a threshold quantity of a CAA § 112(r) regulated substance.
- Clean Air Act (CAA) Public Law 101−549, Title VI, *Protection of Stratospheric Ozone*, Subpart A, Appendix A, class I and Appendix B, Class II, Controlled Substances, (CFCs) Ozone-depleting substances under 40CFR82.
- Clean Water Act (CWA) Priority toxic water pollutants defined by the US Environmental Protection Agency for 65 pollutants and classes of pollutants which yielded 129 specific substances.[6]
- Chemicals designated by EPA as "Hazardous Substances"[4] under the Clean Water Act (CWA) 40CFR116.4, Table 116.4A.
- Clean Water Act (CWA) § 311 Hazardous Materials Discharge Reportable Quantities (RQs). This regulation establishes reportable quantities for substances designated as hazardous (see §116.4, above) and sets forth requirements for notification in the event of discharges into navigable waters. Source: 40CFR117.3, amended at 60FR30937.
- Clean Water Act (CWA) § 307 List of Toxic Pollutants. Source: 40CFR401.15.
- Clean Water Act (CWA) § 307 Priority Pollutant List. This list was developed from the List of Toxic Pollutants classes discussed above and includes substances with known toxic effects on human and aquatic life, and those known to be, or suspected of being, carcinogens, mutagens, or teratogens. Source: 40CFR423, Appendix A.
- Clean Water Act, § 313 Water Priority Chemicals. Source: 57FR41331.
- RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic with Regulatory levels in mg/L. Source: 40CFR261.24.
- RCRA Hazardous Constituents. Source: 40CFR261, Appendix VIII. Substances listed have been shown, in scientific studies, to have carcinogenic, mutagenic, teratogenic, or toxic effects on humans and other life forms. This list also contains RCRA waste codes. The term "waste number not listed" appears when a RCRA number is NOT provided in Appendix VIII.

Characteristic Hazardous Wastes

Ignitability	A nonaqueous solution containing less than 24% alcohol by volume and having a closed cup flashpoint below 60°C/140°F using Pensky-Martens tester or equivalent. An ignitible compressed gas. A nonliquid capable of burning vigorously when ignited or causes fire by friction, moisture absorption, spontaneous chemical changes at standard pressure and temperature. An oxidizer. See §261.21.
Corrosivity	Liquids with a pH equal to or less than 2 or equal to or more than 12.5 or which corrode steel at a rate greater than 6.35 mm (0.25 in) per year at 55°C/130°F. See §261.22.
Reactivity	Unstable substances that undergo violent changes without detonating. Reacts violently with water or other substances to create toxic gases. Forms potentially explosive mixtures with air. See §261.23.
Toxicity	A waste that leaches specified amounts of metals, pesticides, or organic chemicals using Toxicity Characteristic Leaching Procedure (TCLP). See §261, Appendix II, and §268, Appendix I. **Listed Hazardous Wastes**.
"F" wastes	Hazardous wastes from nonspecific sources §261.31.
"K" Wastes	Hazardous wastes from specific sources §261.32.
"U" Wastes	Hazardous wastes from discarded commercial products, off-specification species, container residues §261.34. Covers some 455 compounds and their salts and some isomers of these compounds.
"P" Wastes	Acutely hazardous wastes from discarded commercial products, off-specification species, container residues §261.33. Covers some 203 compounds and their salts plus soluble cyanide salts.

Note: If a waste is not found on any of these lists, it may be found on state hazardous waste lists.

RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic. Source: 40CFR261.24, Table I. These are listed with regulatory level in mg/L and "D" waste numbers representing the broad waste classes of ignitability, corrosivity, and reactivity.

EPA Hazardous Waste code(s), or RCRA number, appears in its own field. Acute hazardous wastes from commercial chemical products are identified with the prefix "P." Nonacutely hazardous wastes from commercial chemical products are identified with the prefix "U."

RCRA Universal Treatment Standards. Lists hazardous wastes that are banned from land disposal unless treated to meet standards established by the regulations. Treatment standard levels for wastewater (reported in mg/L) and nonwastewater [reported in mg/kg or mg/L TCLP (Toxicity Characteristic Leachability Procedure)] have been provided. Source: 40CFR268.48 and revision, 61FR15654.

RCRA Ground Water Monitoring List. Sets standards for owners and operators of hazardous waste treatment, storage, and disposal facilities, and contains test methods suggested by the EPA (see Report SW-846) followed by the Practical Quantitation Limit (PQL) shown in parentheses. The regulation applies only to the listed chemical; and, although both the test methods and PQL are provided, they are *advisory only*. Source: 40CFR264, Appendix IX.

Safe Drinking Water Act (SDWA) Maximum Contaminant Level Goals (MCLGs) for Organic Contaminants. Source: 40CFR141 and 40CFR141.50, amended 57FR31776.

- Maximum Contaminant Levels (MCLs) for Organic Contaminants. Source: 40CFR141.61.
- Maximum Contaminant Level Goals (MCLGs) for Inorganic Contaminants. Source: 40CFR141.51.
- Maximum Contaminant Levels (MCLs) for Inorganic Contaminants. Source: 40CFR141.62.
- Maximum Contaminant Levels for Inorganic Chemicals. The maximum contaminant level for arsenic applies only to community water systems. Compliance with the MCL for arsenic is calculated pursuant to §141.23. Source: 40CFR141.11.
- Secondary Maximum Contaminant Levels (SMCLs). Federal advisory standards for the states concerning substances that effect physical characteristics (i.e., smell, taste, color, etc.) of public drinking water systems. Source: 40CFR143.3.
- CERCLA Hazardous Substances (“RQ” Chemicals). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.
- Releases of CERCLA hazardous substances in quantities equal to or greater than their reportable quantity (RQ) are subject to reporting to the National Response Center under CERCLA. Such releases are also subject to state and local reporting under §304 of SARA Title III (EPCRA). CERCLA hazardous substances, and their reportable quantities, are listed in 40CFR302, Table 302.4. RQs are shown in pounds and kilograms for chemicals that are CERCLA hazardous substances. For metals listed under CERCLA (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, and zinc), no reporting of releases of the solid is required if the diameter of the pieces of solid metal released is 100 μm (0.004 in.) or greater. The RQs shown apply to smaller particles.
- EPCRA §302 Extremely Hazardous Substances (EHS). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. The presence of Extremely Hazardous Substances in quantities in excess of the Threshold Planning Quantity (TPQ) requires certain emergency planning activities to be conducted. The Extremely Hazardous Substances and their TPQs are listed in 40CFR355, Appendices A & B. For chemicals that are solids, there may be two TPQs given (e.g., 500/10,000). In these cases, the lower quantity applies for solids in powder form with particle size less than 100 μm; or, if the substance is in solution or in molten form. Otherwise, the higher quantity (10,000 pounds in the example) TPQ applies.
- EPCRA §304 Reportable Quantities (RQs). In the event of a release or spill exceeding the reportable quantity, facilities are required to notify State Emergency Response Commissions (SERCs) and Local Emergency Planning Committees (LEPCs). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.
- EPCRA § 313 Toxic Chemicals. From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. Chemicals on this list are reportable under §313 and §6607 of the Pollution Prevention Act. Some chemicals are reportable by category under §313. Category codes needed for reporting are provided for the EPCRA§313 categories. Information and Federal Register references have been provided where a chemical is subject to an administrative stay, and not reportable until further notice.
- From “*Toxic Chemical Release Inventory Reporting Form R and Instructions, Revised 2005 Version,*” EPA document 260-B-06-001 was used for *de minimis* concentrations, toxic chemical categories.
- Chemicals which EPA has made the subject of Chemical Hazard Information Profiles or “CHIPS” review documents.
- Chemicals which NIOSH has made the subject of “Information Profile” review documents on “Current Intelligence Bulletins.”
- Carcinogens identified by the National Toxicology Program of the US Department of Health and Human Services at Research Triangle Park, NC.[10]
- Substances regulated by EPA[7] under the major environmental laws: Clean Air Act, Clean Water Act, Safe Drinking Water Act, RCRA, CERCLA, EPCRA, etc. A more detailed list appears above. Substances with environmental standards set by some international bodies including those in Europe and Canada.[43]
- New to the 6th edition: United States Department of Homeland Security Chemicals of Interest from the

Federal Register, Appendix A, including all provisions of 6 CFR Part 27, including § 27.210(a)(1)(i). In developing the list, the DHS looked to existing expert sources of information including other federal regulations related to chemicals, including the following: Chemicals covered under the Environmental Protection Agency's Risk Management Program. Chemicals included in the Chemical Weapons Convention. Hazardous materials, such as gases, that are poisonous by inhalation. Explosives regulated by the Department of Transportation. The Department of Homeland Security has identified three security issues related to chemicals: *Release*—Toxic, flammable, or explosive chemicals or materials that, if released from a facility, have the potential for significant adverse consequences for human life or health. *Theft or Diversion*—Chemicals or materials that, if stolen or diverted, have the potential to be misused as weapons or easily converted into weapons using simple chemistry, equipment or techniques, in order to create significant adverse consequences for human life or health. *Sabotage or Contamination*—Chemicals or materials that, if mixed with readily available materials, have the potential to create significant adverse consequences for human life or health. Also considered were these security issues as well as to determine their potential future inclusion in Appendix A and/or coverage under Chemical Facility Anti-Terrorism Standards: *Critical to Government Mission*—Chemicals or facilities, the loss of which could create significant adverse consequences for national security or the ability of the government to deliver essential services, and *Critical to National Economy*—Chemicals or facilities, the loss of which could create significant adverse consequences for the national or regional economy.

- Chemicals on California's Proposition 65 List, revised as of January 7, 2011. The Safe Drinking Water and Toxic Enforcement Act of 1986 requires that the Governor revise and republish at least once per year the list of chemicals known to the State to cause cancer or reproductive toxicity.
- Also new in the 6th edition are the water hazard classifications from the German Federal Water Management Act on Water Hazard Classification, *Verwaltungsvorschrift Wassergefährdende Stoffe* (VwVwS). This law requires all chemical substances be evaluated for their detrimental impact on the physical, chemical, or biological characteristics of water. Substances can be classified as nonhazardous to water (*nwg, nicht wassergefährdende*) or assigned to one of three numeric water hazard classes, WGK: 1—low hazard to waters (low polluting to water), WGK: 2—hazard to waters (water pollutant), or WGK: 3—severe hazard to waters (severe pollutant). The English acronym for WGK is WHC (water hazard class). This work uses the German acronym "WGK" so there is no confusion as to its source. Material Safety Data Sheets (MSDS) that use these water hazards also use the German acronym.

Description: This section contains a quick summary of physical properties of the substance including state (solid, liquid, or gas), color, odor description, molecular weight, density, boiling point, freezing/melting point, vapor pressure, flash point, autoignition temperature, explosion limits in air, Hazard Identification (based on NFPA-704 M Rating System) in the format: Health (ranked 1−4), Flammability (ranked 1−4), Reactivity (ranked 1−4) (see also below for a detailed explanation of the System and Fire Diamond), and solubility or miscibility in water. This section may also contain special and relevant comments about the substance. Terms in this section are also defined in the glossary.

Odor threshold: This is the lowest concentration in air that most humans can detect by smell. Some value ranges are reported. The value cannot be relied on to prevent overexposure, because human sensitivity to odors varies over wide limits, some chemicals cannot be smelled at toxic concentrations, odors can be masked by other odors, and some compounds rapidly deaden the sense of smell.

Molecular weight: The MW as calculated from the molecular formula using standard elemental molecular weights (e.g., carbon = 12.1).

Boiling point at 1 atm: The value is the temperature of a liquid when its vapor pressure is 1 atm. For example, when water is heated to 100°C/212°F its vapor pressure rises to 1 atm and the liquid boils. The boiling point at 1 atm indicates whether a liquid will boil and become a gas at any particular temperature and sea-level atmospheric pressure.

Melting/Freezing point: The melting/freezing point is the temperature at which a solid changes to liquid or a liquid changes to a solid. For example, liquid water changes to solid ice at 0°C/32°F. Some liquids solidify very slowly even when cooled below their melting/freezing point. When liquids are not pure (e.g., saltwater) their melting/freezing points are lowered slightly.

Flash point: This is defined as the lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. Depending on the test method used, the values given are either Tag Closed Cup (cc) (ASTM D56) or Cleveland Open Cup (oc) (ASTM D93). The values, along with those in *Flammable Limits in Air* and *Autoignition temperature* below, give an indication of the relative flammability of the chemical. In general, the open cup value is slightly higher (perhaps 10−15°F higher) than the closed cup value. The flash points of flammable gases are often far below 0° (F or C) and these values are of little practical value, so the term "flammable gas" is often used instead of the flash point value.

Autoignition Temperature: This is the minimum temperature at which the material will ignite without a spark or flame being present. Values given are only approximate and may change substantially with changes in geometry, gas, or vapor concentrations, presence of catalysts, or other factors.

Flammable Limits in Air: The percent concentration in air (by volume) is given for the LEL (lower explosive flammable limit in air, % by volume) and UEL (upper explosive flammable limit in air, % by volume), at room temperature, unless other specified. The values along with those in "Flash point" and "Autoignition temperature" give an indication of the relative flammability of the chemical.

NFPA Hazard Classifications: The NFPA 704 Hazard Ratings (Classifications) are based on those found in "*Fire Protection Guide to Hazardous Materials*," 2001 edition, National Fire Protection Association, Quincy, MA, ©1994. The classifications are defined in Table 1 below.

Table 1. Explanation of NFPA Hazard Classifications

Classification	*Definition*
HEALTH HAZARD (blue)	
4	Materials which on very short exposure could cause death or major residual injury (even though prompt medical treatment was given), including those that are too dangerous to be approached without specialized protective equipment.
3	Materials which on short exposure could cause serious temporary or residual injury (even though prompt medical treatment was given), including those requiring protection from all bodily contact.
2	Materials that, on intense or continued (but not chronic) exposure, could cause temporary incapacitation or possible residual injury, including those requiring the use of protective clothing that has an independent air supply.
1	Materials which on exposure would cause irritation but only minor residual injury, including those requiring the use of an approved air-purifying respirator.
0	Materials that, on exposure under fire conditions, offer no hazard beyond that of ordinary combustible material.
FLAMMABILITY (red)	
4	This degree includes flammable gases, pyrophoric liquids, and Class IA flammable liquids. Materials which will rapidly or completely vaporize at atmospheric pressure and normal ambient temperature, or which are readily dispersed in air and which will burn readily.
3	Includes Class IB and IC flammable liquids and materials that can be easily ignited under almost all normal temperature conditions.
2	Materials that must be moderately heated before ignition will occur and includes Class II and Class IIIA combustible liquids and solids and semisolids that readily give off ignitable vapors.
1	Materials that must be preheated before ignition will occur, such as Class IIIB combustible liquids, and solids and semisolids whose flash point exceeds 200°F/93.4°C, as well as most ordinary combustible materials.
0	Materials that will not burn.
REACTIVITY (yellow)	
4	Materials that, in themselves, are readily capable of detonation, explosive decomposition, or explosive reaction at normal temperatures and pressures.
3	Materials that, in themselves, are capable of detonation, or explosive reaction, but require a strong initiating source or heating under confinement. This includes materials that are sensitive to thermal and mechanical shock at elevated temperatures and pressures and materials that react explosively with water.
2	Materials that are normally unstable and readily undergo violent chemical change, but are not capable of detonation. This includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures. This also includes materials that may react violently with water or that may form potentially explosive mixtures in water.
1	Materials that are normally stable, but that may become unstable at elevated temperatures and pressures and materials that will react with water with some release of energy, but not violently.
0	Materials that are normally stable, even under fire exposure conditions, and that do not react with water.
OTHER (white)	
₩	Materials which react so violently with water that a possible hazard results when they come in contact with water, as in a fire situation. Similar to Reactivity Classification 2.Oxy—Oxidizing material; any solid or liquid that readily yields oxygen or other oxidizing gas, or that readily reacts to oxidize combustible materials.

It should be noted that OSHA and DOT have differing definitions for the term "flammable liquid" and "combustible liquid." DOT defines a flammable liquid as one which, under specified procedures, has a flashpoint of 140°F/60°C or less. A combustible liquid is defined as "having a flashpoint above 140°F/60°C and below 200°F/93°C." OSHA defines a combustible liquid as having a flash point above 100°F/37.7°C.

Potential Exposure: A brief indication is given of the nature of exposure to each compound in the industrial environment. Where pertinent, some indications are given of background concentration and occurrence from other than industrial discharges such as water purification plants. Obviously in a volume of this size, this coverage must be very brief. It is of course recognized that nonoccupational exposures may be important as well. This 6th edition contains a brief summary called a Compound Description (Toxicity evaluation),[77] such as Agricultural Chemical, Mutagen, Tumorigen, Mutagen, Reproductive Effector, Primary Irritant, Human Data, etc. Compound descriptors define the types of toxicity data found in a record or uses or applications of the chemical if they are recognized by NIOSH. The Compound Descriptor does not represent an evaluation of the toxicity of a substance, nor are the descriptors all-inclusive (i.e., there may be some substances that should be, but are not, coded as belonging to certain application classes). The codes must be interpreted only in conjunction with the other information found in each record.[77]

Incompatibilities: Potentially hazardous incompatibilities of each substance are listed where available. Where a hazard with water exists, it is described. Reactivity with other materials are described including structural materials such as metal, wood, plastics, cement, and glass. The nature of the hazard, such as severe corrosion formation of a flammable gas, is described. This list is by no means complete or all inclusive. In some cases a very small quantity of material can act as a catalyst and produce violent reactions such as polymerization, disassociation, and condensation. Some chemicals can undergo rapid polymerization to form sticky, resinous materials, with the liberation of much heat. The containers may explode. For these chemicals the conditions under which the reaction can occur are given.

Permissible Exposure Limits in Air: The permissible exposure limit (PEL) has been cited as the federal standard where one exists. Inasmuch as OSHA has made the decision to enforce only pre-1989 PELs, we decided to use these values rather than the transitional limits that were vacated by court order. Except where otherwise noted, the PELs are 8-h work-shift time-weighted average (TWA) levels. Ceiling limits, Short-Term Exposure Limits (STELs), and TWAs that are averaged over other than full work shifts are noted.

The Short-Term Exposure Limit (STEL) values are derived from NIOSH,[58] ACGIH,[1] and HSE[33] publications. This value is the maximal concentration to which workers can be exposed for a period up to 15 min continuously without suffering from: irritation; chronic or irreversible tissue change; or narcosis of sufficient degree to increase accident proneness, impair self-rescue, or materially reduce work efficiency, provided that no more than four excursions per day are permitted, with at least 60 min between exposure periods, and provided that the daily TWA also is not exceeded. The "Immediately Dangerous to Life or Health" (IDLH) concentration represents a maximum level from which one could escape within 30 min without any impairing symptoms or any irreversible health effects. However, the 30-min period is meant to represent a MARGIN OF SAFETY and is NOT meant to imply that any person should stay in the work environments any longer than necessary. In fact, every effort should be made to exit immediately. The concentrations are reported in either parts per million (ppm) or milligrams per cubic meter (mg/m^3).

Most US specifications on permissible exposure limits in air have come from ACGIH[1] or NIOSH.[2] In the United Kingdom, the Health and Safety Executive has set forth Occupational Exposure Limits.[33] In Germany, the DFG has established Maximum Concentrations in the workplace[3] and the former USSR-UNEP/IRPTC project has set maximum allowable concentrations and tentative safe exposure levels of harmful substance in work-place air and residential air for many substances.[43] This section also contains numerical values for allowable limits of various materials in ambient air[60] as assembled by the US EPA. Where available, this field contains legally enforceable airborne Permissible Exposure Limits (PELs) from OSHA. It also contains recommended airborne exposure limits from NIOSH, ACGIH, and international sources and special warnings when a chemical substance is a Special Health Hazard Substance. Each are described below. TLVs have not been developed as legal standards and the ACGIH does not advocate their use as such. The TLV is defined as the time-weighted average (TWA) concentration for a normal 8-h workday and a 40-h workweek, to which nearly all workers may be repeatedly exposed, day after day, without adverse effects. A ceiling value (TLV-C) is the concentration that should not be exceeded during any part of the working exposure. If instantaneous monitoring is not feasible, then the TLV-C can be assessed by sampling over a 15-min period except for those substances that may cause immediate irritation when exposures are short. As some people become ill after exposure to concentrations lower than the exposure limits, this value cannot be used to define exactly what is a "safe" or "dangerous" concentration. ACGIH threshold limit values (TLVs) are reprinted with permission of the American Conference of Governmental Industrial Hygienists, Inc., from the booklet entitled, *Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices.* This booklet is revised on an annual basis. No entry appears when the chemical is a mixture; it is possible to calculate the TLV for a mixture only when the TLV for each component of the mixture is known and the composition of the mixture by weight is also known. According to ACGIH, "Documentation of the Threshold Limit Values and Biological Exposure Indices, 7th Edition" is necessary to fully interpret and implement the TLVs.

OSHA Permissible Exposure Limits (PELs) are found in Tables Z-1, Z-2, and Z-3 of OSHA, "General Industry Air Contaminants Standard (29CFR1910.1000)" that were effective on July 1, 2001 and which are currently enforced by OSHA.

Unless otherwise noted, PELs are the Time-Weighted Average (TWA) concentrations that must not be exceeded during any 8-h shift of a 40-h workweek. An OSHA ceiling concentration must not be exceeded during any part of the workday; if instantaneous monitoring is not feasible, the ceiling must be assessed as a 15-min TWA exposure. In addition, there are a number of substances from Table Z-2 that have PEL ceiling values that must not be exceeded except for a maximum peak over a specified period (e.g., a 5-min maximum peak in any 2 h).

NIOSH Recommended Exposure Limits (RELs) are Time-Weighted Average (TWA) concentrations for up to a 10-h workday during a 40-h workweek. A ceiling REL should not be exceeded at any time. Exposure limits are usually expressed in units of parts per million (ppm), i.e., the parts of vapor (gas) per million parts of contaminated air by volume at 25°C/77°F and one atmosphere pressure. For a chemical that forms a fine mist or dust, the concentration is given in milligrams per cubic meter (mg/m^3).

Protective Action Criteria (PAC) are emergency exposure limits developed by the US Department of Energy (DOE) for 3388 chemicals in revision 26, published September 2010. These exposure limits can be used to estimate the consequences of the uncontrolled release of hazardous materials and to plan for emergency response. These PACs have been added to the 6th edition of Sittig because other well-established exposure limits in air are available for only a limited number of chemicals from other governmental and advisory sources. PAC values are given in parts per million (ppm) for volatile liquids and gases; in milligrams per cubic meter (mg/m^3) for solids, particulates, and nonvolatile liquids. Chemicals for which TEELs (Temporary Emergency Exposure Limits) are available have their values displayed using a regular (non-bold) font. Chemicals for which Acute Emergency Guideline Levels (AEGLs) and Emergency Response Planning Guidelines (ERPGs) have their values displayed in **bold** font. TEELs are intended for use until AEGLs or ERPGs are adopted for chemicals.

PAC Definitions:[SCAPA]

There are subtle difference in the definitions of AEGLs, ERPGs, and TEELs and major differences in how they are developed and issued. Differences in their definitions include: AEGLs pertain to the "general population, including susceptible individuals," but ERPGs and TEELs pertain to "nearly all individuals."

AEGLs are defined as the level "above which" certain health effects are expected, while ERPGs and TEELs are defined as the level "below which" certain health effects are not expected.

Acute Emergency Guideline Levels (AEGLs) are defined as follows:

- *AEGL-1:* the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic, nonsensory effects. However, these effects are not disabling and are transient and reversible upon cessation of exposure.
- *AEGL-2:* the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting adverse health effects or an impaired ability to escape.
- *AEGL-3:* the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience life-threatening adverse health effects or death.

Emergency Response Planning Guidelines (ERPGs) are defined as follows:

- *ERPG-1*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 h without experiencing other than mild transient adverse health effects or perceiving a clearly defined objectionable odor.
- *ERPG-2*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 h without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action.
- *ERPG-3*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 h without experiencing or developing life-threatening health effects.

Temporary Emergency Exposure Limits (TEELs) are defined as follows:

- *TEEL-0*: the threshold concentration below which most people will experience no adverse health effects.
- *TEEL-1:* the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic, nonsensory effects. However, these effects are not disabling and are transient and reversible upon cessation of exposure.
- *TEEL-2:* the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting adverse health effects or an impaired ability to escape.
- *TEEL-3:* the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience life-threatening adverse health effects or death.
- TEELs are intended for use until AEGLs or ERPGs are adopted for chemicals.

Additional information on PAC values, TEEL values, and links to other sources of information can be found on the webpage for the *Subcommittee for Consequence Assessment and Protective Action (SCAPA)*: http://orise.orau.gov/emi/scapa/teels.htm

The German MAK (DFG MAK) values are conceived and applied as 8-h time-weighted average (TWA) values.[3]

Short-Term Exposure Limits (15-min TWA): This field contains Short-Term Exposure Limits (STELs) from ACGIH, NIOSH, and OSHA. The parts of vapor (gas) per million parts of contaminated air by volume at 25°C/77°F and one atmosphere pressure is given. The limits are given in milligrams per cubic meter (mg/m^3) for chemicals that can form a fine mist or dust. Unless otherwise specified, the STEL is a 15-min TWA exposure that should not be exceeded at any time during the workday.

Determination in Air: The citations to analytical methods are drawn from various sources, such as the *NIOSH Manual of Analytical Methods.*[18] In addition, methods have been cited in the latest US Department of Health and Human Services publications including the *"NIOSH Pocket Guide to Chemical Hazards"* August, 2006.

Permissible Concentrations in Water: The permissible concentrations in water are drawn from various sources also, including: The National Academy of Sciences/National Research Council, Safe Drinking Water Committee Board on Toxicology and Environmental Health Hazards, *Drinking Water and Health,* 1980.[16]

The priority toxic pollutant criteria published by US EPA 1980.[6]

The multimedia environmental goals for environmental assessment study conducted by EPA.[32] Values are cited from this source when not available from other sources.

The US EPA has come forth with a variety of allowable concentration levels:

For allowable concentrations in "California List" wastes.[38] The California List consists of liquid hazardous wastes containing certain metals, free cyanides, polychlorinated biphenyls (PCBs), corrosives with a pH of less than or equal to 2.0, and liquid and nonliquid hazardous wastes containing halogenated organic compounds (HOCs).

For regulatory levels in leachates from landfills.[37]

For concentrations of various materials in effluents from the organic chemicals and plastics and synthetic fiber industries.[51]

For contaminants in drinking water.[36]

For National Primary and Secondary Drinking Water Regulations.[62]

In the form of health advisories for 16 pesticides,[47] 25 organics,[48] and 7 inorganics.[49]

For primary drinking water standards starting with a priority list of 8 Volatile Organic Chemicals.[40]

State drinking water standards and guidelines[61] as assembled by the US EPA.

Determination in Water: The sources of information in this field have been primarily US EPA publications including the test procedures for priority pollutant analysis[25] and later modifications.[42]

Routes of Entry: The toxicologically important routes of entry of each substance are listed. In other words, the way in which the people or experimental animals were exposed to the chemical is listed, e.g., eye contact, skin contact, inhalation, intraperitoneal, intravenous. Many of these are taken from the *NIOSH Pocket Guide,*[2] but are drawn from other sources as well.

Harmful Effects and Symptoms: These are primarily drawn from NIOSH, EPA publications, and New Jersey and New York State fact sheets on individual chemicals, and are supplemented from information from the draft criteria documents for priority toxic pollutants[26] and from other sources. The other sources include:

EPA Chemical Hazard Information Profiles (CHIPS) cited under individual entries.

NIOSH Information Profiles cited under individual entries.

EPA Health and Environmental Effect Profiles cited under individual entries.

Particular attention has been paid to cancer as a "harmful effect" and special effort has been expended to include the latest data on carcinogenicity. See also "Regulatory Authority and Advisory Bodies" section.

Short Term Exposure: These are brief descriptions of the effects observed in humans when the vapor (gas) is inhaled, when the liquid or solid is ingested (swallowed), and when the liquid or solid comes in contact with the eyes or skin. The term LD_{50} signifies that about 50% of the animals given the specified dose by mouth will die. Thus, for a Grade 4 chemical (below 50 mg/kg), the toxic dose for 50% of animals weighing 70 kg (150 lb) is $70 \times 50 = 3500$ mg = 3.5 g, or less than 1 teaspoonful; it might be as little as a few drops. For a Grade 1 chemical (5−15 g/kg), the LD_{50} would be between a pint and a quart for a 150-lb man. All LD_{50} values have been obtained using small laboratory animals such as rodents, cats, and dogs. The substantial risks taken in using these values for estimating human toxicity are the same as those taken when new drugs are administered to humans for the first time.

Long Term Exposure: Where there is evidence that the chemical can cause cancer, mutagenic effects, teratogenic effects, or a delayed injury to vital organs such as the liver or kidney, a description of the effect is given.

Points of Attack: This category is based, in part, on the "Target Organs" in the *NIOSH Pocket Guide*[2] but the title has been changed as many of the points of attack are not organs (e.g., blood). This is human data unless otherwise noted.

Medical Surveillance: This information is often drawn from a NIOSH publication[27] but also from *New Jersey State Fact Sheets*[70] on individual chemicals. Where additional information is desired in areas of diagnosis, treatment, and medical control, the reader is referred to a private publication[28] which is adapted from the products of the NIOSH Standards Completion Program.

First Aid: Guides and guidance to first aid found in this work should not be construed as authorization to emergency personnel to perform the procedures or activities indicated or implied. Care of persons exposed to toxic chemicals must be directed by a physician or other recognized professional or authority. Simple first aid procedures are listed for response to eye contact, skin contact, inhalation, and ingestion of the toxic substance as drawn to a large extent from the *NIOSH Pocket Guide*[2] but supplemented by information from recent commercially available volumes in the United States,[29] in the United Kingdom, and in Japan[24] as well as from state fact sheets. They deal with exposure to the vapor (gas), liquid, or solid and include inhalation, ingestion (swallowing), and contact with eyes or skin. The instruction "Do NOT induce vomiting" is given if an unusual hazard is associated with the chemical being sucked into the lungs (aspiration) while the patient is vomiting.

"*Seek medical attention*" or "*Call a doctor*" is recommended in those cases where only competent medical personnel can treat the injury properly. In all cases of human exposure, seek medical assistance as soon as possible. In many cases, medical advice has been included for guidance only.

Personal Protective Methods: This information is drawn heavily from NIOSH publications[2, 77] and supplemented by information from the United States,[29] the United Kingdom, and Japan.[24] There are indeed other "personal protective methods" which space limitations prohibit describing here in full. One of these involves limiting the quantities of carcinogens to which a worker is exposed in the laboratory. The items listed are those recommended by (a) NIOSH and/or OSHA, (b) manufacturers, either in technical bulletins or in material safety data sheets (MSDS), (c) the Chemical Manufacturers Association (CMA), or (d) the National Safety Council (NSC), for use by personnel while responding to fire or accidental discharge of the chemical. They are intended to protect the lungs, eyes, and skin.

Respirator Selection: The 6th edition, like its predecessors, presents respirator selection with a full text description. For each line a maximum use concentration (in ppm, mg/m^3, μg/m^3, fibers/m^3, or mppcf) condition (e.g., escape) followed by the NIOSH code and full text related to respirator recommendations. All recommended respirators of a given class can be utilized at any concentration equal to or less than the class's listed maximum use concentration. Respirator selection should follow recommendations that provide the greatest degree of protection. Respirator codes found in the *NIOSH Pocket Guide* have been included to ease updating.

All respirators selected must be approved by NIOSH under the provisions of 42CFR84. The current listing of NIOSH/MSHA-certified respirators can be found in the *NIOSH Certified Equipment List*, which is available on www.cdc.gov/niosh/npptl/topics/respirators/cel (NIOSH Web site).

For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive-pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*. In the case of chemical warfare agents, use only SCBA Respirator certified by NIOSH for CBRN environments. CBRN stands for "Chemical, Biological, Radiological, and Nuclear."

Pesticides are not identified as such in the respirator selection tables. For those substances that are pesticides, the recommended air-purifying respirator must be specifically approved by NIOSH/MSHA. Specific information on choosing the appropriate respirator will be provided on pesticide labels. Approved respirators will carry a "TC" number prefix, which signifies they have been tested and certified for a specific level of protection. New respirators may carry a "TC-84A" prefix in compliance with 42CFR84 for testing and certifying nonpowered, air-purifying, particulate-filter respirators. The new Part 84 respirators have passed a more demanding certification test than the old respirators (e.g., dust and mist [DM], dust, fume, and mist [DFM], spray paint, and pesticide) certified under 30CFR11.

Additionally, a complete respirator protection program should be implemented including all requirements in 29CFR1910.134 and 42CFR84. At a minimum, a respirator protection program should include regular training, fit-testing, periodic environmental monitoring, maintenance inspection, and cleaning. The selection of the actual respirator to be used within the classes of recommended respirators depends on the particular use situation, and should only be made by a knowledgeable person. Remember, air-purifying respirators will not protect from oxygen-deficient atmospheres. For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive-pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*.

Storage: The 6th edition now provides, as general guidance, a color-coded classification system similar to those often found in commerce and laboratories. It is the objective of any chemical storage classification system to prevent accidental combination of two or more incompatible materials that might be stored in the same space. To prevent an unwanted and possibly dangerous reaction, chemicals must be separated by space and/or physical barriers. Chemical storage areas should be appropriately labeled. Users must be careful to check the MSDS for both additional and specific information. Some chemical entries contain multiple storage codes because the chemical profile fits more than a single category.

Code	***Hazard***
Red	Flammables (flash point <100°F)
Blue	Health hazards/toxics/poisons
Yellow	Reactives/oxidizers
White	Contact hazards
Green*	General storage

*For general storage, the colors Gray and Orange are also used by some companies.

- Chemical containers that are not color coded should contain hazard information on the label.
- Check the MSDS to learn what personal protective equipment is required when using the substance
- *Red*: Flammability Hazard: Store in a flammable (liquid or materials) storage area or approved cabinet away from ignition sources and corrosive and reactive materials.
- *Blue*: Health Hazard/Toxics/Poisons: Store in a secure poison location.
- *Yellow*: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles.
- *White*: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location.
- *Green (or Gray or Orange)*: General storage may be used. Generally, for flammability, health, and corrosivity with an NFPA rating of no higher than "2."

- Chemicals with labels that are colored and diagonally striped may react with other chemicals in the same hazard class. See MSDS for more information.
- *Red Stripe*: Flammability Hazard: Store separately from all other flammable materials. Example: sodium metal.
- *Yellow Stripe*: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. *Example*: reducing agents.
- *White stripe*: Contact Hazard; not compatible with materials in solid white category. Store separately. *Exampl*e: Bases.

Other data in this field are drawn from, or based on, various resources, including the NFPA,[17] Japanese sources,[24] and publications such as the *Hazardous Substance Fact Sheets* published by the New Jersey Department of Health and Senior Services.[70]

Shipping: The shipping guidance offered herein does not replace the training requirements of the Department of Transportation and in no way guarantees that you will be in full compliance with the Department of Transportation Regulations. *Labeling*: This section refers to the type label or placard required by regulation on any container or packaging of the subject compound being shipped. In some cases a material may require more than one hazardous materials label. *Quantity limitation:* This section lists quantities of material that may be shipped on passenger aircraft, rail, and cargo aircraft. Materials in certain hazard classes may be shipped under the small quantities exception (see 49CFR173.4) with specific approval from the Associate Administrator for Hazardous Materials Safety, Department of Transportation. *Hazard class or division:* This number refers to the division number or hazard class that must appear on shipping papers. This information is drawn from DOT publications[19] as well as UN publications[20] and also NFPA publications.[17] The US Department of Transportation[19] has published listings of chemical substances which give a hazard classification and required labels. The US DOT listing now corresponds with the UN listing[20] and specifies first a hazard class of chemicals as defined in the following table, and then a packing group (I, II, or III) within each of the classes. These groups are variously defined depending on the hazard class but in general define materials presenting: I—a very severe risk (great danger); II—a serious risk (medium danger); and III—a relatively low risk (minor danger).

HAZARD CLASSIFICATION SYSTEM

The hazard class of dangerous goods is indicated either by its class (or division) number or name. For a placard corresponding to the primary hazard class of a material, the hazard class or division number must be displayed in the lower corner of the placard. However, no hazard class or division number may be displayed on a placard representing the subsidiary hazard of a material. For other than Class 7 or the OXYGEN placard, text indicating a hazard (e.g., “CORROSIVE”) is not required. Text is shown only in the United States. The hazard class or division number must appear on the shipping document after each shipping name.

Class 1—Explosives
Division 1.1: Explosives with a mass explosion hazard
Division 1.2: Explosives with a projection hazard
Division 1.3: Explosives with predominantly a fire hazard
Division 1.4: Explosives with no significant blast hazard
Division 1.5: Very insensitive explosives with a mass explosion hazard
Division 1.6: Extremely insensitive articles
Class 2—Gases
Division 2.1: Flammable gases
Division 2.2: Nonflammable, nontoxic* gases
Division 2.3: Toxic* gases
Class 3—Flammable liquids [and Combustible liquids (US)]
Class 4—Flammable solids; Spontaneously combustible materials; and Dangerous when wet materials/Water-reactive substances
Division 4.1: Flammable solids
Division 4.2: Spontaneously combustible materials
Division 4.3: Water-reactive substances/Dangerous when wet materials
Class 5—Oxidizing substances and Organic peroxides
Division 5.1: Oxidizing substances
Division 5.2: Organic peroxides
Class 6—Toxic* substances and Infectious substances
Division 6.1: Toxic* substances
Division 6.2: Infectious substances
Class 7—Radioactive materials
Class 8—Corrosive substances
Class 9—Miscellaneous hazardous materials/Products, Substances, or Organisms
*The words “poison” or “poisonous” are synonymous with the word “toxic.”

Spill Handling: Spill or leak information provided is intended to be used only as a guide. The term *Issue warning* is used when the chemical is a poison, has a high flammability, is a water contaminant, is an air contaminant (so as to be hazardous to life), is an oxidizing material, or is corrosive. *Restrict access* is used for those chemicals that are unusually and immediately hazardous to personnel unless they are protected properly by appropriate protective clothing, eye protection, and respiratory protection equipment. *Evacuate area* is used primarily for unusually poisonous chemicals or those that ignite easily. *Mechanical containment* is used for water-insoluble chemicals that float and do not evaporate readily. *Should be removed* is used for chemicals that cannot be allowed to disperse because of potentially harmful effects on humans or on the ecological system in general. The term is not used unless there is a reasonable chance of preventing dispersal, after a discharge or leak, by chemical and physical treatment. *Chemical and physical treatment* is recommended for chemicals that can be removed by skimming, pumping, dredging, burning, neutralization, absorption, coagulation, or precipitation. The corrective response may also include the use of dispersing agents, sinking agents, and biological treatment. *Disperse and flush* is used for chemicals that can be made nonhazardous to humans by simple dilution with water. In a few cases the response is indicated even when the compound reacts with water because, when proper care is taken, dilution is still the most effective way of removing the primary hazard. This material safety data sheet information is drawn from a variety of sources including New Jersey Department of Health and Senior Services *Hazardous Substance Fact Sheets*[70] and EPA *Profiles on Extremely Hazardous Substances.*[82]

Fire Extinguishing: Fire information provided is intended to be used only as a guide. Certain extinguishing agents should not to be used because the listed agents react with the chemical and have the potential to create an additional hazard. In some cases they are listed because they are ineffective in putting out the fire. Many chemicals decompose or burn to give off toxic and irritating gases. Such gases may also be given off by chemicals that vaporize in the heat of a fire without either decomposing or burning. If no entry appears, the combustion products are thought to be similar to those formed by the burning of oil, gasoline, or alcohol; they include carbon monoxide (poisonous), carbon dioxide, and water vapor. The specific combustion products are usually not well known over the wide variety of conditions existing in fires; some may be hazardous. This information is drawn from NFPA publications,[17] FEMA,[78] and other sources. Any characteristic behavior that might increase significantly the hazard involved in a fire is described. The formation of flammable vapor clouds or dense smoke, the possibility of polymerization, and explosions is stated in this section and/or the incompatibility section. Unusual difficulty in extinguishing the fire is noted.

Disposal Method Suggested: The disposal methods for various chemical substances have been drawn from various sources, including government documents and a UN publication.[22, 79]

References: The general bibliography for this volume follows immediately. It includes both general reference sources and references dealing with analytical methods. The references at the end of individual chemical records are generally restricted to: references dealing only with that particular compound; and references which, in turn, contain bibliographies giving references to the original literature on toxicological and other behavior of the substance in question.

Key to Abbreviations and Acronyms

α	the Greek letter *alpha*; used as a prefix to denote the carbon atom in a straight chain compound to which the principal group is attached.
as-	prefix for asymmetric
ACGIH	American Conference of Governmental Industrial Hygienists
AEGL	Acute Emergency Guideline Level, developed by the EPA
AIHA	American Industrial Hygiene Association
approx.	approximately
asym-	prefix for asymmetric
atm.	atmosphere
ATSDR	Agency for Toxic Substances and Disease Registry
β	the Greek letter *beta*
BEI	Biological Exposure Indices (ACGIH in the USA; South Africa; New Zealand)
BLV	Biological Limit Values
BP	boiling point
°C	degrees Centigrade
CAA	Clean Air Act
CAAA	Clean Air Act Amendments of 1990
CAMEO	Computer-Aided Management of Emergency Operations (NOAA)
carc.	carcinogen
CAS	Chemical Abstract Service
cc	cubic centimeter
cc	closed cup (Flash point)
CDC	US Center for Disease Control
CEPA	Canadian Environmental Protection Act
CERCLA	Comprehensive Environmental Response, Compensation, And Liability Act
CFCs	chlorofluorocarbons
CFR	*Code of Federal Regulations*
cis-	(Latin: on this side). Indicating one of two geometrical isomers in which certain atoms or groups are on the same side of a plane
CMA	Chemical Manufacturers Association
CPR	Cardiopulmonary Resuscitation
CWA	Clean Water Act
cyclo-	(Greek, circle). Cyclic, ring structure; as cyclohexane
Δ or δ	Greek letter *delta*
DFG	Deutsche Forschungs-gemeinschaft
DOE	US Department of Energy
DOT	US Department of Transportation
DOT ID	Department of Transportation Identification Numbers
EEC or EC	European Economic Community
EEGL	Emergency Exposure Guidance Level
EHS	Extremely Hazardous Substances
EINECS	European Inventory of Existing Commercial Chemical Substances
ε	Greek letter *epsilon*
EPA (US)	Environmental Protection Agency
EPCRA	Emergency Planning and Community Right-to-Know Act
ESLI	End of Service Life Indicator
EU	European Union
°F	degrees Fahrenheit
FDA	Food and Drug Administration
FEMA	Federal Emergency Management Agency
FR	*Federal Register*
γ	Greek letter *gamma*
GHS	Globally Harmonized System of Classification and Labeling of Chemicals
h	hour(s)
HCFC	hydrochlorofluorocarbons
HCS	Hazard Communication Standard
HSDB	Hazardous Substances Data Bank
IARC	International Agency for Research on Cancer
IATA	International Air Transport Association
IDLH	Immediately Dangerous to Life or Health
ILO	International Labor Office
IRIS	Integrated Risk Information System (EPA)
iso-	(Greek, equal, alike). Usually denoting an isomer of a compound
kg	kilogram(s)
l	liter(s)
lb	pound(s)
LC_{50}	The concentration of a substance in air that kills 50% of the test population.
LC_{Lo}	The lowest concentration of a substance in air that has been shown to cause death in a test population.
LD_{50}	The dose of a substance administered by any route (other than inhalation) that causes death to 50% of the test population.
LD_{LO}	The lowest dose of a substance administered by any route (other than inhalation) that has been shown to cause death in a test population.
LEL	Lower explosive (flammable) limit in air, % by volume at room temperature or other temperature as noted
LEPC	Local Emergency Planning Committees
LTEL	Long-Term Exposure Limit (UK)
m-	an abbreviation for "*meta-*," a prefix used to distinguish between isomers or nearly related compounds
m^3	cubic meter

MACT	Maximum Achievable Control Technology (CAA)
MAK	airborne exposure limit "Maximale Arbeitsplatz-Konzentration" (maximum workplace concentration) from the Deutsche Forschungs-gemeinschaft (DFG), German Research Foundation.
MCL	Maximum Contaminant Level (SDWA)
MCLG	Maximum Contaminant Level Goal (SDWA)
mg	milligram(s)
μ	micro
μg	microgram(s)
min	minute(s)
mmHg	millimeters of mercury (non-SI symbol for pressure). Also known as "torr"
mppcf	million particles per cubic foot
MSDS	Material Safety Data Sheets
n-	abbreviation for "normal," referring to the arrangement of carbon atoms in a chemical molecule prefix for normal
N-	Symbol used in some chemical names, indicating that the next section of the name refers to a chemical group attached to a nitrogen atom. The bond to the nitrogen atom
NCI	National Cancer Institute (USA)
NFPA	National Fire Protection Association (USA)
NIOSH	National Institute for Occupational Safety and Health (USA)
NLM	National Library of Medicine (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOAEL	No Observed Adverse Effect Level
NOS	not otherwise specified
NPRI	National Pollutant Release Inventory (Canada)
NTIS	National Technical Information Service (USA)
NTP	National Toxicology Program (USA)
o-	*ortho-*, a prefix used to distinguish between isomers or nearly related compounds
OEL	Occupational Exposure Limit
ω	Greek letter *omega*
oc	open cup
OSHA	Occupational Safety and Health Administration (USA)
Oxy	Oxidizer or oxidizing agent
p-	an abbreviation for "*para-*," a prefix used to distinguish between isomers or nearly related compounds
PAC	Protective Action Criterion (US DOE)
PBB	polybrominated biphenyl
PCB	polychlorinated biphenyl
PE	polyethylene
PEL	Permissible Exposure Limit (USA, Japan, Mexico)
PNOS	Particulates Not Otherwise Specified
POTW	Publicly Owned Treatments Works
PP	polypropylene
ppb	parts per billion
PPE	Personal Protective Equipment
ppm	parts per million
PQL	Practical Quantitation Limit (RCRA)
prim-	prefix for primary
REL	Recommended Exposure Limits (NIOSH)
RQ	Reportable Quantity
RTECS	Registry of Toxic Effects of Chemical Substances
RTK	Right-to-Know
SARA	Superfund Amendments and Reauthorization Act
s. carc.	Suspected Carcinogen
SCAPA	Subcommittee on Consequence Assessment and Protective Actions (DOE)
SCBA	Self-Contained Breathing Apparatus
SDWA	Safe Drinking Water Act
sec-	prefix for secondary
SERC	State Emergency Response Commissions
SMCL	Secondary Maximum Contaminant Levels (SDWA)
STEL	Short-Term Exposure Limit
sym-	abbreviation for "symmetrical," referring to a particular arrangement of elements within a chemical molecule
t-	prefix for tertiary
TC_{Lo}	The lowest concentration of a substance in air that has been shown to produce toxic effects in a test population.
TD_{Lo}	The lowest dose of a substance that has been shown to produce toxic effects in a test population
TEEL	Temporary Emergency Exposure Limit
TRK	Technical Guiding Concentrations (DFG) for workplace control of carcinogens
tert-	abbreviation for "tertiary," referring to a particular arrangement of elements within a chemical molecule
TLV®	Threshold Limit Value (ACGIH)
TQ	Threshold Quantity
trans-	(Latin: across). Indicating that one of two geometrical isomers in which certain atoms or groups are on opposite sides of a plane
TRI	Toxic Release Inventory
TSCA	Toxic Substances Control Act
TWA	Time-Weighted Average. Often shown as TWA—8 h
UEL	Upper Explosive (flammable) Limit in air, % by volume at room temperature or other temperature as noted
UN	United Nations
unsym-	prefix for asymmetric

USDA	US Department of Agriculture
USCG	US Coast Guard
VOCs	Volatile Organic Compounds
WEEL	Workplace Environmental Exposure Level (AIHA)
WHMIS	Workplace Hazardous Materials Information System (Canada)
>	symbol for “greater than”
<	symbol for “less than”
≤	symbol for “less than or equal to”
≥	symbol for “greater than or equal to”
°	degrees of temperature
%	percent

A

Abrin A:0025

Molecular Formula: None
Synonyms: Abrins; *Abrus precatorius* seed; Agglutinin; Aivoeiro; Arraccu-mitim; Buddhist rosary bead; Carolina muida; Crab's eyes; Deadly crab's eye; Indian bead; Indian licorice seed; Jequirite; Jequirity bean; John Crow bead Jumble bead; Juquiriti; Lectin protein; Love bean; Lucky bean; Mienie-Mienie; Phytotoxin *(Abrus precatorius* seed); Prayer bead; Precatory bean; Rosary beads; Rosary Pea; Ruti; Seminole bead; Tentos da America (Spanish); Tentos dos mundos (Spanish); Toxalbumin; Vegetable Toxalbumin; Weather plant; Wild licorice
CAS Registry Number: 1393-62-0
RTECS® Number: AA5250000
UN/NA & ERG Number: UN3462 (Toxin, extracted from living sources, solid)/153; UN3172 (Toxins, extracted from living sources, n.o.s.)/153
EC Number: Not assigned
Regulatory Authority and Advisory Bodies
Report any release of WMD to National Response Center 1-800-424-8802.
European/International Regulations: Hazard Symbol: T; Risk phrases: R26/27/28; R42/43; Safety phrases: S23; S28; S36/37; S45 (see Appendix 4).
WGK (German Aquatic Class): No value assigned. However, *based on toxicity the following may apply*: 3—Severe hazard to waters.
Description: Abrin is a lethal, delayed-action cytotoxin/biotoxin. It is stable under ambient conditions and can persist in the environment for a long time despite extreme conditions and temperatures. Abrin is a yellowish-white powder. Molecular weight = (approx.) 63,000−67,000 Da; Boiling point = decomposes at 80°C (most of the toxicity is lost in 30 min); Volatility = negligible; Vapor pressure = negligible at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4; Flammability -; Reactivity 0. Sparingly soluble in water; solubility = 160 mg/L.
Detection: The BTA® (BioThreat Alert®) test strips (Tetracore Inc., 9901 Belward Campus Drive, Rockville, MD; Telephone: 240/268-5400) allows for screening of Abrin. Abrin is detectable in urine, plasma, and environmental samples. Instant Chek Abrin/Ricin Detection Kit, Catalog Number: IC-RA-003-10 Kit Contents: 10 test units each test contains two tests (1 Abrin and 1 Ricin) per unit, lyophilized reagent, reconstitution buffer, wash buffer, transfer pipettes, instruction booklet. EY Laboratories, Inc., 107 N. Amphlett Blvd, San Mateo, CA 94401, USA, Toll Free (North America) 1-800-821-0044; Telephone: 1-650-342-3296, Option 2 or 3; Fax: +1 (650) 342 2648.
History of the Material: Abrin has not been known to have been used as a biological weapon in any wars or terrorist attacks. Rosary pea vines, or *Abrus precatorius*, are perennial plants that are native to India and other tropical areas throughout the world. The vines can grow up to 10−20 feet, producing small, colored flowers ranging in color from pink to red and purple bean-bearing legume pods that are 1−1.5 inches in length. Rosary peas or jequirity beans are uniform in size and weight and are an attractive bright red color with black spots on one end. Rosary pea vines are capable of growing in warm climates around the world, including the United States, where they are established in Florida. The beans, in Florida, are called "Seminole beads." Dangerous to both people and pets, these invasive plants should be professionally removed to prevent both spreading and accidental poisonings.
Potential Exposure: Abrin is a lectin, plant glycoprotein, and cytotoxin that is present in the rosary pea (*Abrus precatorius*). The poison in Abrin binds and agglutinates animal cells. Abrin is among the most potent and lethal substances known to humankind. A single seed can be fatal; a single milligram is capable of killing an adult within a few days. When the seeds of the rosary pea are damaged, these drilled beads (drilled with holes for making beaded jewelry or rosaries/prayer beads) can be fatally dangerous if swallowed. The dust inside the beads remains stable, and years following collection some people can be poisoned if the beads are broken and the dust is inhaled, ingested, gets in the eyes, or comes in contact with broken skin. Many, perhaps most, cases of *Abrus* seed poisonings are unintentional and in children who are attracted to the colorful looking beans. The severity of an exposure is often dependent on how much Abrin is released when the seeds are chewed or masticated, releasing poisonous vegetable *toxalbumins*. Some cases of *Abrus* exposure, even after ingestion of large amounts of plant material, may result in little or no clinical effects. This situation may reflect variations in toxicity and/or poor GI absorption. If the seeds of these plants are *not chewed and swallowed whole*, symptoms are much less likely to occur. Due to the hard shell, it is possible for the seeds to pass through the gastrointestinal tract without incident.

This relatively inexpensive, accessible, natural source may allow for easy preparation of large and dangerous quantities of Abrin. It can be made in various forms: as a powder or mist that can be inhaled; in the form of a pellet for injection in the skin; or a powder which can be dissolved in water and ingested. One can also be exposed by touching surfaces on which Abrin particles or droplets of Abrin have landed; or if particles or droplets of Abrin land on injured or broken skin or in the eyes. Abrin can contaminate water and food and it can be released into outdoor air as an aerosol which has the potential to contaminate agricultural products.

Abrin is much more poisonous than a related cytotoxin, Ricin [LD_{50} = (Ricin) 3 μg/kg; (Abrin) 0.04 μg/kg in laboratory mice]. Abrin poisoning is not contagious and does not spread from person to person. Because Abrin is not a living

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00001-1

thing but rather a chemical made by living things, it probably would NOT make as effective a military weapon such as viruses or bacteria (i.e., ebola virus or anthrax). Nevertheless, it would make an effective terrorist weapon because it is both easy to make and use. With no known antidote, vaccine, or other effective therapy available for Abrin poisoning, the threat of this agent being released into the environment as an aerosol, or added to the food or water supply, could be catastrophic.

Leaves and roots of the rosary pea vine have been used as a herbal remedy in traditional or folk medicine. It should be noted that although Abrin has the potential to be used as a terrorist weapon, it also has some potential medical uses. In modern medicine, Abrin may be used in medical research and to kill malignant cells in cancer treatment. Ricin is extremely hazardous when freeze-dried, forming a light, easily-dispersed powder. For this reason, researchers are directed to avoid freeze-drying Ricin. Abrin potentially has similar properties and dangers.

Incompatibilities: Toxic proteins of Abrin are resistant to digestive enzymes but are destroyed in cooking. The toxic portion of Abrin is heat stable at ambient temperatures and begins to decompose at 60°C/140°F. At 80°C/176°F, most of the toxicity is lost in about 30 min. Avoid contact with strong oxidizers. When heated to decomposition, Abrin releases toxic nitrogen oxides.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC), not determined/established.

ChemWatch®: 0.00006 mg/m^3 Ceiling limit (sensitizer).[CDC]

Determination in Air: No NIOSH or OSHA methods available.

Permissible Concentration in Water: Unknown.

Routes of Entry: Abrin can be absorbed by all routes of exposure but normally enters the body by ingestion. Aerosolized Abrin can enter the body by inhalation. The toxin attaches to cell surfaces of various tissues, particularly the stomach lining if ingested; or in the moist, upper respiratory tissues if inhaled.

Harmful Effects and Symptoms

Abrin inhibits protein synthesis by penetrating the body's cells and block the body's ability to regenerate essential proteins in vital organs of the body such as the liver, central nervous system (CNS), kidneys, and adrenal glands. The toxin A-chain is an *N-glycosidase* protein that removes an adenine residue from 28S RNA, which disrupts protein synthesis throughout the body. Once this cellular protein synthesis mechanism is disrupted, within hours the body's systems begins to shut down and die due to multisystem organ failure. EXTREMELY TOXIC—estimated human fatal dose after oral consumption by humans is approximately 0.005–0.007 mg/kg.[NIOSH] LD_{50} = (oral-mice) about 3 g/kg by injection or aerosol; LD_{50} = (oral-mice) 0.04 μg/kg.

The major symptoms of Abrin poisoning are dependent on the purity, route, and level (dose) of exposure (inhalation, ingestion, or injection) though multiple organs may be affected in severe cases. Initial symptoms of Abrin poisoning by inhalation may occur within 8 h of exposure. The American Medical Association's *Quick Reference Guide to Biological Weapons* estimates "8–24 h (acute symptoms may appear as early as 4–8 h following exposure)." Following ingestion of Abrin, initial symptoms may occur in less than 6 h but are often delayed for 1–3 days. Intravenous or intramuscular injection (parenteral administration) of Abrin is of greatest concern because a high fatality rate is normally expected. Although symptoms may be delayed for several days, patients frequently develop the gastrointestinal effects within 6 h.[TOXNET] It is possible for death from Abrin poisoning to take place within 36–72 h of exposure. Within several days, the person's liver, spleen, and kidneys might stop working and the person will die. If death has not occurred after 5 days following symptoms of exposure, without complications, it is possible that the victim may not die and recovery is possible.

When directly exposed, toxalbumins (poisonous vegetable matter) in Abrin can cause severe gastrointestinal lesions with irritation of the area of the throat, at the back of the mouth (oropharynx), esophagus, or stomach. Although clinically similar to alkaline caustic burns, they are usually delayed two or more hours following exposure. This exposure can be severe and life threatening, particularly in those locales not having advanced health care systems. There are a a few reported cases of Abrin causing an acute and diffuse inflammation of the brain and spinal cord usually caused by a hypersensitivity response to tissue surrounding a blood vessel.

Short Term Exposure: The following lists do not convey prioritization or indicate specificity. *Ingestion*: Generally within a few hours symptoms will appear, including nausea, profuse vomiting, abdominal pain and cramping, watery diarrhea (possibly bloody), later vomiting of blood (hematemesis) and stools or vomit stained black by blood pigment or dark blood products melena (melena), hemagglutination (the agglutination of red blood cells caused by an antibody either for red blood cell antigens or for antigens that coat red blood cells, or by the presence of viruses or other microbes), lowered blood pressure, hallucinations, seizures, tetany, gastrointestinal bleeding, pancreatitis, tachycardia, low or no urinary output, dilation of the pupils, hallucinations, drowsiness, fever, thirst, sore throat, headache, dilated pupils, vascular collapse, and shock. *Note*: abnormal liver function tests (elevated liver enzymes), multiple ulcerations, and hemorrhages of gastric and small-intestinal mucosa on endoscopy. Severe vomiting and diarrhea may result from severe dehydration (hypovolaemic-shock) followed by low blood pressure and multisystem organ failure. Within 36–72 h following exposure, organs (liver, spleen, and kidneys) might stop working and the victim may die. *Inhalation*: Within a few hours of inhaling significant amounts of Abrin, the likely symptoms would be respiratory distress, difficult or labored breathing; shortness of breath; chest tightness, hypoxemia, fever, cough, nausea, sweating, aching muscles. Heavy sweating may follow as noncardiogenic pulmonary edema develops.* This would make breathing even more difficult, and the skin might turn blue. Excess fluid in the lungs would be diagnosed by X-ray or by listening to the chest with a stethoscope. Finally, low blood pressure, blue skin, multisystem organ failure, respiratory failure may occur, and possible death. *Skin*: It is generally believed that the risk of Abrin toxicity is low from contact with unbroken skin; however, it may be absorbed through irritated, damaged, abraded, wounded, or injured skin; or through normal skin when Abrin is dissolved in solvents such as hydrocarbons or petroleum products. If enough Abrin gets through the skin, the symptoms will be similar to those described for ingestion. If Abrin is injected, the muscles and lymph nodes near the injection site would die. This could lead to possible seizures, liver and kidney failure, cardio-collapse, and death. *Eyes:* Abrin in the powder or mist form can cause redness and pain of the skin and the eyes. Tearing, swelling of the eye-lids, pain, redness, corneal injury, fever, fatigue, weakness, muscle pain, dehydration, possible seizures, cardio-collapse, and death. Like Ricin, urinary excretion of Abrin is probably slow and limited, with the estimated half-life being about 8 days. *Late phase complications*: based on Ricin, it is expected that complications are related to Abrin's cell killing (cytotoxic) effects on the liver, central nervous, kidneys, and adrenal glands, typically 2−5 days after exposure. The patient may be asymptomatic (showing no symptoms of exposure) during the preceding 1−5 days.[CDC]

*Based on Ricin, Abrin-induced pulmonary edema would be expected to occur much later (1−3 days postexposure) compared to that induced by other agents such as phosgene (about 6 h postexposure).

Long Term Exposure: Based on its similarity to Ricin, repeated exposure to Abrin may cause allergic/asthma-like symptoms with congestion of nose and throat; itchy, watery eyes; hives; tightness of the chest; and in acute cases, wheezing. May affect kidneys, liver, pancreas. Based on exposure of Ricin to animals, Abrin may be capable of causing severe lung damage in humans. Information about carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to Abrin is unknown at this time.

Points of Attack: Lungs, eyes, skin (primarily through cuts and bruises). The risk of toxicity from unbroken skin exposure to Abrin is low but there may still be a danger of allergic skin reactions.

Medical Surveillance: Unfortunately Abrin symptoms resemble those that are similar to other diseases, especially the common flu. Laboratory testing might include metabolic acidosis, increased liver function tests, increased renal function tests, hematuria, leukocytosis (2- to 5-fold higher than normal).

First Aid: No antidote exists for Abrin. Make all exposed people go to the nearest hospital emergency department. Make all potentially exposed people shower and change clothes. In case you have gotten Abrin on your skin or your clothing, immediately shower and change clothes. See a doctor as soon as possible: since it can take only a day and a half for symptoms to appear, all exposed persons should get to a doctor that same day. If exposure includes contact with Abrin, remove it *off or out* of the body as quickly as possible. Treatment needs to be provided in a hospital setting. Make the doctors and nurses aware of the potential for exposure so that they can protect themselves; and provide the most appropriate treatments and therapies. If you have to wait for medical assistance, make the victim comfortable. If Abrin has been ingested, the airway must be secured and stomach pumping (gastric lavage) may be considered. Gastric lavage is recommended only if it can be done shortly after ingestion (generally within 1 h). Risk of aggravating injury to the lining of the gastrointestinal (GI) tract must be considered.

To minimize the effects of the poisoning and to keep the patient stable, Abrin poisoning is treated through supportive therapy. The types of supportive medical care would depend on several factors, such as the route by which victim(s) were poisoned (i.e., whether poisoning was by inhalation, ingestion, eye, or skin exposure). Do not induce vomiting. Rinse mouth, flush stomach with activated charcoal* (if the Abrin has been very recently ingested), washing out the victim's eyes with water, especially if the eyes are red and irritated. Supportive care could include intravenous fluid input and support of circulation and respiration; giving medications to treat conditions such as seizure and low blood pressure. Fluid input is critical, as fluid losses of up to 2½ L are probable. If individual is drowsy or unconscious, do not give anything by mouth. In the event of vomiting, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration. Fluid and electrolyte balance should be monitored and restored if abnormal. Early and aggressive IV fluid and electrolyte replacement. If the victim's lungs fill with fluid, you administer oxygen if his breathing is difficult or labored.

*Superactivated charcoal may be of little value for large molecules such as Abrin and Ricin.[USAMRICD]

Decontamination: When Abrin symptoms appear and you know the location of the attack, the area should be decontaminated with responders wearing level A (fully encapsulated suit with SCBA). Otherwise, stay away. Move as fast as possible; extra minutes before decontamination might make a big difference. If the Abrin attack was by small particles floating in the air (aerosol), and you have the equipment, (*this is very important*) then you have to decontaminate as soon as you can. If you do not have the equipment and training, do not enter the hot zone to rescue and decontaminate victims. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. If possible, place all clothing in a labeled durable 6-mil polyethylene bag. If the victim cannot move, decontaminate, if possible, without touching and without entering the hot zone. To prevent spreading the agent, be certain that victims are decontaminated as much as possible before allowing them to leave the area. During the decontamination process, be careful not to break the patient/victim's skin and take care to cover all open wounds. The CDC recommends a decontamination procedure solution of detergent and water (with a pH value in the alkaline range of more than 8 but less than 10.5). Soft brushes should be available to remove contamination from the personal protective equipment. Also recommended for cleanup of people and surfaces is household bleach. Use a fresh (made daily) solution of 0.5% sodium hypochlorite [diluted household bleach (10%, or one part bleach to nine parts water)]. Contact time: 15 min. Do not get bleach solution in the victim's eyes, open wounds (especially of the abdomen, spinal cord, or brain), or mouth. Wash off the diluted bleach solution after 15 min. Labeled, durable 6-mil polyethylene bags should be available for disposal of clothing and contaminated personal protective equipment. In the absence of pH adjusted solutions, wash the victim with lots of warm water with soap. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing (at least down to undergarments), begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: the idea is to immediately wash with water, then have the victim (not the responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction.

Personal Protective Methods: Level A (Fully encapsulated suit with SCBA) protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level A (fully encapsulated suit with SCBA) protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. Recommenced protective clothing and materials include Tychem® BR or Responder® CSM. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

Respirator Selection: Pressure demand, self-contained breathing apparatus [SCBA; Chemical, Biological, Radiological, Nuclear (CBRN), if available] is recommended in response to nonroutine emergency situations.

Storage: Color Code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked poison location. Store in a cool, dry, well-ventilated area and away from food stuff containers.

Shipping: Toxin, extracted from living sources, solid. Label "POISON (TOXIC)." This falls in Hazard Class: 6.1(a), Packing Group: I.

Spill Handling:. You must be careful! Avoid generating dust. Since an Abrin attack may be by small particles of Abrin floating in the air (aerosol), do not breathe it or get it on you. Remember that the victim's clothes or body may have Abrin; touch them and you can become a victim. If you think Abrin particles might be in the area, stay out until you are equipped with level A (fully encapsulated suit with SCBA), proper personal protective equipment (PPE), including protective clothing and respiratory protection. Shut off heating, ventilation, and air conditioning (HVAC) systems to prevent the tiny aerosolized (floating in the air) Abrin droplets from spreading throughout the building. Keep the public away. Immediately call for medical assistance. For those contaminated by Abrin, do not allow anyone to leave the hot zone. The Abrin chemical does not dissipate quickly and "survives" in clothing and bedding for long periods of time. Consequently, people as well as "things" must be quarantined and decontaminated. Do not allow anyone to leave until medical people examine them. Do not breathe, touch, or eat anything that might be contaminated with Abrin. Notify the federal authorities, local health, and pollution/environmental agencies. See Decontamination.

Fire Extinguishing: If a tank, rail car, or tank truck is involved in a fire, isolate it for 0.5 mi (800 m) in all directions; also, consider initial evacuation for 0.5 mi (800 m) in all directions.[CDC] On fire, use foam, dry chemical powder, BCF [bromochlorodiflouromethane (Halon 1211)] where regulations permit, carbon dioxide, water spray or fog—large fires only. When heated to decomposition, Abrin emits toxic nitrogen oxides. If the situation allows, control and properly dispose of run-off (effluent).

Disposal Method Suggested: Do not clean up or dispose of Abrin, except under supervision of a specialist. Disposal of spillage in sealed 6-mil polyethylene or polypropylene containers.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4.

RCRA, 40CFR264, Appendix 9, Ground Water Monitoring List, Suggested Testing Methods (PQL μg/L): 8100 (200); 8270 (10).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% as coal tar pitch volatiles.

Mexico, Drinking Water, Criteria (Ecological): 0.02 mg/L; wastewater: organic toxic pollutant.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S26; S37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acenaphthene is a white combustible, crystalline solid. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 154.07; Density = 1.02; Boiling point = 277.5−279°C; Freezing/Melting point = 93.6−97°C; Vapor pressure = 2.8×10^{-3} mmHg at 20°C; Flash point = 135°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2; Flammability 1; Reactivity 0. Practically insoluble in water; solubility = 3.45−7.38 mg/L at 25°C.

Potential Exposure: Acenaphthene occurs naturally in coal tar and in coal tar produced during the high-temperature carbonization or coking of coal; coal tar distilling; petroleum processing; shale oil processing. It is used as an intermediate for dyes, fungicides, insecticides, herbicides, pharmaceuticals, plant growth hormones; 1,8 naphthalic acid; in the manufacture of some plastics; and, has been detected in cigarette smoke and gasoline exhaust condensates; a constituent of coal tar creosote, asphalt, and diesel fuel. It has been used as an polyploidy agent.

Incompatibilities: Ozone and strong oxidizing agents, including perchlorates, chlorine, fluorine, and bromine.

Permissible Exposure Limits in Air

Except for TEEL (shown below), no specific standards have been established for acenaphthene.

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene, soluble fraction). OSHA defines “coal tar pitch volatiles” in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (*cyclohexane-extractable fraction*). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen.

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.4 mg/m^3

PAC-1: 1.25 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 250 mg/m^3

DFG MAK: Category 1, human carcinogen.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 1700 μg/L. *To protect saltwater aquatic life:* on an acute basis 970 μg/L and on a chronic basis 520 μg/L. *To protect human health:* 20.0 μg/L (based on organoleptic data).[6] See also Regulatory Authority for United States and Mexico regulatory levels.

Determination in Water: Gas chromatography or high-performance liquid chromatography (EPA Method 610) or gas chromatography and mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 3.8−4.43.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Acenaphthene is irritating to eyes, skin, and respiratory tract, causing coughing and wheezing. May cause vomiting if swallowed in large quantities. LD_{50} = (ipr-rat) 600 mg/kg

Long Term Exposure: Although acenaphthene has not been identified as a carcinogen, it should be handled with care as several related polycyclic aromatic hydrocarbons (PACs) are carcinogens. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (Category 1) in animal studies. Repeated or high exposures may cause lung irritation, bronchitis with cough, phlegm, and/or shortness of breath. Acenaphthene may affect the liver and kidneys. The most thoroughly investigated effect of acenaphthene is its ability to produce nuclear and cytological changes in microbial and plant species. Most of these changes, such as an increase in cell size and DNA content, are associated with disruption of the spindle mechanism during mitosis and the biological impact of acenaphthene on mammalian cells. These effects are reported here because they are the only substantially investigated effects of acenaphthene. Reported to be a mutagen.[11]

Points of Attack: Skin, respiratory system, bladder, liver, kidneys.

Medical Surveillance: Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the workplace. Complete blood count, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis [cytology, hematuria], liver, kidney, and bladder function tests recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get immediate medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *NIOSH* (as coal tar pitch volatiles): *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as Environmentally hazardous substances, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. May be isolated using bentonite lined dam.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Incineration or permanganate oxidation.

WGK (German Aquatic Hazard Class): No value assigned.
Description: Acenaphthylene is a flaky yellow solid. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 152.20; Boiling Point = 275−280°C; Freezing/Melting point = 88−90°C; 92−93°C; Vapor pressure = 9.12×10^{-4} mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Water soluble; solubility = 16 mg/L at 25°C.
Potential Exposure: In coal tar processing.
Incompatibilities: Ozone and strong oxidizing agents, such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine, and fluorine.
Permissible Exposure Limits in Air
NIOSH IDLH: 80 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.06 mg/m^3
PAC-1: 0.2 mg/m^3
PAC-2: 1.5 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: Category 1, human carcinogen.
Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.
Permissible Concentration in Water: Kansas[61] has set a guideline for drinking water of 0.03 μg/L.
Determination in Water: Use EPA Method #610. Octanol−water coefficient: Log K_{ow} = 3.94−4.07.
Routes of Entry: Ingestion, inhalation, eye and/or skin contact. Absorbed through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Acute systemic toxin: short-term high hazard effects.[SCAPA]
Long Term Exposure: May cause dermatitis. May cause lung irritation; bronchitis may develop. May be a potential occupational carcinogen based on being a PAH compound. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (Category 1) in animal studies.
Points of Attack: Skin, respiratory system, bladder, liver, kidneys as PAH.
Medical Surveillance: Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the workplace. Complete blood count, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests recommended for coal tar pitch volatiles.[2]
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.
Personal Protective Methods: Good particulate emission controls are the indicated engineering control scheme. Contact lenses should not be worn when working with coal tar pitch volatiles. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when

working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *NIOSH* (as coal tar pitch volatiles): *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as Environmentally hazardous substances, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Irritating and toxic fumes, including carbon dioxide and carbon monoxide are produced in fire. Use foam, dry chemical, and carbon dioxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Product residues and sorbent media may be packaged in epoxy-lined drums, then destroyed by incineration, permanganate oxidation, or microwave plasma treatment. The US EPA has investigated chemical precipitation for wastewater treatment.

Carcinogenicity: Not listed. However, similar aldehydes are known to be carcinogenic.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36/38; Safety phrases S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Acetal, an aldehyde, is a clear, volatile liquid with an agreeable odor. Molecular weight: 118.2[A2]; Boiling point = 102°C at 1 atm[A2]; Melting/Freezing point = − 100°C[A2]; Vapor pressure: (Reid) 1.1 psia; 10 mm at 8°C[A2]; Flash point = − 21°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2; Flammability 3; Reactivity, 0. Explosive limits: LEL = 1.6%; UEL = 10.4%. Slightly water soluble.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Primary Irritant. Used as a solvent; in synthetic perfumes, such as jasmine, cosmetics, flavors, in organic synthesis.

Incompatibilities: Oxidizing materials. Presumed to form explosive peroxides on contact with air and light. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria established.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of the eyes with redness and pain. Inhalation can cause coughing, headache, and dizziness. Skin contact can cause irritation with redness and pain. Ingestion can cause stomach pain, nausea, sleepiness, and high exposure can cause unconsciousness. Affects the central nervous system; acts as a narcotic or hypnotic.

Long Term Exposure: A narcotic; may be addictive.

Medical Surveillance: Test for narcotic effects.

Points of Attack: Inhalation, ingestion; skin and/or eye contact.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3, Packing Group II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use dry chemicals, alcohol-resistant foam, carbon dioxide. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA

1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetaldehyde is a flammable, volatile, colorless liquid or gas with a characteristic, penetrating, fruit odor. Odor threshold = 0.067 ppm. Molecular weight = 44.06; Density = 0.788 at 16; Boiling point = 20.4°C; Melting/Freezing point = − 123°C; Electrical conductivity = 1.2×10^8 pS/m; Flash point = − 38°C (oc); Autoignition temp. 185−193°C. Heat of combustion = − 5890 cal/g[A2]; Maximum ignition energy = 0.37 mJ; Vapor pressure = 740 mmHg at 20°C; Specific gravity (H_2O:1) = 0.804. Flammable limits: LEL = 4.1%, UEL = 60%; Hazard Identification (based on NFPA-704 M Rating System): Health 4; Flammability 2; Reactivity 2. Freely soluble in water.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Acetaldehyde can be reduced or oxidized to form acetic acid, acetic anhydride, acrolein, aldol, butanol, chloral, paraldehyde, and pentaerythritol. It is used as an intermediate for the synthesis of other chemicals, including acetic acid, acetic anhydride, butanol, ethyl acetae, etc.; in plating; the manufacture of disinfectants, drugs, dyes, explosives, flavorings, lacquers, mirrors (silvering), perfume, photographic chemicals, phenolic and urea resins, rubber accelerators and antioxidants, varnishes, vinegar, and yeast. It is also used as a pesticide intermediate. Acetaldehyde is the product of most hydrocarbon oxidations; it is a normal intermediate product in the respiration of higher plants; it occurs in all ripe fruits and may form in wine and other alcoholic beverages after exposure to air. Acetaldehyde is an intermediate product in the metabolism of sugars in the body and hence occurs in traces in blood. It has been reported in fresh leaf tobacco as well as in tobacco smoke and in automobile and diesel exhaust. It has been found in 5 of 10 water supplies surveyed by EPA with the highest concentrations in Philadelphia and Seattle at 0.1 μg/L.

Incompatibilities: Reacts with air to form unstable peroxides which can explode. Contact with air causes acetaldehyde to chemically degrade to acetic acid. Strong oxidizers, acids, bases, alcohols, ammonia, amines, halogens, phenols, acid anhydrides, ketones, hydrogen cyanide, hydrogen sulfide. May dissolve rubber. Slightly corrosive to mild steel. May explode without warning when exposed to heat, dust, corrosives, or oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 200 ppm/360 mg/m^3 TWA.

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 25 ppm/45 mg/m^3 Ceiling Concentration, confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 2000 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 25 ppm

PAC-1: **45** ppm

PAC-2: **270** ppm

PAC-3: **840** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 50 ppm/91 mg/m^3 TWA; Peak Limitation Category I [a momentary value of 100 ml/m^3/180 mg/m^3 should not be exceeded]; Carcinogen Category 5; Pregnancy risk Group C.

Arab Republic of Egypt: (TWA) 100 ppm (180 mg/m^3), 1993; Australia: (TWA) 100 ppm (180 mg/m^3); STEL 150 ppm, 1993; Austria: MAK 50 ppm (90 mg/m^3), suspected carcinogen, 1999; Belgium: (TWA) 100 ppm (180 mg/m^3); STEL 150 ppm (270 mg/m^3), 1993; Denmark: (TWA) 25 ppm (45 mg/m^3), 1999; Finland: (TWA) 50 ppm (90 mg/m^3); STEL 75 ppm (135 mg/m^3), 1993; France: VME 100 ppm (180 mg/m^3), continuous; carcinogen, 1999; the Netherlands: MAC-TGG 180 mg/m^3, 2003; India: (TWA) 100 ppm (180 mg/m^3); STEL 150 ppm (270 mg/m^3), 1993; Japan: 50 ppm (90 mg/m^3), 2B carcinogen, 1999; the Philippines: (TWA) 200 ppm (360 mg/m^3), 1993; Poland: MAC: (TWA) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 5 mg/m^3 [skin] 1993; Sweden: NGV 25 ppm (45 mg/m^3), KTV 50 ppm (90 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 50 ppm (90 mg/m^3), KTV 100 ppm (180 mg/m^3), 1999; Turkey: (TWA) 200 ppm (360 mg/m^3), 1993; United Kingdom: (TWA) 20 ppm (37 mg/m^3); STEL 50 ppm (92 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®[1]: 25 ppm Ceiling Concentration.

Determination in Air: NIOSH Analytical Method, #1994: Acetaldehyde by GC, #2538; by HPLC, #3507; Aldehydes, screening, #2539; OSHA ANALYTICAL METHOD ID-68.

Permissible Concentration in Water: Human exposure to acetaldehyde probably antedates recorded history, inasmuch as acetaldehyde is the major metabolite of ethyl alcohol. An additional source of widespread human exposure is tobacco smoke. The pharmacology and toxicology of acetaldehyde have been studied most extensively in its relationship to alcohol toxicity and human metabolism. Because of this background of human and laboratory experience, there appears to be no need to establish limits for acetaldehyde in drinking water.[32] However, EPA has set an ambient environmental goal of 2480 μg/L for acetaldehyde on a health basis. This compares with a standard of 0.2 mg/L for domestic water supplies set by Russia.[43]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.39$.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

LD_{50} = (oral-rat) 50 g/kg.

Short Term Exposure: This chemical can cause intense irritation and cause severe eye burns. Inhalation can irritate the nose, throat and lungs, causing coughing and/or shortness of breath. When the victim is removed from exposure, the symptoms may clear up. Higher exposure can affect the central nervous system causing symptoms similar to acute alcoholic intoxication, sleepiness, dizziness, and possible unconsciousness. High levels may cause pulmonary edema, a medical emergency, which may be delayed.

Long Term Exposure: Acetaldehyde may be a carcinogen in humans since it has been shown to cause cancer in animals and may be a teratogen in humans since it has been shown to be a teratogen in animals. Exposure to acetaldehyde has produced nasal tumors in rats and laryngeal tumors in hamsters. Exposure to malonaldehyde has produced thyroid gland and pancreatic islet cell tumors in rats. NIOSH therefore recommends that acetaldehyde be considered a potential occupational carcinogen in conformance with the OSHA carcinogen policy. This chemical may cause dermatitis and skin allergy. If allergy develops, very low future exposure can cause itching and skin rash. Repeated exposure may cause chronic irritation of the eyes leading to permanent damage. May affect the central nervous system, respiratory tract, and kidneys, causing chronic alcohol-like intoxication. See also "*NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes*" [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Eyes, skin, respiratory system, kidneys, central nervous system, reproductive system. Cancer site in animals: nasal cavity.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air; urine (chemical/metabolite), during exposure. Consideration should be given to skin, eyes, and respiratory tract in any preplacement or periodic examinations. Lung function tests are recommended. If symptoms develop or overexposure is suspected consider chest X-ray and evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes remove any contact lenses at once and irrigate immediately for at least 30 min, ocassionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing. Immediately wash area with large amounts of soap and water. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. Transfer promptly to medical facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact; **8 h** (More than 8 h of resistance to breakthrough >0.1 micron->g/cm^2/min): Butyl rubber (gloves, suits, boots), Responder™ suits; Trychem 1000™ suits; **4 h** (At least 4 but<8 h of resistance to breakthrough >0.1 micron->g/cm^2/min.): Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves. Wear eye protection to prevent any potential for eye contact. Employees should wash promptly when skin is wet. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. See Incompatibilities. Acetaldehyde should be stored in tightly closed airtight containers in a cool, dark, well-ventilated area. Nitrogen or other inert gas should be used as an "inert gas blanket" over liquid acetaldehyde in storage containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of acetaldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers.

Shipping: Should be labeled "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.[19, 20]

Spill Handling: *Liquid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar noncombustible absorbent material and deposit in sealed containers. Keep liquid out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty.

Fire Extinguishing: Acetaldehyde is a flammable and reactive liquid or gas. Poisonous gases, including carbon monoxide are released in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use dry chemicals, alcohol-resistant foam, CO_2. Water or regular foam may be ineffective on fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

Acetaldehyde ammonia A:0120

Molecular Formula: C_2H_7NO

Common Formula: $C_2H_4O \cdot H_3N$

Synonyms: Acetaldehidato amonico (Spanish); Acetaldehyde, Amine salt; Aldehyde ammonia; 1-Aminoethanol; α-Aminoethyl alcohol; Ethanol, 1-amino-

CAS Registry Number: 75-39-8

RTECS® Number: AB1950000

UN/NA & ERG Number: UN1841/171

EC Number: 200-868-2

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbols: XI; Risk phrases: R36/37/38; Safety phrases: S26; S37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetaldehyde ammonia is a combustible, colorless, white, yellow, or brown crystalline solid. Molecular weight = 61.12; Melting/Freezing point = 97°C; Flash point = 55°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Freely soluble in water.

Potential Exposure: Acetaldehyde ammonia is used to make acetaldehyde and other chemicals, organic synthesis, and to vulcanize rubber.

Incompatibilities: Keep away from strong oxidizing agents such as chlorine, bromine, and fluorine and strong acids such as hydrochloric, sulfuric, and nitric since violent reactions occur.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact with acetaldehyde ammonia can irritate and may burn eyes and skin. Inhalation can irritate the nose, throat, and lungs, causing coughing and/or shortness of breath.

Long Term Exposure: Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Skin, lungs.

Medical Surveillance: If illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing and wash contaminated skin with large amounts of water immediately. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Prevent repeated or prolonged skin contact. Wear impact-resistant eye protection with side shields or goggles when eye exposure is reasonably probable. Wash skin and change clothing upon contamination. Eyewash fountains should be provided in the immediate work area for emergency use. If there is the potential for skin exposure, emergency shower facilities should be provided. Do not eat, smoke, or drink where this chemical is handled, processed or stored. Use vacuum or wet method to reduce dust during cleanup. Do not dry sweep.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Should be labeled "CLASS 9." Symbol: AW. "The letter "A" restricts the application of requirements of this subchapter to materials offered or intended for transportation by aircraft, unless the material is a hazardous substance or a hazardous waste. The letter "W" restricts the application of requirements of this subchapter to materials offered or intended for transportation by vessel, unless the material is a hazardous substance or a hazardous waste." It falls in Hazard Class 9 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including acetaldehyde, ammonia, nitrogen oxides, and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Acetaldehyde oxime A:0130

Molecular Formula: C_2H_5NO

Common Formula: $CH_3CH{=}NOH$

Synonyms: β-Acetaldehyde oxime; Acetaldoxime; β-Acetaldoxime; Aldoxime; Ethanal oxime; Ethylidenehydroxylamine

CAS Registry Number: 107-29-9

RTECS® Number: AB2975000

UN/NA & ERG Number: UN2332/129

EC Number: 203-479-6

Regulatory Authority and Advisory Bodies

Canada: WHMIS: Class B3; NDSL list.

European/International Regulations: Hazard Symbols: N/A; Risk phrases: R10; R20/21/22; R40; Safety phrases: S16; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetaldehyde oxime is an extremely flammable, colorless liquid or crystalline solid; low melting crystalline compound. Molecular weight = 59.12; Boiling point = 115°C (decomposes); Freezing/Melting point = 46.5°C (α-); 12°C (β-); Vapor pressure = 9.8 mmHg at 20°C; 9.9 mmHg at 26°C; Specific gravity (H_2O:1) = 0.97; Flash point = 38−40°C (pure); <22°C (technical grade). Hazard Identification Health 2; Flammability 3[NJDHSS]; Reactivity, 0. Soluble in water.

Potential Exposure: Used as a chemical intermediate and as an antioxidant and radical scavenger with applications in many industries, including detergents, pharmaceuticals, plastics, paints and lacquers, rubber, and textiles.

Incompatibilities: Oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric). Vapor forms explosive mixture with air. The *beta* form is able to form unstable peroxides.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Inhalation can irritate nose, throat, and respiratory tract.

Long Term Exposure: Chronic health effects are unknown at this time.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preemployment and regular physical exams are recommended. For those with frequent or high exposure, lung function tests are recommended.

First Aid: Immediately remove any contact lenses and flush eyes with water for 15 min, occasionally lifting upper and lower lids. Quickly remove contaminated clothing. Immediately wash contaminated skin with soap and water. Remove person from exposure area and begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear impact- and splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of acetaldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.[19, 20]

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use foam spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acetaldehyde oxime out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Poisonous gases, including nitrous oxides, and carbon monoxide are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Acetamide is a colorless to yellow, deliquescent, crystalline solid. Odorless if pure, "mousy" odor if impure. Odor threshold = 140−160 mg/m^3. Molecular weight = 59.1; Density = 1.16 g/cm^3; Boiling point = 221.2°C; Freezing/Melting point = 81°C; Vapor pressure = 133 Pa at 65°C; Specific gravity (H_2O:1) = 1.16. Autoignition: 558°C. Flammable limits: LEL = 36,000 ppm, UEL = unknown; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Decomposes slowly in cold water; solubility in water = 200 g/100 mL.

Potential Exposure: Used as a stabilizer, plasticizer, wetting agent; solvent in plastics, lacquers, explosive; soldering flux ingredient; and chemical manufacturing.

Incompatibilities: Reacts with strong acids, such as hydrochloric, sulfuric, and nitric, strong oxidizers; strong bases; strong reducing agents; ammonia, isocyanates, phenols, cresols. Contact with water causes slow hydrolyzation to ammonia and acetate salts.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 25 mg/m^3

PAC-1: 75 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: Carcinogen Category 3B (2004).

Austria: suspected carcinogen, 1999; Finland: carcinogen, 1993; Sweden: TWA 10 ppm (23 mg/m^3); STEL 25 ppm

(60 mg/m^3), carcinogen, 1999; the Netherlands: MAC-TGG 25 mg/m^3, 2003.

New York State has set 0.03 μg/m^3 for ambient air.[60]

Determination in Air: Not listed.

Permissible Concentration in Water: No criteria set; not very toxic to fish but increases BOD.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -1.25; -1.16$.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Powdered form irritates eyes and respiratory tract. Acute systemic toxin: short-term high hazard effects.[SCAPA] LD_{50} = (oral-rat) 7000 mg/kg.

Long Term Exposure: Acetamide may be a carcinogen in humans since it has been shown to cause cancers in animals. May cause injury to the liver, kidney, and brain. Reproductive toxin.[SCAPA]

Points of Attack: Cancer site in animals: liver and lymph.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Should be stored in cool, well-ventilated area. Store in a dry area away from water because of deliquescent properties. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as Environmentally hazardous substances, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Material is very water soluble and hydrolyzes slowly to ammonia and acetate salts. May be removed from alkaline solutions with adsorbent carbon. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This substance is a combustible solid. Poisonous gases are produced in fire, including nitrogen oxides and carbon monoxide. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add to alcohol or benzene as a flammable solvent and incinerate; oxides of nitrogen produced may be scrubbed out with alkaline solution. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in analgesic drugs) (Japan).[13]

Canada: WHMIS Class D2B; DSL list.

European/International Regulations: Hazard Symbols: Xn; Risk phrases: R22; R36 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetanilide is odorless, orthorhombic plates or scales; or white, shining, crystalline solid or powder. Molecular weight = 135.17; Density = 1.2190 at 15°C; Boiling point = 304°C at 760 mmHg; Freezing/Melting point = 113.7°C; Vapor pressure = 1 mmHg at 114.0°C, Vapor density = 4.65; Flash point = 169°C (oc); Autoignition temperature = 530°C; Specific gravity (H_2O:1) = 1.21 at 4°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Sinks in water; slightly soluble; solubility = 0.541 g/mL; <1 mg/mL at 22°C.

Potential Exposure: In rubber industry as accelerator, in plastics industry as cellulose ester stabilizer, in pharmaceutical manufacture, stabilizer for hydrogen peroxide, azo dye manufacture.

Incompatibilities: Alkyl nitrates, alkalis (liberate aniline), chloral hydrate, phenols, ferric salts.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.4 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 50 mg/m^3

Permissible Concentration in Water: Russia MAC is 0.004 mg/L in water bodies used for fishery purposes.[43]

Determination in Water: Log K_{ow} = 1.16 at 23°C.

Routes of Entry: Ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if ingested; may cause hallucinations, sleepiness, cyanosis, respiratory, kidney damage, cyanosis, blood toxin: methemoglobinemia, decreased body temperature. Acute respiratory irritant and may be toxic. LD_{50} = (oral-rat) 800 mg/kg. Animals tolerate doses of 200−400 mg/kg for many weeks.[11] Has been lethal to man at 59 mg/kg.

Long Term Exposure: May cause kidney damage, skin allergy, eczema. An allergen. Causes contact dermatitis; inhalation or ingestion can cause eczema and cyanosis and methemoglobinemia.

Points of Attack: Skin and blood stream.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Note to physician: If warranted, treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear skin protection. Avoid dust inhalation (see respirator selection below).

Respirator Selection: Wear filter mask unless high vapor concentrations are encountered; then use NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in a pressure-demand or other positive-pressure mode. For increased protection use in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Solids may be dredged. Carbon adsorbent may be used on dissolved portion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrous oxides. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add to flammable solvents (alcohol or benzene) and incinerate. Oxides of nitrogen may be scrubbed from combustion gases with alkaline solution.[22]

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: Histidine reversion—Ames test.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3, (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada WHMIS Ingredients Disclosure List Concentration Reporting Level: 1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R10; R35; Safety phrases: S1/2; S23; S25; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetic acid is a colorless liquid or crystals with a sour, vinegar-like odor. Pure compound is a solid below 17°C. Often used in an aqueous solution. Odor threshold = 0.016 ppm. Glacial acetic acid contains 99% acid. Molecular weight = 60.08[A2]; Specific gravity (H_2O:1) = 1.051at 20°C (aqueous solution)[A2]; Boiling point = 117.9°C[A2]; Melting/Freezing point = 16.7°C[A2]; Electrical conductivity = 6×10^5 pS/m; Critical pressure = 57.1 atm; Heat of combustion = − 3136 cal/g[A2]; Vapor pressure = 11 mmHg at 20°C[A2]; Flash point = 39°C[NFPA] (glacial); Autoignition temperature = 463°C (glacial).[NFPA] Explosive limits: LEL = 4.0%; UEL = 19.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2 Freely soluble in water.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data; Primary Irritant. Acetic acid is widely used as a chemical feedstock for the production of vinyl plastics, acetic anhydride, acetone, acetanilide, acetyl chloride, ethyl alcohol, ketene, methyl ethyl ketone, acetate esters, and cellulose acetates. It is also used alone in the dye, rubber, pharmaceutical, food preserving, textile, and laundry industries. It is utilized, too in the manufacture of Paris green, white lead, tint rinse, photographic chemicals, stain removers, insecticides, and plastics.

Incompatibilities: Vapor forms explosive mixture with air. Violent reaction with oxidizers, organic amines, and bases, such as hydroxides and carbonates. Incompatible with strong acids; aliphatic amines; alkanolamines, isocyanates, alkylene oxides; epichlorohydrin, acetaldehyde, 2-aminoethanol, ammonia, ammonium nitrate, chlorosulfonic acid, chromic acid; ethylene diamine, ethyleneimine, halides, peroxides, perchlorates, perchloric acid, permanganates, phosphorus isocyanate, phosphorus trichloride, potassium *tert*-butoxide, and xylene. Attacks cast iron, stainless steel, and other metals forming flammable/explosive hydrogen gas. Will attack many forms of rubber or plastic.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.46 mg/m^3 at 25°C & 1 atm

OSHA PEL: 10 ppm/25 mg/m^3 TWA

NIOSH REL: 10 ppm/25 mg/m^3 TWA; 15 ppm/37 mg/m^3 STEL

ACGIH TLV®[1]: 10 ppm/25 mg/m^3 TWA; 15 ppm/37 mg/m^3 ppm STEL

Protective Action Criteria (PAC)*

TEEL-0: 5 ppm

PAC-1: **5** ppm

PAC-2: **35** ppm

PAC-3: **250** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 10 ppm/25 mg/m^3 TWA; Peak Limitation Category I(2).

Australia: TWA 10 ppm (25 mg/m^3); STEL 15 ppm, 1993; Austria: MAK 10 ppm (25 mg/m^3), 1999; Belgium: TWA 10 ppm (25 mg/m^3); STEL 15 ppm, 1993; Denmark: TWA 10 ppm (25 mg/m^3), 1999; Finland: TWA 10 ppm (25 mg/m^3); STEL 15 ppm (37 mg/m^3) [skin] 1993; France: VLE 10 ppm (25 mg/m^3), 1999; Hungary: TWA 10 mg/m^3; STEL 20 mg/m^3, 1993; the Netherlands: MAC-TGG 25 mg/m^3, 2003; Japan; 10 ppm (25 mg/m^3), 1999; Norway: TWA 10 ppm (25 mg/m^3), 1999; the Philippines: TWA 10 ppm (25 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 35 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 5 mg/m^3 [skin] 1993; Sweden: NGV 5 ppm (13 mg/m^3), KTV 10 ppm (25 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (25 mg/m^3), KZG-W 20 ppm (50 mg/m^3), 1999; Thailand: TWA 10 ppm (25 mg/m^3), 1993; Turkey: TWA 10 ppm (25 mg/m^3), 1993; United Kingdom: TWA 10 ppm (25 mg/m^3); STEL 15 ppm (37 mg/m^3), Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm. Russia[43] MAC for ambient air in residential areas is 0.2 mg/m^3 on a momentary basis and 0.06 mg/m^3 on a daily average basis. Several states have set guidelines or standards for acetic acid in ambient air.[60] They range from 0.25 mg/m^3 (North Dakota) to 0.4 mg/m^3 (Virginia) to 0.5 mg/m^3 (Connecticut and South Dakota) to 0.595 mg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #1603, OSHA Analytical Method 186SG.

Permissible Concentration in Water: No US limit has been established. However, EPA, [32] has proposed an ambient environmental goal of 345 μg/L based on health effects.

Determination in Water: Acetic acid in water may be determined by titration. Harmful to aquatic life. Octanol–water coefficient: Log $K_{ow} = -0.2$ to -0.31.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Can cause severe irritation, burns, and permanent eye damage. Skin contact can cause severe irritation and burns. Breathing can cause irritation of the mouth, nose, and throat; coughing; and shortness of breath. Higher exposures can cause bronchopneumonia and pulmonary edema, a medical emergency.

Long Term Exposure: Repeated exposure may cause bronchitis to develop, with cough, phlegm, and/or shortness of breath. Repeated skin exposure can cause thickening and cracking of the skin, particularly the skin of the hands. Chronic exposure may result in pharyngitis and catarrhal bronchitis. Ingestion, though not likely to occur in industry, may result in penetration of the esophagus, bloody vomiting, diarrhea, shock, hemolysis, and hemoglobinuria which is followed by anuria. Repeated or prolonged exposure to acetic acid may cause darkening, irritation of the skin, erosion of the exposed front teeth, and chronic inflammation of the nose, throat, and bronchi.

Points of Attack: Respiratory system, skin, eyes, teeth.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure. Consideration should be given to the skin, eyes, teeth, and respiratory tract in placement or periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. If this chemical has been inhaled, remove from exposure, begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. If swallowed, do not induce vomiting. Transfer promptly to a medical facility. Medical observation recommended for 24–48 h following inhalation overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Contact lenses should not be worn when working with acetic acid. Prevent skin contact; **8 hr** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Butyl rubber (gloves, suits, boots), Teflon™ gloves, suits, boots; Viton™, 4H™, and Silver Shield™ gloves, Responder™ suits; Trychem 1000™ suits; **4 hr** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min.) Neoprene™, Barricade®. Remove clothing immediately if wet or contaminated with liquids containing 50% and promptly remove if liquid contains 10–49% acetic acid. Provide emergency eyewash if liquids containing >5% acetic acid are involved, drench if >50% acetic acid is involved.

Respirator Selection: NIOSH/OSHA *50 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Should be stored in cool dry place away from heat and incompatible substances listed above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: *Acetic acid >80%:* Should be labeled "CORROSIVE, FLAMMABLE LIQUID." Hazard Class 8. Shipping Group II.[19, 20] *Acetic acid 10−80%:* Should be labeled "CORROSIVE," shipped in glass and polyethylene carboys, metal drums aluminum tank cars and wooden barrels. It falls in Hazard Class 8. Do not transport with human food or animal feedstuffs.

Spill Handling: Warn other workers of spill. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, or similar material and deposit in sealed containers and transport to outdoor location. With expert help, cautiously neutralize spilled liquid with lime or sodium bicarbonate. Wash away remainder with plenty of water (extra personal protection: chemical protection suit including self-contained breathing apparatus). Alternatively cover with soda ash and then flush to sewer with water.[24] Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Points of Attack: Use water spray, dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Wear goggles and self-contained breathing apparatus when fighting fires. Poisonous gases are produced in fire, including carbon monoxide. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Acetic anhydride A:0170

Molecular Formula: $C_4H_6O_3$

Common Formula: $(CH_3CO)_2O$

Synonyms: Acetic acid, anhydride; Acetic oxide; Acetyl anhydride; Acetyl ether; Acetyl oxide; Anhidrido acetico (Spanish); Anhydride acetique (French); Essigsaeureanhydrid (German); Ethanoic anhydrate; Ethanoic anhydride

CAS Registry Number: 108-24-7

RTECS® Number: AK1925000

UN/NA & ERG Number: UN1715/137

EC Number: 203-564-8 [*Annex I Index No.:* 607-008-00-9]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Singapore) (UN).[13]

FDA, Controlled Substance Act, Essential Chemicals.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg).

Controlled Subststance Act (FDA): TV (domestic and import/export) = 250 gallons (1023 kg weight)

Canada, WHMIS, Ingredient Disclosure Concentration: 1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R10; R20/22; R34; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetic anhydride is a combustible, colorless, strongly refractive, liquid which has a strongly irritating odor. Odor threshold = 0.14 ppm. Molecular weight = 102.09[A2]; Boiling point at 1 atm = 139°C[A2]; Melting/Freezing point = −69 to −73°C[A2]; Critical temperature = 296°C[A2]; Critical pressure = 679 psia = 46.2 atm = 4.68 MN/m^2[A2]; Vapor pressure = 3.8 mmHg at 20°C; 4.9 mmHg at 25°C; 6.8 mmHg at 30°C. Flash point = 49.4°C (cc); Heat of combustion = −7058 Btu/lb = −3921 cal/g[A2]; Autoignition temperature = 316°C. Explosive limits: LEL = 2.7%, UEL = 10.3%. Specific gravity (H_2O:1) = 1.08[A2]; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩; Soluble in water; violent reaction.

Potential Exposure: Acetic anhydride is used as an acetylating agent or as a solvent in the manufacture of cellulose acetate, acetanilide, aspirin, synthetic fibers, plastics, explosives, resins, perfumes, and flavorings; and it is used in the textile dyeing industry. It is widely used as a pharmaceutical intermediate and as a pesticide intermediate.

Incompatibilities: Water, alcohols, strong acids; strong oxidizers; chromic acid (violent reaction), amines, strong caustics; finely divided metals. Contact with water forms acetic acid and liberates a large amount of heat. Corrosive to iron, steel, and other metals.

Permissible Exposure Limits in Air

OSHA PEL: 5 ppm/20 mg/m^3 TWA.

NIOSH REL: 5 ppm/21 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 5 ppm TWA.

NIOSH IDLH: 200 ppm.

Temporary Emergency Exposure Limits (DOE).

TEEL-0: 0.5 ppm

PAC-1: 0.5 ppm

PAC-2: 15 ppm

PAC-3: 100 ppm

DFG MAK: 5 ppm/21 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group C.

Austria: MAK 5 ppm (20 mg/m^3), 1999; Denmark: TWA 5 ppm (20 mg/m^3), 1999; France: VLE 5 ppm (20 mg/m^3), 1999; Japan: 5 ppm (21 mg/m^3), 1999; Poland: TWA 10 mg/m^3, 1999; Sweden: Ceiling 5 ppm (20 mg/m^3), 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; United Kingdom: TWA 0.1 ppm (0.5 mg/m^3); STEL 0.4 ppm (2 mg/m^3), 2000. Several states have set guidelines or standards for acetic anhydride in ambient air[60] ranging from 67 μg/m^3 (NY) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (North Dakota) to 400 μg/m^3 (Connecticut) to 476 μg/m^3 (Nevada) to 500 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method #3506,[18] OSHA Analytical Methods 82, 102.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.2$ (measured).[V]

Routes of Entry: Inhalation, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can cause severe skin and eye irritation. Permanent damage to the eyes may result from exposure to high concentrations. Breathing acetic anhydride can irritate the respiratory tract and high concentrations can cause severe lung damage and/or coughing and shortness of breath. In high concentrations, vapor may cause conjunctivitis, photophobia, lacrimation, and severe irritation of the nose and throat. Liquid acetic anhydride does not cause a severe burning sensation when it comes in contact with the skin. If it is not removed, the skin may become white and wrinkled, and delayed severe burns may occur. Both liquid and vapor may cause conjunctival edema and corneal burns, which may develop into temporary or permanent interstitial keratitis with corneal opacity due to progression of the infiltration. Contact and, occasionally, hypersensitivity dermatitis may develop. Immediate complaints following concentrated vapor exposure include conjunctival and nasopharyngeal irritation, cough, and dyspnea. Necrotic areas of mucous membranes may be present following acute exposure. Inhalation may cause pulmonary edema, a medical emergency. Medical observation recommended for 24−48 h following inhalation overexposure, as pulmonary edema may be delayed.

Long Term Exposure: Prolonged or repeated exposure to this chemical may cause skin disorders or allergy. If allergy develops, very low future exposure can cause itching and a skin rash.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately with large amounts of water. If this chemical contacts the skin, quickly remove clothing and immediately wash area with large amounts of water. If a person breathes this chemical, move the exposed person to fresh air at once and perform (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if hearth action has stopped. When this chemical has been swallowed, get medical attention immediately. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron- >g/cm^2/min): butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves; Barricade®, Trellchem HPS™ suits;

Trychem 1000™ suits; **4 h** (At least 4 but<8 h of resistance to breakthrough >0.1 micron>g/cm^2/min.): Teflon™ gloves, suits, boots. Contact lenses should not be worn when working with this chemical. Wear splash proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA, *125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *200 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister] or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferred. Store in tightly closed containers in a cool, well-ventilated place, away from moisture, sources of ignition, and heat. Avoid pits, depressions, and basements. Separate from other storage. Inside storage should be in a standard flammable liquids storage room or cabinet. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This chemical requires a shipping label of "CORROSIVE, FLAMMABLE LIQUID." It falls in Hazard Class 8, Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use foam spray to reduce vapors. Cover with vermiculite, dry sand, earth, or similar absorbent material and neutralize with lime or sodium bicarbonate. Deposit absorbent material in sealed containers. Alternatively cover with soda ash and then flush away with water.[24] Ventilate area of spill or leak after cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acetic anhydride out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. You may want to seek assistance from EPAs Environmental Response Team at (908) 548−8730. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Poisonous gases, including carbon monoxide and acetic acid, are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use water spray to disperse vapors only, as water contact will form acetic acid. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[24]

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetone is a highly flammable, colorless liquid with a sweet, mint-like odor. Odor threshold = 4.58 ppm; AIHA geometric mean air odor threshold is 62 ppm (detectable); 130 ppm (recognizable). Molecular weight: 58.08; Boiling point = 56.1°C; Melting/Freezing point = − 94.7°C; Critical temperature = 235°C[A2]; Critical pressure = 682 psia = 46.4 atm = 4.70 MN/m^2[A2]; Specific gravity (H_2O:1) = 0.791 at 20°C (liquid)[A2]; Relative vapor density (air = 1) = 2.0[A2]; Ratio of specific heats of vapor (gas) = 1.127; Latent heat of vaporization = 122 cal/g[A2]; Heat of combustion = − 12,250 Btu/lb = − 6808 cal/g[A2]; Heat of fusion = 23.42 cal/g[A2]; Vapor pressure = 179 mmHg[A2]; Minimum ignition energy = 1.15 mJ; Electrical Conductivity = 4.9×10^5 pS/m; Autoignition temperature = 465°C; Flash point = − 18°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 2. Explosive limits: LEL = 2.5%, UEL = 12.8%. Freely soluble in water.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. It is used as a solvent in nail polish remover and many other chemicals. Used in the production of lubricating oils and as an intermediate in the manufacture of chloroform and of various pharmaceuticals and pesticides.

Incompatibilities: May explode when mixed with chloroform, chromic anhydride. Incompatible with acids, bases, and oxidizing materials, such as peroxides, chlorates, perchlorates, nitrates, and permanganates. Unstable peroxides formed with strong oxidizers. May accumulate static electrical charges and may cause ignition of its vapors. Dissolves most rubber, resins, and plastics.

Permissible Exposure Limits in Air

OSHA PEL: 1000 ppm/2400 mg/m^3 TWA.

NIOSH REL: 250 ppm/590 mg/m^3 TWA.

ACGIH TLV®[1]: 500 ppm/1188 mg/m^3 TWA; 750 ppm/1782 mg/m^3 STEL; not classifiable as a human carcinogen; BEI: 50 mg[Acetone]/L in urine/end-of-shift.

NIOSH IDLH is 2500 ppm [10% LEL].

Protective Action Criteria (PAC)*
TEEL-0: 200 ppm
PAC-1: **200** ppm
PAC-2: **3200** ppm
PAC-3: **5700** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

MAK: 500 ppm/1200 mg/m^3; Peak Limitation Category I (2); BAT: 80 mg[acetone]/L in urine/end-of-shift; Pregnancy Risk Group D; (2006).

Australia: TWA 500 ppm (1185 mg/m^3); STEL 1000 ppm, 1993; Austria: MAK 750 ppm (1780 mg/m^3), 1999;

Belgium: TWA 750 ppm (1780 mg/m^3); STEL 1000 ppm, 1993; Denmark: TWA 250 ppm (600 mg/m^3), 1999; Finland: TWA 500 ppm (1200 mg/m^3); STEL 625 ppm (1500 mg/m^3), 1993; France: VME 750 ppm (1800 mg/m^3), 1999; Hungary: TWA 600 mg/m^3; STEL 1200 mg/m^3, 1993; the Netherlands: MAC-TGG 1780 mg/m^3, 2003; Japan; 200 ppm (470 mg/m^3), 1999; Norway: TWA 125 ppm (295 mg/m^3), 1999; the Philippines: TWA 1000 ppm (2400 mg/m^3), 1993; Poland: MAC (TWA) 600 mg/m^3, MAC (STEL) 1800 mg/m^3, 1999; Russia: TWA 200 ppm; STEL 200 mg/m^3, 1993; Sweden: NGV 250 ppm (600 mg/m^3), KTV 500 ppm (1200 mg/m^3), 1999; Switzerland: MAK-W 500 ppm (1200 mg/m^3); STEL 1000 ppm (2400 mg/m^3), 1999; Turkey: TWA 1000 ppm (2400 mg/m^3), 1993; United Kingdom: TWA 750 ppm (1810 mg/m^3); STEL 1500 ppm (3620 mg/m^3); Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 750 ppm. Several states have set guidelines or standards for acetone in ambient air[60] ranging from 8 mg/m^3 (Massachusetts) to 11.8 mg/m^3 (Connecticut and South Dakota) to 17.8−23.75 mg/m^3 (North Dakota) to 30 mg/m^3 (Virginia) to 35.6 mg/m^3 (Florida and New York) to 42.4 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1300, #2555, #3800,[1, 18] OSHA Analytical Method 69.

Permissible Concentration in Water: Massachusetts has set a guideline of 250 μg/L and Maryland a guideline of 3600 μg/L.[61]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.23$.

Routes of Entry: Skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin. Exposure can irritate the eyes and respiratory tract. Exposure to high concentrations can cause dizziness, lightheadedness, and unconsciousness. Alcohol consumption exacerbates toxic effects.

Long Term Exposure: Repeated skin exposure can cause dryness and skin cracking. This chemical has not been adequately evaluated to determine whether brain or nerve damage could occur with repeated exposure. However, many solvents and other petroleum-based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration; personality changes (withdrawal, irritability) and fatigue; sleep disturbances; reduced coordination; and/or effects on the nerves to the arms and legs (weakness, "pins and needles").

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); expired exposure, during exposure; pulmonary function tests; urine (chemical/metabolite); end-of-shift. Evaluation for brain effects, such as changes in memory, concentration, sleeping patterns and mood, as well as headaches and fatigue. Consider evaluations of the cerebellar, autonomic, and peripheral nervous systems. Positive and borderline individuals should be referred for neuropsychological testing. See also NIOSH Criteria Document: 78-173 *Ketones*.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately with large amounts of water for at least 15 min. If this chemical contacts the skin, quickly remove contaminated clothing and wash with large amounts of soap immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron->g/cm^2/min): butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves; Barricade®, CPF3™ suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, *2500 ppm:* CcrFOv* (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The required US DOT shipping designation is "FLAMMABLE LIQUID." It falls in Hazard Class 3, Packing Group II.[19, 20]

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep acetone out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Acetone is a highly flammable liquid. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Vapors may travel long distances to ignition sources and flashback. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.[22]

EC Number: 200-909-4 [*Annex I Index No.:* 608-004-00-X]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA); 40CFR423, Priority Pollutants.

US EPA Hazardous Waste Number (RCRA No.): P069.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA Land Ban Chemical.

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R26/27/28; R50/R53; Safety phrases: S1/2; S7/9; S27; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Acetone cyanohydrin is a very flammable, colorless to light yellow liquid with an almond-like odor. Molecular weight = 85.10[A2]; Density (H_2O:1) = 0.9267 at 25°C; Boiling point = 95°C at 760 mmHg; Freezing/Melting point = − 19°C[A2]; Specific gravity (H_2O:1) = 0.925 at 25°C (liquid)[A2]; Vapor pressure = 0.8 mmHg at 20°C[A2]; Relative vapor density (air = 1) = 2.93[A2]; Ratio of specific heats of vapor (gas) = (estimate) 1.074[9]. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 2; Flash point = 74°C; Autoignition temperature = 688°C. LEL = 2.2%, UEL = 12.0%. Freely soluble in water but decomposes, forming hydrogen cyanide.

Potential Exposure: Used in the manufacture of insecticides and making other chemicals, such as methyl methacrylate.

Incompatibilities: Forms explosive mixture with air. Not compatible with strong reducers, strong bases, strong oxidizers and strong acids, such as hydrochloric, sulfuric (explosive), and nitric. Contact with strong acid and strong bases may cause explosions. Slowly decomposes to acetone and hydrogen cyanide gas at room temperatures; rate is accelerated by and increase in pH, contact with water, or temperature.

Permissible Exposure Limits in Air

Conversion 1 ppm = 3.48 mg/m^3.

OSHA PEL: None.

NIOSH REL: 1 ppm/4 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 Ceiling Concentration [skin].

AIHA WEEL: 2 ppm TWA; 5 ppm STEL [15 min.] [skin].

Protective Action Criteria (PAC)*

TEEL-0: 1.44 ppm

PAC-1: **2** ppm

PAC-2: **7.1** ppm

PAC-3: **15** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm TWA; 5 ppm STEL; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group C.

Hungary: STEL 0.9 mg/m^3, carcinogen, 1993; Russia: STEL 0.9 mg/m^3 [skin] 1993; the Netherlands: MAC-TGG 3.5 mg/m^3 [skin] 2003.

Determination in Air: Solid sorbent tube: Porapak® QS, 100 mg/50 mg tube; Ethyl acetate; Gas chromatography/nitrogen/phosphorus (thermionic) detection; NIOSH Analytical Method 2506.[18]

Permissible Concentration in Water: Russia set a MAC of 0.001 mg/L for water used for domestic purposes.

Determination in Water: The substance is very toxic to aquatic organisms. Avoid release to the environment in circumstances different to normal use.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. May be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation. Breathing this chemical can irritate the respiratory tract causing wheezing and shortness of breath. Slows down tissue respiration. High exposure can cause sudden death without warning. Symptoms of exposure include weakness, headache, confusion, nausea, vomiting, and a pounding heart. High exposure can cause liver and kidney damage. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases.

Long Term Exposure: Can cause thyroid gland to enlarge and interfere with normal thyroid function. May cause kidney and liver injury. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidneys, gastrointestinal tract.

Medical Surveillance: Test for urine thiocyanate and blood cyanide levels.

First Aid: Move victim to fresh air; call emergency medical care. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing and wash with large amounts of water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. When this chemical has been swallowed, get medical attention immediately. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility. If not breathing, give artificial respiration (avoid mouth to mouth resuscitation). If breathing is difficult, give oxygen. If heart has stopped, begin CPR. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Avoid contact with contaminated skin. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be available within 1−2 min of exposure.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH, *10 ppm:* Sa (APF = 10) (any supplied-air respirator); *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); *50 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece); *250 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Do not store for long periods of time; toxic fumes may form in closed container. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Outside storage and separated storage is preferred.

Shipping: Acetone cyanohydrin requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1, Packing Group I.[19, 20]

Spill Handling: Issue poison warning. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial Isolation and Protective Action Distances.

when spilled in water

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 800/2500
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.9/3.1

Fire Extinguishing: Acetone cyanohydrin is a combustible liquid. Poisonous gases, including hydrogen cyanide and nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Note: Water may cause frothing if it gets below surface of liquid and turns to steam. Water fog gently applied to surface will cause frothing which may extinguish fire.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Add with stirring to strong alkaline calcium hypochlorite solution. Alternatively dissolve in flammable solvent and burn in incinerator with afterburner and scrubber.

Regulatory Authority and Advisory Bodies
CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).[7]
Note: The lower quantity applies for solids in powder form with particulate size less than 100 μm. Otherwise the 10,000 lb TPQ applies.
European/International Regulations: Hazard Symbol: T; Risk phrases: R21; R25; R26; Safety phrases: S2; S28; S36/37/39 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Acetone thiosemicarbazide is a combustible, white to yellow crystalline solid. Molecular weight = 131.19; Freezing/Melting point = 172−175 °C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. No reaction with water.
Potential Exposure: Acetone thiosemicarbazone is used as an intermediate in the manufacture of pharmaceuticals and pesticides.
Incompatibilities: Contact with strong oxidizers may cause fire and explosions.
Permissible Exposure Limits in Air
DOE Temporary Emergency Exposure Limits (TEELs)
TEEL-0: 20 mg/m^3
PAC-1: 60 mg/m^3
PAC-2: 100 mg/m^3
PAC-3: 100 mg/m^3
Routes of Entry: Ingestion.
Harmful Effects and Symptoms
High oral toxicity reported. The LD_{low}oral (rat) = 10 mg/kg (highly toxic). LD_{50} = (oral-rat) 48.5 mg/kg.
Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system; liver, kidneys, gastrointestinal tract.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.
Personal Protective Methods: Contact lenses should not be worn when working with this chemical. Wear splash proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: For emergency situations, wear a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in a pressure-demand or other positive-pressure mode. For increased protection use in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.
Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.
Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: When heated to decomposition, it emits very toxic fumes of nitrogen oxide and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Acetonitrile is an extremely flammable, colorless liquid with an ether-like odor. Odor threshold = 40 ppm; irritating: 875 mg/m^3. Molecular weight = 41.06; Specific gravity = 0.78745 at 15°C; Boiling point at 1 atm = 81.6°C[9]; Melting/Freezing point = −45.7°C[9]; Critical temperature = 274.7°C[9]; Critical pressure = 47.7 atm; Specific gravity (H_2O:1) = 0.787 at 20°C (liquid)[9]; Relative vapor density (air = 1) = 1.4[9]; Ratio of specific heats of vapor (gas) = 1.192[9]; Ionization potential = 12.20 eV; Latent heat of vaporization = 313 Btu/lb = 174 cal/g; Heat of combustion = −13,360 Btu/lb = −7420 cal/g[9]; Vapor pressure = 73.7 mmHg at 20°C[9]; 9.60 kPa at 20°C; Electrical conductivity = 6×10^4 pS/m. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2; Flash point = 6°C (oc)[NFPA]; 12.8°C (cc); Autoignition temperature = 524°C. Explosive limits LEL = 3.0%, UEL = 16.0%. Freely soluble in water.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Acetonitrile is used as an extractant for animal and vegetable oils, as a solvent; particularly in the pharmaceutical industry, and as a chemical intermediate in pesticide manufacture; making batteries and rubber products. It is present in cigarette smoke.

Incompatibilities: Strong oxidizers, such as chlorine, bromine, and fluorine, chlorosulfonic acid, oleum, or sulfuric acid. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.68 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 40 ppm/70 mg/m^3 TWA.

NIOSH REL: 20 ppm/34 mg/m^3 TWA.

ACGIH TLV®[1]: 20 ppm/34 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 13 ppm

PAC-1: **13** ppm

PAC-2: **320** ppm

PAC-3: **670** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 20 ppm/34 mg/m^3; [skin]; Peak Limitation Category II(2); Pregnancy Risk Group C (2006).

Arab Republic of Egypt: TWA 40 ppm (70 mg/m^3) [skin] 1993; Australia: TWA 40 ppm (70 mg/m^3); STEL 60 ppm [skin] 1993; Austria: MAK 40 ppm (70 mg/m^3), 1999; Belgium: TWA 40 ppm (67 mg/m^3); STEL 60 ppm (101 mg/m^3) [skin] 1993; Denmark: TWA 40 ppm (70 mg/m^3), 1999; Finland: TWA 40 ppm (70 mg/m^3); STEL 60 ppm (105 mg/m^3), 1993; France: VME 40 ppm (70 mg/m^3) [skin] 1999; the Netherlands: MAC-TGG 70 mg/m^3, 2003; Norway: TWA 30 ppm (50 mg/m^3), 1999; the Philippines: TWA 40 ppm (70 mg/m^3), 1993; Poland: TWA 70 mg/m^3; STEL 140 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Sweden: TWA 30 ppm (50 mg/m^3); STEL 50 ppm (100 mg/m^3), 1999; Switzerland: MAK-W 500 ppm (1200 mg/m^3); STEL 1000 ppm (2400 mg/m^3), 1999; Turkey: TWA 40 ppm (70 mg/m^3), 1993; United Kingdom: TWA 40 ppm (68 mg/m^3); STEL 60 ppm (102 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 60 ppm. Several states have set guidelines or standards for acetonitrile in ambient air[60]: California TWA PEL 40 ppm (70 mg/m^3) 0.68 mg/m^3 (Connecticut) to 0.70−1.05 mg/m^3 (North Dakota) to 1.1 mg/m^3 (Virginia) to 1.4 mg/m^3 (Florida and New York) to 1.67 mg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method 1606.[18]

Permissible Concentration in Water: Acetonitrile is infinitely soluble and stable in water. No criteria have been set, but EPA has proposed[32] an ambient environmental goal of 970 μg/L based on health effects. Russia[43] set a MAC of 0.7 mg/mL for water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.3$.

Routes of Entry: Inhalation, percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Exposure can cause fatal cyanide poisoning. Symptoms include flushing of the face, chest tightness, headache, nausea, and vomiting, weakness, and shortness of breath. These reactions may begin hours following overexposure.

Long Term Exposure: Repeated exposure may cause the thyroid gland to enlarge and cause permanent damage. Acetonitrile may cause damage to the developing fetus. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Kidneys, liver, lungs, skin, eyes, central nervous system, cardiovascular system.

Medical Surveillance: Consider the lung, skin, respiratory tract, heart, central nervous system, renal and liver function in placement and periodic examinations. A history of fainting spells or convulsive disorders might present an added risk to persons working with toxic nitriles. Blood cyanide test and/or urine thiocyanate test. Blood cyanide over 0.1 mg/L or urine thiocyanate over 20 mg/L indicate overexposure. Maintain close medical monitoring. Slow release of cyanide from absorbed acetonitrile may cause delayed symptoms. Blood plasma, expired air, urine (chemical/metabolite).

First Aid: Acetonitrile can cause fatal cyanide poisoning. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be available within 1−2 min. In the event of overexposure and/or symptoms: move victim to fresh air; call emergency medical care. Give Amyl Nitrate capsules (as directed, by trained personnel only). If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, quickly remove contaminated clothing and wash with large amounts of water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. When this chemical has been swallowed, get medical attention immediately. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility. If not breathing, give artificial respiration (avoid mouth to mouth resuscitation). If breathing is difficult, give oxygen. If heart has stopped begin CPR. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Avoid contact with contaminated skin. Observe victim for 24−48 h.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): butyl rubber gloves, suits, boots; Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves; Barricade®, Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH: *200 ppm*: CcrOv (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator) or SCBA (any self-contained breathing apparatus); *500 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where acetonitrile may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3, Packing Group II.[19, 20]

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use foam spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep acetonitrile out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen cyanide and nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be ineffective for fighting fires. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with nitrogen oxide removal from effluent gases by scrubbers or incinerators.[22]

Acetonyl acetone A:0215

Molecular Formula: $C_6H_{10}O_2$

Common Formula: $CH_3COCH_2CH_2COCH_3$

Synonyms: Acetonylacetone; Diacetonyl; α,β-Diacetylethane; 1,2-Diacetylethane; 2,5-Diketohexane; 2,5-Dioxohexane acetonyl acetone; 2,5-Hexanedione

CAS Registry Number: 110-13-4

RTECS® Number: MO3150000

EC Number: 203-738-3

Regulatory Authority and Advisory Bodies

Listed on the TSCA inventory.

Canada: NDSL List; WHMIS Category B3; D2B.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S23; S26 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Acetonyl acetone is a clear liquid, when pure; contact with air will turn it yellow to brown. Highly flammable. Molecular weight = 114.14; Specific gravity = 0.97; Boiling point = 186°C; Freezing/Melting point = −6°C; Vapor pressure = 0.4 mmHg at 20°C; Flash point = 78.9°C (cc); Autoignition temperature = 390°C. Explosive limits LEL = 1.5%, UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 1. Soluble in water; solubility ≥100 mg/mL at 25°C.

Potential Exposure: Neurotoxic. Solvent for cellulose acetate, roll-coating inks, lacquers, stains; intermediate for pharmaceuticals and photographic chemicals; electroplating.

Incompatibilities: Forms explosive mixture with air. Ketones react violently with strong oxidizers, many acids, bases, amines, amides, and inorganic hydroxides, alkali metals, hydrides, nitrides, and perchloric acid. Contact with all preceding materials that release heat and flammable gases, including hydrogen, the heat may be sufficient enough to ignite the hydrogen, causing fire or explosion. Incompatible with aldehydes, aliphatic amines, alkanolamines, cyanides, isocyanates,, peroxides. May attack plastics and some rubbers and coatings.

Permissible Exposure Limits in Air

ACGIH TLV®: 10 ppm/49 mg/m^3.

AIHA WEEL: 10 ppm.

No TEEL available.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = -0.27$.

Routes of Entry: Lungs, skin, eyes. May be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, mucous membrane, and respiratory tract. Absorbed through the skin. Skin contact may remove natural oils, causing redness and cracking. Inhalation may cause dizziness and high levels can cause narcosis and loss of consciousness. Ingestion causes gastrointestinal irritation with stomach pain, nausea, vomiting, and diarrhea. May affect central nervous system. Oral, rat: LD_{50} = (oral-rat) 2076 mg/kg.

Long Term Exposure: Chronic ingestion may cause brain damage; peripheral neuropathy; impairment of the central nervous system and peripheral nervous systems; testicular germinal cell damage. Prolonged skin contact may cause skin problems; dryness, dermatitis. It may cause testes and blood damage.

Points of Attack: Central nervous system (CNS), brain.

First Aid: Remove any contact lenses at once, then flush eyes, wash contaminated areas of body with soap and water. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: In an emergency use NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Based on its flash point, butyl glycidyl ether requires a “FLAMMABLE LIQUID” label. It falls into Hazard Class 3 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar noncombustible material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. Do not dump into a sewer. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. Poisonous gases, including carbon dioxide and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, water spray, halon, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.[22]

RCRA Land Ban Waste Restrictions.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg).

California Proposition 65 Chemical: Cancer 10/1/89 (phenacetin and analgesic mixtures containing phenacetin).

European/International Regulations: Hazard Symbol: T; Risk phrases: R22; R45; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetophenetidin is a fine, white, crystalline powder or solid. Odorless with a slightly bitter taste. Molecular weight = 179.22; Boiling point = about 100°C (decomposes); Freezing/Melting point = 134−137°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Phenacetin is used as an analgesic and antipyretic drug. It is used alone or in combination with aspirin and caffeine for mild to moderate muscle pain relief. Phenacetin has also been used as a stabilizer for hydrogen peroxide in hair bleaching preparations. A laboratory reagent. In veterinary medicine, it is used as an analgesic and antipyretic.

Incompatibilities: Oxidizing agents, iodine and nitrating agents.[52]

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 10 mg/m^3
PAC-3: 60 mg/m^3

Russia[43] set a MAC of 0.5 mg/m^3 in working zones for phenacetin.

Determination in Water: EPA Method 8250A. Octanol−water coefficient: Log K_{ow} = <3.0.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure to high levels of this chemical can cause methemaglobinemia which lowers the ability of the blood to carry oxygen. This can result in a bluish color to skin and lips (cyanosis), headache, dizziness, collapse, and possible death.

Long Term Exposure: This chemical is a probable cancer-causing agent in humans. It has been shown to cause bladder, urinary tract, and nose cancer in animals. Mutation, reproductive, teratogenic data reported. There is limited evidence that this chemical may damage the developing fetus. High or repeated exposures can destroy red blood cells, causing low blood count; aplastic anemia; jaundice, kidney damage; and brownish color to urine. Can lead to a general allergic reaction with rash and itching.

Points of Attack: Bladder, kidneys, eyes, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: Blood test for methemoglobin level; Complete blood count and reticulocyte count; Blood and urine bilirubin; Blood Phenacetin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash with soap immediately. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Wear chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any exposure level:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd, Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where Phenacetin is handled, used, or stored. Store in tightly-closed containers in a cool, well-ventilated area away from heat.

Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak after cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including nitrogen oxides, are produced in fire. Use any extinguishing agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Permanganate oxidation, microwave plasma treatment, alkaline hydrolysis, or incineration.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetophenone is a combustible, colorless, oily liquid with a sweet, floral odor. Molecular weight = 120.15[9]; Specific gravity (H_2O:1) = 1.028 at 20°C (liquid)[9]; Boiling point at 1 atm = 201.7°C[9]; Melting/Freezing point = 19.7°C[9]; Critical temperature = 428°C[9]; Critical pressure = 38 atm[9]; Surface Tension = 39.8 dynes/cm at 20°C (in contact with vapor); Liquid surface tension = 12 dynes/cm = 0.012 N/m at 30°C[9]; Liquid water interfacial tension = (estimate) 40 dynes/cm = 0.04 N/m at 27°C[9]; Relative vapor density (air = 1) = 4.15[9]; Ratio of specific heats of vapor (gas) = (estimate) 1.071[9]; Latent heat of vaporization = 150 Btu/lb = 83.6 cal/g[9]; 11,731.5 gcal/gmole; Heat of combustion = − 14,850 Btu/lb = − 8250 cal/g[9]; 991.60 kcal/g at 25°C (liquid); Vapor pressure = 0.99 mmHg at 20°C[9]; 0.133 kPa at15°C; Electrical conductivity = 3.12×10^5 pS/m[52]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 1; Flash point = 77°C (cc); 82°C (oc); Autoignition temperature = 570°C. Poor solubility in water; solubility = 0.73 g/100 mL at 20°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Primary Irritant. Acetophenone is used as a solvent and in perfume manufacture to impact a pleasant jasmine or orange-blossom odor. It is used as a catalyst in olefin polymerization and as a flavorant in tobacco. It is also used in the synthesis of pharmaceuticals.

Incompatibilities: Forms explosive mixture with air. See flash point, above. Strong oxidizers, strong bases, and strong reducing agents.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 10 ppm/49 mg/m^3 TWA.

AIHA WEEL: 10 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 200 mg/m^3

Hungary: TWA 15 mg/m^3; STEL 30 mg/m^3[skin] 1993; Russia: STEL 5 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 49 mg/m^3, 2003.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water for domestic purposes and 0.04 mg/L in water used for fishery purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.58.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Skin contact can cause burning and rash. Exposure can result in headache, dizziness, nausea, and loss of coordination. A hypnotic, high levels of exposure may affect the nervous system. Toxic effects exacerbated by alcohol consumption.

Long Term Exposure: There is evidence that this chemical can cause genetic changes, mutations, and acne-like skin rash. Long-term exposure may cause central nervous system damage.

Points of Attack: Skin, eyes, central nervous system.

Medical Surveillance: Testing for hippuric acid levels in the urine is recommended.

First Aid: Remove any contact lenses at once, then flush eyes, wash contaminated areas of body with soap and water. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. ACGIH recommends Teflon™ as a protective material. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where acetophenone may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards but may be classified[52] as Environmentally hazardous substances, liquid, n.o.s. which falls in Hazard Class 9 and Packing Group III. This chemical requires a shipping label of "CLASS 9."

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use foam spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acetophenone out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, water spray, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably with a flammable solvent.

Acetyl acetone

see 2,4-Pentanedione (CAS: 123-54-6)

Acetyl acetone peroxide A:0250

Molecular Formula: A C_{10}-ketone with no single definite structure, coexists with isomers. (Patnaik)

Synonyms: Lupersol 224; 2.4-Pentanedione, peroxide; Percure A; Peroxido de acetilacetona (Spanish); Trigonox 40

CAS Registry Number: 37187-22-7

RTECS® Number: SA2400000

UN/NA & ERG Number: UN3105 (organic peroxide type D, liquid)/145; UN3106 (organic peroxide type D, solid or paste)/145

EC Number: 253-384-9

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetyl acetone peroxide is an extremely flammable and dangerously explosive colorless to light yellow liquid with a sharp smell. An organic peroxide. May be shipped as a solution or a paste. Flash point = >90°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2. Soluble in water.

Potential Exposure: A catalyst to make resins, vinyl, polyolefins, and silicones; a curing agent for unsaturated thermoset resins.

Incompatibilities: An organic peroxide. May ignite combustibles, such as wood, cloth, oil, etc. Contact with oxidizers, heat, sparks, flame, shock, or contamination can cause explosions. Keep away from hot materials, cobalt napthenate, dimethyl aniline, and other accelerators, promoters, or reducing agents.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Acetyl acetone peroxide can be absorbed through the skin, thereby increasing exposure. Irritates eyes, skin, and respiratory tract. Can cause wheezing and coughing, dizziness, nausea, headache, and loss of consciousness. LD_{50} = (oral-rat) 3300 mg/kg.

Long Term Exposure: Unknown at this time.

Points of Attack: Eyes, skin, central nervous system.

First Aid: Remove any contact lenses at once, then flush eyes, wash contaminated areas of body with soap and water. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow Stripe: Reactivity Hazard; store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where acetyl acetone peroxide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: "ORGANIC PEROXIDE." FORBIDDEN from Transport by the US DOT, when active oxygen content >9%. This chemical requires a shipping label of "ORGANIC PEROXIDE TYPE D." It falls in Hazard Class 5.2, Packing Group II[19, 20].

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid or paste. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators

recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 7/1/87.

Canadas WHMIS Ingredients Disclosure List Concentration Reporting Level: 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Acetylaminofluorene is a combustible, tan powder or crystalline solid. Molecular weight = 223.3; Freezing/Melting point = 194°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. 2-Acetylaminofluorene (AAF) was intended to be used as a pesticide, but it was never marketed because this chemical was found to be carcinogenic. AAF is used frequently by biochemists and technicians engaged in the study of liver enzymes and the carcinogenicity and mutagenicity of aromatic amines as a positive control. Therefore, these persons may be exposed to AAF.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions. Not compatible with cyanides, acids, and acid anhydrides.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: potential occupational carcinogen; limit exposure to the lowest feasible concentration.

NIOSH IDLH: Not determined. Potential occupational carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 2.5 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 350 mg/m^3

Belgium carcinogen, 1993; Finland: carcinogen, 1993; Sweden; carcinogen, 999.

New York: 0.03 $\mu g/m^3$ for ambient air.[60]

Routes of Entry: Ingestion, inhalation, mucous membrane, skin absorption, skin and/or eye contact.

Harmful Effects and Symptoms

A carcinogen. Handle with extreme care.

Short Term Exposure: This chemical has limited use in industry, and contact is kept to a minimum to prevent cancer. Reduced function of liver, kidneys, bladder, pancreas (Potential occupational carcinogen).

Long Term Exposure: Incorporation of this compound in feed caused increased incidences of malignant tumors in a variety of organs in the rat. Long-term studies in which mice were given 2-acetylaminofluorene in their diet showed that this compound caused increased incidences of tumors and cancer of the liver, kidney, urinary bladder, lung, skin, and pancreas. There is limited evidence that this chemical is a teratogen in animals.

Points of Attack: Liver, bladder, kidney, pancreas, skin, lungs.

Medical Surveillance: Urine cytology for abnormal cells in the urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Prevent skin contact. Contact the manufacturer for recommendations. Because AAF is a carcinogen, on February 11, 1974, OSHA promulgated a standard for this chemical designating protective clothing, hygiene procedures for workers, and special engineering requirements for the manufacture or processing of AAF. Open vessel operations are prohibited. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Remove non-impervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode), or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where 2-acetylaminofluorene is handled, used, or stored. 2-Acetylaminofluorene must be stored to avoid contact with cyanides since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Usually shipped in small laboratory bottles as noted above. The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.

Spill Handling: If 2-Acetylaminofluorene is spilled or leaked, only specifically trained personnel should be involved in the cleanup. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover with lime or soda ash; collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Presumably high temperature incineration with scrubber for any produced nitrogen oxides can be used.

Acetyl benzoyl peroxide A:0270

Molecular Formula: $C_9H_8O_4$

Common Formula: $CH_3CO \cdot OO \cdot COC_6H_5$

Synonyms: Acetozone; Benzozone; Peroxide, acetyl benzoyl; Peroxido de acetil benzoilo (Spanish)

CAS Registry Number: 644-31-5

RTECS® Number: SD7860000

UN/NA & ERG Number: with>9% by mass active oxygen, FORBIDDEN

EC Number: 211-412-7

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetyl benzoyl peroxide is a white crystalline solid, forming needles. Molecular weight = 180.16; Freezing/Melting point = 36−39°C; Boiling point = 130°C; Flash point: 104°C. Decomposes in water; violent reaction; solubility = 639 mg/L at 25°C.

Potential Exposure: Used in disinfectants, to bleach flour; and in medications.

Incompatibilities: Acetyl benzoyl peroxide is an organic peroxide which can detonate if shocked, heated, or on contact with contaminants. A strong oxidizer. Avoid contact with moisture, water, steam, sources of ignition, combustible materials. Not compatible with strong bases, reducing materials, other oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria set. Reacts violently with water.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.98$.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Contact can severely irritate and burn the eyes and skin. It may cause permanent damage. Breathing Acetyl benzoyl peroxide can irritate the nose, throat and lungs, causing a cough, difficulty breathing and chest tightness. Higher levels of exposure can cause pulmonary edema, a medical emergency, which can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may cause chronic irritation of the skin and eczema-like rash. Repeated lung exposure can cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, nose, throat, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Avoid skin contact with Acetyl Benzoyl Peroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear impact-resistant goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures to solid acetyl benzoyl peroxide, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for high exposures and to the liquid form of Acetyl Benzoyl Peroxide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. This chemical is an organic peroxide which can detonate if shocked or heated. Before entering confined space where acetyl benzoyl peroxide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Acetyl benzoyl peroxide, solid, or with >40% in solution and falls in the FORBIDDEN category.[19] Solutions with <45% fall in Hazard Class 5.2 and Packing Group II. They must be labeled “ORGANIC PEROXIDE.”

Spill Handling: Restrict persons not wearing butyl rubber protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep this substance out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical or carbon dioxide extinguishers. Irritating fumes are produced in fire. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WMIS Ingredients Disclosure List Concentration Reporting Level: 1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R14; R34; Safety phrases: S25; S36/37/39; S45; S9 WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetyl bromide is a colorless, fuming liquid that turns yellow on contact with air. It has a sharp, unpleasant odor. Molecular weight = 122.97; Specific gravity (H_2O:1) = 1.58; Boiling point = 76.7°C; Freezing/Melting point = −96°C; Vapor pressure = 101 mmHg at 20°C; 13 kPa at 20°C; Relative vapor density (air = 1) = 4.2; Combustible but difficult to ignite; Flash point = 71°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Sinks in water; violent decomposition, forming toxic hydrogen bromide.

Potential Exposure: Acetyl bromide is used as an acetylating agent in the organic synthesis of other chemicals, pesticides, perfume, pharmaceuticals, and it is also used as a dye intermediate.

Incompatibilities: Contact with moisture, water, steam, alcohols causes a violent reaction releasing corrosive carbonyl bromide, hydrogen bromide, and bromine gases. Incompatible with organic solvents, ethers, oxidizers, and strong bases. Corrodes or attacks most metals and wood in the presence of moisture. Contact with combustibles may cause ignition.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.2 ppm
PAC-1: 0.6 ppm
PAC-2: 4 ppm
PAC-3: 20 ppm

Routes of Entry: Eye and/or skin contact, inhalation, and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Skin and eye contact can cause severe irritation and possible permanent damage including blindness. Inhalation and swallowing are very toxic. Exposure can irritate the nose, throat, air passages, and lungs with coughing and/or shortness of breath. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated respiratory exposure can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Repeated skin exposure can cause chronic skin irritation.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, lung function tests are recommended. If symptoms develop or overexposure is suspected, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear corrosive-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Acetyl Bromide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and sunlight. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Acetyl bromide requires a shipping label of "CORROSIVE MATERIAL." It falls in Hazard Class 8, Packing Group II.[19, 20]

Spill Handling: Prevent liquid from reaching water if possible. This material creates large amounts of toxic hydrogen bromide (HBr) vapor when spilled in water, and is considered by the North American Emergency Response Guide to be dangerous from 0.5 to 10 km (0.3−6.0 miles downwind). Enter area from upwind side. Evacuate area and issue warning of danger, including possible explosion. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids using dry lime or soda ash. *Do not use water or wet method.* Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.1/1.8

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 and seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line).

Fire Extinguishing: This chemical is a combustible liquid, but does not ignite readily. Poisonous gases, including hydrogen bromide, carbonyl bromide, and bromine, are produced in fire. Reacts violently with water-based extinguishers, such as foam. *Do not use water or foam extinguishers.* Use dry chemical or carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire.

If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Slow addition to sodium bicarbonate solution.

Acetyl chloride A:0290

Molecular Formula: C_2H_3ClO

Common Formula: CH_3COCl

Synonyms: Acetic acid chloride; Acetic chloride; Cloruro de acetilo (Spanish); Ethanoyl chloride

CAS Registry Number: 75-36-5

RTECS® Number: AO6390000

UN/NA & ERG Number: UN1717/155

EC Number: 200-865-6

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Listed on the TSCA inventory.

Clean Air Act: 42USC7412; Title I, Part A, §112 Hazardous Pollutants; RQ 40CFR117.3 (same as CERCLA).

US EPA Hazardous Waste Number (RCRA No.): U006.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg).

Banned or Severely Restricted (Singapore) (UN).[13]

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R11; R14; R34; Safety phrases: S9; S16; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acetyl chloride is a highly flammable, colorless, fuming liquid with a pungent odor. The odor threshold is 1.0 ppm (as acetic acid or as HCl). Molecular weight = 78.5[9]; Specific gravity (H_2O:1) = 1.1[9]; Boiling point at 1 atm = 51°C[9]; Melting/Freezing point = − 112°C[9]; Critical temperature = (estimate) 246°C[9]; Critical pressure = (estimate) 845 psia = 57.5 atm[9]; Specific gravity = 1.1039 at 21°C (liquid); Liquid surface tension = 26 dynes/cm = 0.026 N/m at 20°C[9]; Relative vapor density (air = 1) = 2.7[9]; Electrical conductivity = $4 \times 10^{\ 7}$[du]; Ratio of specific heats of vapor (gas) = 1.1467[9]; Latent heat of vaporization = 160 Btu/lb = 88 cal/g[9]; Heat of combustion = − 6000 Btu/lb = − 3300 cal/g[9]; Heat of solution = (estimate) − 54 Btu/lb = − 30 cal/g[9]; Vapor pressure = 213 mmHg at 20°C[9]; 32 kPa at 20°C; Flash point = 4°C; Autoignition temperature = 390°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 3₩. Explosive limits LEL = 7.3%, UEL = 19.0%. Violent decomposition in water.

Potential Exposure: Compound description: Mutagen; Human Data. Acetyl chloride is used in organic synthesis as an acetylating agent, in testing for water and/or cholesterol in organic liquids, in the pharmaceutical industry, and in pesticide manufacture.

Incompatibilities: Avoid contact with moisture, steam, water, alcohols, dimethylsulfoxide, strong bases, phosphorus trichloride, oxidizers, and amines since violent reactions may occur. Keep away from heat, fire, and welding operations.

Permissible Exposure Limits in Air

AIHA WEEL: 1000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.0025 ppm

PAC-1: 0.0075 ppm

PAC-2: 0.05 ppm

PAC-3: 125 ppm

Permissible Concentration in Water: No criteria set. However, acetyl chloride reacts violently with water. Thus, its half-life in ambient water should be short and exposure from water should be nil. The degradation products should likewise pose no exposure problems if the pH of the water remains stable.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Acetyl chloride is an irritant and a corrosive. Cutaneous exposure results in skin burns, while vapor exposure causes extreme irritation of the eyes and mucous membranes. Inhalation of 2 ppm acetyl chloride has been found irritating to humans. Death or permanent injury may result after short exposures to small quantities of acetyl chloride. An aquatic toxicity rating has been estimated to range from 10 to 100 ppm.

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Skin and eye contact can cause severe irritation and possible permanent damage including blindness. Inhalation and swallowing are very toxic. Exposure can irritate the nose, throat, air passages, and lungs with coughing and/or shortness of breath. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated respiratory exposure can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Repeated skin exposure can cause chronic skin irritation.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, lung function tests are recommended. If symptoms develop or overexposure is suspected, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear corrosive-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Acetyl Chloride, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and sunlight. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Should bear "FLAMMABLE LIQUID, CORROSIVE" label. It falls in Hazard Class 3 and 8, Packing Group II.[19, 20]

Spill Handling: Prevent liquid from reaching water if possible. This material creates large amounts of toxic hydrogen chloride (HCl) vapor when spilled in water and is considered by the North American Emergency Response Guide to be dangerous from 0.5 to 10 km (0.3−6.0 miles downwind). Enter area from upwind side. Evacuate area and issue warning of danger, including possible explosion. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids using dry lime or soda ash. *Do not use water or wet method.* Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/60
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.8/2.8

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line).

Fire Extinguishing: This chemical is a combustible liquid but does not ignite readily. Poisonous gases, including hydrogen bromide, carbonyl bromide, and bromine, are produced in fire. *Do not use water or foam extinguishers*. Use dry chemical or carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. May be mixed slowly with sodium bicarbonate solution and then flushed to sewer with large volumes of water. May also be incinerated.

Acetyl cyclohexane sulfonyl peroxide A:0300

Molecular Formula: $C_8H_{14}O_5S$

Synonyms: Acetil ciclohexilsulfoniloperoxide (Spanish); Acetyl cyclohexylsulfonyl peroxide; Lupersol 228Z; Peroxide, acetyl cyclohexylsulfonyl; Peroxido de acetilciclohexanosulfonil (Spanish)

CAS Registry Number: 3179-56-4

RTECS® Number: SD7864200 (>82%); SD7864000 (<82%); SD7864100 (<32% in solution)

UN/NA & ERG Number: UN3112 (Organic peroxide type B, solid, temperature controlled)/148

EC Number: 221-658-7

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetyl cyclohexane sulfonyl peroxide is a white solid which is often used in a liquid solution. It is an unstable organic peroxide. Molecular weight = 222.25; Flash point = 63°C. Insoluble in water.

Potential Exposure: Used in paint, rubber, and plastics manufacture.

Incompatibilities: Danger of explosion when dry. A very unstable organic peroxide that is heat, shock, and contamination sensitive. Store away from combustible materials; oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Eye and skin contact may cause irritation and burns. Inhalation can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can cause lung irritation with coughing and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure, lung function tests are recommended before beginning work and at regular times after that. If symptoms develop or overexposure is suspected, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. One manufacturer of acetyl cyclohexane sulfonyl peroxide recommends rubber as a protective material. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to *solid* Acetyl cyclohexane sulfonyl peroxide, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures* to *liquid* Acetyl cyclohexane sulfonyl peroxide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Danger of explosion when dry. Acetyl cyclohexane sulfonyl peroxide is commonly stored in a water slurry. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Acetyl cyclohexane sulfonyl peroxide must be stored to avoid contact with combustible materials, such as wood, paper, and oil, since violent reactions occur. Detached storage is recommended. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Danger of explosion when dry. Acetyl cyclohexane sulfonyl peroxide is commonly transported in a water slurry. Shipment of acetyl cyclohexane sulfonyl peroxide, with $>82\%$ wetted with $<12\%$ water is forbidden. Shipment of material $<82\%$ wetted with $>12\%$ water falls in Hazard Class 5.2 and Packing Group I; such materials must be labeled "ORGANIC PEROXIDE." Shipment of material $<32\%$ in solution falls in Hazard Class 5.2 and Packing Group II; such material must be labeled "ORGANIC PEROXIDE."

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep spilled material wet. Because this chemical is a severe explosion hazard, contact the manufacturer regarding the safest method for cleanup and disposal. Keep acetyl cyclohexane sulfonyl peroxide out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid or in solution. Poisonous gases, including sulfur oxides; are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Containers may explode in fire. *Evacuate area* if temperature control cannot be maintained. Cool containers with liquid nitrogen, dry ice, or ice. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

CAS Registry Number: 74-86-2
RTECS® Number: AO9600000
UN/NA & ERG Number: UN1001/116

EC Number: 200-816-9 [*Annex I Index No.:* 601-015-00-0]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: 42USC7412; Title I, Part A, §112 Hazardous Pollutants, Accidental Release Prevention/Flammable Substances (Section 68.130) TQ = 10,000 lb (4540 kg).

US EPA Hazardous Waste Number (RCRA No.): D001.

Highly Reactive Substance and Explosive (World Bank).[15]

European/International Regulations: Hazard Symbol: F + ; Risk phrases: R5; R6; R12; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonhazardous to water

Description: Acetylene is a highly flammable, colorless, compressed gas. It has a faint ethereal odor when pure; a garlic-like odor when contaminated. Molecular weight = 26.04[9]; Specific gravity (H_2O:1) = 0.613 at − 80°C (liquid)[9]; Boiling point at 1 atm = 84.0°C (sublimes)[9]; Melting/Freezing point = − 81°C (sublimes)[9]; Critical temperature = 35.2°C[9]; Critical pressure = 890.7 psia = 60.59 atm = 6.138 MN/m^2[A2]; Relative vapor density (air = 1) = 0.907[9]; Ratio of specific heats of vapor (gas) = 1.235[9]; Heat of combustion = − 20,747 Btu/lb = − 11,526 cal/g = − 482.57 × 10^5 J/kg[9]; Vapor pressure = 33.9 mmHg at 20°C[9]; Autoignition temperature: 305°C; Adiabatic flame temperature: 1597°C (estimate)[9]; Minimum ignition energy = 0.017 mJ[du]; Stoichiometric air-to-fuel ratio: 13.18 (estimate); Explosive limits: LEL = 2.5%, UEL = 82%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity (*gas*) 3; (*dissolved in acetone*) 2. Low solubility in water = 1.65 g/100 mL at 20°C.

Potential Exposure: Acetylene can be burned in air or oxygen and is used for brazing, welding, cutting, metallizing, hardening, flame scarfing, and local heating in metallurgy. The flame is also used in the glass industry. Chemically, acetylene is used in the manufacture of vinyl chloride, acrylinitrile, synthetic rubber, vinyl acetate, trichloroethylene, acrylate, butyrolactone, 1,4-butanediol, vinyl alkyl ethers, pyrrolidone, and other substances.

Incompatibilities: The substance may polymerize due to heating. The substance decomposes on heating and increasing pressure, causing a fire and explosion hazard. The substance is a strong reducing agent and reacts violently with oxidants and with fluorine or chlorine under influence of light, causing fire and explosion hazard. Reacts with copper, silver, and mercury or their salts, forming shock-sensitive compounds (acetylides). The content of lines carrying acetylene must not exceed 63% copper. Forms explosive mixture with air. Forms shock-sensitive mixture with copper and copper salts, mercury and mercury salts, and silver and silver salts. Reacts with brass, bromine, cesium hydride, chlorine, cobalt, cuprous acetylise; fluorine, iodine, mercuric nitrate; nitric acid, potassium, rubidium hydride; trifluoromethyl hypofluorite; and sodium hydride.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.06 mg/m^3 at 25°C & 1 atm

OSHA PEL: None established.

NIOSH REL: 2500 ppm/2662 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: Simple asphyxiant with no TLV value.

Arab Republic of Egypt: TWA 1 ppm (14 mg/m^3), 1993; Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: MAK-W 1000 ppm (1080 mg/m^3), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Simple asphyxiant. Virginia has set a guideline or standard of 3.0 $\mu g/m^3$ for ambient air.[60]

Determination in Air: see NIOSH Acetylene Criteria Document.

Permissible Concentration in Water: No criteria set but EPA[32] suggests an ambient water limit of 73,000 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Rapid evaporation of the liquid may cause frostbite. Initial signs and symptoms of exposure to harmful concentrations of impure acetylene are rapid respiration, air hunger, followed by impaired mental alertness and muscular uncoordination. Other manifestations include cyanosis, weak and irregular pulse, nausea, vomiting, prostration, impairment of judgment and sensation, loss of consciousness, convulsions, and death. Low order sensitization of myocardium to epinephrine resulting in ventricular fibrillation may be possible. At high concentrations pure acetylene may act as a mild narcotic and asphyxiant. Most accounted cases of illness or death can be attributed to acetylene containing impurities of arsine, hydrogen sulfide, phosphine, carbon disulfide, or carbon monoxide.

Long Term Exposure: The substance may cause effects on the nervous system.

Points of Attack: Central nervous system; respiratory system.

Medical Surveillance: Watch for complications due to impurities, such as arsine, hydrogen sulfide, phosphine, carbon disulfide, or carbon monoxide.

First Aid: Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. If breathing is difficult, give oxygen. Remove and isolate contaminated clothing and shoes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. See also NIOSH criteria document cited below. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Acetylene poisoning can quite easily be prevented if (1) there is adequate ventilation and (2) impurities are removed when acetylene is used in poorly ventilated areas. General industrial hygiene practices for welding, brazing, and other metallurgical processes should also be observed.

Respirator Selection: See NIOSH criteria document for Acetylene, cited below. In an emergency use NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. After use for welding, turn valve off, regularly check tubing, etc., and test for leaks with soap and water. Acetylene in process may be stored in atmospheric gas holders. May be stored in conventional compressed gas cylinders. Content of lines carrying acetylene must not exceed 63% copper (Cu). Storage of liquid acetylene should be avoided. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Acetylene (liquefied) has a hazard class of "FORBIDDEN." Acetylene (dissolved) is in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Stop flow of gas. Gases in confined areas may explode when exposed to fire. Gases may travel long distances to ignition sources and flash back. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Use dry chemicals, carbon dioxide. From a secure explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

Canada, WHMIS, Ingredient Disclosure List Concentration 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R26; R36; R52/53; Safety phrases: S1/2; S27; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetylene tetrabromide is a combustible, colorless to yellow liquid with a strong odor. Molecular weight = 345.7; Boiling point = 245.5°C (decomposes); Specific gravity (H_2O:1) = 2.96; Freezing/Melting point = − 1°C; Vapor pressure = 0.02 mmHg at 20°C; Relative vapor density (air = 1) = 11.9; Autoignition temperature = 335°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Very slightly soluble in water; solubility = 0.07%.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Primary Irritant. Acetylene tetrabromide is used as a solvent, a gauge fluid, and as a refractive index liquid in microscopy.

Incompatibilities: Chemically active metals (sodium, potassium, magnesium, zinc), strong caustics, hot iron. Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

OSHA PEL: 1 ppm/14 mg/m^3 TWA.

NIOSH REL: After reviewing available published literature, NIOSH provided comments to OSHA on August 1, 1988, regarding the "Proposed Rule on Air Contaminants" (29 CFR 1910, Docket No. H-020). In these comments, NIOSH questioned whether the PELs proposed for this chemical were adequate to protect workers from recognized health hazards.

ACGIH TLV®[1]: 0.1 ppm/1.4 mg/m^3, inhalable fraction and vapors TWA.

NIOSH IDLH: 8 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.1 ppm

PAC-1: 6 ppm

PAC-2: 8 ppm

PAC-3: 8 ppm

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 1 ppm (15 mg/m^3), 1993; Austria: MAK 1 ppm (14 mg/m^3), 1999; Belgium: TWA 1 ppm (14 mg/m^3), 1993; Denmark: TWA 1 ppm (14 mg/m^3), 1999; Finland: TWA 1 ppm (14 mg/m^3); STEL 3 ppm (42 mg/m^3), 1999; France: VME 1 ppm (15 mg/m^3), 1999; the Netherlands: MAC-TGG 7 mg/m^3 [skin] 2003; the Philippines: TWA 1 ppm (14 mg/m^3), 1993; Sweden: TWA 1 ppm (14 mg/m^3); STEL 2 ppm (30 mg/m^3), 1999; Turkey: TWA 1 ppm (14 mg/m^3), 1993; United Kingdom: 0.5 ppm (7.2 mg/m^3) [skin] 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm. Several states have set guidelines or standards for acetylene tetrabromide in ambient air[60] ranging from 0.15 mg/m^3 (North Dakota) to 0.25 mg/m^3 (Virginia) to 0.28 mg/m^3 (Connecticut) to 0.357 mg/m^3 (Nevada).

Determination in Air: Silica absorption followed by THF treatment and gas chromatographic analysis. See NIOSH Analytical Method, 1994: 1,1,2,2-Tetrabromoethane, #2003.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Can cause headaches, fatigue, dizziness, lightheadedness, and unconsciousness. High concentrations can cause death. Prolonged skin contact can cause burns.

Long Term Exposure: There is limited evidence that acetylene tetrabromide causes cancer, possibly stomach cancer. Repeated exposures can cause liver, kidney, and lung damage, and drying and cracking of the skin.

Points of Attack: Eyes, upper respiratory system, liver, kidneys, lungs, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests; expired air.[58]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of saltwater and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 8 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry in unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Acetylene tetrabromide begins to decompose at 245°C producing flammable and highly toxic vapors of bromine and carbonyl bromide. Avoid contact with incompatible materials cited above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Tetrabromoethane requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire, including bromine and carbonyl bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with combustible fuel and with scrubber to remove halo acids produced.

Acetyl iodide A:0330

Molecular Formula: C_2H_3IO
Common Formula: CH_3COI
Synonyms: Yoduro de acetilo (Spanish)
CAS Registry Number: 507-02-8
RTECS® Number: AP4670000
UN/NA & ERG Number: UN1898/156

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Corrosive; Risk phrases: R14; R34; Safety phrases: S26; S36/37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetyl iodide is a corrosive, colorless liquid that turns brown on contact with air or moisture. It has a suffocating odor. Molecular weight = 169.96; Boiling point = 107.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0; (NJDHSS): Health 2, Flammability 1, Reactivity 1. Decomposes in water.

Potential Exposure: Used as an organic intermediate; to make other chemicals.

Incompatibilities: Moisture, water, steam, or alcohol. Corrosive to metals.

Permissible Exposure Limits in Air

As iodides

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA.

No TEEL available.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Can cause severe skin and eye burns. Breathing this chemical can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency. This can cause death.

Long Term Exposure: Repeated exposure can cause lung irritation, bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure, lung function tests are recommended before beginning work and at regular times after that. If symptoms develop or overexposure is suspected, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility. Continue observation for 24−48 h after breathing exposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture and alcohols. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Shipping label required is "CORROSIVE." It falls in Hazard Class 8, Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.1/1.8

Fire Extinguishing: Acetyl iodide may burn but does not readily ignite. Poisonous gases are produced in fire, including iodine vapors and iodides. Do not use water as this chemical reacts forming corrosive and toxic fumes. Use dry chemical, carbon dioxide or foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: Sperm morphology—mouse; Inconclusive: Mammalian micronucleus.

US EPA, FIFRA, 1998 Status of Pesticides: Active registration.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Developmental/Reproductive toxin (female) 7/1/90. Aspirin (*Note:* It is especially important not to use aspirin during the last 3 months of pregnancy, unless specifically directed to do so by a physician because it may cause problems in the unborn child or complications during delivery).

European/International Regulations: Hazard Symbol: T; Risk phrases: R25; Safety phrases: S24; S27; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acetylsalicylic acid is a white crystalline solid with a slightly bitter taste. It is odorless but hydrolyzes in moist air to give an acetic acid odor. Molecular weight = 180.15; Boiling point = decomposes at <140°C; Freezing/Melting point = 135°C[A1]; Density = 1.4 g/cm^3; Vapor pressure = 0 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0 Poor solubility in water = 0.3% at 15°C.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Used as an over-the-counter and proprietary pharmaceutical and veterinary drug. Those engaged in manufacture of aspirin or, more likely, in its consumption in widespread use as an analgesic, antipyretic, and anti-inflammatory agent.

Incompatibilities: Strong oxidizers, strong acids, strong bases, carbonates, moisture. Dust dispersed in air is explosive.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 ppm TWA.

ACGIH TLV®[1]: 5 ppm TWA.

Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Norway: TWA 5 gm/m^3, 1999; Russia: STEL 0.5 mg/m^3, 1993; Switzerland: MAK-W 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea,New Zealand, Singapore, Vietman: ACGIH TLV®: TWA 5 mg/m^3. Some states have set guidelines or standards for aspirin in ambient air[60] ranging from 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.21.

Routes of Entry: Primarily oral in medicinal use.

Harmful Effects and Symptoms

Short Term Exposure: Eye and skin contact can cause irritation. Burns to the eyes and scarring can occur. High exposures may cause headache, dizziness, depression, and irritability. This chemical can be absorbed through the skin, thereby increasing exposure. Adverse effects from the usual doses of aspirin are infrequent, most common are gastrointestinal disturbances. Prolonged administration of large doses results in occult bleeding and may result in anemia. LD$_{50}$ = (oral-rat) 200 mg/kg.

Long Term Exposure: Repeated exposures may cause headache, dizziness, depression, and irritability; allergy may develop causing hives. Animal tests show that this substance possibly causes toxic effects upon human reproduction; possible teratogen. This chemical can decrease the clotting ability of blood.

Points of Attack: *Cancer site:* Eyes, skin, respiratory system, blood, liver, kidneys.

Medical Surveillance: Tests of blood clotting ability. People taking anticoagulants may be at increased risk. Skin testing with dilute Acetylsalicylic acid may help diagnose allergy, if done by a qualified allergist. If allergy is confirmed, all future exposure to this chemical should be avoided since even small exposure can cause an allergic reaction. It is possible for severe allergic reaction to occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH; however where the potential exists for exposure, the following might be considered: P2 filter respirator for harmful particles meeting NIOSH classified N95. The use of N95 respirators is restricted to use in atmospheres free of oil aerosols. In Europe, similar respirators may contain the prefix "FF" (for filtering face-piece) and may be classified as FFP2.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture.

Shipping: This chemical requires a shipping label of "TOXIC SOLID, ORGANIC, n.o.s." It falls in Shipping Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Sweep spilled substance into containers; if appropriate, moisten first to prevent dusting. Carefully collect remainder, then remove to safe place (extra personal protection: P2 filter respirator for harmful particles). Use a vacuum or wet method to reduce dust during cleanup. *Do not dry sweep*. The spilled material may be dampened with 60−70% ethanol to avoid airborne dust and the material then scooped up for disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Acetylsalicylic acid itself may burn but does not readily ignite. Dust of this chemical dispersed in air is explosive. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be flushed to sewer with large volumes of water.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 1-Acetyl-2-thiourea is a white crystalline solid; forming needles. Molecular weight = 118.16; Freezing/Melting point = 165−168°C; Flash point = 80°C. Slightly soluble in water.

Potential Exposure: Studied as possible rodenticide; used in organic synthesis.

Incompatibilities: Strong oxidizers, strong acids.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

An LD_{50} value (oral-rat) has been reported as 50 mg/kg and is the apparent basis for EPA classification as hazardous substance[4] and hazardous waste.[5] Acts as poison in humans by ingestion and intraperitoneal routes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where potential for exposure exists:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture.

Shipping: This chemical requires a shipping label of "TOXIC SOLID, ORGANIC, n.o.s." It falls in Shipping Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and sulfur oxides. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Acifluorfen A:0360

Molecular Formula: $C_{14}H_7ClF_3NO_5$

Common Formula: $F_3C-C_6H_3(Cl)-O-C_6H_3(NO_2)(COOH)$

Synonyms: Acifluorfen; Acifluorfene; Benzoic acid, 5-[2-chloro-4-(trifluoromethyl)phenoxy]-2-nitro-; Blazer®; Carbofluorfen; 5-[2-Chloro-4-(trifluoromethyl)phenoxy]-2-nitrobenzoic acid; 5-(2-Chloro-α,α,α-trifluoro-*p*-tolyloxy)-2-nitrobenzoic acid; Tackle®

RTECS® Number: DG5643200

UN/NA & ERG Number: UN2588/151 (pesticide, solid, toxic, n.o.s.)

EC Number: 256-634-5 [*Annex I Index No.*: 604-041-00-0]

Regulatory Authority and Advisory Bodies

Carcinogenicity: Possible human; animal positive (EPA), *possibly carcinogenic to humans*, Group 2B, as sodium salt.

Clean Water Act: CFR 455, Table 1.

California Proposition 65 Chemical: Cancer 1/1/90 (62476-59-9).

SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0% (sodium salt).

European/International Regulations (*includes sodium*): Hazard Symbol: Xn, N; Risk phrases: R22; R38; R41; R50/53; Safety phrases: S2; S24; S39; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acifluorfen, a diphenyl ether, is a combustible, off-white, light tan to brown solid. Molecular weight = 361.65; Freezing/Melting point = 152–157°C[23]; 124–126°C (sodium salt). The sodium salt is soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this selective preemergence and postemergence herbicide used to control weeds and grass in soybean and peanut crops.

Incompatibilities: Strong oxidizers. Avoid contact with all sources of ignition.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: A no-adverse-effect level (NOAEL) has been determined to be 20 mg/kg. Body weight/day based on fetotoxicity. However, an NOAEL of 5.6 was determined based on increase in liver size of male rats; further an NOAEL of 1.25 mg/kg/day was determined in a 2-generation rat reproduction study. Based on this, a long-term health advisory of acifluorfen has been set at 0.44 mg/L for a 70-kg adult. A lifetime health advisory for that same adult is 0.009 mg/L. The EPA has also determined a reference dose (acceptable daily intake) of 0.013 mg/kg/day.

Determination in Water: Analysis of acifluorfen is by a gas chromatographic (GC) method applicable to the determination of certain chlorinated acid pesticides in water samples. In this method, approximately 1 L of sample is acidified. The compounds are extracted with ethyl ether using a separatory funnel. The derivatives are hydrolyzed with potassium hydroxide, and extraneous organic material is removed by a solvent wash. After acidification, the acids are extracted and converted to their methyl esters using diazomethane as the derivatizing agent. Excess reagent is removed, and the esters are determined by electron capture GC. The method detection limit has not been determined for this compound, but it is estimated that the detection limits for analytes included in this method are in the range of 0.5−2 μg/L. Fish Tox: 1499.99565000 ppb MATC (VERY LOW).

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

The acute oral LD_{50} for male rats is 2025 mg/kg; for female rats is 1370 mg/kg. Acifluorfen is a moderate dermal irritant.

Long Term Exposure: A known carcinogen. Similar chlorinated diphenyl ethers have caused liver damage in laboratory animals. Human Tox = 3.27103 ppb CHCL (Chronic Human Carcinogen Level) (HIGH).

Points of Attack: Skin and liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Acifluorfen may be classified as a pesticide, solid, toxic, n.o.s. It would then fall in Hazard Class 6.1 and Packing Group III. This requires a “KEEP AWAY FROM FOOD” label.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Do not flush spilled material into sewer. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Reverse osmosis (RO) is a promising treatment method for pesticide-contaminated water. As a general rule, organic compounds with molecular weights greater than 100 are candidates for removal by RO, which yields 99% removal efficiency of chlorinated pesticides by a thin-film composite polyamide membrane operating at a maximum pressure of 1000 psi and at a maximum temperature of 45°C. More operational data are required, however, to specifically determine the effectiveness and feasibility of applying RO for the removal of acifluorfen from water. Also, membrane adsorption must be considered when evaluating RO performance in the treatment of acifluorfen-contaminated drinking water supplies. Soil Adsorption Index (K_{oc}) = 113 (Estimate).

Fire Extinguishing: This chemical is a combustible solid but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides, carbon monoxide, chlorides, and fluorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Acridine A:0370

Molecular Formula: $C_{13}H_9N$

Synonyms: 10-Azaanthracene; 9-Azaanthracene; 2,3-Benzoquinoline; Benzo(b)quinoline; Dibenzo(b,e)pyridine; Dibenzopyridine

CAS Registry Number: 260-94-6

RTECS® Number: AR7175000

UN/NA & ERG Number: UN2713/153

EC Number: 205-971-6

Regulatory Authority and Advisory Bodies

Carcinogenicity: Coal tar and similar materials which are known to be carcinogenic to humans may contain dibenzo (b,e)pyridine. (See also Coal Tar Pitch Volatiles).

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR1910.1002) as coal tar pitch volatiles.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: (*Coke oven emissions*) Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1% as coal tar pitch volatiles.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acridine is a crystalline solid made up of small, colorless or light yellow orthorhombic plates or needles. Molecular weight = 179.22; Density = 1.005 at 20°C; Boiling point = 346°C at 760 mmHg; Freezing/Melting point = 108−110.5°C (sublimes at 100°C); Vapor Pressure = 1 mmHg; Heat of combustion = −15,800 Btu/lb = −8790 cal/g = -368×10^5 J/kg.[C] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0.

Solubility in water = 38 mg/L; highly soluble in boiling water.

Potential Exposure: Acridine and its derivatives are widely used in the production of dyestuffs, such as acriflavine, benzoflavine, and chrysaniline; and in the synthesis of pharmaceuticals, such as aurinacrine, proflavine, and rivanol. A constituent of coal tar, coal tar creosote; found in wastes from gas and tar plants and coke oven emissions.

Incompatibilities: Strong acids, strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available. However, EPA[32] suggests an ambient air limit of 162 $\mu g/m^3$ based on health effects.

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene-soluble aerosol); Confirmed Human Carcinogen.

NIOSH IDLH: 80 mg/m^3 (as benzene-soluble aerosol).

DFG MAK: Category 1, human carcinogen.

Determination in Air: By fluorometry; NIOSH Analytical Method 5800, Polycyclic aromatic compounds.

Permissible Concentration in Water: No criteria set but EPA[32] suggests an ambient level goal of 800 μg/L based on health effects.

Determination in Water: Harmful to aquatic life in small quantities. Octanol−water coefficient: Log K_{ow} = about 3.5.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Acridine is a severe irritant to the conjunctiva of the eyes, the mucous membranes of the respiratory tract, and the skin. It is a powerful photosensitizer of the skin. Acridine causes sneezing on inhalation. Poisonous by ingestion and subcutaneous routes. Toxicity by ingestion = Grade 2; LD_{50} oral rat = 2000 mg/kg[C].

Long Term Exposure: Yellowish discoloration of sclera and conjunctiva may occur. Mutational properties have been ascribed to acridine, but its effect on humans is not known. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (Category 1) in animal studies.

Points of Attack: Eyes, skin, and respiratory tract.

Medical Surveillance: Evaluate the skin, eyes, and respiratory tract in the course of any placement or periodic examinations. Complete blood count, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests recommended for coal tar pitch volatiles.[2]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. A protective layer of petroleum jelly, lanolin, or castor oil has been recommended in ILO literature. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as coal tar pitch volatiles): At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Acridine requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Apply carbon or peat absorbents to dissolved material. Dredge up solid material for removal to disposal area. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use water spray or foam extinguishers, CO_2 and dry chemicals may not be effective. Poisonous gases are produced in fire, including nitrogen oxides. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with nitrogen oxide removal from the effluent gas by scrubber, catalytic or thermal device.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Acrolein is a highly flammable, clear to yellowish liquid. It has a piercing, disagreeable odor and causes tears. Molecular weight = 56.06; Specific gravity = 0.843 at 20°C (liquid)[9]; Boiling point at 1 atm = 53°C[9]; Melting/Freezing point = − 88°C[9]; Critical temperature = (estimate) 254°C[9]; Critical pressure = (estimate) 737 psia = 50.0 atm[9]; Liquid surface tension = 24 dynes/cm = 0.024 N/m at 20°C[9]; Liquid water interfacial tension = (estimate) 35 dynes/cm = 0.035 N/m at 20°C; Relative vapor density (air = 1) = 1.94[9]; Ratio of specific heats of vapor (gas) = 1.1487[9]; Latent heat of vaporization = 216 Btu/lb = 120 cal/g[9]; Heat of combustion = − 12,500 Btu/lb = − 6950 cal/g[9]; Heat of polymerization = (estimate) − 50 Btu/lb = − 28 cal/g = -1.2×10^5 J/kg[9]; Vapor pressure = 210 mmHg at 20°C[9]; 290 hPa at 20°C; Flash point = − 26°C (cc); Autoignition temperature (unstable) = 220°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3; (Dimer): Health 1, Flammability 2, Reactivity 1. Explosive limits: LEL = 2.8%, UEL = 31.0%. Odor threshold = 0.174 ppm. Soluble in water; 20 g/100 mL at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Used as pharmaceutical; slimicide; and in production of cosmetics and food supplements; as an intermediate in the production of glycerine and in the production of methionine analogs (poultry feed protein supplements). It is also used in chemical synthesis (1,3,6-hexametriol and glutaraldehyde); as a liquid fuel; antimicrobial agent, in algae and aquatic weed control; and as a slimicide in paper manufacture; making plastics, drugs, and tear gas. Also, most allyl compounds may be metabolized to allyl alcohol which is metabolized to acrolein.

Incompatibilities: Forms explosive mixture with air. Elevated temperatures or sunlight may cause explosive polymerization. A strong reducing agent; reacts violently with oxidizers. Reacts with acids, alkalis, ammonia, amines, oxygen, peroxides. Shock-sensitive peroxides or acids may be formed over time. Attacks zinc and cadmium.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.33 mg/m^3[A1] at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.25 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.25 mg/m^3 TWA; 0.3 ppm/0.8 mg/m^3 STEL.

ACGIH TLV®[1]: 0.1 ppm/0.23 mg/m^3 Ceiling Concentration [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 2 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.03 ppm

PAC-1: **0.030** ppm

PAC-2: **0.1** ppm

PAC-3: **1.4** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 3B.

Arab Republic of Egypt: TWA 0.1 ppm (0.25 mg/m^3), 1993; Australia: TWA 0.1 ppm (0.25 mg/m^3); STEL 0.3 ppm, 1993; Austria: MAK 0.1 ppm (0.25 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.23 mg/m^3); STEL

0.3 ppm, 1993; Finland: STEL 0.1 ppm (0.25 mg/m^3) [skin] 1993; France: VLE 0.1 ppm (0.25 mg/m^3), 1999; Hungary: TWA 0.25 mg/m^3; STEL 0.5 mg/m^3, 1993; the Netherlands: MAC-TGG 0.05 mg/m^3, 2003; Japan; 0.1 ppm (0.23 mg/m^3), 1999; Norway: TWA 0.1 ppm (0.25 mg/m^3), 1999; the Philippines: TWA 0.1 ppm (0.25 mg/m^3), 1993; Poland: MAC (TWA) 0.2 mg/m^3, MAC (STEL) 0.5 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 0.2 mg/m^3, 1993; Sweden: NGV 0.1 ppm (0.2 mg/m^3), KTV 0.3 ppm (0.7 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.25 mg/m^3), KZG-W 0.2 ppm (0.5 mg/m^3), 1999; Turkey: TWA 0.1 ppm (0.25 mg/m^3), 1993; United Kingdom: TWA 0.23 mg/m^3; STEL 0.70 mg.m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: ceiling 0.1 ppm (skin). Several states have set guidelines or standards for acrolein in ambient air[60] ranging from 0.83 μg/m^3 (New York) to 1.25 μg/m^3 (South Carolina) to 2.5 μg/m^3 (Florida, North Dakota) to 4 μg/m^3 (Virginia) to 5 μg/m^3 (Connecticut) to 6.9 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2501, OSHA Analytical Method #52.

Permissible Concentration in Water: To protect freshwater aquatic life on an acute basis 68 μg/L and on a chronic basis 21 μg/L. *To protect saltwater aquatic life:* 55 μg/L on an acute toxicity basis. To protect human health—320 μg/L.[6] In addition, two states have set guidelines for acrolein in drinking water.[61] These are both 320 μg/L as set by Arizona and Kansas.

Determination in Water: Gas chromatography (EPA Method #603) or gas chromatography and mass spectrometry (EPA Method #624). Octanol−water coefficient: Log $K_{ow} = 0.88$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 44 mg/kg. This chemical can be absorbed through the skin, thereby increasing exposure. Eye and skin contact may cause intense tearing, irritation, blisters, and burns. Inhalation can irritate the lungs, causing irritation, coughing, wheezing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. If swallowed, produces acute abdominal pains. Extremely toxic; probable oral human lethal dose is 5−50 mg/kg, between 7 drops and one teaspoon for a 70-kg (150 lb) person. Inhalation of air containing 10 ppm of acrolein may be fatal in a few minutes. Death from cardiac failure accompanied by hyperemia and hemorrhage of the lungs and degeneration of the bronchial epithelium is possible. Acrolein causes acute respiratory and eye irritation, severe gastrointestinal distress with slowly developing pulmonary edema (lung fill up with fluid), and skin irritation.

Long Term Exposure: This chemical is a metabolite of cyclophosphamide, a well-recognized animal teratogen. Acrolein may cause mutations. Such chemicals have a cancer risk. Long-term exposure can cause drying and cracking of the skin. High or repeated lower exposure may cause permanent lung damage. Testing has not been completed to determine the carcinogenicity of acrolein. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Heart, lungs, eyes, skin, respiratory system.

Medical Surveillance: Preplacement and periodic medical examinations should consider respiratory, skin, and eye disease. For those with frequent or potentially high exposure, lung function tests are recommended before beginning work and at regular times after that. Chest X-ray, expired air, pulmonary function tests.[2]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron->g/cm^2/min): butyl rubber gloves, suits, boots; Barricade®™ coated suits; Trychem 1000™ suits. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA/NIOSH *2 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF

(APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SAF: Pd,Pp:ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. *Do not* store uninhibited acrolein under any circumstances. Protect against physical damage. Outside or detached storage is preferable. Inside storage should be in a standard flammable liquids storage room or cabinet. Before entering confined space where acrolein may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and light. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Ship in unbreakable packaging. Do not transport with human food or animal feedstuffs. This chemical requires a shipping label of “POISON, FLAMMABLE LIQUID.” It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Take up very *small spills* for disposal by absorbing it in vermiculite, dry sand, or earth and disposing in a secured landfill or combustion chamber. Alternatively, cover with sodium bisulfite, add small amount of water and mix. Then, after 1 h, flush with large amounts of water and wash site with soap solution. Liquid should not be allowed to enter confined space, such as a sewer, because of potential for explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance ay need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 2.0/3.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0 + /11.0 +
Night 7.0 + /11.0 +

Fire Extinguishing: This chemical is a flammable liquid and explosion hazard. Under fire conditions, polymerization may occur, blocking relief valves leading to tank explosion. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration. Conditions are 816°C, 0.5 s minimum for primary combustion; 1093°C, 1.0 s for secondary combustion.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Water Pollution Standard Proposed (EPA)[48] (Minnesota).[61]

Clean Air Act: 42USC7412; Title I, Part A, §112 Hazardous Pollutants.

US EPA Hazardous Waste Number (RCRA No.): U007.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 19; Nonwastewater, 23.

Safe Drinking Water Act, MCL, treatment technique; MCLG = zero; Regulated Chemical (47FR9352).

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg), SARA 313: Form R *de minimis* Concentration Reporting Level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 1/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R46; R20/21; R25; R36/38; R43; R48/23/24/25; R62; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Acrylamide in monomeric form is odorless, flake-like crystals. May be dissolved in a flammable liquid. Molecular weight = 71.08; Specific gravity (H_2O:1) = 1.05 at 25°C (liquid); 1.122 at 30°C; Boiling point = (decomposes) 175−300°C at 1 atm; Melting/Freezing point = 85°C; Vapor pressure = 0.0068 mmHg at 20°C; Relative vapor density (air = 1) = 1.0 at 20; Vapor density = 2.46; Autoignition temperature = 240°C; Flash point = 138°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2. Soluble in water; solubility = 2155 g/L at 30°C; 2045 g/L at 25°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Used in the manufacture of plastics, resins, rubber, synthetic textiles; as a dye, pigment. A major application for monomeric acrylamide is in the production of polymers as polyacrylamides. Polyacrylamides are used for soil stabilization, gel chromatography, electrophoresis, papermaking strengtheners, clarifications, and treatment of potable water and foods.

Incompatibilities: Acrylamide may decompose with heat and polymerize at temperatures above 84°C, or exposure to light, releasing ammonia gas. Reacts violently with strong oxidizers. Reacts with reducing agents, peroxides, acids, bases, and vinyl polymerization initiators. Fine particles of dust form explosive mixture with air.

Permissible Exposure Limits in Air

OSHA PEL: 0.3 mg/m^3 TWA [skin].

NIOSH REL: 0.03 mg/m^3 TWA [skin] Potential occupational carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.03 mg/m^3 TWA inhalable fraction and vapors [skin]; confirmed animal carcinogen with unknown relevance to humans (2003).

NIOSH IDLH: (potential occupational carcinogen) 60 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.03 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 60 mg/m^3

DFG MAK: [skin]; danger of skin sensitization; Carcinogen Category 2; Germ Cell Mutagen Group 2 (2004).

Australia: TWA 0.3 mg/m^3, [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 0.3 mg/m^3, [skin], Carcinogen 1993; Denmark: TWA 0.03 mg/m^3, [skin], 1999; Finland: TWA 0.3 mg/m^3; STEL 0.9 mg/m^3, 1993; France: VME 0.1 ppm (0.3 mg/m^3), [skin], continuous; carcinogen, 1999; Hungary: STEL 0.3 mg/m^3, [skin], carcinogen, 1993; Japan: 0.3 mg/m^3, [skin], 2A carcinogen, 1999; Norway: TWA 0.3 mg/m^3, 1999; the Philippines: TWA 0.3 mg/m^3, [skin], 1993; Poland: TWA 0.1 mg/m^3, 1999; Russia: STEL 0.2 mg/m^3, [skin], 1993; Sweden: NGV 0.03 mg/m^3, KTV 0.1 mg/m^3, [skin], 1999; Switzerland; MAK-W 0.03 mg/m^3, [skin], carcinogen, 1999; United Kingdom: TWA 0.3 mg/m^3, [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for acrylamide ambient concentrations in air[60]: 0.3 μg/m^3 (South Carolina) to 1.0 μg/m^3 (New York) to 3.0 μg/m^3 (South Dakota) to 5.0 μg/m^3 (Virginia) to 6.0 μg/m^3 (Connecticut) to 7.0 μg/m^3 (Nevada).

Determination in Air: Filter/Si gel; Methanol; Gas chromatography/Nitrogen/phosphorus detection; OSHA Analytical Method 21: The sampling train consists of a 13-mm glass fiber filter in a Swinnex cassette (available from the laboratory), followed by a standard silica gel tube. The filter and gaskets, within the cassette used to hold the filter, are extracted in the field in exactly 1 mL of methanol. This extraction is very important so a volumetric pipette calibrated to 1 mL must be used. The silica gel tube is extracted with methanol at the laboratory. Analysis is performed by gas chromatography (GC) using a nitrogen/phosphorous detector; or OSHA Analytical Method PV 2004: Samples are collected by drawing known volumes of air through OSHA versatile sampler (OVS-7) tubes, each containing a glass fiber filter and two sections of XAD-7 adsorbent. Samples are desorbed with a solution of 5% methanol 95% water and analyzed by high-performance liquid chromatography using an ultraviolet detector.

Permissible Concentration in Water: Health advisories have been developed by EPA[48] on a long-term (7 year) basis as 0.02 mg/L for a 10-kg child and 0.07 mg/L for a 70-kg adult. A guideline for acrylamide in drinking water of 0.10 μg/L has been developed by the state of Minnesota.[61]

Determination in Water: There is no standardized method for the determination of acrylamide in drinking water. An analytical procedure for the determination of acrylamide has been reported in the literature. This procedure consists of bromination, extraction of the brominated product from water with ethyl acetate, and quantification using high-performance liquid chromatography (HPLC) with an ultraviolet detector. The concentration of the ethyl acetate to dryness and dissolution in a small volume of distilled water prior to HPLC analysis allows the detection of acrylamide at concentrations of 0.2 μg/L.[48] Octanol−water coefficient: Log $K_{\mathrm{ow}} = -0.65$.

Routes of Entry: Eyes, skin, central and peripheral nervous systems, reproductive system. Acrylamide can be absorbed through unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Symptoms of exposure include complaints of drowsiness, fatigue, tingling of fingers. A stumbling, propulsive type of walking with sense of unsteadiness has been reported. Motor and sensory impairment, numbness, tremor, abnormal feelings in the lower limbs accompanied by weakness, and speech disturbances were also reported. Classified as very toxic; probably oral lethal human dose is between 50 and 500 mg/kg or between one teaspoon and 1 oz for a 150-lb person. Polymerized acrylamide may not be toxic, but the monomer can cause peripheral nerve damage. Toxic effects exacerbated by alcohol consumption.

Long Term Exposure: There is evidence that acrylamide causes cancer in animals. It may cause skin and lung cancer in humans. There is limited evidence that this chemical damages the male testes. It can cause damage to the central nervous system; causing numbness and weakness of the hands and feet. Acrylamide is a cumulative neurotoxin and repeated exposure to small amounts may cause serious injury to the nervous system. The neurological effects may be delayed. Polymer inhibitors or stabilizers added to the monomer may also produce toxicity. The symptoms of acrylamide toxicity are consistent with midbrain lesions and blocked transport along both motor and sensory axons.

Points of Attack: Central nervous system, peripheral nervous system, skin, and eyes.

Medical Surveillance: Since skin contact with the substance may result in localized or systemic effects, NIOSH recommends that medical surveillance be made available to all employees working in an area where acrylamide is stored, produced, processed, or otherwise used, except as an unintentional contaminant in other materials at a concentration of less than 1% by weight. For those with frequent or potentially high exposure, nerve condition tests should be considered. The use of alcoholic beverages may enhance the harmful effects. Nerve conduction studies.[2]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If this chemical contacts the skin, flush with water immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron->g/cm^2/min): butyl rubber gloves, suits, boots; Tychem 1000™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): nitrile rubber gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves. Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. Wear protective gloves and clothing to prevent repeated or prolonged skin contact. Wear dust-proof eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately when skin is wet or contaminated. Work clothing should be changed daily if clothing is contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store only if stabilized, under inert gas. Before entering confined space where acrylamide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Use water spray to reduce vapors. Remove all ignition sources. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. If you need to seek emergency information, call CHEMTREC at (800) 424-9300, or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: A combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Dike fire control water for later disposal; do not scatter the material.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Acrylamide residue and sorbent material may be packaged in epoxy-lined drums and taken to an EPA-approved disposal site. Incineration with provisions for scrubbing of nitrogen oxides from flue gases. Deep well injection.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Acrylic acid is a colorless, flammable, and corrosive liquid or solid (below 13°C) with an irritating rancid odor. Sinks and mixes with water; irritating vapor is produced. Molecular weight = 72.07; Specific gravity = 1.05; Vapor pressure = 3 mmHg at 20°C; Freezing/Melting point = 12−14°C; Boiling point = 141°C; Relative vapor density (air = 1): 2.48; Flash point = 50°C (oc) [glacial]; 54°C (oc); Autoignition temperature = 438°C[17]; 360°C. Explosive limits: LEL = 2.4%, UEL = 8.02%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2. Odor threshold = 0.092 ppm. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Acrylic acid is chiefly used in manufacture of plastics, acrylates, polyacrylic acids, polymer, and resins; as a monomer in the manufacture of acrylic resins and plastic products, leather treatment, and paper coatings. Also, it is used as a tackifier and flocculant.

Incompatibilities: Forms explosive mixture with air. Light, heat, and peroxides can cause polymerization. Violent reaction with strong oxidizers. Incompatible with sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides, epichlorohydrin, toluene diamine, oleum, pyridine, methyl pyridine, *n*-methyl pyrrolidone, 2-methyl-6-ethyl aniline, aniline, ethylene diamine, ethyleneimine, and 2-aminoethanol. Severely corrodes carbon steel and iron; attacks other metals. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion: 1 ppm = 2.95 mg/m^3.

OSHA PEL: None.

NIOSH REL: 2 ppm/6 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 2 ppm/5.9 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 1.5 ppm

PAC-1: **1.5** ppm

PAC-2: **46** ppm

PAC-3: **180** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 10 ppm/30 mg/m^3; Peak Limitation Category I (1); Pregnancy Risk Group C.

Australia: TWA 10 ppm (30 mg/m^3), 1993; Belgium: TWA 10 ppm (29 mg/m^3), 1993; Denmark: TWA 2 ppm (5.9 mg/m^3), [skin], 1999; France: VME 10 ppm (30 mg/m^3), 1999; Norway: TWA 10 ppm (30 mg/m^3), 1999; Russia: STEL 5 mg/m^3, 1993; The Netherlands: MAC-TGG 5.9 mg/m^3, 2003; Switzerland: MAK-W 0.03 mg/m^3, [skin], carcinogen, 1999; United Kingdom: TWA 10 ppm (30 mg/m^3), STEL 20 ppm (60 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The former Russia-UNEP/IRPTC joint project has set a limit in workplace air of 5 mg/m^3.[43] Several states have set guidelines or standards for acrylic acid in ambient air[60]: 0.003 mg/m^3 (North Dakota) to 0.1 mg/m^3 (New York) to 0.45 mg/m^3 (Virginia) to 0.6 mg/m^3 (Connecticut) to 0.714 mg/m^3 (Nevada).

Determination in Air: XAD®[2]; Methanol/Water; High-pressure liquid chromatography/Ultraviolet detection; OSHA Analytical Method #28.

Permissible Concentration in Water: No US criteria set, but former USSR-UNEP/IRPTC joint project has set 0.5 mg/L as a limit in drinking water.[43]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.36$ (estimated).

Routes of Entry: Inhalation, skin and eye contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact can cause burns and permanent damage. Inhaling this chemical can cause respiratory tract irritation.

Long Term Exposure: Acrylic acid may cause skin allergy and lung and kidney damage.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Consider lung function tests in preplacement and regular physical examinations. Consider kidney function tests if symptoms develop or overexposure is suspected. Skin testing with dilute acrylic acid may be used by a qualified allergist to diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): butyl rubber gloves, suits, boots; Saranex™, Responder™ suits, Trellchem HPS™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Teflon™ gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. In an emergency use NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Do not allow to solidify. Can be stored only in glass, stainless steel, aluminum, or polyethylene-lined containers. Before entering confined space where acrylic acid may be present, check to make sure that an explosive concentration does not exist. Acrylic acid is a dangerous explosion hazard unless it is stored with an inhibitor. Store in tightly closed containers in a cool, well-ventilated area away from heat and sunlight. Do not freeze or refrigerate acrylic acid. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Acrylic acid, inhibited, requires a shipping label of "CORROSIVE, FLAMMABLE LIQUID." It falls in DOT/UN Hazard Classes 8 and 3, and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover spill with soda ash or sodium bicarbonate. Mix and add water. Neutralize and flush into sewer. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Keep acrylic acid out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up

spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. In advanced or massive fires, firefighting should be done from a safe distance or from a protected location. If a leak or spill has not ignited, use water spray to disperse the vapors. Water spray may be used to flush spills away from exposures and to dilute spills to nonflammable mixtures. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration. 100−500 ppm potassium permanganate will degrade acrylic acid to a hydroxy acid which can be disposed of at a sewage treatment.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Acrylonitrile is a highly flammable, clear, colorless or light yellowish liquid. It has an irritating, faint garlic- or onion-like odor. Its odor threshold is 17 ppm; odor can only be detected above the PEL. Molecular weight: 53.05; Specific gravity (H_2O:1) = 0.806 at 20°C;

Boiling point: 77.4°C[C] at 1 atm; Melting/Freezing point: − 83.6°C[C]; Critical temperature: 263°C[C]; Critical pressure: 660 psia = 45 atm = 4.6 MN/m^2[C]; Specific gravity: 0.8075 at 20°C[C]; Relative vapor density (air = 1): 1.83[C]; Ratio of specific heats of vapor (gas): 1.151[C]; Latent heat of vaporization: 265 Btu/lb = 147 cal/g = 6.16 × 10^5 J/kg[C]; Heat of combustion: − 14,300 Btu/lb = − 7930 cal/g = − 332 × 10^5 J/kg[C]; Ionization potential = 10.9 eV; Vapor pressure: 83 mmHg at 20°C[C]; Saturation concentration in air = 257 g/m^3 at 20; Flash point = 0°C[17]; − 5°C[52]; Autoignition temperature = 480°C; Explosive limits: LEL = 3%, UEL = 17%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 2. Floats on water and is moderately soluble; solubility = 7.3 g/mL at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Acrylonitrile is used in the manufacture of synthetic fibers, polymers, acrylostyrene plastics, acrylonitrile-butadiene-styrene plastics, nitrile rubbers, chemicals, and adhesives. It is also used as a pesticide. In the past, this chemical was used as a room fumigant and pediculicide (an agent used to destroy lice).

Incompatibilities: Forms explosive mixture with air. Reacts violently with strong acids, strong alkalis, bromine, and tetrahydrocarbazole. Copper, copper alloys, ammonia, and amines may cause breakdown to poisonous products. Unless inhibited (usually with methylhydroquinone) acrylonitrile may polymerize spontaneously. It may also polymerize on contact with oxygen, heat, strong light, peroxides, and concentrated or heated alkalis. Reacts with oxidizers, acids, bromine, amines. Attacks copper and copper alloys. Attacks aluminum in high concentrations. Heat and flame may cause release of poisonous cyanide gas and nitrogen oxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.21 mg/m^3[C] at 25°C & 1 atm. Odor threshold is 17 ppm; odor can only be detected above the PEL.

OSHA PEL: [1910.1045] 2 ppm TWA [skin]; 10 ppm [15 min] Ceiling Concentration.

NIOSH REL: 1 ppm TWA; 10 ppm [15 min] Ceiling Concentration; [skin] potential occupational carcinogen.

ACGIH TLV®[1]: 2 ppm/4.3 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 85 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **10** ppm

PAC-2: **35** ppm

PAC-3: **75** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin]; Carcinogen Category: 2; Danger of skin sensitization (2006); TRK: 3 mL/m3/7 mg/m^3; Sampling time: not fixed; 420 μg[erythrocytes cyanoethylvaline]/L blood.

Arab Republic of Egypt: TWA 2 ppm, [skin], 1993; Australia: TWA 2 ppm (4.5 mg/m^3), [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 2 ppm (4.3 mg/m^3), [skin], Carcinogen 1993; Denmark: TWA 2 ppm (4 mg/m^3), [skin], 1999; Finland: TWA 2 ppm (4.5 mg/m^3); STEL 4 ppm, [skin], carcinogen, 1993; France: VME 2 ppm (4.5 mg/m^3), VLE 15 ppm (32.4 mg/m^3), carcinogen, 1999; Hungary: STEL 0.5 mg/m^3, [skin], carcinogen, 1993; India: TWA 2 ppm (4.5 mg/m^3), [skin], carcinogen, 1993; Japan; 2 ppm (4.3 mg/m^3), [skin], 2A carcinogen, 1999; Norway: TWA 2 ppm (4 mg/m^3), 1999; the Philippines: TWA 20 ppm (45 mg/m^3), [skin], 1993; Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Russia: TWA 2 ppm; STEL 0.5 mg/m^3, [skin], 1993; Sweden: NGV 2 ppm (4.5 mg/m^3), KTV 6 ppm, [skin], carcinogen, 1999; Switzerland: MAK-W 2 ppm (4.5 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 20 ppm (45 mg/m^3), [skin], 1993; United Kingdom: TWA 2 ppm (4.4 mg/m^3), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for acrylonitrile in ambient air[60]: 0.0147 μg/m^3 (Indiana) to 0.145 μg/m^3 (North Carolina) to 0.15 μg/m^3 (Massachusetts) to 11.3 μg/m^3 (Pennsylvania) to 15.0 μg/m^3 (New York) to 22.0 μg/m^3 (Connecticut and South Dakota) to 22.5 μg/m^3 (South Carolina) to 45.0 μg/m^3 (Florida and Virginia).

Determination in Air: Charcoal adsorption followed by acetone extraction and gas chromatographic analysis. Use NIOSH Analytical Method 1604[18] or OSHA Analytical Method 37 where samples are collected on charcoal, desorbed with acetone, and analyzed by gas chromatography using a nitrogen/phosphorus detector.

Permissible Concentration in Water: The substance is toxic to aquatic organisms. Acrylonitrile usually breaks down in about 1 or 2 weeks, but this can vary depending on conditions. For example, high concentrations (such as might occur following a spill) tend to be broken down more slowly. In one case, measurable amounts of acrylonitrile were found in nearby wells 1 year after a spill (ATSDR public Health Statement, December 1990). See RCRA and Clean Water Act under Regulatory Authority and Advisory Bodies. To protect freshwater aquatic life (on an acute basis), 7550 μg/L and on a chronic basis, 2600 μg/L over 30 days. *To protect saltwater aquatic life:* insufficient data to yield a value. *To protect human health:* preferably zero. Water concentration should be below 0.58 μg/L to keep lifetime cancer risk below 10^{-5}. Russia[43] set a MAC of 2.0 mg/L for water bodies used for domestic purposes. The Mexico drinking water ecological criteria is 0.0006 mg/L, reduce human exposure to a minimum. Several states have set guidelines for acrylonitrile in drinking water[61] ranging from 0.67 μg/L (Minnesota) to 3.8 μg/L (Kansas) to 10 μg/L (Arizona) to 35 μg/L (Connecticut).

Determination in Water: Charcoal tube; Acetone/CS2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1604. Also, by gas chromatography (EPA Method #603) or gas chromatography plus mass spectrometry (EPA Method #624). Octanol−water coefficient: Log $K_{ow} = -0.91$.

Routes of Entry: Inhalation and percutaneous absorption. It may be absorbed from contaminated rubber or leather. Routes include ingestion and eye and skin contact. Acrylonitrile vapor is absorbed readily from the lungs; and inhalation is an important route of exposure. This chemical's odor generally provides inadequate warning of hazardous concentrations and olfactory fatigue develops rapidly.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Splashes in the eye may result in corneal damage. Skin contact can cause severe irritation and blistering. Breathing acrylonitrile can irritate the lungs, causing coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can result in death. Skin contact contributes significantly in overall exposure and can lead to systemic toxicity. Acrylonitrile reaction causes redness, blisters, and some systemic signs. Symptoms derive from tissue anoxia in order of onset: limb weakness, dyspnea (difficult breathing); burning sensation in throat; dizziness, impaired judgment; cyanosis (turning blue); nausea, collapse, irregular breathing; convulsions and death. In later stages, collapse, irregular breathing or convulsions, and cardiac arrest may occur without warning. Some patients appear hysterical or may even be violent. Acrylonitrile is classified as very toxic. Probable oral lethal dose for humans is 50−500 mg/kg (between 1 teaspoon and 1 oz) for a 70-kg (150 lb) person. Toxic concentrations have been reported at 16 ppm/20 min. Acute toxicity is similar to that due to cyanide poisoning and the level of cyanide ion in blood is related to the level of poisoning. Inhalation or ingestion can result in fatal systemic poisoning, collapse and death due to tissue anoxia (lack of oxygen), and cardiac arrest (heart failure). At higher concentrations there may be damage to red blood cells and the liver. Jaundice may develop 24 h following exposure and persist for several days. Because of continued metabolic release of cyanide, symptoms of severe poisoning may recur and the patient may relapse.

Long Term Exposure: This chemical is a probable carcinogen in humans. There is some evidence that it causes lung and large intestine cancer in humans and has been shown to cause brain and stomach cancer in animals. Exposure may cause the thyroid gland to enlarge and interfere with normal thyroid function. There is limited evidence that acrylonitrile may damage the developing fetus and the male reproductive system. Repeated exposure can irritate the nose, causing discharge, nose bleeds, and sores inside the nose. Acrylonitrile may affect the liver function.

Points of Attack: Eyes, skin, cardiovascular system, liver, kidneys, central nervous system. *Cancer site:* brain, lung, and bowel.

Medical Surveillance: For those with frequent or high exposure, consider urine thiocyanate levels, blood cyanide levels, liver function tests; fecal occult blood screening, pulmonary function tests. Consider the skin, respiratory tract, heart, central nervous system; renal and liver function in placement and periodic examinations. A history of fainting spells or convulsive disorders might present and added risk to persons working with toxic nitriles. Fecal occult blood screening for workers 40 years of age or older and chest X-ray *Code of Federal Regulations. 29 CFR Part 1910* Occupational Safety and Health Standards. Part 1910.1045, Page 319.[2] Pulmonary function tests, Blood cyanide, Blood plasma, Blood serum, Expired air, Urine (chemical/metabolite).[2]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron->g/cm^2/min): butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves; Barricade®™ coated suits; Responder™ suits; Trychem 1000™ suits. Wear protective gloves and clothing to prevent repeated or prolonged skin contact. Leather should not be used in protective clothing since it is readily penetrated by acrylonitrile; contaminated leather shoes and gloves should be destroyed. Rubber clothing should be frequently washed and inspected because it will soften and swell. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Contact lenses should not be worn when working with this substance. Employees should wash immediately when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide emergency showers. See also NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SAF:Pd,Pp:ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. See Incompatibilities for materials and physical conditions not permitted in storage room or cabinet. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in tightly closed containers in a cool, well-ventilated area. Do not store uninhibited acrylonitrile under any conditions. Store drums on end with bungs up, no more than two high. Outside tanks should be above ground and surrounded with dikes of sufficient capacity to hold entire tank contents. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Acrylonitrile, inhibited, requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 3 and Packing Group I.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep acrylonitrile out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Acrylonitrile is a dangerously reactive and flammable liquid. Poisonous gases are produced in fire, including hydrogen cyanide. A few "whiffs" of vapor could cause death. Vapor or liquid could be fatal on penetrating the firefighter's normal full protective clothing. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. May react with itself without warning, blocking relief valves, and leading to container explosion. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Vapors may travel long distances to ignition sources and flash back. Storage containers and parts of containers may rocket great distances, in many directions. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay away from ends of tanks. Do not get water inside container. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. From a secure explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with provision for nitrogen oxides removal from effluent gases by scrubbers or afterburners. A chemical disposal method has also been suggested involving treatment with alcoholic NaOH; the alcohol is evaporated and calcium hypochlorite added; after 24 h the product is flushed to the sewer with large volumes of water. Recovery of acrylonitrile from acrylonitrile process effluents is an alternative to disposal.

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb (114 kg).

Clean Air Act: 42USC7412; Title I, Part A, §112(r), Regulated Chemicals for Accidental Release Prevention/Flammable Substances (Section 68.130) TQ = 5000 lb (2270 kg).

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).[7]

WGK (German Aquatic Hazard Class): No value assigned.

Description: Acryloyl Chloride is a highly flammable and toxic (inhalation), light yellow liquid. A lacrimator. Molecular weight = 90.51; Boiling point = 75°C; Specific gravity: 1.114 at 20°C. Flash point = 14°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Reacts violently with water.

Potential Exposure: May be used as a monomer in preparation of specialty polymers or as a chemical intermediate.

Incompatibilities: Reacts violently with water, forming acrylic acid. Keep away from strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.05 ppm
PAC-1: 0.15 ppm
PAC-2: 0.243 ppm
PAC-3: 10 ppm

Routes of Entry: Inhalation and percutaneous absorption. Can be absorbed through the eyes.

Harmful Effects and Symptoms

Short Term Exposure: A highly toxic and corrosive lacrimator. Inhalation, skin absorption, or ingestion can be fatal. Highly destructive to the mucous membranes and upper respiratory system, skin, and eyes. May cause blindness. Skin contact can cause burns.

Harmful Effects and Symptoms

LC_{50} (inh., mouse, 2 h) = 92 mg/m^3; this may be the basis for inclusion in the EPA "Extremely Hazardous Substances" list.[7] Inhalation may cause burning feeling, coughing, shortness of breath, headache, dizziness, nausea, and vomiting; spasm, inflammation; chemical pneumonitis. Exposure can cause pulmonary edema, a medical emergency that can result in death.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Acryloyl chloride requires a shipping label of WATER-REACTIVE LIQUID, TOXIC, N.O.S. 4.2 (Packing Group II) “POISON INHALATION HAZARD, FLAMMABLE LIQUID; PIH: ZONE A.” It falls in DOT/UN Hazard Class 6.1 and Packing Group I.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Acryloyl chloride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 2.9/4.7
Night 5.5/8.9

Fire Extinguishing: Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Violent reaction with water. Poisonous gases are produced in fire, including carbon monoxide. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: NCI: Carcinogenesis Studies (ipr); clear evidence rat; no evidence mouse; IARC: Animal Inadequate Data; Human No Available Data, Group 3, 1987.
California Proposition 65 Chemical: Cancer 10/1/89; Developmental/Reproductive toxin 1/1/89.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Actinomycin D is a bright-red crystalline solid; Freezing/Melting point = 241.5−243°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Soluble in water.
Potential Exposure: An antibiotic product from *Streptomyces*, used as anticancer drug.
Incompatibilities: Strong oxidizers, strong acids, and strong bases.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Intravenous, skin, eyes.
Harmful Effects and Symptoms
Short Term Exposure: Highly Toxic. Irritates eyes and skin. A poison if ingested. LD_{50} = (oral-rat) 7.2 mg/kg.
Long Term Exposure: Has been shown to cause peritoneal and local sarcomas in animals. May damage the developing fetus.
Medical Surveillance: Complete blood count (CBC), EKG.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers may be able to provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or other cool, dry place.
Shipping: Classified as medicines, toxic solid, n.o.s. This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Shipping Class 6.1 and Packing Group III.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen with 60−70% ethanol to avoid airborne dust, then transfer to a suitable sealed container in the most convenient and safe manner. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Adamsite (Agent DM, WMD) A:0435

Molecular Formula: $C_{12}HgAsClN$; $C_6H_4 \cdot NH \cdot C_6H_4 \cdot AsCl$
Common Formula: $HN{-}(C_6H_4)_2{-}AsCl$
Synonyms: Dibenzo-1-chloro-1,4-arsenine; DM (US Army code); Diphenylamine chloroarsine; Diphenylamine chloroarsine (DOT); phenarsazine chloride

CAS Registry Number: 578-94-9
RTECS® Number: SG0680000
UN/NA & ERG Number: UN1698/154
EC Number: 209-433-1
Regulatory Authority
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Adamsite, or Agent DM, is a light green to yellow crystalline solid at room temperature; can be dark green depending on purity and age; canary yellow when concentrated; colorless when diluted with air. Odorless but irritating; similar to pepper. Molecular weight = 277.59; Density (solid) = 1.65 at 20°C; Boiling point = 410°C; Freezing/Melting point = 193−195°C; Vapor pressure = very low; 2×10^{-13} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water. Not readily soluble in any of the liquid chemical warfare agents.

Potential Exposure: Adamsite (military designation DM), a chloroarsenical, was first produced during World War I. Adamsite (DM) is used as a riot control or harassing agent, tear gas, and (vomiting agent) gas. It was designed as a battlefield agent and can be dissolved in acetone and dispersed as an aerosol. Adverse health effects due to exposure to adamsite (DM) are generally self-limited and do not require specific therapy. Most adverse health effects resolve within 30 min. Exposure to large concentrations of adamsite (DM), or exposure to adamsite (DM) within an enclosed space or under adverse weather conditions, may result in more severe adverse health effects, serious illness, or death. Adamsite (DM) is more disagreeable than tear gas, but less dangerous than sarin. It is considered to be too extreme for use against civilian populations, and was banned for this use in the 1930s by western nations. Produced worldwide, DM was superseded by the CN series of tear agents. It produces irritation to the upper respiratory tract and the eyes. Although DM has been replaced by CS, it might be mixed with a nerve agent. This may cause a vomiting victim to remove respiratory protection and be exposed to the more lethal agent.

Persistence of Chemical Agent: Short, because compounds are disseminated as an aerosol. *Soil*: persistent; *Surface of materials* (wood, metal, masonry, rubber, paint): persistent. *Water*: persistent; when material is covered with water, an insoluble film forms which prevents further hydrolysis.

Incompatibilities: Slowly hydrolyzes in water. *Stability:* stable in pure form; after 3 months, caused extensive corrosion of aluminum, anodized aluminum, and stainless steel; will corrode iron, bronze, and brass when moist. *Corrosive properties:* titanium—71°C, 6 months, appeared good. Stainless steel—43°C, 30 days, slight discoloration. Common steel—43°C, 30 days, covered with rust. Aluminum anodized—43°C, 30 days, minor corrosion and pitting. Aluminum—43°C, 30 days, severe corrosion. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC) DM
TEEL-0: 0.016 mg/m^3
PAC-1: **0.016** mg/m^3
PAC-2: **2.6** mg/m^3
PAC-3: **6.4** mg/m^3
NOAEL (no-observed-adverse-effect-level, inhalation) = 4 mg-min/m^3.

Determination in Air: No method is available to detect Adamsite in environmental samples.

Determination in Water: No method is available to detect Adamsite in environmental samples. People should not drink water containing DM. Warn pollution control authorities and advise shutting water intakes. Octanol−water coefficient: Log K_{ow} = 4.05.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms
Adamsite (Agent DM) is a vomiting compound. It is normally a solid, but upon heating, DM first vaporizes and then condenses to form aerosols. It is toxic through inhalation, ingestion, and skin contact. Adamsite is dispersed as an aerosol, irritating to the eyes and respiratory tract but not necessarily to the skin. Under field conditions, vomiting agents can cause great discomfort to the victims; when released indoors, they can cause serious illness or death. Symptoms include irritation of eyes and mucous membranes, coughing, sneezing, severe headache, acute pain and tightness in the chest, nausea, and vomiting. DM has been noted to cause necrosis of corneal epithelium in humans. The human body will detoxify the effects of mild exposures within 30 min of evacuation. Severe exposures may take several hours to detoxify and minor sensory disturbances may persist for up to 1 day. The majority of exposures occur by inhalation and typically lead to symptoms of ocular, nasal, and respiratory tract irritation. Nonspecific gastrointestinal symptoms (e.g., vomiting or diarrhea) might also occur. The effects of adamsite poisoning take minutes to begin and might last for hours. If a rapid onset of manifestations of one of the following respiratory effects occurs, the clinical description for adamsite poisoning has been met: nose or throat irritation, cough, or dyspnea.

Short Term Exposure: The majority of exposures occur by inhalation and typically lead to symptoms of ocular, nasal, and respiratory tract irritation. Nonspecific gastrointestinal symptoms (e.g., vomiting or diarrhea) might also occur. The effects of adamsite poisoning take minutes to begin and might last for hours (1). If a rapid onset of manifestations of one of the following respiratory effects occurs, the clinical description for adamsite poisoning has been met: nose or throat irritation, cough, or dyspnea.[CDC]

Long Term Exposure: No assessment has been made of possible long-term effects of short-term exposures to Adamsite. However, see medical surveillance below.

Medical Surveillance: Pulmonary function tests and radiographic imaging, especially those who have persistent symptoms of dyspnea, cough, or chest discomfort.

First Aid: *Inhalation: Never* perform mouth-to-mouth resuscitation, or you will get sick. Remove victim to fresh air;

wear a mask/respirator in spite of coughing, sneezing, salivation, and nausea; lift the mask from the face briefly, if necessary, to permit vomiting or to drain saliva from the face-piece; seek medical attention immediately. *Eye contact:* Don a respiratory protective mask; seek medical attention immediately. *Skin contact:* Rinse the nose and throat with saline water or bicarbonate of soda solution; wash exposed skin and scalp with soap and water and allow to dry on the skin; dust the skin with borated talcum. *Ingestion:* seek medical attention immediately; carry on duties as vigorously as possible; this will help to lessen and shorten the symptoms.

Decontamination: Decontaminate as soon as possible. This is extremely important. Victims will be removed immediately to an uncontaminated atmosphere. Personnel handling casualty cases will give consideration to their own safety and will take precautions and employ the prerequisite protective equipment to avoid becoming exposed themselves. If you do not have the equipment and training do not enter the hot or the warm zone to rescue and decontaminate victims. If the victim cannot move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and uphill direction. Contaminated clothes and personal belongings should be placed in a sealed double bag. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 min. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident.

Personal Protective Methods:
Protective Gloves: Wear Norton chemical protective glove set, wear chemical goggles; wear a mask/respirator in open areas. Wear additional protective clothing, such as gloves and lab coat with an M9, M17, or M40 mask readily available in closed or confined spaces.

Respirator Selection: When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Diphenylamine chloroarsine requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Issue poison warning. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial Isolation and Protective Action Distances (**when used as a weapon**)

Small Spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters)	100/30
Then: Protect persons downwind (miles/kilometers)	
Day	0.1/0.2
Night	0.2/0.3

Large Spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters)	200/60
Then: Protect persons downwind (miles/kilometers)	
Day	0.2/0.3
Night	0.9/1.5

Fire Extinguishing: In case of fire, *do not put out the fire*. DM vapor and liquid are so bad that the fire is safer than the unburned DM. If there is some reason that you have to put out the fire—for example, there are things you cannot let burn nearby—use water or ordinary foam. It is always best to use a spray or fog pattern rather than a solid stream, to avoid spreading the burning liquid around. In the unlikely situation where there is a pile of DM canisters adjacent to a fire, cool the canisters with large amounts of water, but first evacuate the area—if the canisters rupture from heating, toxic gases could kill. Poisonous gases are produced in fire, including arsenic and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters.

Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Approximately 9 tons of Adamsite was discovered on the territory of Poland after World War II. This agent was stored in steel barrels and special preventive measures were undertaken in order to protect it against spreading. The Polish government decided to destroy the abandoned Adamsite and different suitable technologies were considered. The first laboratory experiments have started in 1996 and elimination of the Adamsite on semi-technical scale will begin by June 1998. In this paper methods of neutralization of Adamsite, based on its hydrolysis with hydrochloric acid, reduction with phosphorous acid, and fusion with sulfur, are discussed. These methods were found to be useful at the laboratory scale. Advantages and disadvantages of considered methods of destruction of organic arsenical agents have been discussed. The most promising method seems to be the reduction of Adamsite with phosphorous acid. The products of this reaction are metallic arsenic, diphenylamine (DPA), and hydrogen chloride. These products can be separated and reused or neutralized.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg), SARA 313 [4].

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Adipic acid is a combustible, white, crystalline solid. Odorless. Molecular weight = 146.14; Boiling point = (decomposes) 337°C at 760 mmHg; Specific gravity (H_2O:1) = 1.37 at 20°C (solid); Freezing/Melting point = 152°C[C]; Vapor pressure = 7.7×10^{-4}; 10 Pa at 18.5°C; Relative vapor density (air = 1) = 5.04; Flash point = 196°C (cc). Explosive limits: (*dust*): 10–15 mg/L[C]; Autoignition temperature = 421°C; Heat of combustion = -8242 Btu/lb = -4579 cal/g = -191.6×10^5 J/kg[C]; Heat of Vaporization = 19,570.2 g cal/g mol[C]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in hot water; solubility = 1.5%.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Workers in manufacture of nylon, plasticizers, urethanes, adhesives, and food additives.

Incompatibilities: Oxidizers, reducing agents, and strong bases. Dust forms an explosive mixture with air. Friction from stirring, pouring, or pneumatic transfer can form electrostatic charge on dry material.

Permissible Exposure Limits in Air

ACGIH TLV® 5 mg/m^3 TWA, averaged over an 8-h work shift.

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 125 mg/m^3
Russia: STEL 4 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003.

Permissible Concentration in Water: Regulated as a hazardous substance by the Clean Water Act.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <0.9, 0.08$.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause burns to nose, throat, and respiratory tract. May cause eye irritation and burns. There may be an asthmatic reaction.

Long Term Exposure: Repeated prolonged exposure may cause asthma. The symptoms of asthma may not be apparent for hours following exposure and may be aggravated by physical effort. Anyone with symptoms of asthma due to this chemical should avoid all further contact with it.

Medical Surveillance: Consult a qualified allergist if asthma is suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: There are no UN/DOT labeling requirements for adipic acid. Adipic acid falls in DOT Hazard Class ORM-E and UN Hazard Class 9.2 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Moisten spilled material to prevent dust buildup. This is a weak acid: use lime or sodium bicarbonate to neutralize, and absorb with peat, vermiculite, or carbon. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including acidic vapors and valeric acid. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Adiponitrile A:0450

Molecular Formula: $C_6H_8N_2$
Common Formula: $NC(CH_2)_4CN$
Synonyms: Adipic acid dinitrile; Adipic acid nitrile; Adipodinitrile; Adiponitrilo (Spanish); 1,4-Dicyanobutane; Hexanedinitrile; Hexanedioic acid, dinitrile; Tetramethylene cyanide
CAS Registry Number: 111-69-3
RTECS® Number: AV2625000
UN/NA & ERG Number: UN2205/153
EC Number: 203-896-3
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).[7]
CERCLA/SARA 40CFR304, Appendix A, Reportable Quantity (EHS, RQ): 1 lb (0.454 kg), SARA 313: (as cyanide compounds) Form R *de minimis* Concentration Reporting Level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures or solutions.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Adiponitrile is a combustible, water-white to yellow, oily liquid. A solid below 1.1°C. Practically odorless. Molecular weight = 108.10[C]; Boiling point = 295°C[C]; Freezing/Melting point = 2.3°C; Specific gravity = 0.97 at 25°C (liquid)[C]; Latent heat of vaporization = (estimate) 240 Btu/lb = 134 cal/g = 5.59×10^5 J/kg[C]; Heat of combustion = −14,230 Btu/lb = −7910 cal/g = -331×10^5 J/kg[C]; Flash point = 93°C, technical grade (oc); 163°C (pure); Vapor pressure = 2.3×10^{-3} mmHg at 20°C; 0.3 Pa at 20°C; Explosive limits: LEL = 1%, UEL = 5.0%; Autoignition temperature = 550°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Floats on water; slightly soluble.
Potential Exposure: Compound Description: Reproductive Effector. Used in the manufacture of corrosion inhibitors, rubber accelerators, and Nylon 66; and in organic synthesis.
Incompatibilities: Forms explosive mixture with air. Violent reaction with oxidizers. Also incompatible with strong acids, strong bases, and reducing agents.
Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 4 ppm/18 mg/m^3 TWA.
ACGIH TLV®[1]: 2 ppm/8.8 mg/m^3 TWA [skin].
Protective Action Criteria (PAC)
TEEL-0: 2 ppm
PAC-1: 3.85 ppm
PAC-2: 3.85 ppm
PAC-3: 150 ppm
Russia: STEL 10 mg/m^3, 993; the Netherlands: MAC-TGG 8.8 mg/m^3, 2003.
A guideline or standard in ambient air has been set in Connecticut[60] at 360 μg/m^3.
Determination in Air: Charcoal tube; Toluene; Gas chromatography/Flame ionization detection; See NIOSH Criteria Document 212 *Nitriles*.
Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.32$.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Irritates eyes, skin, and respiratory tract. Skin and eye contact can cause burns. This chemical can be absorbed through the skin, thereby increasing exposure. Inhalation can cause coughing and shortness of breath. Exposure can cause fatal cyanide poisoning with symptoms of flushing of the face, chest tightness, nausea and vomiting, weakness, lightheadedness, confusion, headache, trouble breathing, and convulsions. Higher exposure can lead to convulsions, irregular heartbeat, coma, and death. Ingestion of a few milliliters may cause weakness, mental confusion, vomiting, rapid respiration, fast heartbeat, and convulsions.
Long Term Exposure: Adiponitrile produces disturbances of respiration and circulation, irritation of the stomach and intestine, and loss of weight. Repeated exposure may cause personality changes, depression, anxiety, irritability, thyroid gland damage and enlargement, and nervous system damage. Adiponitrile may damage the developing fetus. Adiponitrile may have effects on the blood and adrenal gland, resulting in anemia and tissue lesions.
See also NIOSH Criteria Document 212 *Nitriles*.
Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system.
Medical Surveillance: Consider urine thiocyanate test for preemployment and regular medical testing. If symptoms develop or overexposure is suspected, have blood cyanide levels, nervous system, and thyroid function tested.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote

kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Prevent skin contact **4 h** (At least 4 but $<$8 h of resistance to breakthrough $>$0.1 micron$>$g/cm^2/min): Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document *212 Nitriles.*

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Up to 40 ppm*: Sa (APF = 10) (any supplied-air respirator). *100 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *200 ppm*: SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 ppm*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other *positive-pressure mode*). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Outside or detached storage is preferred. Before entering confined space where adiponitrile may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. *Small spills:* absorb liquids in vermiculite, dry sand, earth, peat, activated carbon, or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line). Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep adiponitrile out of a confined space, such as a sewer, because of the potential for an explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including deadly hydrogen cyanide, nitrogen oxides, hydrogen, and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add excess alcoholic KOH. Then evaporate alcohol and add calcium hypochlorite. After 24 h, flush to sewer with water.[24] Can also be incinerated with afterburner and scrubber to remove nitrogen oxides.

Adriamycin A:0460

Molecular Formula: $C_{27}H_{29}O_{11}N$

Synonyms: ADM; Adriablastine; Adriamycin-HCl; Adriamycin semiquinone; Adriblastina; Doxorubicin; DX; 14′-Hydroxydaunomycin; 14-Hydroxydaunomycin; 14-Hydroxydaunorubicine

CAS Registry Number: 23214-92-8

RTECS® Number: AV9800000

UN/NA & ERG Number: UN2811 (as medicines, toxic solid, organic, n.o.s.)/154

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: probably carcinogenic to humans, *probably carcinogenic to humans*, Group 2A, 1987. NTP: Reasonably anticipated to be a human carcinogen.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Adriamycin is an orange to red cake-like or needle-like crystalline solid. Molecular weight = 543.6; Freezing/Melting point = 205°C. Slightly soluble in water.

Potential Exposure: An antibiotic product from *Streptomyces*, used as anticancer drug.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Intravenous, skin, eyes.

Harmful Effects and Symptoms

Short Term Exposure: Highly toxic. Irritates eyes and skin. A poison if ingested. This chemical can be absorbed through the skin, thereby increasing exposure.

Long Term Exposure: Has been shown to cause breast cancer in animals. There is limited evidence that adriamycin is a teratogen in animals. Causes baldness, stomatitis, and bone marrow aphasia in humans. Fatal human cardiac disturbances have been reported.

Points of Attack: Cardiovascular system.

Medical Surveillance: Complete blood count (CBC), EKG, examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: A regulated, marked area should be established where Adriamycin is handled, used, or stored. All operations should be enclosed and locally ventilated through HEPA filters. Wear protective work clothing. Wash thoroughly immediately after exposure to Adriamycin and at the end of the work shift. Medical personnel preparing solutions of Adriamycin should only do so under a biological safety hood with a vertical laminar flow. Workers whose clothing has been contaminated by Adriamycin should change into clean clothing promptly. Do not take contaminated work clothes home. Family members could be exposed. Contaminated work clothes should be laundered by individuals who have been informed of the hazards of exposure to Adriamycin. Do not eat, smoke, or drink where Adriamycin is handled, processed, or stored, since the chemical can be swallowed. Wash hands carefully before eating or smoking. When vacuuming, a high-efficiency particulate absolute (HEPA) filter should be used, not a standard shop vacuum.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where Adriamycin is handled, used, or stored.

Shipping: Medicines, toxic solid, n.o.s. require shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup

is complete. Remove all ignition sources. Collect powdered material using a HEPA filter vacuum cleaner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and hydrogen chloride. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP 11th Report on Carcinogens, Known to be a Human Carcinogen; IARC: naturally occurring aflatoxins, *carcinogenic to humans*, Group 1; Aflatoxin M_1, *possibly carcinogenic to humans*, Group 2B, 1997; Human Sufficient Evidence, naturally occurring mixtures of aflatoxins and aflatoxin B_1; Animals Sufficient Evidence, naturally occurring mixtures of aflatoxins and aflatoxins B_1, G_1, and M_1; Human Inadequate Evidence, aflatoxin M1; Animal Limited Evidence aflatoxin B_2; Animal Inadequate Evidence aflatoxin G_2; NTP: Known to be a human carcinogen.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.[5]

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: The aflatoxins are a group of molds produced by the fungus *Aspergillus flavus*. They are natural contaminants of fruits, vegetables, and grains. They are also described as a series of condensed-ring heterocyclic compounds. They form colorless to pale yellow crystals. Slightly soluble in water. Molecular weight = 312.3 (B1), 383.2 (B1 dichloride), 314.3 (B2), 328.3 (G1), 330.3 (G2), 328.3 (M1), 314.3 (Ro); Freezing/Melting point = 268–269°C (B1), 247–250°C (G1), 237–240°C (G2), 290°C (M1), 225°C (Ro).

Potential Exposure: Aflatoxins are a group of toxic metabolites produced by certain types of fungi. Aflatoxins are not commercially manufactured; they are naturally occurring contaminants that are formed by fungi on food during conditions of high temperatures and high humidity. Most human exposure to aflatoxins occurs through ingestion of contaminated food. The estimated amount of aflatoxins that Americans consume daily is estimated to be 0.15–0.50 μg. Grains, peanuts, tree nuts, and cottonseed meal are among the more common foods on which these fungi grow. Meat, eggs, milk, and other edible products from animals that consume aflatoxin-contaminated feed may also contain aflatoxins. Aflatoxins can also be breathed in.

Permissible Exposure Limits in Air

No standards or TEEL available.

DFG MAK: [skin]; Carcinogen Category 2B [CAS: 6795-23-9 (M1)].

Routes of Entry: Ingestion and inhalation. An unavoidable contaminant in foods: the FDA limits the levels of aflatoxin contamination that are permitted in food. The complete elimination of aflatoxin contamination of food is probably not technically feasible. The FDA has lowered the maximum amount allowed in food products as methods of detection and methods of control have improved. Upper limits of 20 ppb (total B1, B2, G1, and G2) in foods and feeds and 0.5 ppm (M1) in milk are now in effect.

Harmful Effects and Symptoms

Aflatoxins are carcinogenic in mice, rats, fish, ducks, marmosets, tree shrews, and monkeys by several routes of administration (including oral), producing mainly cancers of the liver, colon, and kidney. Epidemiological studies have shown a positive correlation between the average dietary concentrations of aflatoxins in populations and the incidence of primary liver cancer. These studies were undertaken to test this specific hypothesis; however, no studies have been carried out which could link an increased risk of liver cancer to actual aflatoxin intake in individuals.

Short Term Exposure: No acute health effects are known at this time.

Long Term Exposure: Aflatoxins are carcinogens in humans. They may cause liver cancer. They have also been shown to be teratogens in animals. Aflatoxins may cause liver and kidney damage.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: A Class I, Type B, biological safety hood should be used when handling, mixing, or preparing aflatoxins. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Latex gloves are recommended as a protective material, *unless using aflatoxins in chloroform.* Contact lenses should not be worn when working with this chemical. Wear indirect vent, impact and splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where aflatoxins are handled, used, or stored. Store in a refrigerator and protect from exposure to air and light.

Shipping: Falling in the DOT category of Toxic solid, organic, n.o.s. Aflatoxins require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% of acetone to avoid airborne dust, then transfer to a suitable sealed container for disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but will not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Use of oxidizing agents such as hydrogen peroxide or 5% sodium hypochlorite bleach. Acids and bases may also be used.[22]

RTECS® Number: AE1225000

UN/NA & ERG Number: UN2588 (pesticides, solid, toxic, n.o.s.)/155; UN3077

EC Number: 240-110-8 [*Annex I Index No.:* 616-015-00-6]

Regulatory Authority and Advisory Bodies

Carcinogenicity: (EPA) Probable human; likely for high doses; not likely for low doses.[47]

US EPA Gene-Tox Program, Positive: *S. cerevisiae* gene conversion.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Banned or Severely Restricted (EPA-FIFRA) (See "References" below).

Safe Drinking Water Act, MCL, 0.002 mg/L; MGLC, zero; Regulated chemical (47 FR 9352).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 1 lb (0.454 kg), SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0%.

Water Pollution Standard Proposed (Various States).[61]

California Proposition 65 Chemical: Cancer 1/1/89.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R40; R43; R50/53; Safety phrases: S2; S36/37; S46; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3-severe hazard to waters.

Description: Alachlor, an acetanilide pesticide, is a cream-colored solid. Molecular weight = 269.79; Density = 1.1 g/cm^3; Freezing/Melting point = 39.5−41.5°C; Flash point = 137°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. A chloracetanilide herbicide. In manufacture, formulation, and application of this preemergence herbicide, personnel may be exposed. Its major use (99%) is as a preemergence herbicide for field crops (corn, soybeans, peanuts, etc.).

Incompatibilities: Strong oxidizers. Corrosive to iron and steel.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 1 mg/m^3 TWA inhalable fraction and vapor; confirmed animal carcinogen with unknown relevance to humans.

Permissible Concentration in Water: No adverse-effect-level in drinking water has been calculated by NSA/NRC[46] as 0.7 mg/L. Allowable daily intake (ADI) has been calculated at 0.1 mg/kg/day. More recently, the EPA[47] has reviewed alachlor and determined a 10-day health advisory value of 0.1 mg/L for a 10-kg child. An acceptable daily intake was calculated as 0.01 mg/kg/day in the study. A maximum level in drinking water of 0.002 mg/L has been proposed by EPA.[62] Several states[61] have set guidelines for alachlor in drinking water ranging from 0.15 μg/L (Arizona) to 0.2 μg/L (Illinois) to 2.0 μg/L (Massachusetts) to 10.0 μg/L (Minnesota) to 15 μg/L (Kansas) to 200 μg/L (Maine).

Determination in Water: May be accomplished by liquid extraction gas chromatographic procedure.[47] Octanol−water coefficient: Log K_{ow} = 3.48.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

No effects found in human studies.[47] Exhibits relatively low acute oral toxicity; the LD_{50} value for rats is 0.93 g/kg. The technical product has only slight skin and eye irritation potential after an acute exposure.[47] However, alachlor feeding studies have demonstrated oncogenic effects including lung tumors in mice, and stomach, thyroid, and nasal turbinate tumors in rats.

Short Term Exposure: Toxic by skin contact, ingestion, and inhalation. Eye contact may cause severe irritation or injury. Skin contact may irritate and burn skin.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. May cause liver damage. A suspected endocrine disruptor and carcinogen; developmental toxin. Human mutation data reported.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If this chemical has been inhaled, remove from exposure and transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Do not reuse container; see disposal methods, below.

Shipping: Do not transport with human food or animal feedstuffs. This chemical requires a shipping label of

"POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. Take up with diatomite, clay, expanded mineral, foamed glass, or synthetic treated absorbent material and deposit in sealed containers for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. For *large spills* seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: This chemical is not flammable, but may support combustion. Stay upwind of fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This compound is hydrolyzed under strongly acid or alkaline conditions, to chloroacetic acid, methanol, formaldehyde, and 2,6-diethylanilne. Incineration is recommended as a disposal procedure. Techniques for alachlor removal from potable water have been reviewed by EPA[47] but the data revealed no superior method. Improper disposal of pesticides is a violation of federal law. Dispose in accordance with 40CFR165; follow recommendations for the disposal of pesticides and pesticide containers.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Data; Human No Available Data, *not classifiable as carcinogenic to humans*, Group 3, 1991; NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat.

Classified by the EPA as Restricted Use Pesticide (RUP).

US EPA Gene-Tox Program, Negative: Carcinogenicity—mouse/rat.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Banned or Severely Restricted (Austria, Belgium, Germany, Israel, Norway, Philippines) (UN).[13]

Very Toxic Substance (World Bank).[15]

US EPA Hazardous waste number (RCRA No.): P070.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Safe Drinking Water Act, MCL, 0.003 mg/L; MCLG 0.001 mg/L; Regulated chemical (47 FR 9352). CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): CERCLA 1 lb (0.454 kg), SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Water Pollution Standard Proposed (EPA)[47] (Several States).[61]

European/International Regulations: Hazard Symbol: T + , N; Risk phrases: R24; R26/28; R50/53; Safety phrases: S1/2; S22; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Aldicarb is a noncombustible, white crystalline solid with a slight sulfurous odor. Molecular weight = 190.28; Boiling point = (decomposes); Freezing/Melting point = 98−100°C; Specific gravity (H_2O:1) = 1.18; Vapor pressure = 3.5×10^{-5} mmHg at 20°C. Relative vapor density (air = 1) = 6.59. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water; solubility = 0.6% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Human Data. A systemic, restricted use (RUP), carbamate pesticide. It is available for purchase and use by certified pesticide applicators or by those under their direct supervision. Personnel involved in manufacture, formulation, or application of this insecticide to crops are at risk.

Incompatibilities: Strong alkalis.

Permissible Exposure Limits in Air

AIHA WEEL: 0.0001 ppm, (skin), 8 h TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.0001 mg/m^3

PAC-1: 0.0003 mg/m^3

PAC-2: 0.3 mg/m^3

PAC-3: 100 mg/m^3

Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, 1999. Guidelines or standards have been set for aldicarb in ambient air[60] ranging from 2.0 μg/m^3 (New York) to 6.0 μg/m^3 (South Carolina).

Permissible Concentration in Water: EPA/Safe Drinking Water Act levels: MCL, 0.003 mg/L; MCLG 0.001 mg/L. Canada Drinking Water Quality = 0.009 mg/L MAC.

Determination in Water: Aldicarb may be determined in water by gas−liquid chromatography with flame photometric detection after oxidation to the sulfone (aldoxycarb) by peracetic acid or 3-chloro-perbenzoic acid. Colorimetric methods have also been used based on hydrolysis to hydroxylamine which is oxidized to nitrous acid, the latter used to diazotize sulfanilic acid which is then coupled to give a dye.[23] Fish Tox = 3.75027000 MATC (HIGH). Octanol−water coefficient: Log $K_{ow} = 1.35$. EC_{50} = 0.41 mg/L (48 h, *Daphnia magna*).

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Aldicarb is a carbamate pesticide. This material is super toxic; the probable oral lethal dose for humans is less than 5 mg/kg, or a taste (less than 7 drops) for a 150-lb person; it is extremely toxic by both oral and dermal routes. Symptoms include headache, blurred vision, nausea, vomiting, diarrhea, and abdominal pain. In severe cases, unconsciousness and convulsions may occur.

Short Term Exposure: This chemical is one of the most highly toxic pesticides. It can be harmful or fatal if swallowed, inhaled, or absorbed through the skin. Exposure can cause rapid severe poisoning with headache, sweating, nausea and vomiting, diarrhea, loss of coordination, and possible death. Aldicarb may affect the nervous system causing convulsions and respiratory failure. It is a cholinesterase inhibitor. Exposure may result in death. The effects may be delayed; medical observation is recommended.

Long Term Exposure: Human mutation data reported. May affect the immune system. Aldicarb is a questionable carcinogen with no firm human evidence. Human tox = 7.00 ppb (MCL) (HIGH).[77]

Points of Attack: Skin, lungs.

Medical Surveillance: Plasma and red blood cell cholinesterase levels (test for enzyme poisoned by this chemical). For this substance, these tests are accurate only if done within about 2 h of exposure.

First Aid: Move victim to fresh air; call emergency medical care. Speed in removing material from eyes and skin is of extreme importance. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. All users of Temik® 150G must have attended a training program and be issued with a Bayer CropScience Certificate of Temik® Accreditation prior to purchase and use of this product.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where Aldicarb is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as Sodium Hydroxide and Sodium Bicarbonate).

Shipping: Aldicarb is a solid toxic carbamate and should be labeled "POISONOUS/TOXIC MATERIALS." It falls into DOT/UN Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with diatomite, clay, expanded mineral, vermiculite, sand, or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line). It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 30.

Fire Extinguishing: May burn but does not ignite readily. Poisonous gases, including oxides of carbon, nitrogen, and sulfur; aldicarb nitrile, aldicarb oxime, and methylamine, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with effluent gas scrubbing is recommended.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Aldol is a flammable, colorless to pale yellow, syrupy liquid. Molecular weight = 88.1; Specific gravity (H_2O:1) = 1.1; Boiling point = 80°C at 20 mmHg,[17] (decomposes above 83°C); Freezing/Melting point = 0°C; Vapor pressure = $<7.6 \times 10^{-3}$ mmHg at 20°C[52]; Vapor density (air = 1) = 2.98; Flash point = 66°C; Autoignition temperature = 250°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2. Good solubility in water.

Potential Exposure: Aldol is used as a solvent and to manufacture rubber accelerators, perfumes; in fungicides; and in engraving, cadmium plating.

Incompatibilities: Contact with oxidizers may cause fire and explosions. Contact with metals may cause the formation of flammable and explosive hydrogen gas. Heat above 83°C causes the formation of crotonaldehyde vapor (which may cause explosion) and water.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin, eyes, and respiratory tract. This chemical can be absorbed through the skin, thereby increasing exposure. Exposure to vapor may cause sore throat, coughing, dizziness, lightheadedness, and unconsciousness. Ingestion causes abdominal pain.

Long Term Exposure: Prolonged or repeated skin contact may cause redness, irritation, and dryness.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where Aldol may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Aldol is a liquid toxic pesticide and should be labeled "POISONOUS/TOXIC MATERIALS." It falls into DOT/UN Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Aldrin is a colorless, crystalline solid. The technical grade is a tan to dark brown solid. It has a mild, chemical odor. Molecular weight = 364.93; Boiling point = 145°C (decomposes); Freezing/Melting point = 104°C (pure); 49−60°C (technical grade); Specific gravity = 1.6 at 20°C (solid); Vapor pressure = 6.6×10^{-6} mmHg. Although noncombustible, aldrin may be dissolved in a flammable liquid. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.003%.[2]

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Formerly used as an insecticide in the US

Pesticide manufacturers, formulators, and applicators. Some people in the United States may be exposed to aldrin (and dieldrin) in air, water, and food because of its persistence in the environment. See "Dieldrin" for more details.

Incompatibilities: Avoid concentrated mineral acids, acid catalysts, acid oxidizing agents, phenol, or active metals.

Permissible Exposure Limits in Air Odor threshold = 0.3 mg/m^3.

OSHA PEL: 0.25 mg/m^3 TWA [skin].

NIOSH REL: 0.25 mg/m^3 TWA [skin], potential occupational carcinogen; Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.05 mg/m^3 TWA inhalable fraction and vapors [skin]; confirmed animal carcinogen with unknown relevance to humans (2006).

NIOSH IDLH: 25 mg/m^3, inhalable fraction [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 25 mg/m^3

DFG MAK: 0.25 mg/m^3 measured as inhalable fraction [skin]; Peak limitation Category II(8).

Australia: TWA 0.25 mg/m^3, [skin], 1993; Austria: MAK 0.25 mg/m^3, [skin], 1999; Belgium: TWA 0.25 mg/m^3, [skin], 1993; Denmark: 0.25 mg/m^3, [skin], 1999; Finland: TWA 0.25 mg/m^3; STEL 0.75 mg/m^3, [skin], 1999; France: VME 0.25 mg/m^3, [skin], carcinogen, 1999; the Netherlands: MAC-TGG 0.25 mg/m^3, [skin], 2003; Norway: TWA 0.25 mg/m^3, 1999; the Philippines: TWA 0.25 mg/m^3, [skin], 1993; Poland: MAC (TWA) 0.5 mg/m^3; STEL 1.5 mg/m^3, 1999; Russia: STEL 0.01 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.25 mg/m^3, [skin], 1999; Thailand: TWA 0.25 mg/m^3, 1993; Turkey: TWA 0.25 mg/m^3, [skin], 1993; United Kingdom: TWA 0.25 mg/m^3; STEL 0.75 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for aldrin in ambient air[60]: 0.035 μg/m^3 (Pennsylvania) to 0.595 μg/m^3 (Kansas) to 1.5 μg/m^3 (Connecticut) to 2.5 μg/m^3 (North Dakota) to 4.0 μg/m^3 (Virginia) to 6.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5502.[18] A filter plus bubbler containing isooctane followed by workup with isooctane and analysis by gas chromatography.

Permissible Concentration in Water: To protect freshwater aquatic life: not to exceed 3.0 μg/L at any time. To protect saltwater aquatic life: not to exceed 1.3 μg/L at any time. To protect human health: preferably zero. A limit of 0.00074 μg/L is believed to keep lifetime cancer risk below 10^{-5}.[6] Russia[43] set a MAC of 0.01 mg/L in water used for domestic purposes. Mexico limit in drinking water 0.00003 mg/L. Several states have set guidelines and standards for Aldrin in drinking water.[61] Illinois has set a standard of 0.1 μg/L. Guidelines in other states range from 0.013 μg/L (Kansas) to 0.03 μg/L (Minnesota) to 0.05 μg/L (California). Aldrin is highly toxic to aquatic organisms and every care must be taken to avoid release to the environment. In the food chain important to humans, bioaccumulation takes place, specifically in aquatic organisms. It is strongly advised not to let the chemical enter into the environment because of its persistence.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 7.4. Fish toxicity (threshold)[77]: 0.18049 ppb MACT. (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye and skin contact can cause irritation and burns. Can be fatal if swallowed or absorbed through the skin. Aldrin tends to produce convulsions before other less serious signs of illness have appeared. Victims have reported headache, nausea, vomiting, dizziness, and mild chronic jerking. Some victims have convulsions without warning. Poisoning by Aldrin usually involves convulsions due to its effects on the central nervous system. Probable oral lethal dose for humans is between 7 drops and 1 oz for a 150-lb adult human.

Long Term Exposure: May cause tumors, cancer, mutations, reproductive effects. Reproductive effects and liver effects have also been reported. It is classified as an extremely toxic chemical. Conflicting reports of carcinogenicity of this compound remain an area of controversy. Similar chemically and toxicologically to dieldrin. Cancer site in animals: lungs, liver, thyroid, and adrenal glands.[2] Human Tox = 0.02058 ppb CHCL (Chronic Human Carcinogen Level) (EXTRA HIGH).

Points of Attack: Central nervous system, liver, kidneys, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. NIOSH recommends the following tests: blood plasma, complete blood count, liver function tests, urinalysis (routine), reticulocyte count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink. Do NOT induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, preferably outdoors.

Shipping: Aldrin requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. For large spill seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: Solid is not combustible, but Aldrin is often dissolved in a flammable liquid. Poisonous gases, including hydrogen chloride and chlorine, are produced in fire. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Aldrin is very stable thermally with no decomposition noted at 250°C. Aldrin (along with the structurally related compounds dieldrin and isodrin) is remarkably stable to alkali (in contrast to chlordane and heptachlor) and refluxing with aqueous or alcoholic caustic has no effect. Incineration methods for aldrin disposal involving 816°C, 0.5 s minimum for primary combustion, 1760°C, 1.0 s for secondary combustion, with adequate scrubbing and ash disposal facilities have been recommended. The combustion of aldrin in polyethylene on a small scale gave more than 99% decomposition. Aldrin can be degraded by active metals, such as sodium in alcohol (a reaction which forms the basis of the analytical method for total chlorine), but this method is not suitable for the layman. A disposal method suggested for materials contaminated with aldrin, dieldrin, or endrin consists of boring 8−12 feet underground in an isolated area away from water suppliers, with a layer of clay, a layer of lye, and a second layer of clay beneath the wastes. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

RTECS® Number: GZ1925000

UN/NA & ERG Number: UN2902 (Pesticides, liquid, toxic, n.o.s.)/151

EC Number: 584-79-2 (I) 209-542-4 [*Annex I Index No.:* 006-025-00-3]; 497-92-7 (II) not listed.

Regulatory Authority and Advisory Bodies

AB 1803-Well Monitoring Chemical (CAL) as pyrethrins.

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum.

Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins.

EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg) as pyrethrins.

European/International Regulations [584-79-2 (I)]: Hazard Symbol: Xn, N; Risk phrases: R20/22; R50/53; Safety phrases: S2; S36; S46; S60; S61; [497-92-7 (II)] Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Allethrin is a clear, yellow to amber, oily liquid which is also available as a wettable powder or granules. Boiling point = 140−160°C; Flash point = approximately 120−123°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0−1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Allethrin is used to control insects in homes and animal shelters, and to treat lice in humans.

Incompatibilities: Strong alkalis and oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 4.75−4.80.

Routes of Entry: Skin, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact causes irritation and burns. Inhalation can cause respiratory tract irritation with coughing and wheezing. High exposure may cause dizziness, shaking, irritability, seizures, and unconsciousness. Allethrins may affect the nervous system.

Long Term Exposure: May cause skin allergy. If the allergy develops, very low future exposure can cause itching and skin rash. Allethrin may cause an asthma-like allergy. Future exposure can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness. Allethrin can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage. There is no evidence that allethrin affects reproduction.[2]

Points of Attack: Skin, lungs, liver, and kidneys.

Medical Surveillance: Liver and kidney function tests. Lung function test. (These could be normal if the person is not having an attack at the time of the test). Evaluation by a qualified allergist may help to diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *5000 mg/m^3:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Allethrin is a liquid toxic pesticide and should be labeled “POISONOUS/TOXIC MATERIALS.” It falls into DOT/UN Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Irritating gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Allyl acetate A:0530

Molecular Formula: $C_5H_8O_2$

Synonyms: Acetic acid, allyl acetate; Acetic acid, 2-propenyl ester; 3-Acetoxypropene; 2-Propenyl methanoate

CAS Registry Number: 591-87-7

RTECS® Number: AF1750000

UN/NA & ERG Number: UN2333/131

EC Number: 209-734-8

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Allyl acetate is a flammable, colorless liquid with an acrid odor. Molecular weight = 100.12; Boiling point = 103−104°C; Flash point = 22°C; Autoignition temperature = 374°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.-

Potential Exposure: Allyl acetate is used to control insects in homes and animal shelters, and to treat lice in humans.

Also, generally speaking, most allyl compounds may be metabolized to allyl alcohol which is metabolized to acrolein.

Incompatibilities: Contact with oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 1.5 ppm
PAC-2: 10 ppm
PAC-3: 50 ppm

Routes of Entry: Skin, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Prolonged or repeated contact can cause rash, redness, and itching. Skin and eye contact causes irritation, severe burns, and permanent damage. Inhalation can cause respiratory tract irritation with coughing and wheezing. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death.

Long Term Exposure: Allyl acetate can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage.

Points of Attack: Skin, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allyl acetate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Allyl acetate requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls into DOT/UN Hazard Class 3, Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl acetate is a highly flammable liquid. Irritating gases, including carbon dioxide and carbon monoxide, are produced in fire. Use propylene foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Allyl alcohol is a flammable, colorless liquid. It has a pungent, mustard-like odor. Molecular weight = 58.09. Boiling point = 97°C. Melting/Freezing point = − 129°C; Critical temperature = 271.9°C; Critical pressure = 840 psia = 57 atm = 5.8 MN/m^2; Specific gravity (H_2O:1) = 0.852 at 20°C (liquid); Relative vapor density (air = 1) = 2.0; Ratio of specific heats of vapor (gas) = 1.12; Latent heat of vaporization = 295 Btu/lb = 164 cal/g = 6.87×10^5 J/kg; Saturation concentration in air = 57 g/m^3 at 20°C; Heat of combustion = − 13,720 Btu/lb = − 7620 cal/g = -319.0×10^5 J/kg; Heat of polymerization = 100°C; Vapor pressure = 24 hPa at 20°C; 18 mmHg at 20°C; Electrical conductivity = 6.5×10^5 pS/m; Flash point = 21°C (cc); 32°C (oc); Autoignition temperature = 378°C. Explosive limits: LEL = 2.5%, UEL = 18.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1. Highly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen, Human Data; Primary Irritant. Allyl alcohol is used without formulation for weed control and applied as a drench to tobacco beds; in the production of allyl esters. These compounds are used as monomers and prepolymers in the manufacture of resins and plastics. Allyl alcohol is also used in the preparation of pharmaceuticals; in organic syntheses of glycerol and acrolein; and as a fungicide and herbicide.

Incompatibilities: Forms explosive mixture with air. Reacts explosively with carbon tetrachloride, strong bases. Also incompatible with strong acids. Contact with oxidizers may cause fire and explosions. Polymerization may be caused by heat above 99°C, peroxides, or oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.38 mg/m^3 Odor threshold = 1.4−2.1 ppm. The odor at 25°C at 1 atm and irritant properties of allyl alcohol is above the TLV and nearly the same as the PEL.

OSHA PEL: 2 ppm/5 mg/m^3 TWA [skin].

NIOSH REL: 2 ppm/5 mg/m^3 TWA; 4 ppm/10 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.5 ppm/1.19 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

NIOSH IDLH value = 20 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **5.1** ppm
PAC-2: **13** ppm
PAC-3: **40** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin]; Carcinogen Category 3B.

Arab Republic of Egypt: TWA 2 ppm (5 mg/m^3), [skin], 1993; Australia: TWA 2 ppm (5 mg/m^3); STEL 4 ppm, [skin], 1993; Austria: MAK 2 ppm (5 mg/m^3), [skin], 1999; Belgium: TWA 2 ppm (4.8 mg/m^3); STEL 4 ppm (9.5 mg/m^3), [skin], 1993; Denmark: TWA 2 ppm (5 mg/m^3), [skin], 1999; Finland: TWA 2 ppm (5 mg/m^3); STEL 4 ppm (10 mg/m^3), [skin], 1993; France: VME 2 ppm (5 mg/m^3), VLE 4 ppm (10 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 5 mg/m^3, [skin], 2003; Japan: 1 ppm (2.4 mg/m^3), [skin], 1999; Norway: TWA 2 ppm (5 mg/m^3), 1999; the Philippines: TWA 2 ppm (5 mg/m^3), [skin], 1993; Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 10 mg/m^3, [skin], 1999; Russia: TWA 1 ppm, 1993; Sweden: NGV 2 ppm (5 mg/m^3), KTV 6 ppm (14 mg/m^3), [skin], 1999; Switzerland: MAK-W 2 ppm (5 mg/m^3), KZG-W 4 ppm (10 mg/m^3), [skin], 1999; Turkey: TWA 2 ppm (5 mg/m^3), [skin], 1993; United Kingdom: TWA 2 ppm (4.8 mg/m^3); STEL 4 ppm (9.7 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Guidelines or standards for allyl alcohol in ambient air have been set[60] by various states: 5 mg/m^3/STEL 10 mg/m^3 (California), 5 mg/m^3 (North Dakota); 8 mg/m^3 (Virginia); 10 mg/m^3 (Connecticut); 11.9 mg/m^3 (Nevada).

Determination in Air: Adsorption on charcoal, workup with CS_2 and gas chromatographic analysis. Use NIOSH Analytical Method #1402.[18]

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 0.17–0.2$.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Allyl alcohol vapor can cause serious irritation and burns of eyes, nose, and throat. Eye irritation may be accompanied by sensitivity to light, pain, blurred vision leading to permanent damage. The pain may not begin until 6 h after exposure. Contact with the liquid may cause first and second degree burns of skin and blister formation. Areas of contact will become swollen and painful and local muscle spasms may occur. Allyl alcohol causes burns on contact; and may cause pulmonary edema, a medical emergency, if inhaled. It is poisonous in small quantities. The probable oral lethal dose is 50–500 mg/kg, or between 1 teaspoonful and 1 oz for a 150-lb person.

Long Term Exposure: Allyl alcohol may cause mutations; such chemicals may have a cancer or reproductive risk. This chemical may cause liver and kidney damage. Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preplacement and periodic examinations should include lung function tests, liver and kidney function tests. Following acute exposure, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): butyl rubber gloves, suits, boots; Teflon™ gloves, suits, boots; Barricade®™ coated suits; Responder™ suits; Trychem 1000™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Viton™ gloves, suits. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm:* Sa:Cf* (APF = 25) * (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Store to avoid contact with strong oxidizers, such as halogens. Avoid smoking, sparks or open flames in storage areas.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." The DOT/UN Hazard Class is 6.1 and 3 (subsidiary), and the Packing Group is I.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep allyl alcohol out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60

Then: Protect persons downwind (miles/kilometers)

Day 0.4/0.6

Night 0.7/1.2

Fire Extinguishing: This chemical is a flammable liquid. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration after dilution with a flammable solvent.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F + , T, N; Risk phrases: R11; R23/24/25; R51/53; Safety phrases: S1/2; S9; S16; S24/25; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Allylamine is a highly flammable, colorless liquid with a strong ammonia odor. Molecular weight = 57.11; Freezing/Melting point = − 88°C; Boiling point = 53−58°C; Specific gravity (H_2O:1) = 0.760 at 20°C; Flash point = − 29°C; Autoignition temperature = 374°C; Vapor pressure = 195 mmHg at 20°C. Explosive limits: LEL = 2.2%, UEL = 22.0%. Odor threshold = 2.5 ppm. Vapors are highly disagreeable; it is unlikely that any person would voluntarily stay in dangerous concentration. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1. Highly soluble in water.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. Used in manufacture of pharmaceuticals (e.g., mercurial diuretics) and in organic synthesis. Used to improve dyeability of acrylic fibers.

Incompatibilities: Forms explosive mixture with air. Oxidizing materials and acids may cause a violent reaction. Attacks copper and corrodes active metals (i.e., aluminum, zinc, etc.).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.23 mg/m^3 at 25°C & 1 atm.

Protective Action Criteria (PAC)*

TEEL-0: 0.125 ppm

PAC-1: **0.42** ppm

PAC-2: **3.3** ppm

PAC-3: **18** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Denmark: TWA 2 ppm (4.7 mg/m^3), [skin], 1999; Norway: TWA 2 ppm (5 mg/m^3), 1999; Russia: STEL 0.05 mg/m^3, [skin], 1993; Sweden: NGV 2 ppm (5 mg/m^3), KTV 6 ppm (14 mg/m^3), [skin], 1999.

Routes of Entry: Inhalation, ingestion and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to eyes, skin, and respiratory tract which is highly toxic if inhaled or ingested and moderately toxic if absorbed on skin. Ingestion or inhalation may cause death or permanent injury after very short exposure to small quantities. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Swallowing liquid may cause pneumonia. Vapors are extremely unpleasant and may ensure voluntary avoidance of dangerous concentrations. Symptoms include irritation of nose, eyes, and mouth with tearing, runny nose, and sneezing. Can cause excitement, convulsions, and death. Skin absorption may cause irreversible and reversible changes. Toxic air concentration in humans is 5 ppm over 5 min.

Long Term Exposure: Mutation data reported.

Points of Attack: Skin, pulmonary, system, cardiovascular system.

Medical Surveillance: Lung function tests. Following acute exposure, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers recommend butyl rubber as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN

149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allylamine may be present, check to make sure that an explosive concentration does not exist. Outside or detached storage preferred. Keep containers closed and away from oxidizers, acids, or combustible materials. If stored indoors, use standard flammable liquids storage room or cabinet. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." The Hazard Class is 6.1 and 3 (subsidiary), and the Packing Group is I.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Keep allylamine out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 1.9/3.1

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High temperature incineration; encapsulation by resin or silicate fixation.

Regulatory Authority and Advisory Bodies

Air and Water Pollutant Standard Set: see Bromine.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Description: Allyl bromide is a highly flammable, colorless to light yellow liquid with an unpleasant, pungent odor. Molecular weight = 120.98; Boiling point = 71.3°C; Freezing/Melting point = − 119°C; Specific gravity (H_2O:1) = 1.4161 at 20°C; Vapor pressure = about 111−112 mmHg at 20°C; Liquid surface tension = 0.0269 N/m at 20°C; Relative vapor density (air = 1) = 4.2; Latent heat of vaporization = (estimate) 2.5×10^5 J/kg; Heat of combustion = (estimate) -150×10^5 J/kg; Flash point = − 1°C; Autoignition temperature = 295°C. Explosive limits: LEL = 4.4%, UEL = 7.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Insoluble in water.

Potential Exposure: Used as an insecticide; in the manufacture of resins, fragrances, and other chemicals.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause fire and explosions. Heat or light exposure may cause decomposition and corrosive vapors.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.1 ppm TWA [skin] Not classifiable as a human carcinogen.

NIOSH IDLH: 3 ppm *bromine.*

Temporary Emergency Exposure Limits (DOE)
TEEL-0: 4 ppm
PAC-1: 12 ppm
PAC-2: 75 ppm
PAC-3: 400 ppm

DFG MAK: Suspended 2004.

European OEL: 0.1 ppm/0.7 mg/m^3 TWA (2004).

Routes of Entry: Skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. This chemical can be absorbed through the skin, thereby increasing exposure. Irritates eyes, skin, and respiratory tract. Can cause burns and permanent damage. Inhalation can cause respiratory tract irritation with coughing and wheezing. Exposure can cause headache, dizziness, nausea, and vomiting. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death.

Long Term Exposure: Allyl bromide can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may cause liver and kidney damage, skin disorders; mutations.

Points of Attack: Skin, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, chest X-ray should be considered. Kidney and liver function tests. Consult a dermatologist if skin disorders result from exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For bromine, OSHA/NIOSH: *2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern. *3 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprTS (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed. Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allyl bromide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Allyl bromide should be labeled "FLAMMABLE LIQUID, POISON." It falls into DOT/UN Hazard Class 3 and 6.1 (subsidiary), and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with activated charcoal adsorbent and deposit in sealed containers. Keep allyl bromide out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl bromide is a highly flammable liquid. Irritating gases, including carbon monoxide and hydrogen bromide gas, are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Allyl chloride is a highly reactive and flammable, colorless, brown or purple liquid, with an unpleasant, pungent odor. Odor threshold = 0.48−5.9 ppm. Molecular weight = 76.53; Boiling point = 44−45°C; Freezing/Melting point = −135°C; Specific gravity (H_2O:1) = 0.9 at 20°C; Relative vapor density (air = 1) = 4.15; Ratio of specific heats of vapor (gas) = 1.0804; Latent heat of vaporization = (estimate) 2.3×10^5 J/kg; Heat of combustion = (estimate) -180×10^5 J/kg; Vapor pressure = 295 mmHg at 20°C; 393 hPa at 20°C; Flash point = −32°C; Autoignition point = 485°C. Explosive limits: LEL = 2.9%, UEL = 11.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Slightly soluble in water; solubility = 0.4%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Allyl chloride is used as a chemical intermediate and in making allyl compounds, epichlorohydrin, and glycerol.

Incompatibilities: Contact with water forms hydrochloric acid. Keep away from strong oxidizers, acids, aluminum, amines, peroxides, chlorides of iron and aluminum; magnesium, zinc.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.13 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/3 mg/m^3 TWA.

NIOSH REL: 1 ppm/3 mg/m^3 TWA; 2 ppm/6 mg/m^3 STEL.

ACGIH TLV®[1]: 1 ppm/3 mg/m^3 TWA; 2 ppm/6 mg/m^3 STEL [skin]; Confirmed Carcinogen with unknown relevance to humans.

NIOSH IDLH value = 250 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **2.8** ppm

PAC-2: **54** ppm

PAC-3: **140** ppm

DFG MAK: [skin] Carcinogen Category 3B (2004).

Australia: TWA 1 ppm (3 mg/m^3); STEL 2 ppm, 1993; Austria: MAK 1 ppm (3 mg/m^3), suspected carcinogen, 1999; Belgium: TWA 1 ppm (3 mg/m^3); STEL 2 ppm, 1993; Denmark: TWA 1 ppm (3 mg/m^3), 1999; Finland: TWA 1 ppm (3 mg/m^3); STEL 3 ppm (9 mg/m^3), 1999; France: VME 1 ppm (3 mg/m^3), 1999; the Netherlands: MAC-TGG 3 mg/m^3, 2003; India: TWA 1 ppm (3 mg/m^3); STEL 2 ppm (6 mg/m^3), 1993; Norway: TWA 1 ppm (3 mg/m^3), 1999; Russia: STEL 0.3 mg/m^3, [skin], 1993; Sweden: TWA 1 ppm (3 mg/m^3); STEL 3 ppm (9 mg/m^3), [skin], 1999; Switzerland: MAK-W 1 ppm (3 mg/m^3), KZG-W 2 ppm (6 mg/m^3), 1999; Turkey: TWA 1 ppm (3 mg/m^3), 1993; United Kingdom: LTEL 1 ppm (3 mg/m^3); STEL 2 ppm (6 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 2 ppm.

Determination in Air: Charcoal tube; Benzene; Gas chromatography/Flame ionization detection; Use NIOSH Analytical Methods (IV) #1000.

Permissible Concentration in Water: Russia[43] set a MAC of 0.3 mg/L in water bodies used for domestic purposes. Minnesota[61] has set a guideline for allyl chloride in drinking water of 2.94 mg/L.

Routes of Entry: Employees may be exposed by dermal or eye contact, inhalation, or ingestion. This chemical can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Corrosive to eyes, skin, and respiratory tract; can cause burns and permanent damage. In addition to burns, skin contact can cause deep aching and "bone pain." Effects on the skin may not be apparent for some hours following contact. Inhalation can cause respiratory tract irritation with coughing and wheezing. Exposure can cause headache, dizziness, nausea, and vomiting. High exposure may cause pulmonary edema, a medical emergency, with severe shortness of breath. This can cause death.

Long Term Exposure: May cause liver and kidney damage, lung irritation and bronchitis, drying and cracking skin. Allyl chloride has caused mutations. There is limited evidence that this chemical causes cancer of the stomach. The potential for damage to the respiratory tract, liver, and kidneys from inhalation was recognized through experimental evidence during the early commercial development of the industry involving this compound and is reflected in the precautions taken during its manufacture and use. Industrial experience in the United States has pointed to such problems as orbital pain and deep-seated aches after eye or skin contact. Both of these phenomena are believed to be transient when they occur and have been minimized through improved work practices.

Points of Attack: Respiratory system, lungs, skin, eyes, liver, and kidneys.

Medical Surveillance: Preplacement and periodic physical examinations have been detailed by NIOSH. They give special attention to the respiratory system, liver, kidneys, skin, and eyes. Urine, blood, and pulmonary function testing are required by NIOSH.[45] If symptoms of overexposure develop, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Tychem 1000™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves· All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls shall be used to maintain allyl chloride vapor concentrations below the permissible exposure limits. Compliance with the permissible exposure limits may be achieved by the use of respirators only in the following situations: (1) During the time necessary to install or test the required engineering controls. (2) For nonroutine operations, such as maintenance or repair activities, in which concentrations in excess of the permissible exposure limits may occur. (3) During emergencies when air concentrations of allyl chloride may exceed the permissible limits. When a respirator is permitted, it shall be selected as follows: *Up to 25 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allyl chloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a dark, cool, well-ventilated and fireproof area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Allyl chloride requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." The DOT/UN Hazard Class is 3 and 6.1 (subsidiary), and the Packing Group is I.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with activated charcoal adsorbent and deposit in sealed containers. Do not wash into sewer. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Allyl chloride is a highly flammable liquid. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. Use dry chemical, carbon dioxide, polymer, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration at a temperature of 982°C for 2 s minimum.

Allyl ethyl ether A:0580

Molecular Formula: $C_6H_{10}O$
Common Formula: $CH_2H_5OCH_2CH{=}CH_2$
Synonyms: 1-Propene, 3-ethoxy-; Eter, aliletil (Spanish)
CAS Registry Number: 557-31-3
RTECS® Number: KM9120000
UN/NA & ERG Number: UN2335/131
EC Number: 209-169-7
Regulatory Authority and Advisory Bodies
DOT Appendix B, §172.101.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
Description: Allyl ethyl ether is a highly flammable liquid. Molecular weight = 86.12; Boiling point = 66°C; Specific gravity (H_2O:1) = 0.79; Vapor pressure = 136 mmHg at 20°C; Flash point = −21°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 4. Insoluble in water.
Potential Exposure: Used for making other chemicals.
Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause fire and explosions. Incompatible with strong acids. May form explosive peroxides during storage.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Through the skin, inhalation, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Irritates eyes, skin, and respiratory tract. Exposure can cause headache, dizziness, nausea, and vomiting. May affect the central nervous system.
Long Term Exposure: May cause central nervous system damage. Removes the skin's natural oils, leading to dryness, irritation, redness, possible cracking.
Points of Attack: Skin, lungs.
Medical Surveillance: If symptoms develop or overexposure is suspected, chest X-ray and nervous system tests should be considered.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary

edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allyl ethyl ether may be present, check to make sure that an explosive concentration does not exist. Check for peroxides and inhibit if necessary. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Allyl ethyl ether should be labeled “FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS.” It falls into DOT/UN Hazard Class 3 and Hazard Class 6.1 (subsidiary) and is in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with activated charcoal adsorbent and deposit in sealed containers. Keep allyl chloride out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl ethyl ether is a highly flammable and reactive liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. New Jersey Department of Health and Senior Services. (August 1998). *Hazardous Substances Fact Sheet: Allyl Ethyl Ether*. Trenton, NJ

Allyl glycidyl ether A:0590

Molecular Formula: $C_6H_{10}O_2$

Synonyms: AGE; Alil glicidikico eter (Spanish); Allyl-2,3-epoxypropyl ether; Allylglycidaether (German); 1-Allyloxy-2,3-epoxy-propan (German); 1-(Allyloxy)-2,3-epoxypropane; 1,2-Epoxy-3-allyloxypropane; Oxirane, [(2-propenyloxy)methyl]; [(2-Propenyloxy) methyl]oxirane

CAS Registry Number: 106-92-3

RTECS$^{®}$ Number: RR0875000

UN/NA & ERG Number: UN2219/129

EC Number: 203-442-4 [*Annex I Index No.:* 603-038-00-1]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: Carcinogenesis Studies (inhalation); some evidence: mouse; equivocal evidence: mouse, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20/22; R37/38; R40; R41; R43; R52/53; R62; R68; Safety phrases: S2; S24/25; S26; S36/37/39; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Allyl glycidyl ether is a colorless liquid with a strong, sweet odor. Molecular weight = 114.16; Boiling point = 154°C; Freezing/Melting point = − 100°C; Density (H_2O:1) = 0.97; Vapor density (air = 1) = 3.9; Vapor pressure = 3.69 mmHg at 20°C; Flash point = 57°C. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Used as a solvent and emulsifier; making epoxy resins, chlorinated compounds; and rubber.

Incompatibilities: Forms explosive mixture with air. Contact with acids or bases may cause explosive polymerization. Contact with oxidizers or amines may cause fire and explosions.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.67 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/45 mg/m^3 Ceiling Concentration.

NIOSH REL: 5 ppm/22 mg/m^3 TWA; 10 ppm/44 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 1 ppm/4.7 mg/m^3 TWA; not classifiable as a human carcinogen.

No TEEL available.

DFG MAK: [skin] Carcinogen Category 2; danger of skin sensitization (2004).

NIOSH IDLH value = 50 ppm.

Australia: TWA 5 ppm (22 mg/m^3); STEL 10 ppm, [skin], 1993; Austria: carcinogen, 1999; Belgium: TWA 5 ppm (23 mg/m^3); STEL 10 ppm (47 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (22 mg/m^3), [skin], 1999; Finland: STEL 5 ppm (22 mg/m^3), [skin], 1999; France: VME 5 ppm (22 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 10 ppm (45 mg/m^3), 1993; Switzerland: MAK-W 0.05 ppm (0.1 mg/m^3), 1999; Thailand: TWA 10 ppm (45 mg/m^3), 1993; Turkey: TWA 10 ppm (45 mg/m^3), 1993; United Kingdom: TWA 5 ppm (24 mg/m^3); STEL 10 ppm (47 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for AGE in ambient air[60]: 22 mg/m^3; STEL 44 22 mg/m^3 (California), 22 mg/m^3 (Connecticut), 44 mg/m^3 (North Dakota), 40 mg/m^3 (Virginia), 52.4 mg/m^3 (Nevada).

Determination in Air: Adsorption in a Tenax-tilled tube, workup with ethyl ether, analysis by gas chromatography. Use NIOSH Analytical Method #2545.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact contributes significantly to overall exposure. Inhalation of vapors may irritate the eyes, skin, and respiratory tract, causing shortness of breath and coughing. Higher exposure may cause dizziness, lightheadedness, unconsciousness, pulmonary edema; a medical emergency that can cause death. Skin or eye contact with the liquid may cause irritation, burns, and skin rash. The DFG warns of the danger of skin sensitization. Use of alcoholic beverages enhances the harmful effect.

Long Term Exposure: This chemical may be a human carcinogen. It may cause mutations and damage male reproductive glands. Repeated exposures may cause permanent lung damage.

Points of Attack: Eyes, skin, respiratory system, blood, reproductive system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests, lung function tests, examination of the eyes for corneal opacities. A qualified allergist may be consulted concerning potential skin allergy. Following acute overexposure, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers recommend natural rubber, butyl rubber, nitrile, polyvinyl alcohol, polyvinyl chloride, Neoprene™/natural rubber material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." Falls in DOT/UN Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquid in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Wash away residue with plenty of water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Allyl iodide A:0600

Molecular Formula: C_3H_5I
Common Formula: $CH_2{=}CHCH_2I$
Synonyms: 3-Iodo-1-propene; 3-Iodopropene; 3-Iodopropylene; 1-Propene, 3-iodo-
CAS Registry Number: 556-56-9
RTECS® Number: UD0450000
UN/NA & ERG Number: UN1723/132
EC Number: 209-130-4 [*Annex I Index No.:* 602-054-00-6]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R11; R34; Safety phrases: S1/2; S7; S16; S26; S45.

Description: Allyl iodide is a highly flammable, corrosive, yellowish liquid that darkens on contact with air. It has an unpleasant, pungent odor. Molecular weight = 167.98; Boiling point = 103°C; Freezing/Melting point = −99°C; Flash point = 18°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Insoluble in water.

Potential Exposure: Allyl iodide may be used as an organic intermediate and in polymer manufacture.

Incompatibilities: Oxidizing materials. Do not expose to heat, light, or air.

Permissible Exposure Limits in Air

As iodides

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA.

No TEEL available.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

A powerful irritant. Acts as a poison by inhalation and ingestion.

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Eye and skin contact can cause burns and permanent damage. Inhalation can cause coughing and/or shortness of breath; may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases.

Long Term Exposure: May cause mutations, liver, kidney damage; and lung damage with the development of bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, nose, throat, and lungs.

Medical Surveillance: Preemployment and annual lung function tests are recommended. If symptoms develop or if overexposure is suspected, liver and kidney function tests may be useful. Consider chest X-rays after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allyl iodide may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat, light, or air. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." The DOT/UN Hazard Class 3, the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep allyl iodide out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen iodide, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: NCI: Carcinogenesis Studies (gavage); clear evidence: rat; (gavage); no evidence: mouse; IARC: Animal Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Allyl isothiocyanate is a highly flammable, colorless to pale yellow, oily liquid with a pungent, irritating odor and acrid taste. Molecular weight = 99.16; Boiling point = 151°C; Flash point = 46°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Used in fumigants, veterinary drugs, ointments and counter irritants, mustard plasters, and as a flavoring agent.

Incompatibilities: Alcohols, strong bases, strong acids, and amines.

Permissible Exposure Limits in Air

AIHA WEEL: 1 ppm STEL (15 min) [skin] Potential for dermal sensitization.

Protective Action Criteria (PAC)

TEEL-0: 0.35 ppm

PAC-1: 1 ppm

PAC-2: 12.5 ppm

PAC-3: 12.5 ppm

DFG MAK: [skin] May cause skin sensitization.

Russia: TWA 0.3 mg/m^3; STEL 0.6 mg/m^3, 1993.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye and skin contact can cause skin irritation. Prolonged contact can cause burns and blisters. This chemical can be absorbed through the skin, thereby increasing exposure.

Long Term Exposure: There is limited evidence that this chemical causes cancer in animals. It may cause bladder cancer in male rats. May damage the developing fetus. Exposure can cause an allergy-type reaction to develop with symptoms of asthma, watery eyes, sneezing, runny nose, coughing, sneezing, chest tightness. Skin allergy may develop, small exposures can cause symptoms to appear.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: Preemployment and regular lung function tests are recommended (these may be normal if the persons are not having an attack at the time of the test). If symptoms develop or if overexposure is suspected, evaluation by a qualified allergist may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "POISON, FLAMMABLE LIQUID." It falls in DOT/UN Hazard Class 6.1 and 3 (subsidiary), and Packing Group II.[19, 20] This chemical must be inhibited.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover with vermiculite, dry sand, soil, or similar adsorbent, and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Allyl isothiocyanate is a highly flammable liquid. Poisonous gases, including nitrogen oxides, sulfur oxides, and hydrogen cyanide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Allyl propyl disulfide A:0620

Molecular Formula: $C_6H_{12}S_2$

Common Formula: $CH_2{=}CHCH_2SSC_3H_7$

Synonyms: Disulfide, 2-propenyl propyl; Disulfuro de alil propilo (Spanish); 4,5-Dithia-1-octene; Onion oil; 2-Propenyl propyl disulfide; Propyl allyl disulfide

CAS Registry Number: 2179-59-1

RTECS® Number: JO0350000

EC Number: 218-550-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Allyl propyl disulfide is a combustible, pale yellow liquid with a strong, irritating, onion-like odor. Molecular weight = 148.29; Boiling point = 67−69°C; Flash point: 54°C; Freezing/melting point = −15°C; Vapor pressure = 1.35 mmHg at 25°C. Insoluble in water.

Potential Exposure: The primary ingredient in onion oil. Workers in onion processing (slicing and dehydration) operations.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.07 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 2 ppm/12 mg/m^3.

NIOSH REL: 2 ppm/12 mg/m^3 TWA; 3 ppm/18 mg/m^3 STEL.

ACGIH TLV®[1]: 0.5 ppm/3 mg/m^3, potential for dermal sensitization (2001).

DFG MAK: 2 ppm/12 mg/m^3 TWA; Peak Limitation Category I(1).

Australia: TWA 2 ppm (12 mg/m^3); STEL 3 ppm (18 mg/m^3), 1993; Austria: MAK 2 ppm (12 mg/m^3), 1999; Belgium: TWA 2 ppm (12 mg/m^3); STEL 3 ppm (18 mg/m^3), 1993; Denmark: TWA 2 ppm (12 mg/m^3), 1999; Finland: TWA 2 ppm (12 mg/m^3); STEL 4 ppm (24 mg/m^3), 1993; Norway: TWA 2 ppm (12 mg/m^3), 1999; the Netherlands: MAC-TGG 12 mg/m^3, 2003; Turkey: TWA 2 ppm (12 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 ppm. Several states have set guidelines or standards for allyl propyl disulfide in ambient air[60]: 2 ppm (PEL); 3 ppm STEL (California), 0.12−0.18 mg/m^3 (North Dakota), 0.20 mg/m^3 (Virginia), 0.24 mg/m^3 (Connecticut), 0.286 mg/m^3 (Nevada).

Determination in Air: Sample collection by charcoal tube, analysis by gas−liquid chromatography.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Irritation of eyes, nose, and throat. Acts as a poison by inhalation and ingestion.[44]

Short Term Exposure: Contact with the eyes produces tears. The vapor can irritate the eyes and respiratory tract, producing runny nose and tears.

Long Term Exposure: May cause skin sensitization and dermatitis. May affect the liver, kidneys, thyroid gland, stomach, and bladder.

Points of Attack: Eyes, nose, and throat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- and gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: No specific labeling or shipping precaution specified by DON/UN.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Cover with vermiculite, dry sand, earth, or similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Allyl trichlorosilane A:0630

Molecular Formula: $C_3H_5Cl_3Si$

Common Formula: $CH_2{=}CHCH_2SiCl_3$

Synonyms: Aliltriclorosilano (Spanish); Allylsilicone trichloride; Allyltrichlorosilane; Allyl trichorosilane, stabilized; Silane, allyltrichloro-; Silane, trichloroallyl-; Silane, trichloro-2-propenyl-; Trichloroallylsilane; Trichloro-2-propenylsilane

CAS Registry Number: 107-37-9

RTECS® Number: VV1530000

UN/NA & ERG Number: UN1724/155

EC Number: 203-485-9

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade) (stabilized).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Allyl trichlorosilane is a volatile, corrosive, flammable, colorless liquid with an irritating odor. Molecular weight = 175.5; Boiling point = 117°C; Specific gravity: 1.215 at 20°C (liquid); Liquid surface tension = (estimate) 20 dynes/cm; Relative vapor density (air = 1) = 6.05; Ratio of specific heats of vapor (gas) = 1.0863; Latent heat of vaporization = 2.3×10^5 J/kg; Heat of combustion = (estimate) = -120×10^5 J/kg; Flash point = 35°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩ (water reactive).

Potential Exposure: Used to make silicones and glass fiber finishes.

Incompatibilities: Water reaction is violent and forms toxic and corrosive hydrogen chloride gas. Contact with oxidizers may cause fire and explosions. Avoid all sources of ignition.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.6** ppm

PAC-2: **7.3** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Permissible Concentration in Water: No criteria set. Reacts vigorously with water.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Allyl trichlorosilane is corrosive and contact can cause severe eye and skin burns. Exposure can irritate the eyes, nose, and respiratory tract. Higher levels can irritate the lungs, causing coughing and shortness of breath; still higher exposures can cause pulmonary edema, a medical emergency that can cause death.

Long Term Exposure: Corrosives may cause long-term lung problems, although it is not known at this time that this chemical causes lung damage.

Points of Attack: Eyes, skin, respiratory tract.

Medical Surveillance: Lung function tests. Following acute overexposure, consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA for *Hydrogen Chloride*: *50 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprS (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern) or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece).

Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where allyl trichlorosilane may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from contact with water and sources of ignition. Use and store allyl trichlorosilane under nitrogen. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Allyltrichlorosilane, stabilized, requires a shipping label of "CORROSIVE, FLAMMABLE LIQUID." It falls in DOT/UN Hazard Class 8, Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use foam spray to reduce vapors. Cover with dry lime, dry sand, soda ash, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep allyl trichlorosilane out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters)	100/30
Then: Protect persons downwind (miles/kilometers)	
Day	0.1/0.2
Night	0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters)	200/60
Then: Protect persons downwind (miles/kilometers)	
Day	0.4/0.6
Night	1.2/1.9

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. This chemical is a highly flammable liquid. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. Do Not Use Water. Use dry chemical, CO_2, or foam extinguishers. Use low or medium expansion AFFF foam or dry chemical if available in sufficient amounts (FEMA). Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 212-075-9 (CAS: 760-19-0); 202-477-2 (CAS: 96-10-6); 209-248-6 (CAS: 563-43-9); 235-137-7 (CAS: 12075-68-2); 235-698-8 (CAS: 12542-85-7)

Regulatory Authority and Advisory Bodies

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List 1% as aluminum alkyl compounds.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*96-10-6; 760-19-0*).

Description: The aluminum alkyl halides are flammable, reactive, and may be spontaneously combustible in air. They are colorless to yellow liquids.

ethyl aluminum sesquichloride: Molecular weight = 247.49; Boiling point = 114.5−116.5°C; Flash point = −20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 3₩; violent reaction with water.

methylaluminum sesquichloride: Boiling point = 120−140°C; Flash point = −17°C.

methylaluminum sesquibromide: Freezing/melting point = −3.8°C; Boiling point = (about) 165°C.

ethylaluminum dichloride: Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 3.

Potential Exposure: These materials are used as components of olefin polymerization catalysts. The reader is referred to the entry on "Aluminum alkyls" for additional information on this entry. The aluminum alkyl halides parallel very closely the aluminum alkyls.

Incompatibilities: These chemicals react violently with nitromethane. Ethylaluminum sesquichloride reacts explosively with carbon tetrachloride at room temperature. This chemical reacts violently with water, forming corrosive hydrogen chloride and flammable ethane gas. Diethylaluminum chloride may form an explosive product with chlorine azide.

Permissible Exposure Limits in Air

As aluminum alkyls

OSHA PEL: None.

NIOSH REL: 2 mg/m³ TWA.

563-43-9

Protective Action Criteria (PAC)

TEEL-0: 9.41 ppm

PAC-1: 10 ppm

PAC-2: 10 ppm

PAC-3: 10 ppm

Determination in Air: Use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Points of Attack: Skin, respiratory system.

Medical Surveillance: Lung function tests.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials.

Shipping: These chemicals require a shipping label of "SPONTANEOUSLY COMBUSTIBLE MATERIAL." They fall in DOT/UN Hazard Class 4.2, Packing Group I.[19, 20]

Spill Handling: Ethyl aluminum sesquichloride is flammable, reactive, and a dangerous fire and explosion hazard. Ethyl aluminum sesquichloride is spontaneously combustible in air and reacts violently with water. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate area of spill or leak. These chemicals ignite spontaneously in air. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Do not use water or wet method*. It may be necessary to contain and dispose of this chemical as a hazardous waste. Ventilate area of spill or leak. Keep ethyl aluminum sesquichloride out of confined spaces, such as sewers, because of the possibility of an explosion. *Do not* wash into sewer. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Aluminum alkyl halides

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.8/1.3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: The aluminum alkyls are highly flammable and reactive, colorless to yellow liquids at room temperature. The lighter trialkylaluminums ignite spontaneously in air. They are normally supplied and used in a 20% solution with a hydrocarbon solvent, such as hexane, heptane, benzene, toluene. Properties may depend on solvent. Reacts violently with water. Molecular weight = 198.33 (triisobutyl-); Boiling point = 86°C (triisobutyl-); 185°C (triethyl-); Freezing/Melting point = 4−6°C (triisobutyl); −46°C (triethyl); Flash point = ignites spontaneously in air. Hazard

Identification (triethyl-, triisobutyl-): Health 3, Flammability 4, Reactivity 3₩ (water reactive; violent).

Potential Exposure: Alkyl aluminum compounds are used as components of olefin polymerization catalysts. They are also used in the synthesis of higher primary alcohols and in pyrophoric fuels, as a catalyst in making ethylene gas, and in plating aluminum.

Incompatibilities: The lighter trialkylaluminums ignite spontaneously in air. These compounds are strong reducing agents. Violent reaction with oxidizers, water. Incompatible with water, oxygen (air), acids, alcohols, phenols, amines, carbon dioxide, sulfur oxides, halogenated compounds, and many other substances.

Permissible Exposure Limits in Air

As aluminum alkyls

OSHA PEL: None.

NIOSH REL: 2 mg/m^3 TWA.

Protective Action Criteria (PAC)

75-24-1

TEEL-0: 5.34 mg/m^3

PAC-1: 16 mg/m^3

PAC-2: 26.7 mg/m^3

PAC-3: 125 mg/m^3

97-93-8

TEEL-0: 8.46 mg/m^3

PAC-1: 8.46 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Determination in Air: Use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.

Permissible Concentration in Water: No criteria set. These compounds react violently with water.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. Can cause severe eye and skin irritation and burns. Inhaling vapors or fumes can irritate the respiratory tract, causing coughing, wheezing, and/or shortness of breath. They can cause "metal fume fever" with symptoms of headache, nausea, vomiting, chills, cough, and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure. See also NIOSH #8310, Metals in Urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: In case of fume inhalation, treat pulmonary edema. Consider administering prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Exposure to large quantities, as in plant transfers, require full body aluminized proximity suit. Gloves, used in plant transfers or operations should be aluminized leather, preformed Neoprene™, aluminized vinyl, or other fire-resistant, nonreactive material. Preformed rubber gloves may be used in the laboratory. All gloves used when handling aluminum alkyls should be loose-fitting for instant removal if necessary. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL: 2 mg/m^3* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Protect against physical damage. Outside or detached storage is preferable. Before entering confined space where aluminum alkyls may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. All transfer lines must be free of water, oxygen, and other substances that react with aluminum alkyls. All vessels must be dry and oxygen free. Transfer lines should be blanked when not in use. Vessels should be top unloading when feasible with remote manual pressure relief. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Shipped in containers containing a blanket of nitrogen gas. Aluminum alkyls require a shipping label of "SPONTANEOUSLY COMBUSTIBLE MATERIAL." The Hazard Class is 4.2 and the Packing Group is I.[19, 20] Also, this material is dangerous when wet.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. These chemicals ignite spontaneously in air. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Stop flow of liquid, if possible, before extinguishing fire. These chemicals may ignite spontaneously in air and are flammable liquids. Poisonous and flammable gases, including aluminum oxides and ethylene, are produced in fire. *Do not use water, foam*, or a *halogenated* extinguishing agent. Use dry chemical, graphite powder, soda ash, or lime extinguishers. On solvent-based material use carbon dioxide or dry chemical. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, carefully use water spray to cool fire-exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Careful incineration.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 100 (*powder*).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as aluminum, elemental, *alpha*-alumina, or aluminum oxide.

Clean Water Act: Section 313 (57FR41331) Water Priority Chemicals (Al, dust, or fume).

US EPA Hazardous Waste Number (RCRA No.): D003.

Safe Drinking Water Act: 47FR9352, regulated contaminants; 53FR1896, list of contaminants, 55FR1470, Priority List; 40 CFR143.3, SMLC, 0.05−0.2 mg/L.

SARA 313: Form R *de minimis* Concentration Reporting Level: 1.0% (Al, dust, and fume); 0.1% (Aluminum oxide, fibrous form only).

European/International Regulations: Hazard Symbol: F; Risk phrases: R15; R17; Safety phrases: S2; S7/8; S43 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Aluminum is a combustible, light, silvery-white, soft, ductile, malleable, amphoteric metal. Molecular weight = 26.96 (aluminum); 101.96 [aluminum oxide (Al_2O_3)] and (corundum); Boiling point = 2470°C; Freezing/Melting point = 660°C; Autoignition temperature = 590°C. Ignition temperature of dust cloud = 650°C; Minimum Explosive concentration = 0.045 oz/ft^3.[USBM] Hazard Identification (*dust*): Health 0, Flammability 3, Reactivity 1. Insoluble in water. Relative explosion hazard of dust: Severe.

The primary sources are the ores cryolite, gibbsite, and bauxite, found as boehmite; aluminum is never found in the elemental state. Aluminum oxide is a noncombustible, white, crystalline powder or granules. Molecular weight = 101.96; Boiling point = about 3000°C; Freezing/Melting point = 2050°C. Insoluble in water.

Pyrophoric aluminums include aluminum powder, trimethyl aluminum (75-24-1), tripropyl aluminum (102-67-0).

Potential Exposure: Compound Description (aluminum): Reproductive Effector; Human Data; Hormone, (aluminum oxide) Tumorigen, Natural Product. Most hazardous exposures to aluminum occur in smelting and refining processes. Aluminum is mostly produced by electrolysis of Al_2O_3 dissolved in molten cryolite (Na_3AlF_6). Aluminum is alloyed with copper, zinc, silicon, magnesium, manganese, and nickel; special additives may include chromium, lead, bismuth, titanium, zirconium, and vanadium. Aluminum and its alloys can be extruded or processed in rolling mills, wire works, forges, or foundries; and are used in the shipbuilding, electrical, building, aircraft, automobile, light engineering, and jewelry industries. Aluminum foil is widely used in packaging. Powdered aluminum is used in the paints and pyrotechnic industries. Alumina, emery, and corundum have been used for abrasives, refractories, and catalysts; and in the past in the first firing of china and pottery.

Incompatibilities: Aluminum powder forms an explosive mixture with air and is a strong reducing agent that reacts violently with oxidizers, strong bases, strong acids, some halogenated hydrocarbons, nitrates, sulfates, metal oxides, and many other substances. Keep away from combustible materials.

Permissible Exposure Limits in Air

As aluminum metal and insoluble compounds

OSHA PEL: 15 mg[Al]/m^3, total dust; 5 mg[Al]/m^3, respirable fraction TWA.

NIOSH REL: 10 mg[Al]/m^3, total dust; 5 mg[Al]/m^3, respirable fraction TWA.

ACGIH TLV®[1]: 1 mg[Al]/m respirable fraction TWA.

Protective Action Criteria (PAC)

Aluminum

TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 12.5 mg/m^3
PAC-3: 60 mg/m^3

Aluminum oxide & aluminum oxide hydrate

TEEL-0: 1 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 25 mg/m^3

DFG MAK: 4 mg[Al]/m^3, total dust; 1.5 mg[Al]/m^3, respirable fraction; Pregnancy risk Group D.

Australia: TWA 10 mg/m^3, 1993; Australia: TWA 2 mg/m^3 (salts), 1993; Australia: TWA 5 mg/m^3 (fumes); TWA 5 mg/m^3 (resp. dust); MAK 6 mg/m^3, dust, 1999; Belgium: TWA 10 mg/m^3; TWA 2 mg/m^3 (salts); TWA 5 mg/m^3 (fumes), 1993; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Denmark: TWA 10 mg/m^3, dust or fume, 1999; Finland: TWA 2 mg/m^3 (salts), 1993; France: VME 10 mg/m^3; VME 5 mg/m^3 (fumes); VME 5 mg/m^3 (resp. dust), 1993; Hungary: STEL 5 mg/m^3; TWA 2 mg/m^3; STEL 4 mg/m^3 (salts), 1993; Norway: TWA 5 mg/m^3, 1999; Russia: STEL 2 mg/m^3, 1993; Sweden: NGV 4 mg/m^3 (resp. dust); NGV 10 mg/m^3 (total dust), 1999; Switzerland: MAK-W 6 mg/m^3, 1999; United Kingdom: TWA 4 mg/m^3, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3 (welding fumes-total particulates). Several states have set guidelines or standards for aluminum in ambient air[60]: 10 mg/m^3, total dust; 5 mg/m^3, respirable fraction (California), 3 mg/m^3 (Virginia), 4 mg/m^3 (Connecticut), 10 mg/m^3 (North Dakota), 23.8 mg/m^3 (Nevada), 10 mg/m^3.

Aluminum oxide

ACGIH 10 mg/m^3; Not suspected as a human carcinogen (for total dust containing no asbestos and less than 1% crystalline silica).

DFG MAK: 1.5 mg[Al]/m^3 [(fume) respirable fraction (previously "fine dust")] 4 mg[Al]/m^3 [(fume) inhalable fraction (previously "total dust")] Pregnancy Risk Group D; BAT: 200 μg[Al]/L in urine, end-of-shift.

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 5 mg/m^3, dust, 1999; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 10 mg[Al]/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 2 mg[Al]/m^3, 1999; Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 16 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Sweden: TWA 4 mg[Al]/m^3 (respirable dust); TWA 10 mg[Al]/m^3 (total dust), 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: TWA 10 mg/m^3, total inhalable dust; TWA 4 mg/m^3, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: For alumina dusts use NIOSH Analytical Method #0500, total dusts, #0600, OSHA Analytical Method ID-109SG, ID-198SG. For aluminum, metal, powder, coated, and uncoated use NIOSH Analytical Method #7013, #7300, #7301, #7303, OSHA Analytical Method #ID-121. For aluminum, pyrophoric powders and welding fumes use NIOSH Analytical Method #7300, #7301, and #7303. For aluminum, soluble salts and alkyls use NIOSH Analytical Method #7013, #7300, #7301, #7303, OSHA Analytical Method #ID-12.

Permissible Concentration in Water: Under the Safe Drinking Water Act, secondary MCLs = 0.05–0.2 mg/L. Mexican drinking water criteria is 0.02 mg/L. In addition, guidelines for aluminum in drinking water have been set[61] ranging from 1430 μg/L (Maine) to 5000 μg/L (Kansas).

Routes of Entry: Inhalation, eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Aluminum dust can cause irritation, and particles can scratch the eyes. Aluminum oxide can irritate the eyes, nose, and respiratory tract. Particles of aluminum deposited in the eye may cause necrosis of the cornea. Salts of aluminum may cause dermatoses, eczema, conjunctivitis, and irritation of the mucous membranes of the upper respiratory system by the acid liberated by hydrolysis. The effects on the human body caused by inhalation of aluminum dust and fumes are not known with certainty at this time. Present data suggest that pneumoconiosis might be a possible outcome. In the majority of causes investigated, however, it was found that exposure was not only due to aluminum dust but also due to a mixture of aluminum, silica fume, iron dusts, and other materials.

Long Term Exposure: There is evidence of an increase in bladder, lung, and other cancers among aluminum smelter workers. The increase appears to be due to polycyclic aromatic compound (PAC) exposure, not to aluminum compounds. Aluminum salts are toxic to the animal fetus and cause fetal damage. Exposure to fine dust from aluminum or aluminum oxide can cause lung damage, pneumonia, and pulmonary fibrosis, with symptoms of coughing, wheezing, and shortness of breath. Very high levels of aluminum may cause brain damage.

Points of Attack: Skin, respiratory system.

Medical Surveillance: Preemployment and periodic physical examinations should give special consideration to the skin, eyes, and lungs. Lung function should be followed, including chest X-ray, pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Actual working conditions will determine the need and type of personal protective equipment. Determine CPC based on working conditions. Dust masks are recommended in areas exceeding the nuisance levels. Aluminum workers generally should receive training in the proper use of personal protective equipment. Workers involved with salts of aluminum may require protective clothing, barrier creams, and where heavy concentrations exist, full face air supplied respirators may be indicated. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.

Storage: Prior to working with this chemical you should be trained on its proper handling and storage. Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Keep aluminum powder dry and isolate from acids, caustics, chlorinated hydrocarbons, oxidizers, and combustible materials. Store both metal and oxide in tightly closed containers in a cool, well-ventilated area, protected from physical damage.

Shipping: Aluminum powder, uncoated, requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.4 and Packing Groups II. Aluminum powder, coated, requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group II or III. For pyrophoric metals the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall into Hazard Class 4.2 and Packing Group I.

Spill Handling: For aluminum metal spills, special care must be taken with aluminum powder which may be very reactive. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not use water to clean up spilled aluminum powder. Do not raise dust level by sweeping. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. May be disposed of as an inert solid in a landfill.

Fire Extinguishing: With aluminum metal, do not use water or halogenated agents. Aluminum powder is a combustible solid. Aluminum oxide is not flammable. Use dry chemical, carbon dioxide, foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal of Aluminum Oxide-Disposal in a sanitary landfill. Mixing of industrial process wastes and municipal wastes at such sites is not encouraged however. Aluminum powder may be recovered and sold as scrap. Recycling and recovery is a viable option to disposal for aluminum metal and aluminum fluoride (A-57).

EC Number: 231-208-1 [*Annex I Index No.:* 013-003-00-7]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade) (*anhydrous*).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

FDA—over-the-counter drug.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

US EPA Gene-Tox Program, Positive: *In vivo* cytogenetics—nonhuman bone marrow.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R34; Safety phrases: S1/2; S7/8; S28; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Aluminum chloride is a noncombustible but highly reactive whitish-gray, yellow, or green powder or liquid. Strong, acidic, irritating odor like hydrochloric acid. Sinks in water and reacts forming toxic and corrosive hydrogen chloride gas. Odor threshold = 6.31 ppm (as hydrogen chloride). Molecular weight = 133.34; Relative density = 2.5; Vapor pressure = 3×10^{-3} mmHg; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩ (water reactive).

Potential Exposure: Compound Description: Drug, Organometallic, Mutagen; Reproductive Effector; Hormone, Primary Irritant. It is used as ethylbenzene catalyst, dyestuff intermediate, and detergent alkylate; in making other chemicals and dyes, astringents, deodorants, in the petroleum refining, and the rubber industries.

Incompatibilities: Contact with air or water forms hydrochloric acid and hydrogen chloride gas. Reaction with water may be violent. Water, alcohol, and alkenes can cause polymerization. Incompatible with nitrobenzene, organic material, and bases. Attacks metal in the presence of moisture, forming flammable hydrogen gas.

Permissible Exposure Limits in Air

As aluminum, soluble salts

OSHA PEL: None.

NIOSH REL: 2 mg[Al]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 9.88 mg/m^3

PAC-1: 9.88 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 2 mg[Al]/m^3, 1993; Belgium: TWA 2 mg [Al]/m^3, 1993; Denmark: TWA 2 mg[Al]/m^3, 1999; France: VME 2 mg[Al]/m^3, 1999; Norway: TWA 2 mg[Al]/m^3, 1999; Russia: TWA 2 mg[Al]/m^3, 1993; Sweden: NGV 2 mg[Al]/m^3, 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: TWA 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg[Al]/m^3.

Permissible Concentration in Water: An ambient water limit of 73 μg/L for aluminum compounds has been suggested by EPA[32] based on health effects.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to eyes, skin, and respiratory tract. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Ingestion can cause severe burns of mouth, throat, and stomach, vomiting, watery or bloody diarrhea, kidney damage, jaundice and liver damage, collapse and convulsions. Estimated lethal dose is about 8 oz for an average 150-lb adult.

Long Term Exposure: May cause pulmonary fibrosis and reduced lung function with symptoms of coughing, wheezing, and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquid or solid, wear indirect vent, splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: If dust levels are high, wear a dust mask. If hydrogen chloride is present, use: *Up to 50 ppm:* CcrS* (APF = 10) (any NIOSH/MSHA- or European Standard EN 149-approved chemical cartridge respirator with cartridge(s) providing protection against the compound of concern) or GmFS (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern] or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard. Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry area in tightly closed container away from moisture, heat, and sunlight.

Shipping: Both anhydrous and solution require a shipping label of "CORROSIVE." The anhydrous form falls in Packing Group II, and the solution in Packing Group III. Both anhydrous and solution fall in DOT/UN Hazard Class 8.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Sweep carefully, being careful not to raise dust. Do not get water inside containers;

keep combustibles away. For liquid aluminum chloride, absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Do not use water or water-based foams; will form poisonous fumes of hydrochloric acid. On solid material use any extinguishing medium suitable for surrounding fire. On solution, use dry chemical, carbon dioxide, or polymer foam extinguishers. Poisonous gases are produced in fire, including hydrochloric acid, aluminum oxide, and nitrogen oxides. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be sprayed with aqueous ammonia in the presence of ice and, when reaction is complete, flushed down drain with running water.[22]

Aluminum fluoride A:0680

Molecular Formula: AlF_3

Synonyms: Aluminum fluoride, anhydrous; Aluminum fluorure (French); Aluminum trifluoride; Fluoruro aluminico hidratado (Spanish)

CAS Registry Number: 7784-18-1

RTECS® Number: BD0725000

UN/NA & ERG Number: UN3077/171

EC Number: 232-051-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act: Regulated chemical (47 FR 9352).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as aluminum, water soluble salts.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Aluminum fluoride is a white, odorless powder or granule. Molecular weight = 83.98; Specific gravity = 2.88 at 25°C; Freezing/Melting point = 1291°C. Boiling point = 1537°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Used as component of electrolyte from which aluminum metal is produced; in the manufacture of ceramics, enamels, aluminum silicate; as flux in metallurgy; as a fermentation inhibitor.

Incompatibilities: Reacts violently with potassium or sodium.

Permissible Exposure Limits in Air

As aluminum soluble salts

OSHA PEL: None.

NIOSH REL: 2 mg/m^3 aluminum, soluble salts.

ACGIH TLV®[1]: 1 mg[Al]/m respirable fraction.

As fluorides

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC)

TEEL-0: 6.23 mg/m^3

PAC-1: 6.23 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction; [skin]; Peak Limitation Category I(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

European OEL: 2.5 mg[F]/m^3 (2004).

NIOSH IDLH: 250 mg[F]/m^3.

As aluminum, soluble salts

OSHA PEL: None.

NIOSH REL: 2 mg[Al]/m^3 TWA.

Permissible Concentration in Water: Fluoride is a safe drinking water act regulated chemical (47FR9352, 56FR 3594); MCL = 4.0 mg/L; MCLG = 4.0 mg/L; SMCL = 2.0 mg/L. The state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, cutaneous absorption.

Harmful Effects and Symptoms

Short Term Exposure: This chemical irritates eyes, skin, and respiratory tract. Skin and eye contact can cause severe burns. Inhalation can cause nose and throat irritation, with possible nose bleeding.

Long Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath, phlegm. This chemical may cause asthma-like allergy, and may lead to dense but brittle bones. It may also lead to stiffening of the joints.

Points of Attack: Lungs, bones, joints.

Medical Surveillance: NIOSH lists the following tests for fluorides, inorganic: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and post-shift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3*: Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) * *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from sodium, potassium, and glass.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.

Spill Handling: Avoid contact with dust. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aluminum fluoride is not combustible. Poisonous gases, including fluorines, are produced in fire. Do not use water as flammable hydrogen gas if formed. Use any extinguishing agent suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Neutralize with soda ash; add slaked lime; let stand for 24 h. Transfer sludge to sewage facility.

Aluminum nitrate A:0690

Molecular Formula: $AlH_{18}N_3O_{18}$

Common Formula: $AlN_3O_9 \cdot 9H_2O$

Synonyms: Aluminum nitrate, nonahydrate; Aluminum(III) nitrate, nonahydrate (1:3:9); Aluminum trinitrate nonahydrate; Nitrato aluminico (Spanish); Nitric acid, aluminum salt; Nitric acid, aluminum(3 +) salt; Nitric acid, aluminum(III) salt

CAS Registry Number: 13473-90-0; 7784-27-2 (nonahydrate)

RTECS® Number: BD1040000

UN/NA & ERG Number: UN1438/140

EC Number: 236-751-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Aluminum nitrate is an odorless, white crystalline solid, often in liquid solution. Molecular weight = 375.98; Boiling point = 135°C (decomposes); Freezing/Melting point = 70–74°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water; solubility = about 65 g/100 mL at 25°C.

Potential Exposure: Aluminum nitrate is used in tanning leather; as an antiperspirant, as a corrosion inhibitor, in the extraction of uranium and as a nitrating agent.

Incompatibilities: Aluminum nitrate is a strong oxidizer; avoid contact with flammable or combustible materials; and reducing agents. In solution this chemical is a strong acid; avoid contact with bases. Explosions may occur when aluminum nitrate is shocked or exposed to heat.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 15.8 mg/m^3

PAC-1: 15.8 mg/m^3

PAC-2: 15.8 mg/m^3

PAC-3: 75 mg/m^3

Nonahydrate

TEEL-0: 27.8 mg/m^3

PAC-1: 27.8 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 500 mg/m^3

As aluminum soluble salts

OSHA PEL: None.

NIOSH REL: 2 $mg[Al]/m^3$ TWA.

Permissible Concentration in Water: An ambient water level of 73 μg/L for aluminum compounds has been suggested by EPA[32] based on health effects.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact may cause permanent damage. High exposures can cause unconsciousness. Prolonged contact can cause skin disorders. Ingestion can cause stomach cramps, nausea, blue skin, weakness, and possible blood problems due to formation of methemoglobin. The oral LD_{50} for rats is 264 mg/kg.

Long Term Exposure: Repeated contact can cause skin problems and eczema. This chemical is a corrosive, and it may cause lung problems.

Points of Attack: Respiratory system, eyes, skin, gastric system.

Medical Surveillance: Lung function tests. A qualified allergist should be consulted if skin problems occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Aluminum nitrate poisoning requires special first aid and antidote.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin contact. Rubber or Neoprene™ gloves will offer some hand protection. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly capped or sealed containers in a cool, well-ventilated area away from combustible materials, heat, or flame. Protect containers from physical shock. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: The required shipping label is "OXIDIZER." It falls into DOT/UN Hazard Class 5.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Sweep into a beaker. Dilute by adding slowly to water. Add soda ash then neutralize with HCl. Flush to sewer with large volume of water.[24] Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable *per se*. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or water spray. Vapors are heavier than air and will collect in low areas. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See Spill Handling above.

Aluminum orthophosphate A:0700

Molecular Formula: $AlPO_4$; AlO_4P

Synonyms: Aluminophosphoric acid; Aluminum acid phosphate; Aluminum monophosphate; Aluminum phosphate; Aluphos; Fosfato aluminico (Spanish); Monoaluminum phosphate; Ortofosfato de alumino (Spanish); Phosphalugel; Phosphoric acid, aluminum salt (1:1), solution

CAS Registry Number: 7784-30-7

RTECS® Number: TB6450000

UN/NA & ERG Number: UN3260 (Corrosive solid, acidic, inorganic, n.o.s.)/154

EC Number: 232-056-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada: On DSL List; no WHMIS classification.

European/International Regulations: Hazard Symbol: C; Risk phrases: R34; Safety phrases: S/24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Aluminum orthophosphate is a white crystalline solid which is often used in liquid or gel form. Molecular weight = 121.94; Freezing/Melting point ≥1450°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Used as a flux in ceramics; in dental cements; in the manufacture of special glasses, paints and varnishes, cosmetics; making pulp and paper; as an antacid.

Incompatibilities: A strong oxidizer; keep away from combustible materials. Violent reaction with reducing agents and strong bases.

Permissible Exposure Limits in Air
As aluminum soluble salts
OSHA PEL: None.
NIOSH REL: 2 mg/m^3.
ACGIH TLV®[1]: withdrawn.
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 100 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3

Permissible Concentration in Water: An ambient water level of 73 μg/L for aluminum compounds has been suggested by EPA[32] based on health effects.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Aluminum phosphate can affect you when breathed in. Aluminum phosphate is a corrosive substance. It can cause severe burns of the eyes and skin on contact. Exposure to the liquid or dust can irritate the eyes, nose, throat, and bronchial tubes. Fine powder can irritate the lungs.

Long Term Exposure: Can irritate the lungs, causing bronchitis with coughing, shortness of breath, and phlegm.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 2 mg/m^3 of aluminum, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases and combustible materials, such as wood, paper, and oil.

Shipping: Aluminum phosphate is not specifically cited in DOT regulations. However, aluminum phosphate solutions are covered under "CORROSIVE SOLID, ACIDIC, INORGANIC, N.O.S. or CORROSIVE LIQUID, ACIDIC, INORGANIC, N.O.S."[19] and labeled "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Restrict persons not wearing protective equipment from area of spill until cleanup is complete. Ventilate area of spill or leak. Collect spilled material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing aluminum phosphate in vermiculite, dry sand, earth or similar material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aluminum Phosphate is nonflammable. Poisonous gases, including phosphine, are produced in fire. Use dry chemical powder extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Aluminum phosphide is a pyrophoric, dark-gray or dark-yellow crystalline solid. Molecular weight = 57.95; Freezing/Melting point ≥ 1000°C; Specific gravity: 2.85 at 25°C. Decomposes in water, forming poisonous and flammable phosphine gas. NFPA-704 Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2, Water reactive; dangerous when wet.
Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Human Data. Used as a rodenticide; wood preservative; as a source of phosphine; as an insecticidal fumigant for grain, peanuts, processed food, animal feed, leaf tobacco, cottonseed; and as space fumigant for flour mills, warehouses, and railcars. Used in semiconductor research.
Incompatibilities: Forms explosive phosphine gas on contact with moisture in air. Reacts violently with water, steam, carbon dioxide, acids, alcohols, and foam fire extinguishers. Contact with water and bases slowly releases flammable phosphine gas. Can ignite spontaneously in air.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 0.442 ppm
PAC-1: 0.442 ppm
PAC-2: **2.0** ppm
PAC-3: **3.6** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
As aluminum soluble salts
OSHA PEL: None.
NIOSH REL: 2 mg/m^3 aluminum, soluble salts.
Routes of Entry: Inhalation, ingestion.
Harmful Effects and Symptoms
Acute toxicity occurs primarily by the inhalation route when aluminum phosphide decomposes into the toxic gas, phosphine. The human median lethal dose for aluminum phosphide has been reported to be 20 mg/kg. Rated as super toxic: probable oral lethal dose is less than 5 mg/kg or less than 7 drops for a 70-kg (150 lb) person. Symptoms of phosphine gas poisoning include restlessness, headache, dizziness, fatigue, nausea, vomiting, coma, convulsions, lowered blood pressure, pulmonary edema, respiratory failure, and disorders of the kidney, liver, heart, and brain may be observed. LD_{50} (oral, male rat) = 13.9 mg/kg.
Short Term Exposure: A severe health hazard. Irritates the eye, skin, and respiratory tract. Inhalation can cause lung irritation with coughing, wheezing, and shortness of breath. Affects metabolism and the central nervous system; exposure can lead to death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.
Long Term Exposure: May cause lung, kidney, and liver damage. May be able to cause skin rash or eczema.
Points of Attack: Central nervous system, liver, kidney, lungs.
Medical Surveillance: Lung, liver, kidney, and nervous system function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 2 mg/m^3 (aluminum), use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed, or where any potential for exposures to Phosphine gas exist, use a NIOSH/MSHA- or European Standard EN149-approved gas mask (Approval number TC-14-98) equipped with a canister offering protection against phosphine, chlorine, hydrogen sulfide, organic vapors, acid gases, and dusts and mists. If the potential for exposure to more than 15 ppm of phosphine gas exists, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. See Phosphine entry.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Prior to working with aluminum phosphide you should be trained on its proper handling and storage. Store in a noncombustible, nonsprinklered building or location, in tightly closed containers in a cool well-ventilated area away from all forms of moisture and strong acids. Aluminum phosphide decomposes in water, forming phosphine gas. Consult the entry on Phosphine for more information.

Shipping: Aluminum phosphide requires a shipping label of "DANGEROUS WHEN WET, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 4.3 and 6.3 (subsidiary) and Packing Group I.[19, 20]

Spill Handling: Shut off ignition; no flares, smoking, or flames in hazard area. Do not touch spilled material. Do not get water on spilled material or inside container. Dike spill for later disposal. Blanket release with dry sand, clay, or ground limestone. Shovel small spill into clean, dry container, and cover. Move containers from spill area. Avoid breathing dust. Wear appropriate protective clothing and use appropriate respiratory protection. Cover large powder spill with plastic sheet or tarp to minimize spreading. Clean up only under supervision of an expert. DOT warns that this chemical is spilled in water: Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.2/1.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 2000/600
Then: Protect persons downwind (miles/kilometers)
Day 3.6/5.8
Night 7.0 + /11.0 +

Fire Extinguishing: This chemical is a combustible solid. Poisonous gases are produced in fire, including phosphorus oxides and aluminum fumes. Do not use water or water-based foam, as phosphine gas is formed. Small fires can be extinguished with dry chemical, soda ash, clay, or ground limestone, or use an approved Class D extinguisher. *Large fires:* withdraw from area and let fire burn. Move container from fire only if you can do it without risk. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Wear self-contained breathing apparatus when fighting fires involving this material. If contact with the material is anticipated, wear full protective clothing.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Allow to react slowly with moisture in the open, being sure that phosphine gas evolved is dissipated. Alternatively, mix with dry diluent and incinerate at temperature above 1000°C with effluent gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Aluminum sulfate A:0730

Molecular Formula: $Al_2S_3O_{12}$
Common Formula: $Al_2(SO_4)_3$
Synonyms: Alum; Aluminum alum; Aluminum sulphate; Aluminum trisulfate; Cake alum; Diaaluminum trisulfate; Dialuminum sulfate; Paper maker's alum; Sulfate d'aluminium (French); Sulfato aluminico (Spanish); Sulfuric acid, aluminum salt; Sulphuric acid, aluminum salt
CAS Registry Number: 10043-01-3
RTECS® Number: BD1700000
UN/NA & ERG Number: UN3264 (solution)
EC Number: 233-135-0
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Reportable Quantity (RQ): 5000 lb (2270 kg).[4]
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Aluminum sulfate is a white powder, often used in water solution. The solution is a strong acid. Molecular weight = 342.12; Freezing/Melting point = 770°C (decomposes, forming corrosive sulfur trioxide). Soluble in water.
Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data; Primary Irritant. Widely used in the paper industry, in waste and water treatment and treating sewage; in antiperspirants, deodorants; in flame retardants; in tanning leather, sizing paper; mordant in dyeing, purifying water, waterproofing cloth, clarifying oils and fats; in agricultural pesticides; manufacturing aluminum salts and others.
Incompatibilities: In aqueous solution, aluminum sulfate forms sulfuric acid; reacts with bases and many other substances. Corrodes metals in the presence of moisture.
Permissible Exposure Limits in Air
As aluminum soluble salts
OSHA PEL: None.
NIOSH REL: 2 mg/m^3 aluminum, soluble salts.
Protective Action Criteria (PAC)
TEEL-0: 12.7 mg/m^3
PAC-1: 12.7 mg/m^3
PAC-2: 12.7 mg/m^3
PAC-3: 150 mg/m^3
Permissible Concentration in Water: An ambient water level of 73 μg/L for aluminum compounds has been suggested by EPA[32] based on health effects.
Routes of Entry: Inhalation, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: Aluminum sulfate powder can irritate the eyes, skin, and respiratory tract. It is capable of causing eye damage. Ingestion of large doses can cause stomach irritation, nausea, and vomiting.
Long Term Exposure: Aluminum sulfate may cause skin disorders; and may cause lung problems.
Points of Attack: Lungs, skin.
Medical Surveillance: Lung function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquid wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with solid or powder wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any concentrations above 2 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a

pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus). Wear a dust mask.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Aluminum sulfate powder should be kept dry since it forms sulfuric acid when wet.

Shipping: Aluminum sulfate is not specifically cited in DOT regulations. However, aluminum sulfate solutions are covered under "CORROSIVE LIQUID, ACIDIC, INORGANIC, N.O.S."[19] and labeled "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Sweep up or vacuum powdered material being careful not to raise dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable. Poisonous gases, including sulfur oxides, are produced in fire. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. When involved in fire, wear goggles and self-contained breathing apparatus and rubber clothing including gloves.[41]

Disposal Method Suggested: Pretreatment involves hydrolysis followed by neutralization with NaOH. The insoluble aluminum hydroxide formed is removed by filtration and can be heated to decomposition to yield alumina which has valuable industrial applications. The neutral solution of sodium sulfate can be discharged into sewers and waterways as long as its concentration is below the recommended provisional limit of 250 mg/L.

Ametryn A:0740

Molecular Formula: $C_9H_{17}N_5S$

Synonyms: Ametrex; Amyphyt; Cemerim; Doruplant; EPA pesticide code 080801; 2-Ethylamino-4-isopropylamino-6-methylmercarpo-*s*-triazine; 2 Ethylamino-4-isopropylamino-6-methylthio triazine; 2-Ethylamino-4-isopropylamino-6-methylthio-1,3,5-triazine; Evik®; Gesapax®; 2-Methylmercapto-4-ethylamino-6-isopropylamino-*s*-triazine; 2-Methylmercapto-4-isopropylamino-6-ethylamino-*s*-triazine; 2-Methylthio-4-ethylamino-6-isopropylamino-*s*-triazine

CAS Registry Number: 834-12-8

RTECS® Number: XY9100000

UN/NA & ERG Number: UN2763 (triazine, pesticides, solid, toxic)/151

EC Number: 212-634-7 [*Annex I Index No.:* 613-010-00-0]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.5 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R50/53; Safety phrases: S2; S36; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ametryn, a triazine compound, is a colorless powder; Freezing/Melting point = 84−86°C; Vapor pressure = 2.7×10^{-6} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water; solubility = 200 mg/L at 20°C.

Potential Exposure: Those involved in the manufacture, formulation, and application of this selective herbicide.
Incompatibilities: Triazines are incompatible with nitric acid.
Permissible Concentration in Water: The No-Adverse-Effect-Level (NOAEL) has been found to be 100 mg/kg/day and on that basis a 10-day health advisory of 8.6 mg/L was determined for a 10-kg child. If, however, one assumes an NOAEL of 10 mg/kg/day one arrives at a long-term health advisory of 0.86 mg/L for a 70-kg adult. The lifetime health advisory for an adult is 0.06 mg/L using a NOAEL of 10.
Determination in Water: Extraction with methylene chloride may be followed by gas chromatography using a nitrogen phosphorus detector. The detection limits are in the range of 0.1−2.0 μg/L. Fish Tox: 989.94257000 ppb MATC (VERY LOW).
Routes of Entry: Ingestion, skin.
Harmful Effects and Symptoms
Short Term Exposure: Ametryn is an eye and skin irritant. It is mildly toxic by skin contact. Poisonous if swallowed or inhaled.
Long Term Exposure: It apparently causes liver degeneration. The LD_{50} value for male Charles River rats was 1207 mg/kg and 1543 mg/kg for female rats. Human Tox: 60.00000 ppb Health Advisory (LOW).
Points of Attack: Liver.
Medical Surveillance: Liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Where there is no NIOSH REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids.
Shipping: Triazine pesticides, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and in Packing Group III.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid inhalation of dust; wear respirator. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Granular activated carbon will remove ametryn from water. Soil Adsorption Index (K_{oc}) = 300.
Fire Extinguishing: Poisonous gases are produced in fire, including carbon monoxide. Wear positive-pressure self-contained breathing apparatus when fighting fires involving this herbicide. Avoid breathing dusts and fumes from burning material. Keep upwind. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Use extinguishing agents suitable for surrounding fire or dry chemical, carbon dioxide, or alcohol foam. Use water in flooding quantities as fog.
Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

2-Aminoanthraquinone A:0750

Molecular Formula: $C_{14}H_9NO_2$
Common Formula: $C_6H_4(CO)_2C_6H_3NH_2$
Synonyms: AAQ; 2-Amino-9,10-aminoanthraquinone; 2-Amino-9,10-anthracenedione; β-Aminoanthraquinone; Aminoantraquinona (Spanish); β-Anthraquinonylamine
CAS Registry Number: 117-79-3
RTECS® Number: CB5120000
UN/NA & ERG Number: UN3143 (dye intermediates, solid, toxic, n.o.s.)/151
EC Number: 204-208-4
Regulatory Authority and Advisory Bodies
Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat; IARC: Animal Limited Evidence; Human No Adequate Data; Group 3, 1987; NTP: Reasonably anticipated to be a human carcinogen.
US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat.
CERCLA/SARA 313: Form R *de minimis* Concentration Reporting Level: 0.1%.
California Proposition 65 Chemical: Cancer 10/1/89.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: 2-Aminoanthraquinone forms red or orange-brown needle-shaped crystalline solid. Molecular weight = 223.24; Freezing/Melting point = 302−306°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Boiling point = sublimes. Insoluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen. 2-Aminoanthraquinone is used as a dye intermediate; in the industrial synthesis of anthraquinone and pharmaceuticals. It is the precursor of five dyes and one pigment, including Color Index Vat Blues 4, 6, 12, and 24; Vat Yellow 1; and Pigment Blue 22. Because AAQ is used on a commercial scale solely by the dye industry, the potential for exposure to the compound is greatest for workers at dye manufacturing facilities. However, no additional data are available on the number of facilities using AAQ. The Consumer Product Safety Commission staff believes that trace amounts of unreacted AAQ may possibly be present in some dyes based on this chemical and in the final consumer product. Exposure even to trace amounts may be a cause for concern. This concern is based on experience with other dyes derived from aromatic amines.
Incompatibilities: Strong oxidizing and/or reducing agents.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 7.5 mg/m^3
PAC-1: 25 mg/m^3
PAC-2: 150 mg/m^3
PAC-3: 500 mg/m^3
Determination in Air: NIOSH Analytical Method #5013, Dyes.
Routes of Entry: Inhalation and skin contact.
Harmful Effects and Symptoms
Technical grade 2-aminoanthraquinone (impurities unspecified), administered in the feed, was carcinogenic in male Fisher "344" rats, causing a combination of hepatocellular carcinomas and neoplastic nodules of the liver. The compound was also carcinogenic in B6C3F1 mice, causing hepatocellular carcinomas in both sexes and malignant hematopoietic lymphomas in females. An IARC: working group considered that the evidence for the carcinogenicity in experimental animals of the material tested was limited. In view of another evaluation of NCl bioassay results, the evidence can be considered as sufficient.
Short Term Exposure: Irritates eyes and skin.
Long Term Exposure: A confirmed carcinogen in animals; causes liver and lymph system cancer. May cause mutations.
Medical Surveillance: This chemical may cause cancer. There are no specific tests. However, if illness occurs or overexposure is suspected, medical attention is recommended.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or

European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area away from strong oxidizers.

Shipping: Dye intermediates, solid, toxic, n.o.s. must be labeled “POISONOUS/TOXIC MATERIALS.” They fall into Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in vapor-tight, sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This chemical is a solid, toxic, organic, n.o.s. should be labeled “POISONOUS/TOXIC MATERIALS.” This material falls in DOT/UN Hazard Class 6.1 and Packing Group I.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NCI:

IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1998; NTP: Reasonably anticipated to be a human carcinogen.

CERCLA/SARA 313: Form R *de minimis* Concentration Reporting Level: 1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1.

California Proposition 65 Chemical: Cancer 7/1/87.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R43; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Aminoazotoluene forms golden yellow or reddish-brown crystalline solid. Molecular weight = 225.31; Freezing/Melting point = 101.7°C; Vapor Pressure = 7.5×10^{-7} mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 7.64 mg/L at 25°C.

Potential Exposure: Used in dyes, medicines; as a colorant in shoe polishes and other wax-based polishes.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category: 2; Germ Cell Mutagen Group 3B (2006).

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.89 (estimate).

Harmful Effects and Symptoms

Stated to be moderately toxic by several routes.[44]

Long Term Exposure: A known animal carcinogen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This chemical is a solid, toxic, organic, n.o.s. should be labeled "POISONOUS/TOXIC MATERIALS." This class of materials falls in DOT/UN Hazard Class 6.1 and Packing Group I.[19, 20]

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical: Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4-Aminobiphenyl is a combustible, colorless to tan crystalline solid that turns purple on exposure to air. May be used in a liquid solution. Floral odor. Molecular weight = 169.24; Freezing/Melting point = 49°C; Boiling point = 302°C; Autoignition temperature = 450°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Human Data. 4-Aminobiphenyl is no longer manufactured commercially and is only used for research purposes. 4-Aminobiphenyl was formerly used as a rubber antioxidant and as a dye intermediate. Is a contaminant in 2-aminobiphenyl.

Incompatibilities: Strong oxidizers, strong acids, and acid anhydrides.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

Protective Action Criteria (PAC)

TEEL-0: 3.5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 200 mg/m^3

NIOSH IDLH: Not determined. Potential occupational carcinogen.

ACGIH TLV®[1]: [skin] Confirmed Human Carcinogen.

DFG MAK: [skin] Carcinogen Category 1.

Australia: [skin] carcinogen, 1993; Austria: carcinogen, 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3 [skin] carcinogen, 1999; France: VME 0.001 ppm (0.007 mg/m^3), 1 carcinogen, 1999; Norway: TWA 0.1 mg/m^3, 1999; Sweden: carcinogen, 1999; Switzerland: [skin], carcinogen, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Several states have set guidelines or standards for 4-aminobiphenyl in ambient air[60]: zero for North Dakota, New York, and South Carolina; 0.8 μg/m^3 (Pennsylvania); 4.0 μg/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (II-4) #P&CAM 269, OSHA Analytical Method 93.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient water limit of 200 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.8$.

Routes of Entry: Inhalation and percutaneous absorption.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Irritates the skin. Exposure may cause methemoglobinemia, which interferes with the blood's ability to carry oxygen. This can cause headache, dizziness, fatigue, fast heart rate, blue color of the lips and skin. Higher levels can cause difficult breathing, collapse and death.

Long Term Exposure: 4-Aminobiphenyl is a known human bladder carcinogen. An exposure of only 133 days has been reported to have ultimately resulted in a bladder tumor and blood in the urine. The latent period is generally 15−35 years. Acute exposure produces headaches, lethargy, cyanosis, urinary burning, and hematuria. Cystoscopy reveals diffuse hyperemia, edema, and frank slough.

Points of Attack: Bladder, skin, blood.

Medical Surveillance: OSHA mandates the following: *Increased Risk*; Reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; NIOSH lists the following tests: cystoscopy, urine (chemical/metabolite), urinalysis (routine). Blood test for hemoglobin levels. Placement and periodic examinations should include an evaluation of exposure to other carcinogens; use of alcohol, smoking, and medications; and family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations. Blood methemoglobin level. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. These are designed to supplement engineering controls (such as the prohibition of open-vessel operations) and to prevent all skin or respiratory contact. Full-body protective clothing and gloves should be used by those employed in handling operations. Full-face supplied-air respirators of continuous-flow or pressure-demand type should also be used. On exit from a regulated area, employees should shower and change into street clothes, leaving their clothing and equipment at the point of exit to be placed in impervious containers at the end of the work shift for decontamination or disposal. Effective methods should be used to clean and decontaminate gloves and clothing.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in accordance with OSHA Standard 1910.1011. Storage area should be marked, regulated, and maintained under negative pressure. Keep away from heat and sources of ignition, oxidizers.

Shipping: This chemical is a solid, toxic, organic, n.o.s. should be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover spills with dry lime or soda ash and collect powdered material, then collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal devices.[22]

2-Amino-4-chlorophenol A:0790

Molecular Formula: C_6H_6ClNO

Common Formula: $HOC_6H_3(NH_2)Cl$

Synonyms: 2-Amino-4-clorofenol (Spanish); *p*-Chloro-*o*-aminophenol

CAS Registry Number: 95-85-2

RTECS® Number: SJ5700000

UN/NA & ERG Number: UN2673/151

EC Number: 202-458-9

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Amino-4-chlorophenol is a grayish to light brown crystalline solid or powder. Molecular weight = 143.57; Freezing/Melting point = 134−140°C; Autoignition temperature = 500°C. Insoluble in water; solubility = <0.1 g/100 mL at 20°C.

Potential Exposure: Used as a chemical raw material, especially in dye manufacture.

Incompatibilities: Keep away from oxidizers, iron, moisture, and temperatures above 43°C.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if inhaled or ingested. Exposure can lower the ability of the blood to carry oxygen. This can result in a bluish color to the skin and lips, headaches, dizziness, collapse, and even death.

Long Term Exposure: Unknown at this time.

Points of Attack: Blood.

Medical Surveillance: Test for blood hemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area way from iron, moisture, and temperatures above 110°C.

Shipping: DOT/UN label required is "POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 2-Amino-4-chlorophenol may burn, but does not readily ignite. Poisonous gases are produced in fire, including chlorides and nitrogen oxides. Use dry chemical, CO_2, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

2-Amino-5-diethylaminopentane A:0800

Molecular Formula: $C_9H_{22}N_2$

Synonyms: *N*,*N*-Diethyl-1,4-pentanediamine; Novoldiamine; Tetramethylenediamine, *N*,*N*-diethyl-4-methyl-

CAS Registry Number: 140-80-7

RTECS® Number: SA0242000

UN/NA & ERG Number: UN2946/153

EC Number: 205-435-1

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2-Amino-5-diethylaminopentane is a light yellow, flammable liquid with a fishy odor. Molecular weight = 158.32; Flash point = 68°C. Boiling point = 200°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Used in the manufacture of quinacrine and other antimalarials having the same basic side chain.

Incompatibilities: Contact with oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: May cause irritation of the nose and throat. Contact with the eyes or skin may cause severe irritation and burns. Passes through the skin; exposure may be increased.

Long Term Exposure: Allergy can develop. Future exposures, even if low, can cause rash and itching. Very irritating substance; may injure the lungs.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to 2-Amino-5-Diethyl Aminopentane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved, self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where 2-amino-5-diethyl aminopentane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 2-Amino-5-diethyl aminopentane is a flammable liquid. Poisonous gas, including nitrogen oxides, is produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerator with scrubber for nitrogen oxides absorption.

2-(2-Aminoethoxy)ethanol A:0810

Molecular Formula: $C_4H_{11}NO_2$

Synonyms: 2-Aminoethyoxyethanol; DGA; Diglycolamine; Ehhanol, 2-(2-aminoethioxy)-

CAS Registry Number: 929-06-6

RTECS® Number: KJ6125000

UN/NA & ERG Number: UN3055/154

EC Number: 213-195-4

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2-(2-Aminoethoxy)ethanol is a combustible, colorless, thick liquid with a fish-like odor. Molecular weight = 105.15; Boiling point at 1 atm = 243°C[C]; Melting/Freezing point = −78°C[C]; Specific gravity = 1.028 at 25°C[C]; Relative vapor density (air = 1) = 3.59[C]; Latent heat of vaporization = (estimate) 4.85×10^5 J/kg[C]; Heat of combustion = (estimate) -287×10^5 J/kg[C]; Heat of solution = (estimate) -0.1×10^5 J/kg[C]; Vapor pressure = 0.001 mmHg at 20°C (approx.)[C]; Flash point = 127°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used to remove gases from natural gas; in coatings in plastics; textiles, fibers, and metals; and in making other chemicals.

Incompatibilities: Reacts with oxidizers, strong acids, and chemically active metals, such as potassium, sodium, magnesium, and zinc.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 12.5 mg/m^3

PAC-1: 35 mg/m^3

PAC-2: 250 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: No numerical value established. Data may be available.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical is highly corrosive. Contact can severely irritate and burn the eyes and skin. Inhalation can irritate the respiratory tract and lungs, causing shortness of breath, coughing, and wheezing. Higher exposures can cause pulmonary edema, a medical emergency. This can cause death.

Long Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath, phlegm.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL:* (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: 2-(2-Aminoethoxy) ethanol should be labeled "CORROSIVE MATERIAL." It falls into DOT/UN Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 2-(2-Aminoethoxy)ethanol may burn, but does not readily ignite. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam to extinguish fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

3-Amino-9-ethylcarbazole A:0820

Molecular Formula: $C_{14}H_{14}N_2$; $C_{14}H_{14}N_2 \cdot ClH$ (hydrochloride)

Synonyms: 3-Amino-*N*-ethylcarbazole; 3-Amino-9-ethylcarbazole HCl (hydrochloride); NCI-C03043 (hydrochloride)

CAS Registry Number: 132-32-1; 6109-97-3 (hydrochloride); 57360-17-5 (hydrochloride)

RTECS® Number: FE3590000; FE3675000 (hydrochloride)

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 205-057-7

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Animal Positive (hydrochloride).

California Proposition 65 Chemical: (*hydrochloride*) Cancer 7/1/89.

European Directive 67/548/EEC: May cause cancer. Toxic if swallowed.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 3-Amino-9-ethylcarbazole is a tan, crystalline compound. The hydrochloride is a bluish-green powder. Molecular weight = 210.3; Freezing/Melting point = 99°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. The hydrochloride forms blue-green crystals.

Potential Exposure: Plant workers engaged in the manufacture of this compound and its use in pigment manufacture. Laboratory workers using this material in colorimetric enzyme assays and as a biological stain.

Permissible Exposure Limits in Air

No standards or TEEL available.

DFG MAK: Germ Cell Mutagen Group 3B.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if swallowed.

Long Term Exposure: Suspected carcinogen and mutagen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place. Protect from exposure to air.

Shipping: The material may be classified as TOXIC SOLIDS, ORGANIC, N.O.S. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and HCl (for the hydrochloride). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Regulatory Authority and Advisory Bodies

DOT Appendix B, §172.101.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R61; R34; R43; R62; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Aminoethylethanolamine is a combustible, colorless, liquid with an ammonia-like odor. A strong base [pH (10 M) = 12.3] Molecular weight = 104.2; Specific gravity = 1.0254 at 25°C; Boiling Point: 243°C; Vapor Pressure: 8.17×10^{-4} mmHg at 25°C; Vapor pressure = 0.01 mmHg at 20°C; Flash point = 132°C; Autoignition temperature = 368°C. Explosive limits: LEL = 1.0%, UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Highly soluble in water.

Potential Exposure: Used to make textile finishing compounds, dyes, resins, rubber, insecticides, medicines, and other chemicals.

Incompatibilities: Contact with cellulose nitrate may cause fires upon contact. Reacts with oxidizers, strong acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 12.5 mg/m^3
PAC-1: 35 mg/m^3
PAC-2: 250 mg/m^3
PAC-3: 500 mg/m^3

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < -1.50$.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can severely irritate and burn the eyes and skin; this can lead to permanent damage. Inhalation can irritate the respiratory tract and lungs, causing shortness of breath, coughing, and wheezing. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath, phlegm. May cause skin allergy. If allergy develops, very low future exposure can cause itching and skin rash.

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function tests. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Evaluation by a qualified allergist may diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL:* (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical should be labeled "CORROSIVE." It falls into DOT/UN Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aminoethylethanolamine is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol-resistant foam to extinguish fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location,

use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

DOT Appendix B, §172.101.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C, N; Risk phrases: R21/22; R34; R43; R52/53; Safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *N*-Aminoethylpiperazine is a combustible and corrosive aliphatic amine. It is a colorless to light yellow liquid. Molecular weight = 129.2; Boiling point = 222°C; Melting/Freezing point = − 17.8; Flash point = 93°C; Autoignition temperature = >300°C; Vapor pressure = 0.076 mmHg at 20°C; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Very soluble in water.

Potential Exposure: Used as an epoxy curing agent and making pharmaceuticals; synthetic fibers, and other chemicals.

Incompatibilities: Solution is a strong base. Incompatible with nonoxidizing mineral acids, strong acids, organic acids, acid chlorides, acid anhydrides, organic anhydrides, isocyanates, chloroformates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution, strong oxidizers. Contact with copper alloys, zinc, or galvanized steel may cause violent reaction.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 2.5 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can severely irritate and burn the eyes and skin (can cause second- and third-degree burns); this can lead to permanent damage. Inhalation can irritate the respiratory tract and lungs, causing shortness of breath, coughing, and wheezing. Exposure can cause headache, nausea, and vomiting. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung irritation, the development of bronchitis, with coughing, shortness of breath, phlegm. Mutation data reported.

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function tests. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear indirect vent, impact and splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL:* (any NIOSH/MSHA- or European Standard

EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: *N*-Aminoethylpiperazine should be labeled "CORROSIVE MATERIAL." It falls into DOT/UN Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence, Human No Adequate Data, Group 2B; NCI: Animal Positive; NTP: Reasonably anticipated to be a human carcinogen.

CERCLA/SARA Section 313, Form R *de minimis* Concentration Reporting Level: 0.1%.

California Proposition 65 Chemical: Cancer 10/1/89.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 1-Amino-2-methylanthraquinone is a red crystalline substance or powder. Molecular weight = 237.27; Freezing/Melting point = 205−206°C. Practically insoluble in water; solubility = <1 mg/mL at 20°C.

Potential Exposure: 1-Amino-2-methylanthraquinone is used almost exclusively as a dye intermediate for the production of a variety of anthraquinone dyes. The Society of Dyers and Colorists reported that it can be used as a dye for a variety of synthetic fibers, especially acetates, as well as wool, sheepskins, furs, and surface dyeing of thermoplastics. None of the dyes that can be prepared from it are presently produced in commercial quantities. 1-Amino-2-methylanthraquinone had been produced commercially in the United States since 1948, but production was last reported by one company in 1970. The potential for exposure is greatest among workers engaged in the dyeing of textiles. 1-Amino-2-methylanthraquinone is not presently used in consumer products according to the CPSC.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Routes of Entry: Inhalation, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may irritate the eyes and skin.

Long Term Exposure: There is evidence that this chemical causes liver and kidney cancer. A mutagen. Technical-grade 1-amino-2-methylanthraquinone (impurities unspecified), administered in the feed, was carcinogenic in Fischer 344 rats, inducing hepatocellular carcinomas in rats of both sexes, and kidney tumors (such as tubular-cell adenomas and adenocarcinomas) in males.

Points of Attack: Liver, kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Should be stored in a refrigerator in a tightly closed container under an inert atmosphere.[52]

Shipping: The material may be classified as Toxic solids, organic, n.o.s. They require a label, "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: rat: positive, mouse: negative. TSCA 40CFR704.225.

California Proposition 65 Chemical: Cancer 1/29/99.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex I (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4-Amino-2-nitrophenol is a dark red crystalline or reddish-purple solid. Molecular weight = 154.12; Freezing/Melting point = 125−131°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = <1 mg/mL at 21°C.

Potential Exposure: In dye formulation for furs and hair.

Incompatibilities: Strong oxidizers, mineral acids, strong bases. It is unknown if this nitro compound is explosive; some are flammable and explosive, and the contact with alkali increases thermal sensitivity of these materials.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: [skin] Carcinogen Category 3B.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Routes of Entry: Inhalation of dust; eye and/or skin contact.

Harmful Effects and Symptoms

Severe eye irritant in rabbits. A suspected carcinogen. LD_{50} (oral, rat) = 1.470 mg/kg.

Short Term Exposure: Poisonous if swallowed or upon skin contact. Irritates eyes and may irritate skin and respiratory tract.

Long Term Exposure: May be carcinogenic in humans. Similar compounds can cause chronic poisoning with fatigue, headache, dizziness, insomnia, cyanosis, anemia, and weight loss. May result in liver and kidneys damage, with toxic hepatitis and fatty degeneration of the kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in cool dry place away from air and from mineral acids and bases.[52]

Shipping: Dyes, solid, toxic, n.o.s. [or] Dye intermediates, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone to avoid airborne dust and remove to sealed containers for disposal.[52] Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Aminophenols A:0870

Molecular Formula: C_6H_7NO

Common Formula: $C_6H_4(OH)(NH_2)$

Synonyms: *ortho-isomer:* 2-Amino-1-hydroxybenzene; *o*-Hydroxyaniline

meta-isomer: 3-Amino-1-hydroxybenzene; 3-Hydroxyaniline

para-isomer: 4-Amino-1-hydroxybenzene; *p*-Hydroxyaniline

CAS Registry Number: 95-55-6 (*o*-isomer); 591-27-5 (*m*-isomer); 123-30-8 (*p*-isomer); 27598-85-2 (mixed isomers)

RTECS® Number: SJ4950000 (*o*-isomer); SJ4900000 (*m*-isomer); SJ5075000 (*p*-isomer)

UN/NA & ERG Number: UN2512 (aminophenols)/152

EC Number: 202-431-1 [*Annex I Index No.:* 612-033-00-3] (*o*-isomer); 209-711-2 [*Annex I Index No.:* 612-127-00-4] (*m*-isomer); 204-616-2 [*Annex I Index No.:* 612-128-00-X] (*p*-isomer)

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (*m*-, *o*-, *p*-isomers).

TSCA CFR721.5820.

European/International Regulations: Hazard Symbol (*o-isomer*): Xn; Risk phrases: R20/22; R68; Safety phrases: S28; S36/37; (*m*-isomer): Hazard Symbol: Xn, N; Risk phrases: R20/22; R51/53; Safety phrases: S2; S28; S61.

(*p*-isomer): Hazard Symbol: Xn, N; Risk phrases: R20/22; R50/53; R68; Safety phrases: S2; S28; S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*o*-isomer); 3—Highly water polluting (*p*-isomer).

Description: *o*-Aminophenol appears as colorless needles or as white crystalline substance turning brown on exposure to air. Molecular weight = 109.13; Boiling point = 164°C (sublimes); Freezing/Melting point = 170−174°C. Soluble in water. *p*-Aminophenol is a white or reddish yellow crystalline substance. Molecular weight = 109.14; Freezing/Melting point = 190°C (decomposes). Boiling point = 284°C. Slightly soluble in water. *m*-Aminophenol is a white crystalline substance. Molecular weight = 143.57; Freezing/Melting point = 122−123°C. Hazard Identification (based on NFPA-704 M Rating System) (*mixed isomers*): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Workers may be exposed to *o*-Aminophenol during its use as a chemical intermediate, in the manufacture of azo and sulfur dyes, and in the photographic industry. There is potential for consumer exposure to *o*-Aminophenol because of its use in dyeing hair, fur, and leather. The compound is a constituent of 75 registered cosmetic products suggesting the potential for widespread consumer exposure. *p*-Aminophenol is used mainly as a dye and dye intermediate and as a photographic developer; and in small quantities in analgesic drug preparation. Consumer exposure to *p*-aminophenol may occur from use as a hair dye or as a component in cosmetic preparations. *m*-Aminophenol is used mainly as a dye intermediate.

Incompatibilities: Strong oxidants.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: Danger of sensitization of the skin.

Permissible Concentration in Water: Russia[43] has set MAC values in water used for domestic purposes. The value for *o*-aminophenol is 0.01 mg/L and for *p*-aminophenol is 0.05 mg/L.

Routes of Entry: Inhalation, ingestion, and skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Aminophenols can be absorbed through the skin, thereby increasing exposure. Can cause lung irritation. Poisonous if swallowed. These chemicals lower the blood's ability to carry oxygen (methemoglobinemia). This condition causes a bluish color to the skin and lips, headaches, dizziness; higher exposures can result in unconsciousness and death. Irritates eyes, skin, and respiratory tract. Skin contact can cause burning sensation and rash. The *o*-isomer can affect the nervous system. *o*-Aminophenol has an oral LD_{50} for rats of 1300 mg/kg and *p*-aminophenol has produced LD_{50} values in rats of 375, 671, and 1270 mg/kg which are all of low acute toxicity. The oral LD_{50} in rats for *m*-aminophenol is 1000 mg/kg. May produce dermatitis, methemoglobinemia, bronchial asthma, and restlessness.

Long Term Exposure: Prolonged or repeated contact can cause blood damage, skin disorders, and liver, kidney, and brain damage. Aminophenols may cause mutations, and there is limited teratogenic evidence. Skin allergy or asthma may develop; future exposures, even in low doses can cause symptoms to occur.

Points of Attack: Blood, liver, kidneys, brain, skin, and lungs.

Medical Surveillance: Blood methemoglobin level; lung function tests. Evaluation by a qualified allergist. Any person who develops asthma from these aminophenols should avoid all future contact with them.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Aminophenols must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur.

Shipping: The DOT/UN label requirement for *o*-, *m*-, and *p*-aminophenols is "POISONOUS/TOXIC MATERIALS." The aminophenols fall in Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Keep dust under control. Use a vacuum or wet method to reduce dust during cleanup. Do not sweep. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Aminophenols may burn, but do not readily ignite. Use dry chemical, CO_2, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 200-209-9

Regulatory Authority and Advisory Bodies

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Developmental/ Reproductive toxin (female) 7/1/87.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Aminopterin is a white to yellow powder; commonly used as the dihydrate which forms clusters of yellow needles. Molecular weight = 440.46; Melting point: 228–235°C; 260–265°C; Vapor pressure = 2.3×10^{-19} mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health -, Flammability 1, Reactivity 0. Soluble in water; solubility = 3.0 × 103 mg/L at 25°C.

Potential Exposure: Aminopterin is used as a medicine (as a folic acid antagonist), rodenticide, and agricultural chemical.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 25 mg/m^3

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Acts as antimetabolite; antagonizes the utilization of folic acid by the body. Highly toxic by ingestion. Has an LD_{low} = (oral-rat) 2.5 mg/kg.

Long Term Exposure: A mutagen and a questionable carcinogen. Listed as a developmental and reproductive toxicant by the state of California (Proposition 65). NIOSH has listed it as a suspected neurotoxin; liver and skin toxin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Storage temperature: 2–8°C. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: The DOT/UN regulations do not set out any specific label requirements or maximum shipping quantities for this chemical. However, this material may be classified as Toxic solids, organic, n.o.s. They require a label, "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Do not create dust. Use a vacuum and water spray to reduce vapors. *Small wet spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: 2-Aminopyridine is a flammable, colorless crystalline solid, or white leaflets or powder, or colorless liquid with a characteristic odor. Molecular weight = 91.13; Freezing/Melting point = 58°C; Boiling point = 211°C; Flash point = 68°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Highly soluble in water; solubility = 10−50 mg/mL at 19°C.
Potential Exposure: Compound Description: Human Data. 2-Aminopyridine is used in the manufacture of pharmaceuticals; especially antihistamines.
Incompatibilities: Strong oxidizers.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 3.85 mg/m^3
OSHA PEL: 0.5 ppm/2 mg/m^3 TWA
NIOSH REL: 0.5 ppm/2 mg/m^3 TWA
ACGIH TLV®[1]: 0.5 ppm/2 mg/m^3 TWA
NIOSH IDLH: 5 ppm
No TEEL available.
DFG MAK: No numerical value established. Data may be available.
Australia: TWA 5 ppm (2 mg/m^3), 1993; Austria: MAK 0.5 ppm (2 mg/m^3), 1999; Belgium: TWA 0.5 ppm (2 mg/m^3), 1993; Denmark: TWA 0.5 ppm (2 mg/m^3), 1999; Finland: TWA 0.5 ppm (2 mg/m^3); STEL 1.5 ppm (6 mg/m^3), 1999; France: VME 0.5 ppm (2 mg/m^3), 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; the Philippines: TWA 0.5 ppm (2 mg/m^3), 1993; Poland: MAC (TWA) 2 mg/m^3, 1999; Switzerland: MAK-W 0.5 ppm (2 mg/m^3), 1999; United Kingdom: TWA 0.5 ppm (2 mg/m^3); STEL 2 ppm (7.8 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm. Several states have set guidelines or standards for 2-aminopyridine in ambient air[61]: 0.5 ppm (2 mg/m^3) TWA (California), 2 mg/m^3 (North Dakota), 3 mg/m^3 (Virginia), 4 mg/m^3 (Connecticut), 4.8 mg/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Method (II-4) #S-158.
Permissible Concentration in Water: No criteria set.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.22$.
Routes of Entry: Inhalation, ingestion, eye, and skin contact (absorption through the skin).
Harmful Effects and Symptoms
Headaches, dizziness, excited state, nausea, flushed appearance, high blood pressure, respiratory distress, weakness, convulsions, stupor.
Short Term Exposure: LD_{50} = (oral-rat) 0.2 g/kg. Skin contact contributes significantly to overall exposure. Irritates eyes, skin, and respiratory tract. Inhalation or skin exposure can cause a fatal reaction that begins with a headache, dizziness, heaviness, and weakness of the limbs, and may progress to convulsions, stupor, and coma.
Long Term Exposure: May cause lung allergy.
Points of Attack: Central nervous system, respiratory system.
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Interview for brain effects including recent memory loss, change in mood, concentration, headache, listless feeling, altered sleep patterns. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *up to 5 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece

and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere[52] or store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Aminopyridines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group II.[19−21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use water spray to reduce dust or vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Dike *large spills*. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with nitrogen oxides removal from effluent gas.

4-Aminopyridine A:0900

Molecular Formula: $C_5H_6N_2$

Synonyms: 4-Aminopiridina (Spanish); γ-Aminopyridine; *p*-Aminopyridine; Amino-4-pyridine; Avitrol; 4-Pyridinamin; 4-Pyridylamine; VMI 10-3

CAS Registry Number: 504-24-5

RTECS® Number: US1750000

UN/NA & ERG Number: UN2671(aminopyridines)/153

EC Number: 207-987-9

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P008.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4-Aminopyridine is white to tan or brown crystalline material. Odorless. Molecular weight = 94.12; Specific gravity: 1.2607 at 25.3°C; Boiling point = 274°C; Freezing/Melting point = 155−158°C; Flash point = 164°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Moderately soluble in water.

Potential Exposure: Used as a chemical intermediate in pharmaceuticals, as an agricultural chemical for field crops, and as a bird repellent and poison.

Incompatibilities: Sodium nitrite, strong oxidizers. Avoid contact with acid anhydrides, acid chlorides, and strong acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) 504-24-5

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 20 mg/m^3

Permissible Concentration in Water: No criteria set. Harmful to aquatic life in very low concentrations.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.28$.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 21 mg/kg. May be fatal if swallowed or absorbed through the skin. Symptoms of exposure include rapid onset of disagreeable taste, immediate burning of throat, and abdominal discomfort; in addition, weakness, dizziness, disorientation, and seizures may occur. Delayed symptoms of oral ingestion include elevated liver enzymes and respiratory arrest. Material may be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes. Material affects neural transmission. In sufficient concentration, material may cause metabolic acidosis, respiratory arrest, and cardiac arrhythmias. The fatal dose to a 70-kg person is about 5 g.

Long Term Exposure: High exposure or repeated exposure may cause liver damage.

Points of Attack: Central nervous system, liver.

Medical Surveillance: Preemployment and regular physical examinations with emphasis on central nervous system. Liver function tests. Persons exposed to *strychnine* or other chemicals capable of causing seizures are probably at increased risk.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *For reference, the information for 2-Aminopiridine follows:* Up to *5 ppm*: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Avoid contact with acid anhydrides, acid chlorides, strong acids, and strong oxidizers (such as halogens). Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Aminopyridines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group II.[19−21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce dust or vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Dike *large spills*. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for

firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with nitrogen oxides removal from effluent gas.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Amitrole is a colorless to off-white crystalline solid. Odorless when pure. Molecular weight = 84.10; Freezing/Melting point = 158−159°C; Specific gravity: 1.138 at 20°C; Vapor pressure = 4.4×10^{-7} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Highly soluble in water; solubility = 280 g/L at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector. Those involved in the manufacture, formulation, and application of this herbicide, which is now limited to noncrop applications as a herbicide and plant growth regulator. Some triazoles have been used as rubber components.

Incompatibilities: Strong oxidizers, strong acids, and light (decomposes). Corrosive to iron, aluminum, and copper.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.2 ppm TWA; suspected occupational carcinogen.

ACGIH TLV®[1]: 0.2 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: 0.2 ppm, inhalable fraction; ; Peak limitation Category II(8); Carcinogen Category 3B; Pregnancy Risk Group C.
Australia: TWA 0.2 mg/m^3, 1993; Austria: MAK 0.2 mg/m^3, 1999; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.2 mg/m^3, 1999; Finland: carcinogen, 1999; Switzerland: MAK-W 0.2 mg/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, 2003; Argentina, Bulgaria, Colombia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for amitrole in ambient air[60]: 0.2 mg/m^3 (California), 0.476 μg/m^3 (Kansas), 1.8 μg/m^3 (Pennsylvania), 2.0 μg/m^3 (North Dakota), 3000 μg/m^3 (Virginia).

Permissible Concentration in Water: No criteria set. Fish toxicity (threshold).

Determination in Water: Fish Tox = 12422.37656000 ppb MATC (VERY LOW). Octanol−water coefficient: Log $K_{ow} = < -0.6$.

Harmful Effects and Symptoms

Carcinogenicity is the primary observed effect. Amitrol is carcinogenic in mice and rats, producing thyroid and liver tumors following oral or subcutaneous administration. Railroad workers who were exposed to amitrole and other herbicides showed a slight (but statistically significant) excess of cancer when all sites were considered together. Because the workers were exposed to several different herbicides, however, no conclusions could be made regarding the carcinogenicity of amitrole alone.

Short Term Exposure: Amitrol can be absorbed through the skin, thereby increasing exposure.

Long Term Exposure: Causes liver, thyroid, and pituitary cancer in animals. May damage the developing fetus. May cause liver, thyroid gland (possible goiter or underactive thyroid), and pituitary gland damage. Human Tox = 0.30973 ppb CHCL (Chronic Human Carcinogen Level) (EXTRA HIGH).

Points of Attack: Liver, thyroid, and pituitary gland.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: Physical examination of the thyroid and thyroid function tests (T_4, TSH, and T_3). If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Pituitary gland function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Shipping: The DOT/UN label requirement for pesticides, solid, toxic, n.o.s. is "POISONOUS/TOXIC MATERIALS." Amitrole is a carcinogen. Packing Group I. The DOT/UN Hazard Class is 6.1.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Contain and isolate spill. Product residues and sorbent media may be packaged in epoxy-lined drums. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Amitrol is resistant to hydrolysis and the action of oxidizing agents. Burning the compound with polyethylene is reported to result in >99% decomposition.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade); *Theft hazard* 2.2 (≥30.00% concentration).

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

CERCLA/SARA Section 304 Reportable Quantity (RQ): 1 lb (0.454 kg).

Classified by EPA as a Restricted Use Pesticide (RUP).

US DOT 49CFR172.101, Inhalation Hazardous Chemical, as organophosphates.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amiton is a liquid organophosphate. Molecular weight = 269.38; Boiling point = 110°C at 0.2 mmHg; Vapor pressure = 0.01 mmHg at 80°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 1. Soluble in water.

Potential Exposure: Amiton is used as an acaricide and an insecticide; exposure may occur in manufacture and in application and use. VG has been used as a military nerve agent.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.3 mg/m^3

PAC-3: 3.3 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Danger—poisonous; can be fatal if swallowed, inhaled, or absorbed through the skin or eyes. This material is highly toxic orally. It is a cholinesterase inhibitor. The LD_{50} = (oral-rat) 5.4 mg/kg. The toxic effects are similar to parathion. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMB-4) have been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See entry on Parathion.

Respirator Selection: NIOSH: (*for Parathion*) *0.5 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTOvHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3:* Sa:Pd, Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." This material falls in DOT/UN Hazard Class 6.1.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate area of spill or leak. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

VG, when used as a weapon No Initial Isolation and Protective Action Distances have been assigned to amiton. This material is similar to parathion and may be considered a nerve agent.

Here, *for user reference*, is a sample of Initial Isolation and Protective Action Distances used for similar nerve agents:

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2

Night 0.1/0.2

Fire Extinguishing: Amiton is a combustible liquid. Poisonous gases, including nitrogen oxides, sulfur oxides, and phosphorus oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration. Hydrolysis may also be used.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 223-100-8

Regulatory Authority and Advisory Bodies

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

CERCLA/SARA Section 304 Reportable Quantity (RQ): 1 lb (0.454 kg).

Classified by EPA as a Restricted Use Pesticide (RUP).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations *not listed in Annex I: however, as an organophosphate, the following may apply*: Hazard Symbol: T+, N; Risk phrases R24; R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amiton oxalate is a crystalline solid. Molecular weight = 359.39; Freezing/Melting point = 98−99°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 1. Soluble in water.

Potential Exposure: Those involved in manufacture and application of this insecticide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 3 mg/m^3

PAC-3: 3 mg/m^3

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Amiton oxalate is a cholinesterase inhibitor. Symptoms include headache, giddiness, nervousness, blurred vision, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, miosis, tearing, salivation and other excessive respiratory tract secretion; vomiting, cyanosis, uncontrollable muscle twitching followed by muscular weakness; convulsions, coma, loss of reflexes, and loss of muscular control. LD_{50} = (oral-rat) 3 mg/kg.

Points of Attack: See entry on "Parathion" as referred to under "Amiton." Bear in mind that the oxalate is a solid whereas amiton is a high-boiling liquid.

Medical Surveillance: See entry on "Parathion" as referred to under "Amiton." Bear in mind that the oxalate is a solid whereas Amiton is a high-boiling liquid.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See entry on Parathion. Bear in mind that the oxalate is a solid whereas amiton is a high-boiling liquid.

Respirator Selection: NIOSH: (*for Parathion*) *0.5 mg/m³*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *1.25 mg/m³*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 mg/m³*: CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m³* Sa:Pd, Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. should be labeled "POISONOUS/TOXIC MATERIALS." It falls in Packing Group I and Hazard Class 6.1.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: Poisonous gases, including nitrogen oxides, sulfur oxides, and phosphorus oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. EC Number: 251-375-4 [*Annex I Index No.:* 612-086-00-2]

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA and California Proposition 65 (pending) suspected carcinogen.[13]

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Banned or Severely Restricted (Argentina, United States).[13]

CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.

California Proposition 65 Developmental/Reproductive toxin 3/3/99.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R43; R48/22; R50/53; Safety phrases: S2; S22; S24; S60; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amitraz forms colorless needle-like crystals. Liquid formulations may contain flammable organic solvents. Molecular weight = 293.45; Freezing/Melting point = 86−87°C; Vapor pressure = 2.6×10^{-6} mmHg. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector; Human Data. Those engaged in the manufacture, formulation, and application of this insecticide and acaricide. A rebuttable presumption against registration for amitraz was issued on April 6, 1977 by US EPA on the basis of oncogenicity.

Incompatibilities: Keep away from strong oxidizers and strong acids. Acids may render this material unstable.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria set. Fish toxicity: 2.00272 ppb, MATC (Maximum Acceptable Toxicant Concentration) (HIGH).

Harmful Effects and Symptoms

Amitraz metabolizes to 2,4-dimethylaniline which is a potential human carcinogen. A mouse oncogenic bioassay was conducted by Boots Chemical Company and reported by EPA; the results of that study have been disputed. Acute oral LD_{50} for rats is 800 mg/kg; for mice is greater than 1600 mg/kg.

Short Term Exposure: Poisonous if ingested or absorbed through the skin. Eye or skin contact can cause irritation. May affect the central nervous system causing dizziness and a lowering of consciousness.

Long Term Exposure: May affect the liver and central nervous system. Human toxicity (long term):1.75 ppb, Health Advisory (HIGH).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention

immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use only NIOSH/MSHA- or European Standard EN 149-approved air-purifying respirators for pesticides.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, away from fertilizers, seed, and other pesticides, flammable materials and sources of heat and flame. Do not reuse containers.

Shipping: Triazine pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." These materials fall in DOT/UN Hazard Class 6.1 and Packing Groups I or II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line). Soil Adsorption Index (K_{oc}) = 1000 Estimate.

Fire Extinguishing: Poisonous gases, including nitrogen oxides, are produced in fire. Small fires: dry chemical, carbon dioxide, water spray, or foam. Large fires: water spray, fog, or foam. Stay upwind; keep out of low areas. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Water polluting (anhydrous).

Description: Ammonia is a colorless, strongly alkaline, and extremely soluble gas with a pungent, suffocating odor. Odor threshold = 5.75 ppm. Molecular weight = 17.03. Boiling point = −33.35°C; Vapor pressure = 2070 kPa at 50°C; Flash point = (flammable gas); Autoignition temperature = 630°C. Explosive limits: LEL = 13%; UEL = 28%. Hazard Identification (based on NFPA-704 M Rating System): (*strong solution >27% <31% in water*) Health 4, Flammability 1, Reactivity 2d (*also:* highly corrosive); (*ammonia solution >10% <35% with density >0.880* at *15°C*) Health 3, Flammability 0, Reactivity 1. Anhydrous ammonia is a colorless, highly irritating gas at room temperature with a pungent, suffocating odor. Ammonia gas is lighter than air; hugs the ground when cool; and flammable at high concentrations and temperatures. Easily compressed, it forms a clear, colorless liquid under pressure. Floats and "boils" on water. Readily dissolves in water, forming ammonium hydroxide, an alkaline, corrosive solution. Poisonous, visible vapor cloud is produced.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Human Data. Ammonia is used as a nitrogen source for many nitrogen-containing compounds. It is used in the production of ammonium sulfate and ammonium nitrate for fertilizers; and in the manufacture of nitric acid, soda, synthetic urea, synthetic fibers, dyes, and plastics. It is also utilized as a refrigerant and in the petroleum refining and chemical industries. It is used in the production of many drugs and pesticides. Other sources of occupational exposure include the silvering of mirrors, gluemaking, tanning of leather, and around nitriding furnaces. Ammonia is produced as a by-product in coal distillation and by the action of steam on calcium cyanamide, and from the decomposition of nitrogenous materials.

Incompatibilities: Violent reaction with strong oxidizers and acids. Shock-sensitive compounds may be formed with gold, halogens, mercury, mercury oxide, and silver oxide. Fire and explosions may be caused by trimethylammonium amide, 1-chloro-2,4-dinitrobenzene, *o*-chloronitrobenzene, platinum, trioxygen difluoride, selenium difluoride dioxide, boron halides, mercury, chlorine, iodine, bromine, hypochlorites, chlorine bleach, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin, and aldehydes. Attacks some coatings, plastics, rubber, copper, brass, bronze, aluminum, steel, tin, zinc, and their alloys.

Permissible Exposure Limits in Air

OSHA PEL: 50 ppm/35 mg/m^3 TWA.

NIOSH REL: 25 ppm/18 mg/m^3 TWA; 35 ppm/27 mg/m^3 STEL.

ACGIH TLV®[1]: 25 ppm/17 mg/m^3 TWA; 35 ppm/24 mg/m^3 STEL.

Protective Action Criteria (PAC) ammonia*

TEEL-0: 25 ppm

PAC-1: **30** ppm

PAC-2: **160** ppm

PAC-3: **1100** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)
ERPG-1: 25 ppm
ERPG-2: 150 ppm
ERPG-3: 750 ppm
DFG MAK: MAK: 20 ppm/14 mg/m^3; Peak Limitation Category I(2); Pregnancy Risk Group: C (2006).
NIOSH IDLH: 300 ppm.
Arab Republic of Egypt: TWA 25 ppm (18 mg/m^3), 1993; Australia: TWA 25 ppm (18 mg/m^3); STEL 35 ppm, 1993; Austria: MAK 25 ppm (18 mg/m^3), 1999; Belgium: TWA 25 ppm (17 mg/m^3); STEL 35 ppm (24 mg/m^3), 1993; Denmark: TWA 25 ppm (18 mg/m^3), 1999; Finland: TWA 25 ppm (18 mg/m^3); STEL 40 ppm (30 mg/m^3), 1993; France: VME 25 ppm (18 mg/m^3), VLE 50 ppm (36 mg/m^3), 1999; the Netherlands: MAC-TGG 14 mg/m^3, 2003; India: TWA 25 ppm (18 mg/m^3); STEL 35 ppm (27 mg/m^3), 1993; Japan: 25 ppm (17 mg/m^3), 1999; Norway: TWA 25 ppm (18 mg/m^3), 1999; the Philippines: TWA 50 ppm (30 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3; MAC (STEL) 27 mg/m^3, 1999; Russia: TWA 25 ppm; STEL 20 mg/m^3, 1993; Sweden: NGV 25 ppm (18 mg/m^3), TGV 50 ppm (35 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (18 mg/m^3), KZG-W 50 ppm (36 mg/m^3), 1999; Thailand: TWA 50 ppm (35 mg/m^3), 1993; Turkey: TWA 25 ppm (35 mg/m^3), 1993; United Kingdom: TWA 25 ppm (18 mg/m^3); STEL 35 ppm (25 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 35 ppm. Several states have set airborne guidelines or standards for ammonia in ambient air[60]: 25 ppm (18 mg/m^3) TWA and STEL of 35 ppm (27 mg/m^3) (California), 0.024 mg/m^3 (Massachusetts), 0.042857 mg/m^3 (Kansas), 0.18−0.27 mg/m^3 (North Dakota), 0.25 mg/m^3 (Virginia), 0.36 mg/m^3 (Connecticut, Florida, New York, South Dakota), 0.429 mg/m^3 (Nevada, Wyoming), 2.7 mg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #6015, and #6016, OSHA Analytical Method ID-164; ID-188.

Permissible Concentration in Water: Russia[43] set a MAC of 2.0 mg/mL in water bodies used for domestic purposes and 0.05 mg/mL in water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin, and eye contact.

Harmful Effects and Symptoms

LC_{50} (inh/4 h, mice) = 2115 ppm.

Short Term Exposure: Eye or skin contact with ammonia can cause irritation, burns, frostbite (anhydrous), and permanent damage. Irritates the respiratory tract causing coughing, wheezing, and shortness of breath. Higher exposure can cause pulmonary edema, a medical emergency, that can be delayed for several hours and is life threatening. Exposure can cause headache, loss of sense of smell, nausea, and vomiting. *Inhalation:* Nose and throat irritation have been reported at 72 ppm after 5 min exposure. Exposures of 500 ppm for 30 min have caused upper respiratory irritation, tearing, increased pulse rate and blood pressure. Death has been reported after an exposure to 10,000 ppm for an unknown duration.

Skin: Solutions of 2% ammonia can cause burns and blisters after 15 min of exposure. These burns may be slow to heal. Anhydrous ammonia may cause skin to freeze. *Eyes:* Levels of 70 ppm (gas) have caused eye irritation. If not flushed with water immediately, contact with eye may cause partial or complete blindness. *Ingestion:* Ammonia will cause pain if swallowed and burning of the throat and stomach. May cause vomiting. One teaspoon of 28% aqua ammonia may cause death.

Long Term Exposure: Repeated exposure can cause chronic eye, nose, and throat irritation. Repeated lung irritation can result in bronchitis with coughing, shortness of breath, and phlegm. Levels of 170 ppm of ammonia vapor has caused mild changes in the spleens, kidneys, and livers of guinea pigs.

Points of Attack: Skin, respiratory system, eyes.

Medical Surveillance: Preemployment physical examinations for workers in ammonia exposure areas should be directed toward significant changes in the skin, eyes, and respiratory system. Persons with corneal disease, glaucoma, or chronic respiratory diseases may suffer increased risk. Periodic examinations should include evaluation of skin, eyes, respiratory system, and pulmonary function test to compare with baselines established at preemployment examination. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): butyl rubber gloves, suits, boots; Teflon™ gloves, suits, boots; Viton™ gloves, suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 hr** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min.): nitrile rubber gloves, suits, boots. Appropriate clothing should be worn to prevent any possible skin contact with liquids of >10% content or reasonable probability of contact with liquids of <10% content. Wear eye protection to prevent any potential for eye contact with liquids of $>10\%$ NH_3 content. Employees should wash immediately when skin is wet or contaminated with liquids of $>10\%$ content. Remove nonimpervious clothing immediately if wet or contaminated with liquids containing $>10\%$ and promptly remove if liquid contains $<10\%$ NH_3 are involved. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas- or splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *250 ppm*: CcrS* (APF = 10) (any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern) or Sa* (APF = 10) (any supplied-air respirator). *300 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS* (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern) or CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd, Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White stripe (*strong solution $>27\%$ $<31\%$*): Contact Hazard; not compatible with materials in solid white category. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferred. Inside storage should be in a cool, well-ventilated, noncombustible location, preferably with automatic monitoring systems, away from all possible sources of ignition. Separate from other chemicals, particularly oxidizing gases, chlorine, bromine, iodine, and acids.

Shipping: Shipped in tank cars, tank trucks, barges, and steel cylinders. Labeling and restrictions vary with concentration[19, 20]:

UN 3318 and UN 1005: Label For domestic: "INHALATION HAZARD; TOXIC GAS." For international: "POISON (TOXIC) GAS, CORROSIVE." Hazardous Class or Division for international: 2.3, subsidiary 2.2; For international: 2.3; subsidiary hazard 8.

Note: For other solutions, see Ammonium hydroxide (1336-21-6).

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Stop the flow of gas if it can be done safely. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and full protective clothing. If the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair the leak or allow the cylinder to empty. For small liquid spills, neutralize with hydrochloric acid. Wipe or mop or use water aspirator. Drain into sewer with sufficient water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Ammonia (used as a weapon): not listed in current DOT tables.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.4/2.3

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. Poisonous gases, including nitrogen oxides, are produced in fire. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Vapors may travel long distances to ignition sources and flash back. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. *Do not put water on liquid ammonia; will increase evaporation. Small fires:* dry chemical or carbon dioxide. *Large fires:* water spray, fog or foam. Apply water gently to the surface. Do not get water inside container. From a secure explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Isolate area until gas has dispersed.

Disposal Method Suggested: Dilute with water, neutralize with HCl and discharge to sewer. Recovery is an option to disposal which should be considered for paper manufacture, textile treating, fertilizer manufacture, and chemical process wastes.

Ammonium acetate A:0960

Molecular Formula: $C_2H_7NO_2$
Common Formula: CH_3COONH_4
Synonyms: Acetic acid, ammonium salt
CAS Registry Number: 631-61-8
RTECS® Number: AF3675000
UN/NA & ERG Number: UN3077/171
EC Number: 211-162-9

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg), 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 1.0%: Source of aqueous ammonia. Molecular weight 77.08. NH_3 Equivalent weight 22.09.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium acetate is a white crystalline solid with an acetic odor. Molecular weight = 77.08; Boiling point = Decomposes; Specific gravity = 1.17 at 20°C. Heat of solution = -0.13×10^5 J/kg; Freezing/Melting point = 114°C. Soluble in water.

Potential Exposure: Ammonium acetate is used as a chemical reagent; to make drugs, foam rubber, vinyl plastics, explosives; and to preserve meats.

Incompatibilities: Sodium hypochlorite, potassium chlorate; sodium nitrite; strong oxidizers; strong acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 2.5 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Can irritate the eyes, skin, and respiratory tract. Eye contact can cause burns and permanent damage. Inhalation can irritate the nose, throat, and lungs; high levels can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposures can cause lung irritation and the development of bronchitis with coughing, shortness of breath, and phlegm.

Points of Attack: Respiratory system, eyes, skin.
Medical Surveillance: Lung function tests. Consider chest X-ray following acute exposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wash thoroughly immediately after exposure to Ammonium Acetate.
Respirator Selection: Where there is the potential for exposure to ammonium acetate: SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from sodium hypochlorite, potassium chlorate, and sodium nitrite since violent reactions occur.
Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of “CLASS 9.” It falls in Hazard Class 9 and Packing Group III.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Ammonium Acetate may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including ammonia and oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ammonium arsenate a combustible, white powder or plate-like colorless crystal. Molecular weight = 176.03; Freezing/Melting point = (decomposes). Soluble in water.

Incompatibilities: Hydrogen gas forms highly toxic arsine gas on contact with inorganic arsenic.

Permissible Exposure Limits in Air

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen.

No TEEL available.

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/ end-of-shift; Carcinogen Category 1.

NIOSH IDLH: 5 mg[As]/m^3.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen.

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301, #7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact can contribute to overall exposure. Irritates eyes, skin, and respiratory tract. Eye contact may cause burns and permanent damage. Inhalation may irritate the nose and throat causing coughing and wheezing. Repeated exposures may cause an ulcer or hole in the cartilage dividing the inner nose and may lead to poor appetite, a metallic or garlic taste, nausea, vomiting, stomach pain, and diarrhea.

Long Term Exposure: May cause liver damage. Prolonged or repeated exposure may cause disturbed sleep, with a feeling of "pins and needles" and loss of coordination. While ammonium arsenate has not been identified as a carcinogen, arsenic and certain arsenic compounds have been determined to be carcinogens. This chemical should be handled with extreme care.

Points of Attack: Liver, central nervous system, eyes, skin.

Medical Surveillance: Liver function, nervous system, and skin tests. Urine tests for arsenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd, Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where ammonium arsenate is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Ammonium arsenate requires a shipping label of "POISONOUS/TOXIC MATERIALS." Ammonium arsenate is in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium arsenate is a combustible solid. Poisonous gases, including arsenic, ammonia, and nitrogen oxides are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ammonium bicarbonate A:0980

Molecular Formula: CH_5NO_3

Common Formula: NH_4HCO_3

Synonyms: ABC-Trieb; Acid ammonium carbonate; Acid ammonium carbonate, monoammonium salt; Ammonium hydrogen carbonate; Bicarbonato amonico (Spanish); Carbonic acid, monoammonium salt

CAS Registry Number: 1066-33-7

RTECS$^{®}$ Number: BO0860000

UN/NA & ERG Number: UN3077/171

EC Number: 213-911-5

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium bicarbonate is a white crystalline solid with a faint ammonia odor. Molecular weight 79.07; Boiling point = Decomposes; Freezing/Melting point = 107.5°C (if heated very rapidly, decomposition may start at 35−60°C); Heat of solution = 3.3×10^5 J/kg. Soluble in water; solubility = 17.4% at 20°C.

Potential Exposure: It is used in leavening for some baked goods, in baking powders and fire extinguishers, to make dyes and pigments, in the manufacture of porous plastics, and as an expectorant.

Incompatibilities: Contact with strong caustics, such as potassium hydroxide, or sodium hydroxide will cause the release of ammonia gas.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 2 mg/m^3
PAC-1: 6 mg/m^3
PAC-2: 40 mg/m^3
PAC-3: 200 mg/m^3

Harmful Effects and Symptoms
The dust can irritate skin, eyes, and mucous membranes. Higher concentrations can cause temporary blindness, pulmonary edema, and cyanosis. It can severely injure respiratory membranes with possible fatal results.

Short Term Exposure: Irritates eyes, skin, and respiratory tract.

Long Term Exposure: Prolonged or repeated exposure may cause lung damage.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from caustics (such as sodium hydroxide or potassium hydroxide) because ammonia gas is released.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium bicarbonate may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia gas and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank

discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be buried in a chemical waste landfill, if neutralized ammonium bicarbonate is amenable to treatment at a municipal sewage treatment plant.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 29.86.

European/International Regulations: Hazard Symbol: T, C; Risk phrases: R25; R34; Safety phrases: S1/2; S22; S26; S37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium bifluoride. Molecular weight = 57.04; Boiling point = 239.5°C; Melting/Freezing point = 125.6°C; Specific gravity = 1.5 at 20°C; Heat of solution = 3.59×10^5 J/kg is a white crystalline compound that is commonly found in solution. Molecular weight = 57.04; Boiling point = 239.5°C; Melting/Freezing point = 125.6°C; Specific gravity = 1.5 at 20°C; Heat of solution = 3.59×10^5 J/kg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: It is used as a sterilizer, in dairy and brewery operations, in ceramic, glass, and electroplating industries, and as a laundry sour.

Incompatibilities: Strong oxidizers, acids. In the presence of moisture, it corrodes concrete, metals, glass.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg [F]/m^3, 15 min. Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

NIOSH IDLH: 250 mg[F]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 3.75 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 375 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg[HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Fluorides (as F) may be collected on a filter and measured by an ion-specific electrode according to NIOSH Analytical Method 7902.[18]

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: The dust irritates and burns the eyes, skin, nose, throat, and lungs. Eye contact may cause permanent damage. Inhalation can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Between 1 teaspoonful and 1 oz may be fatal to humans by ingestion. Ingestion will in any case cause irritation of the mouth and stomach and can cause vomiting, convulsions, collapse, and acute toxic nephritis. If absorbed through the skin this chemical may cause added exposure.

Long Term Exposure: May cause chronic lung irritation and kidney and liver damage. Bronchitis may develop. Chronic exposure may cause weight loss, nausea, vomiting, weakness, shortness of breath.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), pelvic X-ray, sputum cytology, urine (chemical/metabolite), urine (chemical/metabolite) pre- and postshift, urinalysis (routine), complete blood count/differential. Intake of fluoride from natural sources in food or water should be known. In the case of exposure to fluoride dusts, periodic urinary fluoride excretion levels have been very useful in evaluating industrial exposures and environmental dietary sources.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95X* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:*100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine and fluorine) since highly poisonous hydrogen fluoride gas is released. Keep in plastic, rubber or paraffined containers (because it easily etches glass).

Shipping: Ammonium hydrogendifluoride, solid, requires a shipping label of "CORROSIVE MATERIAL" and for solutions is "CORROSIVE MATERIAL, POISON INHALATION HAZARD Zone A or B." The Hazard Class is 8 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium bifluoride may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen fluoride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be buried in a specially designated chemical landfill. Aqueous wastes may be reacted with an excess of lime followed by lagooning and by either recovery or land disposal of the separated calcium fluoride.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium bisulfite is a white crystalline solid or colorless to yellow solution. Molecular weight = 99.1; Melting/Freezing point = 150°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 26.7%.

Potential Exposure: Used as a preservative, in drilling fluids, making industrial explosives, hair waving and bleaching agents, for making other chemicals. A source of sulfur in liquid fertilizers.

Incompatibilities: Sulfites react explosively on contact with oxidizers. Reacts with acids, acid fumes, and water. Corrosive to metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

DFG MAK: Sensitizing substances*, as sulfites.*

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Ammonium bisulfite is highly corrosive. Eye and skin contact can cause severe irritation and burns with possible permanent damage. Inhalation can irritate the lungs, causing coughing and shortness of breath. Higher exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung damage.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits,

gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, water, combustible materials.

Shipping: Bisulfites, inorganic, aqueous solutions, n.o.s. require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Absorb liquid with sand, vermiculite, earth, or similar absorbent material and place into containers for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium bisulfite is noncombustible. Poisonous gases, including ammonia, sulfur oxides, and nitrogen oxides, are produced in fire. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate. It may be possible to dispose of waste material at a municipal facility if treated, neutralized, and oxidized.

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3, (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 99.10; NH_3 Equivalent weight: 21.81.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium carbamate is a colorless crystalline powder or white powder with an ammonia odor; Freezing/Melting point = about 60°C (sublimes). The odor threshold is 5 ppm as NH_3 (detection) and 46.8 ppm as NH_3 (recognition). Molecular weight = 78.07; Boiling point = 60°C; Heat of combustion: (estimate) at 25°C: −2612 Btu/lb; Heat of solution: (endothermic) 86.9 Btu/lb. Highly soluble in water.

Potential Exposure: It is used as a fertilizer and ammoniating agent.

Incompatibilities: Strong bases, strong oxidizers. Keep away from heat (forms urea), moisture, and direct sunlight.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.3 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 6 mg/m^3
PAC-3: 35 mg/m^3

Harmful Effects and Symptoms

Irritates skin, respiratory tract, and mucous membranes on contact.

Short Term Exposure: Exposure can irritate the eyes and skin, causing redness and tearing. Inhalation can irritate the nose and lungs with coughing and/or shortness of breath.

Long Term Exposure: Repeated or prolonged exposure can cause lung irritation and the development of bronchitis.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Lung function testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, moisture, and direct sunlight. See also Incompatibilities.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It is in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia, urea, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium carbonate A:1020

Molecular Formula: $CH_8N_2O_3$

Common Formula: $(NH_4)_2CO_3$

Synonyms: Ammoniumcarbonat (German); Carbonato amonico (Spanish); Carbonic acid, ammonium salt; Carbonic acid, diammonium salt; Crystal ammonia; Diammonium carbonate; Hartshorn; Sal volatile

CAS Registry Number: 506-87-6
RTECS® Number: BP1925000
UN/NA & ERG Number: UN3077/171
EC Number: 208-058-0
Regulatory Authority and Advisory Bodies
Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3, (same as CERCLA).
Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) NH_3 Equivalent molecular weight: 35.45.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium carbonate is a colorless crystal or white lumpy powder with a strong ammonia odor. The odor threshold is <5 ppm as ammonia gas. Molecular weight: 96.09; Freezing/Melting point = 58°C and volatilizes at about 60°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: It is used in dyeing, tanning, medicines, fire extinguishers and in making casein glue, ammonia salts, and baking powders. A laboratory reagent.

Incompatibilities: Acids, acid salts, salts of iron and zinc, alkaloids, calomel, and tartar emetic. Keep cool, below 38°C.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.75 mg/m^3
PAC-1: 2.5 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 75 mg/m^3

Routes of Entry: Inhalation, ingestion, eye and skin contact.
Harmful Effects and Symptoms
Short Term Exposure: Contact can irritate eyes and nose. Breathing Ammonium Carbonate can irritate the nose, throat, and lungs, causing a cough and difficulty in breathing.
Long Term Exposure: May cause lung problems.
Points of Attack: Lungs, eyes, skin.
Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from temperatures above 38°C.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of “CLASS 9.” It falls in Hazard Class 9 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Slowly deposit in a large container of water. Add excess amounts of soda ash and let stand for 24 h. Decant to another container, neutralize with hydrochloric acid, and drain with an excess of water. Ship to landfill.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 53.49; NH_3 Equivalent weight: 31.38.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R36; Safety phrases: S2; S22 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium chloride is a white crystalline solid. Odorless. Molecular weight = 53.50; Boiling point = 520°C; Freezing/Melting point = 338°C (sublimes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water; solubility = 37%.

Potential Exposure: Compound Description: Drug, Mutagen, Human Data; Primary Irritant. Ammonium chloride is used as an industrial chemical, pharmaceutical, and veterinary drug; to make dry batteries; in galvanizing; and as a soldering flux.

Incompatibilities: Acids, alkalis, and silver salts.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: (fume) 10 mg/m^3 TWA; 20 mg/m^3 STEL.

ACGIH TLV®[1]: (fume) 10 mg/m^3 TWA; 20 mg/m^3 STEL

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 20 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 10 mg/m^3; STEL 20 mg/m^3 (fume), 1993; Denmark: TWA 10 mg/m^3, 1999; Russia: STEL 10 mg/m^3 (fume), 1993; United Kingdom: TWA 10 mg/m^3 (fume) STEL 20 mg/m^3 (fume), 2000; Belgium: TWA 10 mg/m^3; STEL 20 mg/m^3 (fume), 1993; France: VME 10 mg/m^3 (fume), 1999; Poland: TWA 10 mg/m^3; STEL 20 mg/m^3 (vapors and fumes), 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 20 mg/m^3, fume. Several states have set guidelines or standards for ammonium chloride in ambient air[60]: 0.1 mg/m^3 (North Dakota), 0.15 mg/m^3 (Virginia), 0.2 mg/m^3 (Connecticut, South Dakota), 0.238 mg/m^3 (Nevada) to 0.25 mg/m^3 (South Carolina).

Determination in Air: Collection on a filter and colorimetric analysis.

Permissible Concentration in Water: Russia[43] set a MAC of 1.2 mg/L in water for fishery purposes. May be toxic to aquatic organisms.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ammonium chloride is an eye, skin, and respiratory system irritant with a low-grade systemic toxicity by ingestion.

Points of Attack: Skin, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. Any barrier that will prevent contamination from the dry chemical. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked everyday before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, alkalis, and silver salts. Protect against physical damage.[17]

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia, chlorine gas, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves addition of sodium hydroxide to liberate ammonia and form the soluble sodium salt. The liberated ammonia can be recovered and sold. After dilution to the permitted provisional limit, the sodium salt can be discharged into a stream or sewer.[22]

Ammonium chloroplatinate A:1040

Molecular Formula: $Cl_6H_8N_2Pt$

Common Formula: $(NH_4)_2PtCl_6$

Synonyms: Ammonium platinic chloride; Diammonium hexachloroplatinate(2-); Diammonium hexachloroplatinate (VI); Platinate(2-), platinic ammonium chloride

CAS Registry Number: 16919-58-7

RTECS® Number: BP5425000

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

EC Number: 240-973-0 [*Annex I Index No.:* 078-008-00-9]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

Dropped from CERCLA/SARA EHS listing in 1988.

European/International Regulations: Hazard Symbol: T; Risk phrases: R25; R41; R42/43; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium chloroplatinate is an orange-red crystalline cubic solid or yellow powder which decomposes when heated. Molecular weight = 443.5. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1. Soluble in water; solubility = 0.7 g/100 mL at 15°C.

Potential Exposure: It is used in photography, platinum plating, and in the manufacture of platinum sponge.

Incompatibilities: This material is unstable and potentially explosive. Incompatible with alkali, acids, and strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.002 mg[Pt]/m^3 TWA.

NIOSH REL: 0.002 mg[Pt]/m^3 TWA.

ACGIH TLV®[1]: 10.002 mg[Pt]/m^3 TWA.

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.

NIOSH IDLH: 4 mg [Pt]/m^3.

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye and skin irritation can cause irritation and burns. Inhalation can cause respiratory tract irritation, causing coughing and shortness of breath. First symptoms are pronounced irritation of the nose and upper respiratory passages, with sneezing, running of eyes, and coughing. Later, "asthmatic syndrome," with cough, tightness of chest, wheezing, and shortness of breath develops. It is toxic by inhalation or ingestion. Toxic concentrations for inhalation are 0.9 μ/min. LD$_{50}$ = (oral-rat) 195 mg/kg.

Long Term Exposure: Platinum salts can cause asthma-like allergy and skin allergy. Symptoms begin during exposure and grow worse with chronic exposure.

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. Like treatment for other platinum salts remove victim to fresh air and give oxygen. Nasal washing to remove salts is recommended. In case of skin or eye contact, irrigate with water immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration above 0.05* mg/m^3: Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or 0.1 mg/m^3: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *4 mg/m^3:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids and strong oxidizers.

Shipping: Toxic solid, inorganic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific

recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium chloroplatinate may burn but is hard to ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including ammonia, nitrogen oxides, chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Because of the high value of the metal, recovery is the economically indicated disposal method.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ammonium chromate is a yellow crystalline compound which can be used in solution, which is yellow with an ammonia odor. Molecular weight = 152.07; Boiling point = 180°C; Heat of solution (endothermic at 25°C) = 68.6 Btu/lb; Freezing/Melting point = 185°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0, Oxidizer. Soluble in water.

Potential Exposure: It is used to inhibit corrosion, in dyeing, in photography, and in many chemical reactions. Used as a fungicide and fire retardant.

Incompatibilities: A strong oxidizer and an explosive. Contact with combustible, organic, and other readily oxidizable substances may cause fire and explosions. Hydrazine, other reducing agents. Corrosive to metals.

Permissible Exposure Limits in Air

as chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.

NIOSH IDLH: 15 mg[Cr(VI)]/m$^{3.}$

Protective Action Criteria (PAC)

TEEL-0: 0.0146 mg/m^3

PAC-1: 1.25 mg/m^3
PAC-2: 7.5 mg/m^3
PAC-3: 43.9 mg/m^3
DFG MAK: Inhalable fraction; [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.
Russia has set a MAK value of 0.01 mg/m^3 for chromates and bichromates in the workplace.[43]

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: To protect human health, hexavalent chromium should be held below 0.05 mg/L according to EPA[6] in studies on priority toxic pollutants. This is also a WHO recommendation for total chromium in drinking water.

Determination in Water: Chromium (VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide).

Routes of Entry: Ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause severe damage with possible loss of vision. Breathing ammonium chromate can cause a sore or hole through the inner nose (septum), sometimes with bleeding, discharge, or crusting. Irritation of nose, throat, and bronchial tubes can also occur, with cough and/or wheezing. Skin contact can cause deep ulcers or an allergic skin rash.

Long Term Exposure: Some water-soluble chromium[16] compounds are inferred noncarcinogens; the water-insoluble compounds are generally deemed to be carcinogens but the border line is neither precise nor universally agreed to. Ammonium chromate is a hexavalent chromium compound which may be carcinogenic and should be handled with extreme caution. Breathing ammonium chromate can cause sores or hole in the septum dividing the inner nose, sometimes with bleeding, discharge, and/or formation of a crust. May cause skin allergy and kidney damage.

Points of Attack: Blood, respiratory system, liver, kidneys, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count; chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Also consider skin and nose examination, kidney function tests, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact (as chromic acid and chromates). **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—Blue (carcinogen): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and away from contact with easily oxidized or combustible materials; heat or any condition which could shock it. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic solid, inorganic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium chromate explodes when heated. Poisonous gases, including ammonia and nitrogen oxides, are produced in fire. Use water only. *Do not* use dry chemical, carbon dioxide, halon, or foam extinguishers. Storage containers may explode and parts of containers may rocket great distances in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Addition of a large volume of a reducing agent solution (hypo, bisulfite, or ferrous salt, and acidify with 3M sulfuric acid). When reduction is complete, flush to drain with large volumes of water.

Tribasic
TEEL-0: 1.5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 35 mg/m^3
PAC-3: 185 mg/m^3

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate eyes, nose, throat, and lungs. Contact may irritate the skin.

Points of Attack: Eyes, lungs, skin.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing and goggles. Wash thoroughly immediately after exposure to ammonium citrate.

Respirator Selection: *At any detectable concentration:* PaprTHie (APF = 50) (any NIOSH/MSHA- or European Standard EN 149-approved air-purifying respirator with a tight-fitting full face-piece and a high-efficiency particulate filter) or SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from caustics (such as sodium hydroxide or potassium hydroxide) because ammonia gas is released.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium citrate may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia gas and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be flushed to sewer with large volumes of water.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ammonium dichromate is a combustible, orange-red crystalline solid which is used in solution. Molecular weight = 252.10; Freezing/Melting point = 170°C (see Incompatibilities); Autoignition temperature = 225°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1 (oxidizer). Soluble in water; solubility = 36% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. It is used in dyeing, leather tanning, to make fireworks and chromic oxide, in lithography and photoengraving, and in manufacture of special mordants and catalysts.

Incompatibilities: An unstable oxidizer; Freezing/Melting point = (decomposes below MP) 180°C; decomposition becomes self-sustaining and violent at about 225°C. Contact with combustible, organic or other easily oxidized materials, strong acids, hydrazine and other reducing agents, alcohols, and sodium nitrite may cause fire and explosions.

Permissible Exposure Limits in Air

As chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

Protective Action Criteria (PAC).

TEEL-0: 0.0121 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 36.4 mg/m^3

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Russia[43] has set a MAK value of 0.01 mg/m^3 for chromates and bichromates in work-place air.

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: To protect human health, hexavalent chromium should be held below 50 μg/L according to EPA[6] in studies on priority toxic pollutants. This is also a WHO recommendation for total chromium in drinking water.

Determination in Water: Chromium(VI) may be determined by extraction and atomic absorption or colorimetry using diphenylhydrazole.

Routes of Entry: Ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

LC_{50} (in h, 4 h; rat) = 0.094 mg/L [Merck].

Short Term Exposure: Should be handled as a carcinogen, with extreme caution. Ammonium dichromate can pass through the skin and may cause overexposure. Eye contact can cause severe damage with possible loss of vision. Irritation of nose, throat, and bronchial tubes can also occur, with cough and/or wheezing. Skin contact can cause deep ulcers or an allergic skin rash. Skin sensitization in humans.

Long Term Exposure: Ammonium dichromate is a hexavalent chromium compound which may be carcinogenic and should be handled with extreme caution. Breathing ammonium chromate can cause sores or hole in the septum dividing the inner nose, sometimes with bleeding, discharge, and/or formation of a crust. May cause skin allergy and kidney damage.

Points of Attack: Blood, respiratory system, liver kidneys, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Also consider skin and nose examination, kidney function tests, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. (as chromic acid and chromates) **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$)*:* polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and away from contact with easily oxidized or combustible materials; heat or any condition which could shock it. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: The UN/DOT label required is "OXIDIZER." The DOT/UN Hazard Class is 5.1 and the Packing Group is II.[20, 21]

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers.

Fire Extinguishing: Ammonium chromate is a combustible solid and explodes when heated. Poisonous gases, including ammonia and nitrogen oxides, are produced in fire. Use water only. *Do not* use dry chemical, carbon dioxide, halon, or foam extinguishers. Storage containers may explode and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Add a large volume of a reductant solution (hypo, bisulfite, or ferrous salt and acidify with sulfuric acid). Neutralize when reduction is complete and flush to sewer with large volume of water.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as fluoride compounds, inorganic.

Mexico, Wastewater (inorganic fluorides).

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium fluoride is a white crystalline solid. Molecular weight: 37.05; Freezing/Melting point = sublimes. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Ammonium fluoride is used in printing and dyeing textiles, glass etching, moth-proofing and wood preserving, in analytical chemistry and agriculture, and as antiseptic in brewing.

Incompatibilities: Acids, alkalis, chlorine trifluoride. Corrodes glass, cement, most metals.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC)

TEEL-0: 4.88 mg/m^3

PAC-1: 4.88 mg/m^3

PAC-2: 4.88 mg/m^3

PAC-3: 4.88 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg[HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Fluoride aerosols may be measured by collection on a filter followed by fluoride ion measurement using an ion-specific electrode. Use NIOSH Analytical Method 7902.

Routes of Entry: Inhalation, skin and/or eye contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the nose, throat, and lungs. Contact can irritate or burn the skin and eyes. Higher exposures could cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: With repeated exposure, some persons may notice poor appetite, nausea, constipation or diarrhea. Repeated overexposure to fluoride can cause brittle bones, stiff muscles and joints, and eventual crippling fluorosis. This usually takes years to develop. High or repeated exposure may scar the lungs, causing shortness of breath and reduced lung function. These effects do not occur with prescribed fluoride levels in drinking water or dental use to prevent cavities.

Points of Attack: Skin, eyes, respiratory system, bones, muscles.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), pelvic X-ray, sputum cytology, urine (chemical/metabolite), urine (chemical/metabolite) pre- and postshift, urinalysis (routine), complete blood count/differential. Urine fluoride level (should be less than 5 mg/L of urine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Ammonium fluoride must be stored to avoid contact with acids or alkalis since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Keep in plastic, rubber, or paraffined containers (because it easily etches glass).

Shipping: Ammonium fluoride requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium fluoride may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen fluoride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Mexico, Wastewater (inorganic fluorides).

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ammonium hexafluorosilicate is a white crystalline powder. Odorless. Molecular weight: 178.18; Boiling point = decomposes at 100°C; Melting/Freezing point = decomposes at 100°C; Heat of solution = 85 Btu/lb; Vapor pressure: <0.075 mm. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Sinks and mixes with water.

Potential Exposure: This material is used as a pesticide and miticide, wood preservative, soldering flux, light metal casting, and in the etching of glass.

Incompatibilities: Liquid is corrosive. Contact with acids and reacts to form hydrogen fluoride, which is a highly corrosive and toxic gas. Corrosive to aluminum. Keep away from strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC) 16919-19-0

PAC-3: 391 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg[HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Fluorides may be measured by collection on a filter and measurement by ion-specific electrode according to NIOSH Analytical Method 7902.[18]

Permissible Concentration in Water: No criteria set for ammonium fluorosolicate as such. Russia[43] has set a limit of 1.5 mg/L for fluorine in water used for domestic purposes.

Routes of Entry: Inhalation, eyes and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause difficult breathing and burning of the mouth, throat, and nose which may result in bleeding. These may be felt at 7.5 mg/m^3. Nausea, vomiting, profuse sweating, and excess thirst may occur at higher levels. May cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. Skin contact may cause rash, itching and burning, and ulceration of skin. Solutions of 1% strength may cause sores if not removed promptly. Eye contact may cause severe irritation. Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. A dose of 5−40 mg may cause nausea, diarrhea, and vomiting. More severe symptoms of burning and painful abdomen, sores in mouth, throat and digestive tract, tremors, convulsions, and shock will occur around a dose of 1 g. Death may result by ingestion of 2−5 g. Also reported as 1 teaspoon to 1 oz.

Long Term Exposure: May cause chronic lung irritation and kidney and liver damage. Bronchitis may develop. Chronic exposure may cause weight loss, nausea, vomiting, weakness, shortness of breath. Fluoride may increase bone density, stimulate new bone growth, or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 mg/m^3 or higher. May cause mottling of teeth at this level.

Points of Attack: Lungs, eyes.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), pelvic X-ray, sputum cytology, urine (chemical/metabolite), urine (chemical/metabolite) pre- and postshift, urinalysis (routine), complete blood count/differential. Intake of fluoride from natural sources in food or water should be known. In the case of exposure to fluoride dusts, periodic urinary fluoride excretion levels have been very useful in evaluating industrial exposures and environmental dietary sources.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a physician or authorized paramedic may consider administering a corticosteroid spray. *Note to physician:* Ingestion: Give aluminum hydroxide gel, if conscious. Inject intravenously 10 mL of 10% calcium gluconate solution. Gastric lavage with lime water of 1% calcium chloride.

Personal Protective Methods: Use only with an effective and properly maintained exhaust ventilation or with a fully enclosed process. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators.

The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine) since highly poisonous hydrogen fluoride gas is released. Keep in plastic, rubber, or paraffined containers (because it easily etches glass).

Shipping: Fluorosilicates, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." The DOT/UN Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Treat with soda ash or slaked lime. Use an industrial vacuum cleaner to remove the spill. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including fluorine, ammonia, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Water may be used but should be contained to prevent fluoride run-off.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ammonium Hydroxide is a colorless to milky-white solution of ammonia, with a strong, irritating odor. Molecular weight: 35.05; Boiling point = 37.8°C (25% NH_3)NH_3; Freezing/Melting point = −77°C; −58°C (25% NH_3); Vapor pressure = 11.9 mm; 48 (25% NH_3) Hg at 20°C. The odor threshold for ammonia is 0.043−47 ppm. Hazard Identification (based on NFPA-704 M Rating System) (*strong solution*): Health 3, Flammability 1, Reactivity 2. Soluble in water.

Potential Exposure: It is used in detergents, stain removers, bleaches, dyes, fibers, and resins.

Incompatibilities: Solution is strongly alkaline. Violent reaction with strong oxidizers, acids (exothermic reaction with strong mineral acids). Shock-sensitive compounds may be formed with halogens, mercury oxide, silver oxide. Fire and explosions may be caused by contact with β-propiolactone, silver nitrate, ethyl alcohol, silver permanganate, trimethylammonium amide, 1-chloro-2,4-dinitrobenzene, *o*-chloronitrobenzene, platinum, trioxygen difluoride, selenium difluoride dioxide, boron halides, mercury, chlorine, iodine, bromine, hypochlorites, chlorine bleach, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin, aldehydes. Attacks some coatings, plastics, and rubber. Attacks copper, brass, bronze, aluminum, steel, zinc, and their alloys.

PAC-3: 100 ppm

DFG MAK: MAK: 20 ppm/14 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C (2004).

Arab Republic of Egypt: TWA 25 ppm (18 mg/m^3), 1993; Australia: TWA 25 ppm (18 mg/m^3); STEL 35 ppm, 1993; Austria: MAK 25 ppm (18 mg/m^3), 1999; Belgium: TWA 25 ppm (17 mg/m^3); STEL 35 ppm (24 mg/m^3), 1993; Denmark: TWA 25 ppm (18 mg/m^3), 1999; Finland: TWA 25 ppm (18 mg/m^3); STEL 40 ppm (30 mg/m^3), 1993; France: VME 25 ppm (18 mg/m^3), VLE 50 ppm (36 mg/m^3), 1999; the Netherlands: MAC-TGG 14 mg/m^3, 2003; India: TWA 25 ppm (18 mg/m^3); STEL 35 ppm (27 mg/m^3), 1993; Japan: 25 ppm (17 mg/m^3), 1999; Norway: TWA 25 ppm (18 mg/m^3), 1999; the Philippines: TWA 50 ppm (30 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3; MAC (STEL) 27 mg/m^3, 1999; Russia: TWA 25 ppm; STEL 20 mg/m^3, 1993; Sweden: NGV 25 ppm (18 mg/m^3), TGV 50 ppm (35 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (18 mg/m^3), KZG-W 50 ppm (36 mg/m^3), 1999; Thailand: TWA 50 ppm (35 mg/m^3), 1993; Turkey: TWA 25 ppm (35 mg/m^3), 1993; United Kingdom: TWA 25 ppm (18 mg/m^3); STEL 35 ppm (25 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 35 ppm.

Determination in Air: Sampling by absorption in sulfuric acid followed by measurement by ion chromatography, conductivity. Use NIOSH Analytical Method #6015, #6016.

Permissible Concentration in Water: Russia[43] set a MAC of 2.0 mg/mL in water bodies used for domestic purposes and 0.05 mg/mL in water bodies used for fishery purposes.

Routes of Entry: Ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ammonium hydroxide is a corrosive chemical and can severely burn the skin and eyes, causing permanent damage. Exposure can severely irritate the nose, throat, and lungs. Inhalation may cause pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases.

Long Term Exposure: Long-term exposure at low levels may cause chronic bronchitis. Repeated skin contact can cause dermatitis, dryness, itching, and redness.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended for ammonia by NIOSH in criteria document #74-136 (Ammonia).

Respirator Selection: NIOSH: *250 ppm*: CcrS* (APF = 10) (any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern) or Sa* (APF = 10) (any supplied-air respirator). *300 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS* (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern) or CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White stripe (*strong solution*): Contact Hazard; not compatible with materials in solid white category. Prior to working with this chemical you should be trained on its proper handling and storage. Store in temperatures below 25°C/77°F. Do not fill bottles completely. Store in tightly closed, strong glass, plastic, or rubber-stoppered containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Ammonium hydroxide−ammonia solution [rel. density between 0.880 and 0.957 at15°C in H_2O, with 10−35% NH_3]. UN/DOT label required “CORROSIVE MATERIAL.” This material is in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. If professional environmental engineering assistance is required, contact the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: Poisonous gases, including ammonia and nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilute with water, neutralize with HCl, and discharge to sewer.[22]

Ammonium metavanadate A:1120

Molecular Formula: H_4NO_3V

Common Formula: NH_4VO_3

Synonyms: Ammonium vanadate; Vanadate (V031-), ammonium; Vanadato amonico (Spanish); Vanadic acid, ammonium salt

CAS Registry Number: 7803-55-6

RTECS® Number: YW0875000

UN/NA & ERG Number: UN2859/154

EC Number: 232-261-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

US EPA Hazardous Waste Number (RCRA No.): P119.

RCRA 40CFR261, Appendix 8, Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ammonium metavanadate is a white or slightly yellow crystalline powder. It is an inorganic acidic salt.

Molecular weight = 116.97; Freezing/Melting point = 200°C (decomposes). Slightly soluble in water, with decomposition.

Potential Exposure: It is used in the metals industry to make alloys, chemical reactions, dyes, inks, varnishes, printing, medicines, and photography.

Incompatibilities: Moisture forms an acidic solution. React with bases and may generate heat and may form flammable hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: 0.05 mg[V_sO_5]/m^3 TWA (*dust*); respirable fraction; 0.1 mg[V_sO_5]/m^3 Ceiling Concentration, (fume).

NIOSH REL: 1.0 mg[V]/m^3 TWA.

ACGIH TLV®[1]: 0.05 mg[V_sO_5]/m^3 TWA, Not classifiable as a human carcinogen, (dust or fume).

NIOSH IDLH = 35 mg[V]/m^3

Protective Action Criteria (PAC)

TEEL-0: 0.0322 mg/m^3

PAC-1: 0.04 mg/m^3

PAC-2: 3.22 mg/m^3

PAC-3: 22.5 mg/m^3

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Group 2 (2005) vanadium inorganic compounds.

These levels are for air levels only. When skin contact also occurs, overexposure is possible even though air levels are less than the airborne permissible limits. For fume limits see "vanadium metal" (CAS 7440-62-2).

Determination in Air: Use NIOSH Analytical Method 7300,[18] #7504, Vanadium oxides.

Permissible Concentration in Water: Russia has set[43] a MAC of 0.1 mg/L for pentavalent vanadium in water for domestic purposes.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, nose, and respiratory tract. Inhalation can cause coughing, wheezing, and phlegm. Exposure may cause headache and a green coating on the tongue. Higher exposures may cause pneumonia and/or pulmonary edema, which can be delayed for several hours; there is a risk of death in serious cases. The oral LD_{50} for rats is 160 mg/kg.

Long Term Exposure: Ammonium metavanadate may be a reproductive hazard. Repeated exposure may cause lung irritation and bronchitis.

Points of Attack: Eyes, skin, and lungs.

Medical Surveillance: Lung function tests. Consider X-ray following acute overexposure. Regulatory examinations that include lung function, X-ray, and skin tests are proposed in criteria document NIOSH 77-222.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 mg/m^3:* 100XQ* (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators] or SA* (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full-face-piece) or SaF (APF = 50) (any supplied-air respirator with a full-face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

**Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: Ammonium metavanadate requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including ammonia, vanadium oxides, and nitrogen oxides, are produced in fire. Extinguish fire using an agent suitable for the type of surrounding fire. Ammonium metavanadate itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium molybdate A:1130

Molecular Formula: $H_8MoN_2O_4$

Common Formula: $(NH_4)_2MoO_4$

Synonyms: Ammonium paramolybdate; Diammonium molybdate; Molibdato amonico (Spanish); Molybdic acid, diammonium salt

CAS Registry Number: 13106-76-8

RTECS® Number: QA4900000

EC Number: 236-031-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia); Molecular weight: 57.04; NH_3 Equivalent weight: 17.38.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium molybdate is a colorless, white, or slightly greenish-yellow powder. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: It is used as an analytical reagent, in pigments, and in the production of molybdenum metal and ceramics.

Incompatibilities: Contact with strong oxidizers or chemically active metals (such as potassium, sodium, magnesium, and zinc) may cause a violent reaction.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Mo]/m^3 TWA soluble compounds, confirmed animal carcinogen with unknown relevance to humans.

OSHA PEL: 5 mg[Mo]/m^3 TWA soluble compounds.

NIOSH IDLH: 1000 mg[Mo]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 30.7 mg/m^3

PAC-1: 61.3 mg/m^3

PAC-2: 102 mg/m^3

PAC-3: 300 mg/m^3

DFG MAK: 5 mg[Mo]/m^3 TWA soluble compounds.

Russia[43] set a MAC for molybdenum in work-place air at 2.0 mg/m^3 for aerosol condensates and 4 mg/m^3 for soluble compounds in the form of dust.

Determination in Air: Molybdenum may be sampled by filter and measured by inductively coupled argon plasma atomic emission spectroscopy as described in NIOSH Analytical Method 7300 for Metals.[18]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Symptoms of molybdenum poisoning include stomach upset, diarrhea, coma; death from heart failure can occur. Exposure to high concentrations may cause irritation of the eyes, nose, and throat. Very high exposure may cause kidney and liver damage.

Long Term Exposure: May cause kidney and liver damage. Inhalation of dust can cause lung disease.

Points of Attack: Skin, lungs.

Medical Surveillance: Kidney, liver, and lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at this site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA (for soluble compounds of molybdenum) *25 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *50 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *125 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 mg/m^3*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store to avoid possible contact with active metals.

Shipping: There are no UN/DOT restrictions.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent for type of surrounding fire. Ammonium molybdate itself does not burn. Poisonous gases, including ammonia and nitrogen oxides, are produced in fire. Use dry chemical appropriate for extinguishing metal fires. *Do not* use water. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium nitrate A:1140

Molecular Formula: $H_4N_2O_3$
Common Formula: NH_4NO_3

Synonyms: Ammonium(I) nitrate(1:1); Ammonium saltpeter; Ansax; Herco prills; Nitram; Nitrato amonico (Spanish); Nitric acid, ammonium salt; Norway saltpeter; Varioform I

CAS Registry Number: 6484-52-2

RTECS® Number: BR9050000

UN/NA & ERG Number: UN1942/140 Ammonium nitrate, with not >0.2% combustible substances; UN2067/140 Ammonium nitrate fertilizers; UN2069/140 Ammonium nitrate mixed fertilizers; UN2071/140 Ammonium nitrate fertilizer, with not >0.4% combustible material; UN2071/140 Ammonium nitrate fertilizers; 2072/140 Ammonium nitrate fertilizer, n.o.s.; UN2072/140 Ammonium nitrate fertilizers; UN2426/140 Ammonium nitrate, liquid (hot concentrated solution); UN3375/140 Ammonium nitrate emulsion; UN3375/140 Ammonium nitrate gel; UN3375/140 Ammonium nitrate suspension; No DOT ID/112 Ammonium nitrate-fuel oil mixtures

EC Number: 229-347-8

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade) (explosive: with more than 0.2% combustible substances, including any organic substances calculated as carbon, to the exclusion of any other substance); *Theft hazard* 2000 (*33% concentration*) (fertilizer: solid, with nitrogen concentration of ≥23% nitrogen).

Highly Reactive Substance and Explosive (World Bank)[15].

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as nitrate compounds.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent weight: 21.28 also reportable as a nitrate compound, water dissociable, (reportable only when in an aqueous solution), at the same reporting level (1.0%).

Canada, National Pollutant Release Inventory (solution only).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium nitrate is a white to gray to brown, beads, pellets, or flakes. Odorless. Molecular weight: 80.06; Boiling point = about 210°C (decomposes below BP); Freezing/Melting point = about 169°C with slow decomposition; the decomposition accelerates as it reaches boiling point and may become explosive. Hazard Identification (based on NFPA-704 M Rating System): (*<23%*) Health 1, Flammability 0, Reactivity 3, Oxidizer. Soluble in water.

Potential Exposure: Used in the manufacture of liquid and solid fertilizer compositions, industrial explosives and blasting agents from ammonium nitrate, matches, antibiotics, and in the production of nitrous oxide.

Incompatibilities: A strong oxidizer. Reducing agents; combustible materials; organic materials; finely divided (powdered) metals may form explosive mixtures or cause fire and explosions. When contaminated with oil, charcoal or flammable liquids, can be considered an explosive which can be detonated by combustion or shock.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.015 mg/m^3

PAC-1: 0.04 mg/m^3

PAC-2: 0.3 mg/m^3

PAC-3: 500 mg/m^3

Russia: MAC 0.3 mg/m^3 on a daily average basis in ambient air.

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for fishery purposes.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The potential for ammonia poisoning in the course of NH_4NO_3 and fertilizer manufacture is the chief toxic effect associated with ammonium nitrate. Exposure may irritate the skin, eyes, nose, throat, and lungs. Overexposure can cause nausea and vomiting, headaches, weakness, faintness, and collapse. Severe overexposure may lower the ability of the blood to carry oxygen. This can result in a bluish color to skin and lips, headaches, dizziness, collapse, and even death.

Long Term Exposure: Unknown at this time.

Points of Attack: Inhalation, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any* *detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a well-ventilated area, away from sparks and flames preferably in a noncombustible location equipped with automatic sprinkler protection. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Keep well closed, dry, separated from materials and labeled "oxidizer." Storage of 500 tons or more should be avoided[35] or at least very carefully regulated. See NFPA 490, *Code for the Storage of Ammonium Nitrate.*

Shipping: Ammonium nitrate [with not more than 0.2% of combustible substances, including any organic substance calculated as carbon, to the exclusion of any other added substance] requires a shipping label of "OXIDIZER." It falls in DOT/UN Hazard Class 5.1 and Packing Group III.[19, 20] Ammonium nitrate liquid [(hot concentrated solution)] requires the same label. It falls in DOT/UN Hazard Class 5.1 and Packing Group is not given.

Spill Handling: Evacuate and isolate the area of the spill and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover the spill with dry lime or soda ash and collect powdered material in the most convenient and safe manner and deposit in sealed containers. Flush area with water. Ventilate area after cleanup is complete. Keep ammonium nitrate out of confined space, such as a sewer, because of the potential for an explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Does not burn but supports combustion. May explode under confinement and high temperatures. Exercise extreme caution. Use flooding amounts of water. Poisonous gases are produced in fire, including nitrogen oxides and ammonia. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves addition of sodium hydroxide to liberate ammonia and form the soluble sodium salt. The liberated ammonia can be recovered and sold. After dilution to the permitted provisional limit, the sodium salt can be discharged into a stream or sewer.[22]

Ammonium oxalate A:1150

Molecular Formula: $C_2H_8N_2O_4$

Common Formula: $NH_4OOCCOONH_4$

Synonyms: Ethanedioic acid, diammonium salt; Oxalato amonico (Spanish)

CAS Registry Number: 1113-38-8

RTECS® Number: RO2750000

UN/NA & ERG Number: UN2811/154

EC Number: 214-202-3

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Clean Water Act: 40CFR116.4 Hazardous Substances; RQ 40CFR117.3 (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 2000 lb (2270 kg); Section

313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 27.45.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium oxalate is an odorless, colorless crystalline material or powder. Molecular weight = 124.12; Freezing/Melting point = decomposes below MP of 70°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Corrosive. Slightly soluble in water.

Potential Exposure: It is used in chemical analysis and to make blueprint paper, explosives, and to make a rust-removal ingredient in metal polishes.

Incompatibilities: Ammonium oxalate reacts as a base to neutralize acids and reacts with strong oxidizers (acts as a reducing agent) generating carbon dioxide. Reacts vigorously with sodium hypochlorite solutions.[Mellor]

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.15 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 20 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Breathing ammonium oxalate can irritate the nose, throat, and lungs. Contact can irritate the skin. Overexposure may cause a kidney stone and kidney damage.

Long Term Exposure: Repeated exposures may cause bronchitis, kidney stones, and kidney damage. Repeated contact may cause cracking of the skin and slow-healing ulcers.

Points of Attack: Lungs, skin, kidneys.

Medical Surveillance: Lung function tests, urinalysis, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium oxalate may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and ammonia gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium perfluoro-octanoate

A:1160

Molecular Formula: $C_8H_{19}NO_2$

Common Formula: $C_7H_{15}COONH_4$

Synonyms: Ammonium pentadecafluorooctanoate; Ammonium perfluorocaprilate; Ammonium perfluorocaprylate; APFO; Perfluoroammonium octonate

CAS Registry Number: 3825-26-1

UN/NA & ERG Number: UN2811/154

RTECS® Number: RH0782000

EC Number: 223-320-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: ACGIH confirmed animal carcinogen with unknown relevance to humans.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ammonium perfluoro-octanate is a free-flowing powder. Molecular weight = 431.12. Boiling point = 125°C (sublines). Highly soluble in water.

Potential Exposure: This compound is used commercially in the polymerization of fluorinated monomers.

Incompatibilities: Keep away from strong oxidizers; strong acids.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.01 mg/m^3 TWA [skin] confirmed animal carcinogen with unknown relevance to humans.

No TEEL available.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Ammonium perfluoro-octanoate is an inhalation poison and has a moderate oral toxicity[53] with an LD_{50} in rats of 540 mg/kg. The material was nonirritating to the skin and produced moderate eye irritation characterized by iridal and conjunctival effects which persisted for at least 7 days. Lethality was produced dermally in rats and rabbits only following large doses, but repeated doses of 20−2000 mg/kg in rats produced liver damage in a dose-related fashion and elevated blood organofluoride levels. Blood levels were reduced but still detectable 42 days after the last exposure.

Long Term Exposure: A suspected human carcinogen and reproductive toxin. NIOSH suspected neuro-, gastrointestinal, or liver- and respiratory toxicant.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Toxic solid, organic, n.o.s, requires a label of "INHALATION HAZARD, POISON INHALATION

HAZARD ZONE A OR B," Hazard Class 6.1, Packing Group II.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium permanganate A:1170

Molecular Formula: H_4MnNO_4

Common Formula: NH_4MnO_4

Synonyms: Permanganato amonico (Spanish); Permanganic acid ammonium salt

CAS Registry Number: 13446-10-1

RTECS® Number: SD6400000

Regulatory Authority and Advisory Bodies

CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as manganese compounds).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium permanganate is a violet-brown or dark purple crystalline (sugar-like or sand-like) solid. Molecular weight = 136.98; Freezing/Melting point = 110°C. It explodes when heated to 60°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 0, Reactivity 3, Oxidizer. Soluble in water.

Potential Exposure: This material is used in bleaching and dyeing operations in the textile and leather industries.

Incompatibilities: A strong oxidizing agent. Contact with reducing agents, fuels and other combustible materials, heat, or friction may cause a violent reaction.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, skin and/or eye contact, ingestion.

Harmful Effects and Symptoms

Ammonium permanganate can affect you when breathed in. Exposure to ammonium permanganate can cause irritation of the eyes, nose, throat, and lungs. Contact can irritate the skin and eyes.

Short Term Exposure: Highly irritating to eyes, skin, and respiratory tract.

Long Term Exposure: Very irritating substances may cause lung effects and possible damage.

Points of Attack: Skin, eyes, nasal passages, throat, and lungs.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Ammonium Permanganate, use a MSHA/NIOAH approved respirator equipped with particulate (dust/fume/mist) filters. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Ammonium Permanganate must be stored to avoid contact with heat, friction, organic and oxidizable material, fuels and combustibles, since violent reactions occur. Always store Ammonium Permanganate at temperatures below

60°C/140°F. Protect containers from shock as ammonium permanganate may explode. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Ammonium permanganate is in the Hazard class of "FORBIDDEN."

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Keep ammonium permanganate out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is highly reactive and heat sensitive. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and ammonia. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium persulfate A:1180

Molecular Formula: $H_8N_2O_8S_2$

Common Formula: $(NH_4)_2S_2O_8$

Synonyms: Ammonium perosycisulfate; Ammonium perosysulfate; Ammonium peroxydisulfate; Ammonium peroxysulfate; Ammonium persulphate; Diammonium peroxydisulfate; Diammonium persulfate; Peroxydisulfuric acid diammonium salt; Persulfate d'ammonium (French); Persulfato amonico (Spanish)

CAS Registry Number: 7727-54-0

RTECS® Number: SE0350000

UN/NA & ERG Number: UN1444/140

EC Number: 231-786-5 [*Annex I Index No.:* 016-060-00-6]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). Molecular weight: 228.19; NH_3 Equivalent weight: 14.93.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: O, Xn; Risk phrases: R8; R22; R36/37/38; R42/43; Safety phrases: S2; S22; S24; S26; S37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium persulfate is a colorless or white crystalline solid. Molecular weight = 228.22; Freezing/Melting point = decomposes below MP of 120°C; Specific gravity = 1.982 at 20°C; Heat of decomposition = 120°C; Heat of solution = 1.8×10^5 J/kg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1, Oxidizer, ₩. Decomposes in water.

Potential Exposure: It is used as a bleaching agent, in photographic chemicals, and to make dyes. It is also used as an ingredient of polymerization catalysts.

Incompatibilities: Decomposes in water, forming oxygen gas. A strong oxidizer; reacts with reducing agents; organic and combustible materials. Incompatible with heat, sodium peroxide (produces a friction-, heat-, and water-sensitive explosive), aluminum powder.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 100 mg/m^3

ACGIH TLV®[1]: 0.1 mg/m^3 TWA *as persulfates.*

DFG MAK: Danger of sensitization of the airways and skin.

United Kingdom: TWA 1 mg(S_2O_8), 2000; the Netherlands: MAC-TGG 1 mg/m^3, 2003.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the skin, eyes, nose, throat, and lungs. Exposure may cause an allergy-like reaction, with eye tearing, nose congestion, asthma-like wheezing and difficulty in breathing.

Life-threatening shock may result. The oral LD_{50} for rats is 820 mg/kg.[9]

Points of Attack: Eye, lungs.

Medical Surveillance: Lung function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended; effects may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing and goggles. Wash thoroughly immediately after exposure to Ammonium persulfate.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Ammonium persulfate must be stored to avoid contact with combustibles (such as wood, paper, and oil), sodium peroxide, aluminum and water, since violent reactions occur. Store in tightly closed containers in a cool, dry, and well-ventilated area. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This chemical requires a shipping label of "OXIDIZER" by DOT.[19] Ammonium persulfate is in DOT/UN Hazard Class 5.1 and Packing Group III.[19, 20]

Spill Handling: Restrict persons not wearing protective equipment from area of spill until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Wash area down with water.

Fire Extinguishing: Ammonium persulfate is a strong oxidizing agent that can cause combustible materials, such as wood, paper, and oil to ignite. Heat above 120°C forms oxygen and sulfur dioxide. In addition, other poisonous gases are produced in fire, including ammonia and oxides of nitrogen. Use dry chemical, CO_2, or water spray extinguishers.

Disposal Method Suggested: May be treated with large volumes of water, neutralized, and flushed to sewer.[22] This applies to small quantities only.

EC Number: 231-987-8

Regulatory Authority and Advisory Bodies

CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 25.79.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium phosphate is a white crystalline or powdery substance. Molecular weight: 132.06 (dibasic); Boiling point = 100°C (decomposes); Melting/Freezing point = decomposes below melting point at 102°C; Specific Gravity = 1.8 at 20°C (dibasic); Heat of solution = 42 Btu/lb. Hazard Identification (based on NFPA-704 M Rating System): (*dibasic*) Health 1, Flammability 0, Reactivity 0; (*monobasic*) Health 1, Flammability 0, Reactivity 1. Highly soluble in water.

Potential Exposure: Used in fireproofing of textiles, wood and paper, in soldering flux, as a fertilizer, a buffer, in baking powder, and as food additives.

Incompatibilities: Incompatible with strong oxidizers, strong bases, strong acids. Contact with air causes this chemical to produce anhydrous ammonia fumes.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 10 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: On short-term exposure, may cause skin and eye irritation; ammonia fumes can cause eye irritation above 70 ppm. In closed spaces, inhalation of ammonia fumes may cause nose and throat irritation (70 ppm, 5 min). Levels of 500 ppm for 30 min may cause irritation to throat and lungs. High levels may result in accumulation of fluid in the lung and suffocation. Ammonia poisoning upon ingestion is characterized by sagging of facial muscles, tremors, anxiety, difficulty in controlling muscles, stupor, and coma. There is only a slight chance of this happening from ingestion of ammonium phosphates, except in persons with impaired liver function. Large doses may cause calcium imbalance and an increased flow of urine.

Points of Attack: Liver, skin, eyes.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Seek medical attention, if necessary. Give large quantities of water or milk. *Inhalation:* Move to fresh air. Give oxygen or artificial respiration if required. Seek medical attention, if necessary.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a dust mask if necessary. A self-contained breathing apparatus may be necessary if ammonia fumes are present.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly sealed containers in a cool location away from oxidizers, bases.

Shipping: There are no DOT/UN requirements for labels or for maximum allowable shipping quantities.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Absorb liquid with sand, vermiculite, earth, or similar absorbent material and place into containers for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Poisonous gases, including ammonia, phosphorus oxides, and nitrogen oxides, are produced in fire. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be flushed to sewer with huge volumes of water.

Ammonium picrate A:1200

Molecular Formula: $C_6H_6NO_7$
Common Formula: $NH_4OC_6H_2(NO_2)_3$
Synonyms: Ammonium carbazoate; Ammonium picrate, dry; Ammonium picrate, wet; Ammonium picrate (yellow); Ammonium picronitrate; Explosive D; Obeline picrate;

Phenol, 2,4,6-trinitro-, ammonium salt; Picratol; Picric acid, ammonium salt; Pictarol; 2,4,6-Trinitrophenol ammonium salt

CAS Registry Number: 131-74-8

RTECS® Number: BS3855000

UN/NA & ERG Number: UN1310 (wetted with not <10% water, by mass)/113

EC Number: 205-038-3

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

US EPA Hazardous Waste Number (RCRA No.): P009.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 10 lb (4.54 kg).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ammonium picrate is a bright yellow crystalline solid, that turns red if contaminated; Freezing/Melting point = decomposes on heating and explodes at 423°C. Slightly soluble in water. A high explosive when dry, and flammable when wet. Hazard Identification (Based on NFPA Rating System): Health 3, Flammability 3, Reactivity 3, Oxidizer.

Potential Exposure: Used in explosives, fireworks, and rocket propellants.

Incompatibilities: A powerful oxidizer that reacts violently with reducing agents. Dangerous when heated or shocked.

Keep away from metals, sodium nitrite, perchlorates, peroxides, permanganates, and any form of shock.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Routes of Entry: Inhalation of dust, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Ammonium picrate can pass through the skin. This chemical can irritate the eyes and skin, and is an allergen. Ingestion can cause a bitter taste, nausea, diarrhea, vomiting, abdominal pain, skin eruptions, stupor, and possible death. Breathing high levels can damage the kidneys, liver, and red blood cells. Urine may become reddish, scant, or even stop; there may be drowsiness, coma, and even death.

Long Term Exposure: Repeated exposure can cause the skin and eyes to turn yellow; skin allergy; liver, kidney, and blood cell damage.

Points of Attack: Eyes, skin, respiratory system, kidneys, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Complete blood count. Liver function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ammonium picrate, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Incompatible with strong oxidizers, strong bases. Contact with air causes substance to give off corrosive anhydrous ammonia fumes. Outside, detached storage is recommended. Store to avoid heat, shock, or the presence of reducing materials. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: The label requirement for UN0004 (dry or wetted with <10% water, by mass) material is "EXPLOSIVES." FORBIDDEN. It falls into Hazard Class 1.1D and is in Packing Group II. The label requirement for UN1310 (wetted with not <10% water, by mass) is "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group I.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Flood area with water. *Keep Material Wet. Do not dry sweep.* Keep ammonium picrate out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. If necessary, seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: Use extreme care as ammonium picrate will explode when heated or shocked, especially when dry. This chemical is a flammable solid. Use flooding quantities of water, applied from a distance. Poisonous gases are produced in fire, including ammonia and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. May be poured onto soda ash, packaged in paper, and burned. May also be mixed with flammable solvent and sprayed into an incinerator equipped with afterburner and scrubber.[24]

Ammonium sulfamate A:1210

Molecular Formula: $H_6N_2O_3S$

Common Formula: $NH_2SO_3NH_4$

Synonyms: Amcide®; Amicide®; Ammat; Ammate®; Ammate herbicide; Ammonium amidosulfonate; Ammonium amidosulphate; Ammonium aminosulfonate; Ammonium salz der amidosulfonsaure (German); Ammonium sulphamate; AMS; Ikurin; Monoammonium salt of sulfamic acid; Monoammonium sulfamate; Sulfamate; Sulfamato amonico (Spanish); Sulfamic acid, monoammonium salt; Sulfaminsaure (German)

CAS Registry Number: 7773-06-0

RTECS® Number: WO6125000

UN/NA & ERG Number: UN3077/171

EC Number: 231-871-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg). Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 14.92.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium sulfamate is a white to yellow crystalline solid. Molecular weight: 114.14; Freezing/Melting point = 131°C (with decomposition); Boiling point = 160°C.

Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 2. Very soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical. Ammonium sulfamate is used as a herbicide and in compositions for retarding flame in textiles and paper products; a softener for paper, cotton textiles.

Incompatibilities: Strong oxidizers, potassium, potassium chlorate, sodium nitrite, metal chlorates, and hot acid solutions. Elevated temperatures cause a highly exothermic reaction with water.

Permissible Exposure Limits in Air

OSHA PEL: 10 mg/m^3, total dust/5 mg/m^3, respirable fraction TWA.

NIOSH REL: 10 mg/m^3, total dust/5 mg/m^3, respirable fraction TWA.
ACGIH TLV®[1]: 10 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 50 mg/m^3
PAC-2: 350 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: No numerical value established. Data may be available.
Australia: TWA 10 mg/m^3, 1993; Austria: MAK 15 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 10 mg/m^3, 1999; Finland: TWA 10 mg/m^3, STEL 20 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Russia: STEL 10 mg/m^3, 1993; Switzerland: MAK-week 10 mg/m^3, 1999; Turkey: TWA 15 mg/m^3, 1993; United Kingdom LTEL 10 mg/m^3, STEL 20 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3. Several states have set guidelines or standards for ammonium sulfamate in ambient air[60]: (total dust) 15 mg/m^3 TWA and, respirable fraction. The California PEL is 5 mg/m^3 TWA. Several states have set guidelines or standards for ammonium sulfamate in ambient air[60]: 0.1 mg/m^3 (North Dakota), 0.15 mg/m^3 (Virginia), 0.2 mg/m^3 (Connecticut), 0.238 mg/m^3 (Nevada).

Determination in Air: Collection on a filter followed by gravimetric analysis. Use NIOSH Analytical Method #S348.

Permissible Concentration in Water: The No-Observed-Adverse-Effect-Level (NOAEL) is 250 mg/kg/day according to the EPA Health Advisory cited below. From this a health advisory of 21.4 mg/L of water was derived for a 10-kg child on a 1-day, 10-day, or longer term basis. An acceptable daily intake has been determined to be 0.214 mg/kg/day and a lifetime health advisory for a 70 kg adult is 1.5 mg/L.

Determination in Water: There is no standard method for determining ammonium sulfamate in water. There is, however, a method for detection in foods which is a colorimetric method based on liberation of SO_4, reduction to H_2S which is measured after treatment with zinc, *p*-aminodimethylaniline, and ferric chloride to give methylene blue.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is moderately toxic by ingestion and may cause gastrointestinal disease. High levels may irritate the eyes, skin, and respiratory tract, and may cause nausea and vomiting. The oral LD_{50} for rat is 3900 mg/kg.

Long Term Exposure: Unknown at this time.

Medical Surveillance: Nothing special indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *100 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *250 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or if *not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *500 mg/m^3*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1500 mg/m^3*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), water, potassium, potassium chlorate, sodium nitrite, metal chlorates, and hot acid solutions.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium sulfamate may burn but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dilute with water, make neutral with acid or base, and flush into sewer with more water.

Ammonium sulfide A:1220

Molecular Formula: H_8N_2S; H_5NS

Common Formula: $(NH_4)_2S$

Synonyms: Ammonium bisulfide; Ammonium hydrogensulphide; Ammonium sulfide, hydrogen; Diammonium sulfide; Sulfuro amonico (Spanish); True ammonium sulfide

CAS Registry Number: 12135-76-1 (solution); 12124-99-1 (solid)

RTECS® Number: BS4900000 (solid); BS4920000 (solution)

UN/NA & ERG Number: UN2683 (solution)/132

EC Number: 235-223-4 (solution); 235-184-3 (solid)

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA).

CERCLA/SARA Section 313: 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg); Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 33.32.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ammonium sulfide is a yellow crystalline (sugar- or sand-like) material, commonly found in liquid solution, which is flammable, and with an odor of rotten eggs. Molecular weight: 51.12; Flash point = 72°C; Freezing/Melting point = (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2. Soluble in water.

Potential Exposure: It is used in photographic developers, synthetic flavors, coloring metals (i.e., to apply patina to bronze), and to make textiles.

Incompatibilities: Strong oxidizers, acids, acid fumes (forms hydrogen sulfide). Keep away from moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3.5 ppm

PAC-1: 10 ppm

PAC-2: 15 ppm

PAC-3: 15 ppm

Routes of Entry: Ingestion, skin absorption, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Ammonium sulfide can be absorbed through the skin, thereby increasing exposure. This substance is a corrosive chemical and contact can irritate and burn the eyes and skin. Exposure can irritate the nose, throat and lungs, causing a cough and difficulty in breathing. Very high levels could cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Very high levels could cause you to feel dizzy, lightheaded, and cause you to pass out.

Long Term Exposure: Repeated exposure can cause lung irritation and bronchitis.

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention

immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing and goggles. Wash thoroughly immediately after exposure to ammonium sulfide and at the end of the work shift.

Respirator Selection: *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store to avoid contact with acids and acid fumes, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from moisture. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Ammonium sulfide solution, requires a shipping label "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." The DOT/UN Hazard Class for this chemical is 8 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Add Ferric Chloride solution to spilled material. Stir and add Soda Ash. Sweep solid material up and deposit in sealed containers. Keep ammonium sulfide out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium sulfide solution is a flammable liquid. Poisonous gases are produced in fire, including flammable hydrogen sulfide and ammonia. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add to a large volume of ferric chloride solution with stirring. Neutralize with soda ash. Flush to drain with water.

Molecular Formula: $H_8N_2O_3S$

Common Formula: $(NH_4)_2SO_3$

Synonyms: *monoammonium salt:* Ammonium acid sulfite; Ammonium hydrogen sulfite; Ammonium hydrosulfite; Ammonium monosulfite; Ammonium sulfite, hydrogen; Monosodium sulfite; Sulfito amonico (Spanish); Sulfurous acid, monoammonium salt. *diammonium salt:* Diammonium sulfite; Sulfito amonico (Spanish); Sulfurous acid, diammonium salt

CAS Registry Number: 10196-04-0; 10192-30-0 (bisulfite)

RTECS® Number: WT3505000 (diammonium); WT3595000 (monoammonium)

UN/NA & ERG Number: UN3077/171

EC Number: 233-484-9 (diammonium salt); 233-469-7 (monoammonium salt/ammonium hydrogensulfite)

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA).

(*diammonium salt*) Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 99.10; NH_3 Equivalent weight: 17.18.

(*monoammonium salt*) Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia) Molecular weight: 116.13; NH_3 Equivalent weight: 29.33.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium sulfite is a colorless to yellow crystalline (sand-like or sugar-like) solid, normally sold or used in a 40% solution. Molecular weight = 99.10; Freezing/Melting point = 150°C (sublimes); Specific gravity = 2.03 (solid); 1.40 (72% aqueous solution); Heat of solution = (endothermic) = 1.01×10^5 J/kg (For dilute solution 1 mole/0.300 moles water, which is equal to 1.833 lb/volume lb of water); Vapor pressure = 395 mmHg at 20°C. Soluble in water.

Potential Exposure: Ammonium sulfite is used in medicines, metal lubricants; explosives, photography, hair wave solutions; and to make other chemicals. It is also used as a preservative and for treating agricultural grain.

Incompatibilities: A strong reducing agent. Reacts violently with strong oxidizers, acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) TEEL-0: 10 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 10 mg/m^3

Bisulfite

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Ammonium sulfite can affect you when breathed in; exposure can irritate the nose, throat, bronchial tubes, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Ammonium sulfite may cause an asthma-like allergy. Future exposures could then cause asthma attacks with cough, shortness of breath, and wheezing. Very severe (anaphylactic) reactions could also occur, and could be fatal.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure, the following are recommended: lung function tests; seek prompt medical attention if symptoms are suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over ammonium sulfite, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for high exposures to ammonium sulfite, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ammonium sulfite must be stored in tightly closed containers in a cool, well-ventilated place to avoid contact with oxidizers and acids as flammable hydrogen sulfide gas is produced.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium sulfite may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia and oxides of sulfur and nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. May be buried in a chemical waste landfill in accordance with federal, state, and local statutes; or, if oxidized and neutralized, it may be sent to a municipal sewage treatment plant for biological treatment incineration.

Ammonium tartrate A:1240

Molecular Formula: $C_4H_{12}N_2O_6$

Common Formula: $NH_4OOCCHOHCHOHCOONH_4$

Synonyms: Ammonium D-tartrate; Ammonium tartrate; Butanedioic acid, 2,3-dihydroxy-[R-(R*,R*)]-, diammonium salt; Diammonium tartrate; 2,3-Dihydroxy-butanedioic acid, diammonium salt; Tartaric acid, ammonium salt; 1-Tartaric acid, diammonium salt; Tartaric acid, diammonium salt; Tartrato amonico (Spanish)

CAS Registry Number: 14307-43-8; 3164-29-2 (diammonium salt)

RTECS® Number: WW8050000

UN/NA & ERG Number: UN3077/171

EC Number: 238-245-2 [ammonium [R-(R*,R*)]-tartrate]; 221-618-9 (diammonium salt)

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA).

Reportable Quantity (RQ): 5000 lb (2270 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ammonium tartrate is a colorless crystalline or white granular solid. Molecular weight = 184.18. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: It is used in the textile industry and in medicine.

Incompatibilities: Strong oxidizers, especially potassium chlorate, sodium nitrite.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Diammonium salt

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 200 mg/m^3

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. Contact can irritate the eyes and skin, and cause permanent damage. May irritate the nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Unknown at this time. However, corrosive substances may cause lung effects and damage.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Lung function tests. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids.

Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.

At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potassium chloride and sodium nitrite.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of “CLASS 9.” It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium tartrate may burn but does not readily ignite. Poisonous gases are produced in fire, including ammonia and oxides of nitrogen. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. May be buried in a chemical waste landfill in accordance with federal, state, and local statutes; or, if oxidized and neutralized, it may be sent to a municipal sewage treatment plant for biological treatment.

Ammonium tetrachloro-platinate A:1250

Molecular Formula: $Cl_4H_8N_2Pt$
Common Formula: $(NH_4)_2PtCl_4$
Synonyms: Ammonium chloropalladate(2 +); Ammonium chloropalladate(II); Ammonium palladium chloride; Ammonium tetrachloropalladate(2 +); Ammonium tetrachloropalladate(II); Diammonium tetrachloropalladate; Tetramine platinum(II) chloride
CAS Registry Number: 13820-41-2
RTECS® Number: TP1840000
UN/NA & ERG Number: UN3077/171
EC Number: 237-499-1 [*Annex I Index No.:* 078-002-00-6]
Regulatory Authority and Advisory Bodies
Listed on the TSCA inventory.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg); Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 11.98.
European/International Regulations: Hazard Symbol: T; Risk phrases: R25; R38; R41; R42/43; Safety phrases: S2; S22; S26; S36/37/39; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Ammonium tetrachloroplatinate is a dark ruby-red crystalline solid. Molecular weight = 372.96; Specific gravity = 2.93; Freezing/Melting point = 140−150°C. Soluble in water.
Potential Exposure: This material is used in photography.
Incompatibilities: Oxidizers, strong acids, strong bases.
Permissible Exposure Limits in Air
OSHA PEL: 0.002 mg[Pt]/m^3 TWA.
NIOSH REL: 0.002 mg[Pt]/m^3 TWA.
ACGIH TLV®[1]: 1 0.002 mg[Pt]/m^3 TWA.
No TEEL available.
DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.
NIOSH IDLH: 4 mg [Pt]/m^3.
Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts).
Routes of Entry: Inhalation of vapor or dust, skin contact.
Harmful Effects and Symptoms
Short Term Exposure: Ammomium tetrachloroplatinate can affect you when breathed in. Ammonium Tetrachloroplatinate may irritate the eyes, nose, and throat; high exposures can cause irritability and even seizures ("fits").
Long Term Exposure: Skin and air passage sensitizer; severe allergy can develop to ammonium tetrachloroplatinate. Symptoms may include asthma (with cough, wheezing, and/or shortness of breath), runny nose, and/or skin rash, sometimes with hives. If allergy develops, even small future exposure can trigger significant symptoms. Some persons exposed to this type of chemical have developed lung scarring.
Points of Attack: Eyes, skin, nose, throat.
Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if a person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray every 3 years should be considered if above tests are not normal. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures over 0.002 mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Green: General storage may be used. It is a skin and inhalation sensitizer; the Color Code—Blue may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, strong bases.
Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However,

based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, CO_2, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia, chlorine, and platinum. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ammonium thiocyanate A:1260

Molecular Formula: CH_4N_2S

Common Formula: NH_4SCN

Synonyms: Ammonium isothiocyanate; Ammonium rhodanate; Ammonium rhodanide; Ammonium sulfocyanate; Ammonium sulfocyanide; Carbo-Tech ammonium thiocyanate; Degussa ammonium thiocyanate; Rhodanid; Thiocyanic acid, ammonium salt; Tiocianato amonico (Spanish)

CAS Registry Number: 1762-95-4

RTECS® Number: XK7875000

UN/NA & ERG Number: UN2672/154

EC Number: 217-175-6

Regulatory Authority and Advisory Bodies

Clean Air Act: 42USC7412; Title I, Part A, §112 Hazardous Pollutants (as cyanide compounds).

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA); 40CFR423, Appendix A, Priority Pollutants (as cyanide compounds).

US EPA Hazardous Waste Number (RCRA No.): P030.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent weight: 22.37. *Note:* May also be reportable as a cyanide compound ($X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur). Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide compounds.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ammonium thiocyanate is a colorless solid which absorbs moisture and becomes liquid. Molecular weight: 76.12; Boiling point = 115°C; Freezing/Melting point = 160°C, decomposes at 170°C; Heat of solution = 3.1×10^5 J/kg. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1, Corrosive. Soluble in water.

Potential Exposure: It has many uses in making matches, fabric processing, metals processing, chemical manufacturing, electroplating, zinc coating, liquid rocket propellants, herbicides, weed killers, defoliants, fabric dyeing, polymerization catalyst, in photography. Used as a laboratory chemical.

Incompatibilities: Lead nitrate, chlorates, nitric acid, acid, acid fumes. In the presence of moisture, corrosive to brass, copper, iron.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 12.5 mg/m^3

PAC-1: 35 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 200 mg/m^3

Determination in Air: Use NIOSH Analytical Method #7904, Cyanides.

Routes of Entry: Skin and/or eyes; may be absorbed through unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact with dust irritates the eyes and cause burns to the eyes and skin. This chemical can be absorbed through the skin, and significantly to overall exposure; prolonged contact may produce various skin eruptions, nausea, dizziness, cramps, and mild to severe disturbance of the nervous system. Ingestion causes dizziness, cramps, nervous disturbances.

Long Term Exposure: Repeated exposure may cause nausea, loss of appetite; runny nose, abdominal problems, loss of weight, weakness, and skin rashes. Prolonged exposure may cause thyroid gland problems, blood cell damage, nervous system damage with personality, and mood changes.

Points of Attack: Thyroid, nervous system, blood cells.

Medical Surveillance: Thyroid function tests, complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nonabsorbent materials are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as cyanides): *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Ammonium thiocyanate must be stored to avoid contact with Potassium chlorate and Lead nitrate, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture, acid, acid fumes, or chlorine because toxic fumes are released. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Ammonia solutions, relative density between 0.880 and 0.957 at 15°C in water, with $>$10% but not $>$35% ammonia require a shipping label of "CORROSIVE." They fall in Hazard Class 8 and Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use vacuum to reduce dust during clean up. *Do not dry sweep.* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium Thiocyanate may burn, but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including ammonia, hydrogen cyanide, hydrogen sulfide, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Slowly add to large container of water. Stir in slight excess of soda ash. Decant or siphon liquid from sludge, neutralize with HCl, and flush to sewer. Sludge may be landfilled.

Ammonium thiosulfate A:1270

Molecular Formula: $H_8N_2O_3S_2$
Synonyms: Ammonium hyposulfite; Amthio; Diammonium thiosulfate; Hypo; Thiosulfuric acid, diammonium salt; Tiosulfato amonico (Spanish)
CAS Registry Number: 7783-18-8
RTECS® Number: XN6465000
EC Number: 231-982-0
Regulatory Authority and Advisory Bodies
CERCLA/SARA Section 313: Form R *de minimis* concentration reporting level: 1.0% (as ammonia). NH_3 Equivalent molecular weight: 22.98.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Ammonium thiosulfate is a white crystalline solid with an ammonia odor. Molecular weight: 148.21; Freezing/Melting point = 150°C [decomposes <50°C (solution); >100°C (anhydrous crystals)]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water.
Potential Exposure: Used as an agricultural chemical and fungicide, metal lubricant, in cleaning metals, in photographic chemicals, and in making other chemicals. A laboratory reagent.
Incompatibilities: Contact with sodium chlorate may cause a violent reaction. Corrodes brass, copper, and copper-based metals.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 7.5 mg/m^3
PAC-1: 25 mg/m^3
PAC-2: 200 mg/m^3
PAC-3: 500 mg/m^3
Routes of Entry: Skin contact.
Harmful Effects and Symptoms
Short Term Exposure: Exposure can irritate eyes, skin, and respiratory tract.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, water, or combustible materials.
Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate closed spaces before entering them. Absorb liquid with sand, vermiculite, earth, or similar absorbent material and place into containers for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ammonium thiosulfate may burn, but does not readily ignite. Poisonous gases, including ammonia, hydrogen sulfide, sulfur oxides, and nitrogen oxides, are produced in fire. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate. It may be possible to dispose of waste material at a municipal facility if treated, neutralized, and oxidized.

Amphetamine A:1280

Molecular Formula: $C_9H_{13}N$

Common Formula: $C_6H_5CH_2CH(NH_2)CH_3$

Synonyms: Actedron; Adipan; Allodene; DL-Amphetamine; Anfetamina (Spanish); Anorexide; Benzedrine; Deoxynorephedrine; racemic-Desoxynorephedrine; DL-Benzedrine; DL-α-Methylbenzeneethaneamine; DL-1-Phenyl-2-aminopropane; Elastonon; Isoamycin; Isomyn; Mecodrin; α-Methylbenzeneethaneamine; Norephedrane; Novydrine; Ortedrine; Phenedrine; 1-Phenyl isopropyl amine; Profamina; Propisamine; Psychedrine; Raphetamine; Simpatedrin; Sympamine; Sympatedrine; Weckamine

CAS Registry Number: 300-62-9

Note: There are various other "amphetamines" listed in the literature; however this CAS is specifically regulated by EPA. RTECS lists this CAS as "Benzedrine."

RTECS® Number: SH9450000

UN/NA & ERG Number: UN3249 (medicine, solid, toxic, n.o.s.)/151

EC Number: 206-096-2

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (UN) (US).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

SUPERFUND/CERCLA 40CFR302.4 Reportable Quantity (RQ): 1 lb (0.454 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amphetamine is a mobile liquid with an amine odor. Molecular weight = 135.23; Boiling point = 200−203°C; Flash point ≤100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Amphetamine is used as a pharmaceutical. It is a central nervous system stimulant.

Incompatibilities: Oxidizing materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 20 mg/m^3

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure include dry mouth, metallic taste, loss of appetite, nausea, vomiting, diarrhea, abdominal cramps, headache, chilliness, flushing or pallor, palpitation, restlessness, dizziness, tremor, hyperactive reflexes, talkativeness, tenseness, irritability, weakness, insomnia, fever, confusion. With large doses, irregular heartbeat, pain and difficulty in urination, convulsions, coma, circulatory collapse may occur. This chemical is classified as extremely hazardous. Probable lethal dose in humans is 5−50 mg/kg or 7 drops to 1 teaspoon for a 70-kg (150 lb) person.

Long Term Exposure: Habit-forming drug which affects the central nervous system.

Points of Attack: Central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.[52]

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." Poisonous solids n. o.s. fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquid in dry sand, vermiculite, or other absorbent material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ampicillin A:1290

Molecular Formula: $C_{16}H_{19}N_3O_4S$

Synonyms: Acillin; Adobacillin; Alpen; Amblosin; Amcill; Amfipen; Aminobenzyl penicillin; D-(-)-α-Aminobenzylpenicillin; D-(-)-α-Aminopenicillin; 6-[D (-)-α-Aminophenylacetamido]penicillanic acid 6; 6-(2-Amino-2-phenylacetamindo)-3,-3-dimethyl-7-oxo-4-thia-1-azabicyclo(3.2.0) heptane-2-carboxylic acid; (Aminophenylmethyl)-penicillin; Amipenix S; Amperil; Ampi-Bol; D-(-)-Ampicillin; D-Ampicillin; Ampicillin A; Ampicillin acid; Ampicillin anhydrate; Ampicillin (USDA); Ampicin; Ampikel; Ampimed; Ampipenin; Amplisom; Amplital; Ampy-penyl; Austrapen; AY-6108; Binotal; Bonapicillin; Britacil; BRL; BRL 1341; Copharcilin; Cymbi; Divercillin; Doktacillin; Grampenil; Guicitrina; Guicitrine; Lifeampil; Marisilan; NSC-528986; Nuvapen; Omnipen; P-50; Penbristol; Penbritin; Penbritin paediatric; Penbritin syrup; Penbrock penicline; Pentrex; Pfizerpen A; Polycillin; Ponecil; Principen; Qidamp; Ro-Ampen; Semicillin; SK-Ampicillin; Synpenin; Tokiocillin; Tolomol; Totacillin; Totalciclina; Totapen; Ultrabion; Ultrabron; Viccillin; Viccillin S; Vicillin; WY-5103

CAS Registry Number: 69-53-4 (anhydrous); 7177-48-2 (trihydrate)

RTECS® Number: XH8350000; HS8425000 (trihydrate)

EC Number: 200-709-7

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ampicillin in anhydrous form occurs as crystals. Molecular weight = 349.44; Freezing/Melting point = 199−202°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): (*anhydrous*) Health 1, Flammability 0, Reactivity 0; (*trihydrate*) Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as an antibiotic.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEELs are available.

Russia[43]: MAC 0.1 mg/m^3 in work-place air, ampicillin.

Harmful Effects and Symptoms

Short Term Exposure: Ampicillin can affect you when breathed in. Exposure can cause skin rash. This may or may not be an allergic reaction, but if hives are present, allergy is likely. Exposure to high levels can cause upset stomach and diarrhea. The LD_{50} for rat is 10 gm/kg and for mouse is 28 mg/kg.[9] Ampicillin can cause hypersensitivity reactions in allergic persons.

Long Term Exposure: Exposure may cause allergy to develop, often accompanied with hives. Once allergy develops, even low future exposures can cause an allergic reaction. Persons having an allergy to penicillin may be more likely to develop an allergic reaction to ampicillin. Exposure can lead to a rare, but sometimes fatal reaction (aplastic anemia) in which blood cell count drops very low. Ampicillin can cause a liver-damaging reaction. Since ampicillin kills many normal germs, new resistant strains can grow after repeated exposure, resulting in a "yeast" or other types of infection.

Points of Attack: Liver, blood cells, skin.

Medical Surveillance: Liver function tests; complete blood count (CBC). Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly at the end of the work shift. Posthazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Ampicillin to potentially exposed workers.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and moisture.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Ampicillin itself does not burn. Poisonous gases are produced in fire, including sulfur oxides and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled (*n*-isomer).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR116.4 Hazardous Substances; 40CFR117.3, RQ (same as CERCLA).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (*n-*, *sec-*, and *iso*-isomers listed).

European/International Regulations (*n-*; *sec-*; *o-*; *iso*-isomers): Hazard Symbol: None; Risk phrases: R10; R66; Safety phrases: S2; S23; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*n-*; *o-*).

Description: All isomers of amyl acetate are highly flammable, colorless to yellow, watery liquids. The *n-* and *iso*-isomers have a persistent, fruity, banana-like or pear-like odor. The *sec*-isomer has a mild fruity odor. Molecular weight of isomers = 130.21. Hazard Identification (based on NFPA-704 M Rating System): (*sec*-isomer) Health 2, Flammability 3, Reactivity 0.

n-isomer: Boiling point = 121°C; Melting/Freezing point = − 72°C; Specific gravity = 0.876 at 20°C; Liquid surface tension = 0.012 N/m at 30°C; Liquid water interfacial tension = (estimate) 0.05 N/m at 17°C; Relative vapor density (air = 1) = 4.5; Ratio of specific heats of vapor (gas) = 1.1; Latent heat of vaporization = 3.1×10^5 J/kg; Heat of combustion = -310.8×10^5 J/kg; Vapor pressure = 0.93 kPa at 20°C; Flash point = 16−21°C, 25°C (cc); Autoignition temperature = 360°C; Explosive limits: LEL = 1.0%; UEL = 7.5%; Odor threshold = 0.0075−7.3 ppm.

sec-isomer: Boiling point = 121°C; Melting/Freezing point = − 148°C; Critical temperature = 326°C; Critical pressure = 411.6 psia = 28.0 atm = 2.83 MN/m^2; Specific gravity = 0.861−0.866 at 20°C; Liquid surface tension = 28.9 dynes/cm = 0.0289 N/m at 20°C; Liquid water interfacial tension = (estimate) 0.0441 N/m at 20°C; Relative vapor density (air = 1) = 4.5; Ratio of specific heats of vapor (gas) = (estimate)>1−1.1 at 20°C; Latent heat of vaporization = (estimate) = 3.0×10^5 J/kg; Heat of combustion = − 14.402 Btu/lb = − 8000 cal/g = -334.9×10^5 J/kg; Vapor pressure = 7 mmHg at 20°C; Flash point = 32°C; Explosive limits: LEL = 1.1%; UEL = 7.0%; Odor threshold = 0.002 ppm.

tert-isomer: Boiling point = 125°C; Flash point = 26°C; Explosive limits: LEL = 1.0%; UEL = 7.5%; Odor threshold = 0.08 *0.0006 in water.

iso-isomer: Boiling point = 142°C; Melting/Freezing point = − 78.5°C; Critical temperature 326.1°C; Critical pressure = 2.84 MN/m^2; Specific gravity = 0.876 at 15°C; Liquid surface tension = 0.02477 N/m at 20°C; Liquid water interfacial tension = 0.0502 N/m at 15°C; Relative vapor density (air = 1) = 4.5; Ratio of specific heats of vapor (gas) = (estimate)>1−1.1; Latent heat of vaporization = (estimate) = 3.07×10^5 J/kg; Heat of combustion = -334.9×10^5 J/kg; Vapor pressure = 4 mmHg at 20°C; Autoignition temperature = 379°C; Flash point = 25°C; Autoignition temperature = 379°C; Explosive limits: LEL = 1.2% at 100°C; UEL = 7.5%; Odor threshold = 0.015.

They all float on water and have poor (slight to negligible) solubility. Water contact forms a flammable, irritating vapor. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0.

*The range of accepted *odor threshold values* is quite broad and caution should be used in relying on odor alone as a warning of potentially hazardous exposure.

Potential Exposure: Compound Description: (*n*-isomer) Human Data; Natural Product; Primary Irritant; (*sec*-isomer) Human Data. Amyl acetates are used as industrial solvents and in the manufacturing and dry-cleaning industry; making artificial fruit-flavoring agents; cements, coated papers, lacquers; in medications as an inflammatory agent; pet repellents, insecticides, and miticide. Many other uses.

Incompatibilities: Nitrates, strong oxidizers; strong alkalis; strong acids. May soften certain plastics. Forms explosive mixture with air.

tert-isomer

ACGIH TLV®[1]: 50 ppm/266 mg/m^3 TWA; 100 ppm/532 mg/m^3 STEL

DFG MAK: 50 ppm/270 mg/m^3 TWA; Peak Limitation Category I(1). Pregnancy Risk Group C.

Determination in Air: Use NIOSH Analytical Method #1450 Esters I, #2549 Volatile Organic Compounds[18] (screening).

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.18$ (*n*-isomer); 2.26 (*sec*-isomer).

Routes of Entry: Inhalation, ingestion, eye, and skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Amyl acetates can be absorbed through the skin, thereby increasing exposure. Irritates the eyes, causing burning sensation. Inhalation can irritate the respiratory tract, causing cough and wheezing. Higher exposure can cause headache, drowsiness, weakness, and loss of consciousness.

Long Term Exposure: (*n*-) May cause liver damage. (*sec*-) May cause slight changes in the nervous system (brain wave changes). Prolonged or repeated skin contact to amyl acetates can cause irritation, dryness, and cracking. Although all of these chemicals have not been adequately tested, many similar petroleum-based chemicals can cause brain or other nerve damage. Effects may include reduced memory and concentration, personality changes such as withdrawl and irritability, fatigue, sleep disturbances, reduced coordination, and/or effects on autonomic nerves, and/or nerves to the arms and legs with weakness and sensation of "pins and needles." See also DFG MAK, above, for Pregnancy Risk Groups.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Liver function tests. Positive and borderline individuals showing brain effects, changes in memory, concentration, mood, and sleeping patterns, as well as headaches and fatigue should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *n*-Amyl acetate (CAS: 628-63-7): Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Barricade®™ coated suits; Responder™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Polyvinyl alcohol gloves; Teflon™ gloves, suits, boots. Employees should wash promptly when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Wear solvent-resistant protective gloves and clothing to prevent any reasonable probability of skin contact. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear solvent-resistant, splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn.

Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (for *n*-, *sec*-, and *iso*-isomers): *1000 ppm:* CcrFOv* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 500) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection. There are no specific respirator specs for *tert*-amyl acetate.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where amyl acetates may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area, preferably a detached shed. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Amyl acetates require a shipping label of "FLAMMABLE LIQUID." For amyl acetates, the DOT/UN Hazard Class is 3 and the Packing Group is III.[19, 20]

Spill Handling: Avoid contact. Stay upwind. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Establish forced ventilation to keep levels below explosive limit. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are flammable liquids. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions, or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (*n-*, *sec-*, *iso-*, *primary-*, and *sec*-isomers listed).

European/International Regulations (*all isomers except tert-*): Hazard Symbol: Xn; Risk phrases: R10; R20; R37; Safety phrases: S2; S46; (*tert-; 75-85-4*): Hazard Symbol: F, Xn; Risk phrases: R11; R20; R37/38; Safety phrases: S2; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amyl alcohols (pentanols) have eight isomers. All are flammable, colorless liquids, except the isomer 2,2-dimethyl-1-propanol, which is a crystalline solid. Odors* are described as "acetone-like" and "similar to fuel oil."

n-isomer: CAS 71-41-0: Molecular weight = 88.17; Boiling point = 137.9°C; Melting/Freezing point = − 78.8°C; Critical temperature = 313°C; Specific gravity: 0.818 at 15°C; Liquid surface tension = 0.02560 N/m at 20°C; Liquid water interfacial tension = 0.005 N/m at 20°C; Relative vapor density (air = 1): 3.04; Ratio of specific heats of vapor (gas): 1.06; Latent heat of vaporization = 5.049×10^5 J/kg; Heat of combustion = -376.8×10^5 J/kg; Electrical conductivity = 2.6×10^7 pS/m; Vapor density (air = 1) = 3.0; Vapor pressure = 2.29 mmHg at 20°C. Explosive limits: LEL = 1.2%; UEL = 10.0% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0.

sec-isomer: CAS 6032-29-7: Molecular weight = 88.17; Boiling point = 118°C; Melting/Freezing point = − 78.8°C; Flash point = 34°C; Autoignition temperature = 343°C. Explosive limits: LEL = 1.2%; UEL = 9.0. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 1, Oxidizer. Slightly soluble in water; solubility = 13.5 g/100 mL.

tert-isomer: CAS 75-85-4: Boiling point = 102°C; Melting/Freezing point = − 8°C; Flash point = 19°C; Autoignition temperature = 436°C; Explosive limits: LEL = 1.2%; UEL = 9. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Moderate solubility in water.

iso-, primary-isomer: CAS: 123-51-3*:* Molecular weight = 88.17; Boiling point = 132°C; Melting/Freezing point: − 117°C; Critical temperature: 307°C; Specific gravity: 0.82 at 20°C; Liquid surface tension = 0.0238 N/m at 20°C; Liquid water interfacial tension = 0.005 N/m at 18°C; Relative vapor density (air = 1) = 3.04; Ratio of specific heats of vapor (gas) = (estimate) 1.062; Latent heat of vaporization = 5.016×10^5 J/kg; Heat of combustion = -376.8×10^5 J/kg; Heat of solution = -1.33×10^5 J/kg; Vapor pressure = 28 mmHg at 20°C; Threshold limit = 0.012−10 ppm; Flash point = 43°C (cc); 55°C (oc); Autoignition temperature = 350°C; Explosive limits: LEL = 1.2%; UEL = 9% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Soluble in water; solubility = 2%. Threshold limit = 0.028−0.072 ppm.

iso-sec-isomer: CAS: 6032-29-7: Boiling point = 113−119°C; Melting/Freezing point = − 50°C; Specific gravity (H_2O:1) = 0.812; Flash point = 35°C; Autoignition temperature = 343°C; Explosive limits: LEL = 1.2%; UEL = 9%.

Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0.

*The range of accepted odor threshold values is quite broad and caution should be used in relying on odor alone as a warning of potentially hazardous exposure.

Amyl alcohols are obtained from fused oil which forms during the fermentation of grain, potatoes, or beets for ethyl alcohol. The fused oil is a mixture of amyl alcohol isomers, and the composition is determined somewhat by the sugar source. Slight to moderate solubility in water.

Potential Exposure: Compound Description (*n*-isomer): Mutagen, Human Data; Primary Irritant; (*iso*-, *primary*-): Tumorigen, Human Data; Primary Irritant; (*sec*-, *active primary*-, and other isomers) Primary Irritant. Used as a solvent in organic synthesis and synthetic flavoring, pharmaceuticals, corrosion inhibitors; making plastics and other chemicals; as a flotation agent. The *n*-isomer is used in preparation of oil additives, plasticizers, synthetic lubricants, and as a solvent.

Incompatibilities: Forms an explosive mixture with air. Contact with strong oxidizers and hydrogen trisulfide may cause fire and explosions. Incompatible with strong acids. Violent reaction with alkaline earth metals forming hydrogen, a flammable gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.61 mg/m^3 (*iso*-, *primary*- and *iso*-, *sec*-isomers) at 25°C & 1 atm.

ACGIH TLV®[1]: 100 ppm TWA; 125 ppm STEL (*isoamyl alcohol*, *primary*-).

OSHA PEL: 100 ppm/360 mg/m^3 (*isoamyl alcohol*, *primary- and sec*-).

NIOSH REL: 100 ppm/360 mg/m^3 TWA; 125 ppm/450 mg/m^3 STEL (*isoamyl alcohol*, *primary*- and *sec*-).

AIHA WEEL: 100 ppm TWA (*n-amyl CAS 71-41-0*).

Determination in Air: Use NIOSH Analytical Method #1402, #1405.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol–water coefficient: Log K_{ow} = 1.34 (*n*-); 1.42 (*sec*-); 1.15 (*iso*-, *primary*-); 1.35 (*iso*-, *sec*-); 0.9 (*tert*-).

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Passes through the skin; contact contributes significantly to overall exposure. Skin contact can cause skin irritation. Inhalation can irritate the eyes and respiratory system, causing headache, nausea, and vomiting. High exposure can cause dizziness, lightheadedness, confusion, and unconsciousness. Very high exposure can cause death.

Long Term Exposure: Can cause liver damage and blood effects.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Regular medical checkups are recommended, depending on degree of exposure.

First Aid: Skin contact contributes significantly to overall exposure. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. ACGIH and safety equipment suppliers/manufacturers recommend polyvinyl alcohol, polyvinyl chloride, Neoprene™, butyl rubber, nitrile rubber, Neoprene™ + styrene−butadiene rubber (SBR), polyurethane, SBR, and SBR/Neoprene™ as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *500 ppm:* Sa:Cf (APF = 25)† (any supplied-air respirator operated in a continuous-flow mode); CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

†Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where amyl alcohols may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids and hydrogen trifluoride; since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Amyl alcohols require a shipping label of "FLAMMABLE LIQUID." They fall in DOT/UN Hazard Class 3 and Packing Group II or III (*n*-).[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use alcohol or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure,

explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Amyl nitrate A:1320

Molecular Formula: $C_5H_{11}NO_3$

Common Formula: $C_5H_{11}ONO_2$

Synonyms: *n*-Amyl nitrate; Diesel ignition improver; Nitrate d'amyle (French); Nitrato de amilo (Spanish); Nitric acid, pentyl ester

CAS Registry Number: 1002-16-0

RTECS® Number: QV0600000

UN/NA & ERG Number: UN1112/140

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amyl nitrate is a flammable, colorless liquid with an ether-like odor. Molecular weight = 133.15; Boiling point = 153−157°C; Melting/Freezing point = −123°C; Specific gravity = 1.0 at 20°C; Flash point = 48°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1, Oxidizer. Floats on water; insoluble.

Potential Exposure: Amyl nitrate is used as an ignition additive in diesel fuels.

Incompatibilities: An oxidizer. Contact with reducing agents or other easily oxidizable substances may cause fire and explosions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 25 ppm
PAC-1: 75 ppm
PAC-2: 500 ppm
PAC-3: 2500 ppm

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Breathing amyl nitrate vapor can cause headaches, dizziness, weakness, and nausea. Higher levels can cause convulsions and death. Exposure can interfere with the ability of the blood to carry oxygen, causing headaches, weakness, and a blue color to the skin and lips.

Long Term Exposure: Repeated exposure may cause anemia. After repeated exposure, tolerance develops. If exposure stops suddenly, chest pain and heart attack could occur.

Points of Attack: Blood cells.

Medical Surveillance: Blood tests for methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, flames, and other combustible materials, such as wood, paper, or oil. Outside or detached storage is preferred. Before entering confined space where amyl nitrate may be present, check to make sure that an explosive concentration does not exist. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." The DOT/UN Hazard Class is 3 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate site of spill or leak. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep Amyl Nitrate out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with scrubber to remove nitrogen oxides in effluent gases.

Amyl nitrites A:1330

Molecular Formula: $C_5H_{11}NO_2$

Synonyms: *n-isomer:* 1-Nitropentane

iso-isomer: Nitrous Acid, 3-methylbutyl ester; Isoamyl nitrite; Isopentyl alcohol nitrite; 3-Methylbutanol nitrite; 3-Methylbutyl nitrite; Nitropentane; Nitrous acid, pentyl ester; Pentyl nitrite

CAS Registry Number: 463-04-7 (*n*-); 110-46-3 (*iso*-)

RTECS® Number: RA1140000 (*n*-); NT0187500 (*iso*-)

UN/NA & ERG Number: UN1113/129

EC Number: 207-332-7 [*Annex I Index No.:* 007-020-00-9] (*n*-); 203-770-8 [*Annex I Index No.:* 007-020-00-9] (*iso*-)

Regulatory Authority and Advisory Bodies

European/International Regulations (*n*- and *iso*-isomers): Hazard Symbol: (*n*- and *iso*-isomers) F + , Xn; Risk phrases: R11; R20/22; Safety phrases: S2; S16; S24; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Amyl nitrites are flammable, yellowish liquid with a penetrating, fruity odor. Molecular weight = 117.17; Boiling point = 104°C; Specific gravity (H_2O:1) = 0.8758 at 20°C; Liquid surface tension = (estimate) 0.020 N/m at 20°C; Liquid water interfacial tension = (estimate) 0.040 N/m at 20°C; Relative vapor density (air = 1) = 4; Ratio of specific heats of vapor (gas) = 1.0709; Latent heat of vaporization = 4.94×10^5 J/kg; Heat of combustion = -290×10^5 J/kg; Vapor pressure = (estimate) 27 mmHg; 3.48 kPa at 20°C; Flash point = 3°C (*n*-); 3°C (*iso*-); Autoignition temperature = 209−210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability-, Reactivity 2. Floats on water; very slightly soluble; decomposes.

Potential Exposure: Compound Description: Mutagen Amyl nitrite is used to make pharmaceuticals, perfumes, diazonium compounds, and other chemicals.

Incompatibilities: Forms explosive mixture with air.

Slowly decomposes in light, heat, and on contact with water. A strong oxidizer. Contact with reducing agents and easily oxidizable materials may cause fire and explosions. Reported to be an explosion hazard when exposed to air and light. Keep away from alcohols, antipyrine, alkaline materials; alkaline carbonates; potassium iodide, bromides, and ferrous salts. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) (*iso*-)

TEEL-0: 3 ppm

PAC-1: 7.5 ppm

PAC-2: 60 ppm

PAC-3: 300 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Amyl nitrite can be absorbed through the skin, thereby increasing exposure. Contact can irritate the eyes and skin. A skin allergy can develop. Chronic overexposure can cause blood cell damage and anemia. Exposure can rapidly cause flushing, headaches, dizziness, sharp drop in blood pressure, fast pulse rate, confusion, a blue color to lips and fingernails, and possible fainting and shock.

Long Term Exposure: Chronic overexposure can cause anemia and red blood cell damage. Repeated exposure causes tolerance to develop. If exposure stops suddenly, chest pain and heart attack could occur. May cause skin allergy to develop.

Points of Attack: Blood, skin.

Medical Surveillance: Blood methemoglobin level, complete blood count (CBC), evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where amyl nitrite may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator.[52] Protect from light. Keep under an inert atmosphere. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." The DOT/UN Hazard Class is 3 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep amyl nitrite out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Amyl trichlorosilane A:1340

Molecular Formula: $C_5H_{11}SiCl_3$
Synonyms: Amiltriclorosilano (Spanish); Pentyltrichlorosilane; Pentylsilicon trichloride; Silane, trichloropentyl-; Trichloroamylsilane; Trichloropentylsilane
CAS Registry Number: 107-72-2
RTECS® Number: VV4725000
UN/NA & ERG Number: UN1728/155
EC Number: 203-515-0
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).
Listed in the TSCA inventory.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Amyl trichlorosilane is a colorless to yellowish liquid with a sharp acrid odor (like hydrochloric acid). Molecular weight = 205.63; Boiling point = 168°C; Specific gravity = 1.137 at 25°C; Liquid surface tension = (estimate) 0.020 N/m at 20°C; Relative vapor density (air = 1) = 7.1; Latent heat of vaporization = 2.02×10^5 J/kg; Heat of combustion = -154×10^5 J/kg; Heat of solution: 4.0×10^5 J/kg; Flash point = 30°C. NFPA 704 M Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Reacts with water.
Potential Exposure: It is used to make silicones.
Incompatibilities: Contact with water forms corrosive and toxic hydrogen chloride fumes. Contact with halogens may cause explosion. Corrodes metals in the presence of moisture.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 0.2 ppm
PAC-1: **0.60** ppm
PAC-2: **7.3** ppm
PAC-3: **33** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Harmful Effects and Symptoms
Short Term Exposure: A corrosive chemical that can cause severe eye and skin burns. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs, causing coughing, and/or shortness of breath; still higher exposures can cause pulmonary edema, a medical emergency which can be delayed for several hours. This can cause death. The oral LD_{50} for rat is 2340 mg/kg.
Long Term Exposure: Similar corrosive chemicals cause lung damage; bronchitis may develop.
Points of Attack: Lungs, skin.
Medical Surveillance: Lung function tests. Consider lung X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Acid gas*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Amyl trichlorosilane requires a shipping label of "CORROSIVE." The DOT/UN Hazard class is 8 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep amyl trichlorosilane out of a confined space, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.2/1.9

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. *Do not use water or foam.* Use dry chemical, carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Aniline is a clear, colorless, oily liquid that darkens on exposure to light, with a characteristic amine-like odor. Molecular weight = 93.14; 129.60 (hydrochloride); Boiling point = 184.2°C; 245°C (hydrochloride); Melting/Freezing point = −6°C; Specific gravity (H_2O:1) = 1.022; 1.2 (hydrochloride) at 20°C; Liquid surface tension = (estimate) 0.020 N/m at 20°C; Liquid water interfacial tension = (estimate) 0.0058 N/m at 20°C; Liquid surface tension: .0455 N/m at 20°C; Critical pressure = 5.31 MN/m^2; Relative vapor density (air = 1) = 4; Ratio of specific heats of vapor (gas) = 1.0709; Electrical conductivity = 2.4×10^6 pS/m; Latent heat of vaporization = 4.61×10^5 J/kg; Heat of combustion = -348.3×10^5 J/kg; Vapor pressure: 0.6 mmHg at 20°C; <0.076 mmHg (hydrochloride); Flash point = 70°C; 193°C (hydrochloride); NFPA 704 M Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Explosive Limits: LEL = 1.3%; UEL = 11%. Odor threshold = 0.58−10 ppm. Slightly soluble in water; solubility = 3.4 g/100 mL at 20°C; the hydrochloride is more soluble = >100 g/100 mL.

Note: This chemical's odor generally provides inadequate warning of exceeded exposure limits.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant; (hydrochloride) Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Aniline is widely used as an intermediate in the synthesis of dyestuffs. It is also used in the manufacture of rubber accelerators and antioxidants, pharmaceuticals, marking inks; tetryl, optical whitening agents; photographic developers; resins, varnishes, perfumes, shoe polishes, and many organic chemicals.

Incompatibilities: Forms explosive mixture with air. Unless inhibited (usually methanol), aniline is readily able to polymerize. Fires and explosions may result from contact with halogens, strong acids, oxidizers, strong base, organic anhydrides, acetic anhydride, isocyanates, aldehydes, sodium peroxide. Strong reaction with toluene diisocyanate. Reacts with alkali metals and alkali earth metals. Attacks some plastics, rubber and coatings, copper, and copper alloys.

Permissible Exposure Limits in Air

Aniline and homologues

Conversion factor: 1 ppm = 3.81 mg/m^3 at 25°C & 1 atm

OSHA PEL: 5 ppm/19 mg/m^3 TWA [skin].

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 2 ppm/7.6 mg/m^3 TWA [skin]; Confirmed animal carcinogen; BEI: 50 mg/L total *p*-aminophenol in urine at end-of-shift.

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)*

Aniline

TEEL-0: 5 ppm

PAC-1: **8** ppm

PAC-2: **12** ppm

PAC-3: **20** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm/7.7 mg/m^3 [skin] danger of skin sensitization; Peak Limitation Category II(2); Carcinogen Category 4; Pregnancy Risk Group C; BAT: 1 mg/L urine/end-of-shift.

Arab Republic of Egypt: TWA 2 ppm (10 mg/m^3), [skin], 1993; Australia: TWA 2 ppm (10 mg/m^3), [skin], 1993; Austria: MAK 2 ppm (8 mg/m^3), [skin], suspected carcinogen, 1999; Belgium: TWA 2 ppm (7.6 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (4 mg/m^3), [skin], 1999; Finland: TWA 2 ppm (7.6 mg/m^3), STEL 4 ppm, [skin], carcinogen, 1993; France: VME 2 ppm (10 mg/m^3), [skin], carcinogen, 1999; the Netherlands: MAC-TGG 1 mg/m^3, [skin], 2003; India: TWA 0.2 mg/m^3, [skin], 1993; Japan: 1 ppm (3.8 mg/m^3), [skin], 1993; Norway: TWA 1 ppm (4 mg/m^3), 1999; the Philippines: TWA 5 ppm (19 mg/m^3), [skin], 1993; Poland: MAC (time-weighted average) 5 mg/m^3; MAC (STEL) 20 mg/m^3, 1999; Russia: TWA 1 ppm, STEL 0.1 mg/m^3, [skin], 1993; Sweden: NGV 1 ppm (4 mg/m^3), KTV 2 ppm (8 mg/m^3), [skin], 1999; Switzerland: MAK-week 2 ppm (8 mg/m^3), KZG-week 10 ppm (40 mg/m^3), [skin], 1999; Turkey: TWA 5 ppm (19 mg/m^3), [skin], 1993; United Kingdom: TWA 1 ppm (4 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Mexico: TWA 10 mg/m^3; STEL 5 ppm (20 mg/m^3). Russia[43] set a MAC of 0.05 mg/m^3 in residential air on a momentary basis and 0.03 mg/m^3 in residential air on an average daily basis. The California standard for work-place air is 2 ppm (7.6 mg/m^3) TWA. Several states have set guidelines or standards for aniline in ambient air[60]: 0.4 mg/m^3 (New York), 1.4 μg/m^3 (Massachusetts), 3.0 μg/m^3 (Rhode Island), 23.81 μg/m^3 (Kansas), 50 μg/m^3 (South Carolina), 100 μg/m^3 (North Dakota), 160 μg/m^3 (Virginia), 200 μg/m^3 (Connecticut), 238 μg/m^3 (Nevada), 1000 μg/m^3 (North Carolina).

Determination in Air: Silica adsorption, workup in *n*-propanol, followed by gas chromatography. Use NIOSH Analytical Method 2002 for aromatic amines.[18]

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit in water of 262 μ/mL based on health effects. Russia[43] set a MAC of 0.1 mg/L in water for domestic purposes and 0.0001 mg/L in water for fishery purposes.

Routes of Entry: Inhalation of vapors, percutaneous absorption of liquid and vapor, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact contributes significantly to overall exposure. Direct contact with liquid aniline can cause skin burns, eye irritation, and possible permanent damage. Inhalation can cause irritation of the respiratory tract with wheezing and coughing. High levels can interfere with the blood's ability to carry oxygen. Higher levels can cause difficult breathing, collapse, and death. Symptoms of exposure include grayish blue skin, headache, nausea, sometimes vomiting, dryness of throat, confusion, vertigo, lack of muscle coordination, ringing in the ears, weakness, disorientation, lethargy, drowsiness, and coma. Urinary signs include painful urinating, blood in the urine, the presence of hemoglobin in the urine, and diminished amounts of urine. Aniline is classified as very toxic. Probable oral lethal dose in humans is 50−500 mg/kg for a 150-lb person. The approximate minimum lethal dose for a 150-lb human is 10 g. Serious poisoning may result from ingestion of 0.25 mL.

Long Term Exposure: Chronic exposure can cause anemia, anorexia, weight loss, and skin lesions. Chronic effects may be due to acute damage to the brain, heart, and kidneys. Loss of appetite, dizziness, insomnia, tremors, malignant bladder growths, liver damage, and jaundice. Anemia has been reported. Has been linked to bladder cancer according to a NIOSH study. Signs and symptoms include blood in the urine, other changes in the appearance of the urine, changes in urinary habits, lumps in the groin and lower abdomen, and pain in the lower abdomen or back. Aniline can cross the placental barrier. Because fetal hemoglobin is more easily oxidized to methemoglobin than is adult hemoglobin and is less easily reduced back to normal hemoglobin, methemoglobin theoretically may be at higher levels in fetuses than in exposed mothers.

Points of Attack: Blood, cardiovascular system, liver, kidneys.

Medical Surveillance: Preplacement and periodic physical examinations should be performed on all employees working in aniline exposure areas. These should include a work history to elicit information on all past exposures to aniline, other aromatic amines, and nitro compounds known to cause chemical cyanosis, the clinical history of any occurrence of chemical cyanosis, a personal history to elicit alcohol drinking habits, and general physical examination with particular reference to the cardiovascular system. Persons with impaired cardiovascular status may be at greater risk from the consequences of chemical cyanosis. A preplacement complete blood count and methemoglobin estimation should be performed as baseline levels, also follow-up studies including periodic blood counts and hematocrit. People at special risk include individuals with glucose-6-phosphate-dehydrogenase deficiency and those with liver and kidney disorders, blood diseases, or a history of alcoholism.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Aniline, the simplest aromatic amine, is a prototypical inducer of methemoglobinemia and impaired oxygen transport to tissues. Chemical protective clothing is recommended because aniline vapor and liquid can be dermally absorbed and may contribute to systemic toxicity. Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): butyl rubber gloves, suits, boots; Polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves; Barricade®™ coated suits; Responder™ suits, Trellchem HPS™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 micron>g/cm^2/min): Teflon™ gloves, suits, boots; Viton™ gloves, suits; Saranex™ coated suits. In areas of vapor concentration, the use of respirators alone is not sufficient; skin protection by protective clothing should be provided even though there is no skin contact with liquid aniline. Personal hygiene practices including prompt removal of clothing which has absorbed aniline, thorough showering after work and before changing to street clothes, and clean working clothes daily are essential. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.

NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where aniline may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, dry, dark, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Aninline requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and the Packing Group is II.[19, 20] Aniline carries a plus sign (+), indicating that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class. The hydrochloride requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Wear positive pressure breathing apparatus and special protective clothing. Remove all ignition sources: no flares, smoking, or flames in hazard area. Do not touch material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with vermiculite, dry sand, earth, or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. Use alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Fight fire from maximum distance. Dike fire control water for later disposal and do not scatter material. If a leak or spill has not ignited, use water spray to control vapors. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration with provision for nitrogen oxides removal from flue gases by scrubber, catalytic or thermal device.[22]

Description: Anisidine exists as *ortho*-, *meta*-, and *para*-isomers. They have characteristic amine (fishy) odors.

o-isomer: A colorless to pink liquid. Solid below 5°C. Molecular weight = 123.17; Boiling point = 224°C; Melting/Freezing point = 5°C; Vapor pressure = <0.1 mmHg at 20°C; Flash point = 118°C (oc); Autoignition temperature = 415°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 1.5%.

m-isomer: Pale yellow liquid. Molecular weight = 123.2; Boiling point = 251°C; Freezing/Melting point = 57.2°C; Vapor pressure = 0.006 mmHg at 20°C.

p-isomer: Reddish-brown solid. Molecular weight = 123.2; Boiling point = 243°C; Freezing/Melting point = 57.2°C; Vapor pressure: 0.4 mmHg at 20°C; Flash point = 122°C; Autoignition temperature = 515°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: (*m-isomer*) Mutagen, (*o*-) Tumorigen, Mutagen, (*p-isomer*) Tumorigen, Drug, Mutagen. Anisidines are used in the manufacture of azo dyes, pharmaceuticals, textile-processing chemicals.

Incompatibilities: Incompatible with strong oxidizers, with risk of fire or explosions. Attacks some coatings and some forms of plastic and rubber.

Permissible Exposure Limits in Air

o- and p-isomers

OSHA PEL: 0.5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA [skin] Potential occupational carcinogen. Reduce exposures to the lowest feasible concentration.

ACGIH TLV®[1]: 0.1 ppm/0.5 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans; BEI established.

Determination in Air: Use NIOSH Analytical Method 2514, anisidine.[18]

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.93$ (*o*-isomer); [v]; Octanol−water coefficient: Log $K_{ow} = 1.18$ (*m*-isomer); Octanol−water coefficient: Log $K_{ow} = 0.95$ [v] (*p*-isomer).

Routes of Entry: Inhalation, ingestion, skin, eye, mucous membrane absorption.

Harmful Effects and Symptoms

Short Term Exposure: These chemicals can be absorbed through the skin, eyes, or mucous membranes, thereby increasing exposure. Contact with anisidines can irritate the eyes, skin, and respiratory tract; can cause a burning sensation and skin rash. Inhalation of *p*-anisidine can cause shortness of breath and coughing. Exposure can interfere with the blood's ability to carry hemoglobin (methemoglobinemia). This can cause headache, dizziness, cyanosis of the skin and lips. Higher levels can cause difficult breathing, collapse, and death.

Long Term Exposure: *o*-Anisidine is a probable carcinogen in humans (IARC: Group 2B, limited human evidence). Related aromatic amines are carcinogens, and *p*-anisidine may be carcinogenic as well. Repeated exposure to these isomers may cause anemia, skin allergy, lung irritation and bronchitis, and nerve and kidney damage.

Points of Attack: Blood, kidneys, liver, cardiovascular system, central nervous system.

Medical Surveillance: *o-anisidine*: Evaluation by a qualified allergist, test for blood hemoglobin, complete blood count (CBC), and reticulocyte count. Consider nerve conduction studies. *p-Anisidine*: lung function tests, evaluation by a qualified allergist, kidney function tests, complete blood count (CBC), methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention

immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof (*o*-anisidine) or dust-proof (*p*-anisidine) chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 500) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dark, well-ventilated area. Protect against sunlight and strong oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Anisidines require a shipping label of "POISONOUS/TOXIC MATERIALS." The DOT/UN Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: *Liquid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Cover with sand and soda ash (9:1). After mixing, collect material in the most convenient and safe manner and deposit in sealed containers. Keep *o*-anisidine out of confined spaces, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in combustible solvent (alcohols, benzene, etc.) and spray solution into furnace equipped with afterburner and scrubber, or burn spill residue on sand and soda ash absorbent in a furnace.

Anisole A:1370

Molecular Formula: C_7H_8O
Common Formula: $C_6H_5OCH_3$
Synonyms: Benzene, methoxy; Ether, methyl phenyl; Methoxybenzene; Methyl phenyl ether; Metil fenil eter (Spanish); Phenyl methyl ether
CAS Registry Number: 100-66-3
RTECS® Number: BZ8050000
UN/NA & ERG Number: UN2222/128
EC Number: 202-876-1
Regulatory Authority and Advisory Bodies
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Anisole is a colorless to yellowish liquid with an agreeable, aromatic, spicy-sweet odor. Molecular weight = 108.15; Boiling point = 154°C; Freezing/Melting point = −37.3°C; Vapor pressure = 3.1 mmHg at 25°C; Flash point = 51.6°C (oc); Autoignition temperature = 475°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.
Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. Anisole is used as a solvent, a flavoring, vermicide, making perfumes, and in organic synthesis.
Incompatibilities: Oxidizers, strong acids.
Permissible Exposure Limits in Air
ACGIH TLV®[1]: 0.1 ppm TWA (A4) [skin]
Protective Action Criteria (PAC)
TEEL-0: 4 mg/m^3
PAC-1: 12.5 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 400 mg/m^3
Russia: STEL 10 mg/m^3, 1993
Permissible Concentration in Water: Russia[43] set a MAC of 0.05 mg/L in water bodies used for domestic purposes.
Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.1.
Routes of Entry: Inhalation, absorbed through the skin, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: A skin irritant since it degreases the skin; prolonged skin contact can cause drying and cracking. It irritates the eyes and respiratory tract if exposure occurs.[57] Exposure can cause dizziness, lightheadedness, and unconsciousness. It is moderately toxic by ingestion.[44] The oral LD_{50} for rat is 3700 mg/kg and for mouse is 2800 mg/kg.[9]
Long Term Exposure: Skin problems, dryness, cracking.
Points of Attack: Eyes, skin, respiratory system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away

from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where anisole may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated, fireproof area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Anisole requires a shipping label of "FLAMMABLE LIQUID." Anisole falls in Hazard Class 3, Packing Group III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate spill or leak area. Absorb spilled liquid in sand or inert absorbent and put in sealed containers and remove for disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 5000 lb (2270 kg), 40CFR 372.65: Form R *de minimis* Concentration Reporting Level: 1.0%.

California Proposition 65 Chemical: (*coke oven emissions*) Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Anthracene is colorless to pale yellow crystalline solid with a bluish fluorescence. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 178.24; Boiling point = 340°C; Freezing/Melting point = 216.5°C; Specific gravity (H_2O:1) = 1.24; Vapor pressure = 0.99 mmHg at 145°C; Flash point = 121°C; Autoignition temperature = 540°C. Explosive limits: LEL = 0.6%.[17] NFPA 704 M Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. It is used as an intermediate in dyestuffs (alizarin), insecticides, and wood preservatives; making synthetic fibers, anthraquinone, and other chemicals. May be present in coke oven emissions, diesel fuel, and coal tar pitch volatiles.

Incompatibilities: Finely dispersed powder forms explosive mixture in air. Contact with strong oxidizers, chromic acid, or calcium hypochlorite may cause violent reactions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 500 mg/m^3

No occupational limits have been established for anthracene. However this chemical may be present as *coke oven emissions* and *coal tar pitch volatiles*.

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen.

DFG MAK: Carcinogen Category 1.

NIOSH IDLH: 80 mg/m^3.

See also entry for coal tar pitch volatiles.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: Anthracene falls in the "polynuclear aromatic hydrocarbon" category of priority toxic pollutants as defined by EPA.[6] The EPA has considered setting criteria in the range from 0.097 to 9.7 ng/L for the protection of human health from polynuclear aromatic hydrocarbons. In addition, Kansas has set forth a guideline for anthracene in drinking water[61] of 0.029 μg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.2$.[d, icsc]

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Anthracene can affect you when breathed in. Skin contact can cause irritation or a skin allergy which is greatly aggravated by sunlight on contaminated skin. Breathing irritates the nose, throat, and bronchial tubes. Eye contact or "fume" exposure can cause irritation and burns.

Long Term Exposure: Repeated skin contact can cause thickening, pigment changes, and growths. Anthracene may cause mutations. Handle with extreme caution. The carcinogenic status of anthracene is a bit confusing: Animal negative[9] compares with ACGIH[1] and DFG[3] categorization of coal tar volatiles as proven carcinogens. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies. The Lewis/Sax reference below states that it is a mutagen and questionable carcinogen.

Points of Attack: Skin, respiratory system, bladder, liver, kidneys, as PAH.

Medical Surveillance: Evaluation by a qualified allergist. NIOSH lists the following tests: complete blood count; chest X-ray; pulmonary function tests: Forced Vital Capacity; Forced Expiratory Volume (1 s); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria.[2]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Antidotes and Special Procedures:* Sun screens for ultraviolet light may help prevent skin allergic reactions. These may need frequent re-applications if you are sweating. Ultraviolet-screening sunglasses can help with eye allergic reactions. Consult your doctor or pharmacist in selecting these.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Anthracene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), chromic acid, and calcium hypochlorite, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Anthracene is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The "Acridine" standard may be used for this chemical. The required label is "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.[22]

TSCA 40CFR704.30; 40CFR716.120(a) List of substances; 40CFR712.30(m); 40CFR799.500 Testing Requirements. Export notification required by §12(b).

California Proposition 65 Chemical: Cancer 9/28/07.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Anthraquinone is a combustible, light yellow to green crystalline solid. Molecular weight = 208.23; Boiling point = 380°C; Melting/Freezing point = 286°C (sublimes); Flash point = 185°C (cc). NFPA 704 M Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Very slightly soluble in water; solubility = <13 mg/L at 22°C.

Potential Exposure: Anthraquinone is an important starting material for vat dye manufacture. Also used in making organics and used as a bird repellent in seeds.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 100 mg/m^3
PAC-3: 500 mg/m^3
Russia[43]: MAC 5 mg/m^3 work-place air.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.39 (measured), 2.7 (calculated).

Routes of Entry: Through the skin, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Can be absorbed through the skin, thereby increasing exposure. Eye or skin contact can cause irritation. An allergen, may cause skin irritation and sensitization. Severe poisoning, may cause seizures and coma.

Long Term Exposure: May cause skin allergy, with itching and rash. It may be mutagenic.

Points of Attack: Skin, lungs.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical can be classified by the hazardous materials description and proper shipping name as: "Dyes, solid, toxic, n.o.s. or dye intermediates, solid, toxic, n.o.s." It requires labeling of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Collect powdered

material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as antimony, elemental; National Pollutant Release Inventory.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Antimony is a silvery-white, lustrous, hard, brittle metal, scale-like crystals, or dark gray lustrous powder. Molecular weight = 121.75; Specific gravity (H_2O:1) = 6.68 at 25°C; Boiling point = 1635°C; Freezing/Melting point = 630°C. Hazard Identification (based on NFPA-704 M Rating System): [powder] Health 2, Flammability 2, Reactivity 0. Insoluble in water and organic solvents.

Potential Exposure: Compound Description: Tumorigen; Human Data. Exposure to antimony may occur during mining, smelting, or refining; alloy and abrasive manufacture; and typesetting in printing. Antimony is widely used in the production of alloys, imparting increased hardness, mechanical strength, corrosion resistance, and a low coefficient of friction. Some of the important alloys are Babbitt, pewter, white metal, Britannia metal, and bearing metal (which are used in bearing shells), printing-type metal, storage battery plates, cable sheathing, solder, ornamental castings, and ammunition. Pure antimony compounds are used as abrasives, pigments, flame-proofing compounds, plasticizers, and catalysts in organic synthesis; they are also used in the manufacture of tartar emetic, paints, lacquers, glass, pottery, enamels, glazes, pharmaceuticals, pyrotechnics, matches, and explosives. In addition, they are used in dyeing, for blueing steel, and in coloring aluminum pewter and zinc. A highly toxic gas, stibine, may be released from the metal under certain conditions.

Incompatibilities: Finely dispersed powder forms explosive mixture in air. Strong oxidizers; strong acids [especially halogenated acids], produce a violent reaction, and deadly stibine gas (antimony hydride). Heat forms stibine gas.

Mixtures with nitrates or halogenated compounds may cause combustion. Forms an explosive mixture with chloric and perchloric acid.

Note: Stibine is formed when antimony is exposed to nascent (freshly formed) hydrogen.[NIOSH]

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Sb]/m^3 TWA.
OSHA PEL: 0.5 mg[Sb]/m^3 TWA.
NIOSH REL: 0.5 mg[Sb]/m^3 TWA.
NIOSH IDLH: 50 mg[Sb]/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 50 mg/m^3

Antimony and inorganic compounds, excluding stibine

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006).

Arab Republic of Egypt: TWA 0.5 mg/m^3, 1993; Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, 1999; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3, 1993; France: VME 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg [Sb]/m^3; MAC-TGG 0.5 mg/m^3, 2003; Japan: 0.1 mg/m^3, 2B carcinogen, 1999; Norway: TWA 0.5 mg[Sb]/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (time-weighted average) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Russia:; TWA 0.2 mg/m^3, STEL 0.5 mg/m^3, 1993; Sweden: NGV 0.5 mg/m^3, 1999; Switzerland: MAK-week 0.5 mg/m^3, 1999; Turkey: TWA 0.5 mg/m^3, 1993; United Nations: TWA 0.5 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg[Sb]/m^3. Several states have set guidelines or standards for antimony in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 1.19 μg/m^3 (Kansas) to 1.2 μg/m^3 (Pennsylvania) to 5 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 10 μg/m^3 (Connecticut) to 12 μg/m^3 (Nevada) to 40 μg/m^3 (Rhode Island).

Determination in Air: OSHA Analytical Methods ID-125G, ID121. See also NIOSH Analytical Method #8005 (elements in blood and tissue).

Permissible Concentration in Water: To protect freshwater aquatic life—on an acute basis 9000 μg/L and on a chronic basis, 1600 μg/L. *To protect saltwater aquatic life:* no criterion due to insufficient data. *To protect human health:* 146 μg/L. EPA has also suggested an ambient limit of 7 μg/L[32] based on health effects. Mexico has set an Ecological Criteria guideline of 0.1 mg/L. Russia[43] set a MAC of 0.05 mg/L of antimony dust in water used for domestic purposes. In addition, Kansas has set a guideline for antimony in drinking water[61] of 143 μg/L.

Determination in Water: Digestion followed by atomic absorption. See EPA Methods 204.1 and 204.2.

Routes of Entry: Inhalation of dust or fume, skin, and/or eye contact.

Harmful Effects and Symptoms

Local: Antimony and its compounds are generally regarded as primary skin irritants. Lesions generally appear on exposed, moist areas of the body, but rarely on the face. The dust and fumes are also irritants to the eyes, nose, and throat, and may be associated with gingivitis, anemia, and ulceration of the nasal septum and larynx. Antimony trioxide causes a dermatitis known as "antimony spots." This form of dermatitis results in intense itching followed by skin eruptions. A diffuse erythema may occur, but usually the early lesions are small erythematous papules. They may enlarge, however, and become pustular. Lesions occur in hot weather and are due to dust accumulating on exposed areas that are moist due to sweating. Neither evidence of eczematous reaction is present, nor an allergic mechanism. *Systemic:* Systemic intoxication is uncommon from occupational exposure. However, miners of antimony may encounter dust containing free silica; cases of pneumoconiosis in miners have been termed "silico-antimoniosis." Antimony pneumoconiosis, *per se*, appears to be a benign process. Antimony metal dust and fumes are absorbed from the lungs into the blood stream. Principal organs attacked include certain enzyme systems (protein and carbohydrate metabolism), heart, lungs, and the mucous membrane of the respiratory tract. Symptoms of acute oral poisoning include violent irritation of the nose, mouth, stomach, and intestines, vomiting, bloody stools, slow shallow respiration, pulmonary congestion, coma, and sometimes death due to circulatory or respiratory failure. Chronic oral poisoning presents symptoms of dry throat, nausea, headache, sleeplessness, loss of appetite, and dizziness. Liver and kidney degenerative changes are late manifestations. Antimony compounds are generally less toxic than antimony. Antimony trisulfide, however, has been reported to cause myocardial changes in humans and experimental animals. Antimony trichloride and pentachloride are highly toxic and can irritate and corrode the skin. Antimony fluoride is extremely toxic, particularly to pulmonary tissue and skin.

Short Term Exposure: Eye and skin contact can cause irritation and itchy skin rash. Inhalation can cause respiratory tract irritation with wheezing and shortness of breath. Exposure can cause headache, nausea, abdominal pain, and loss of sleep.

Antimony poisoning can be delayed from 30 min to 2 h following ingestion. Symptoms include nausea, vomiting, dehydration and thirst, difficulty in swallowing, rapid pulse, cyanosis, watery stool and cramps, collapse, and shock. See also above.

Long Term Exposure: Repeated exposure can cause ulcers and sores of the nose to develop, damage to the kidneys, liver, and heart, lung effects (abnormal chest X-ray). See also above.

Points of Attack: Respiratory system, cardiovascular system, skin, eyes, and lungs.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic

X-ray, sputum cytology, urine (chemical/metabolite), urine (chemical/metabolite) pre- and postshift, urinalysis (routine), complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including antimony. Although BAS is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: A combination of protective clothing, barrier creams, gloves, and personal hygiene will protect the skin. Prevent skin contact. Any barrier that will prevent contamination from the dry chemical. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide washing facilities, emergency showers and eyewash. Eating should not be permitted in exposed areas.

Respirator Selection: *5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, halogens, strong acids, and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Contact with acids forms deadly stibine gas. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist.

Shipping: Antimony powder requires a shipping label of "POISONOUS/TOXIC MATERIALS." The DOT/UN Hazard Class is 6.1 and Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Antimony dust can present a moderate hazard when exposed to flame. Self-contained breathing apparatus may be required when antimony is exposed to extreme temperatures in a fire. Use dry chemical appropriate for metal fires, water spray, fog, or standard foam extinguishers. Toxic fumes are produced in fire, including deadly stibine gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a

secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and recycling is an option to disposal which should be considered for scrap antimony and spent catalysts containing antimony. Dissolve spilled material in minimum amount of concentrated HCl. Add water, until white precipitate appears. Then acidify to dissolve again. Saturate with H_2S. Filter, wash, and dry the precipitate and return to supplier.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (New Zealand)[13] (many countries, especially in food) (UN).[35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: 42USC7412; Title I, Part A, §112 Hazardous Pollutants.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed (as antimony compounds, n.o.s.).

Safe Drinking Water Act: MCL, treatment technique; MCL, 0.006 mg/L; MCLG, 0.006 mg/L; Regulated Chemical (47FR9352).

EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as antimony compounds, n.o.s.; National Pollutant Release Inventory as antimony compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Antimony lactate is a noncombustible, tan solid. Molecular weight = 388.98. Soluble in water. Antimony lactate may be contaminated with arsenic or other toxic substances.

Potential Exposure: Antimony lactate is used in fabric dyeing.

Incompatibilities: Contact with strong oxidizers (chlorates, permanganates, peroxides, and nitrates) may cause a violent reaction. Contact with acids can produce deadly stibine gas.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Sb]/m^3 TWA.

OSHA PEL: 0.5 mg[Sb]/m^3 TWA.

NIOSH REL: 0.5 mg[Sb]/m^3 TWA.

No Teel available.

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006).

NIOSH IDLH: 50 mg[Sb]/m^3.

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia[43] set a MAC of 0.3 mg/m^3 in work-place air.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Antimony lactate can affect you when breathed and by passing through skin. Exposure can irritate the eyes, nose, throat, and skin. Very high levels could cause Antimony poisoning, with symptoms of nausea headaches, abdominal pain, trouble breathing, and death. See also antimony [7440-36-0]. Antimony lactate may be contaminated with arsenic or other toxic substances.

Long Term Exposure: Repeated exposure can cause abnormal chest X-ray and damage the heart and liver. Prolonged or repeated skin contact can cause sores and ulcers.

Points of Attack: Skin, lungs, heart, liver.

Medical Surveillance: EKG, liver function tests, urine tests for antimony. Also test for arsenic if contamination is suspected. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72−216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure and at the end of the work shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of this antimony compound to potentially exposed workers.

Respirator Selection: *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* \100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly-closed containers in a cool, well-ventilated area away from heat, acids, and oxidizers.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The DOT/UN Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony lactate itself does not burn. Poisonous gases are produced in fire, including deadly stibine gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Skin absorption, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Antimony pentachloride is a corrosive chemical; can affect you when breathed in and by passing through your skin. Exposure can cause sore throat, rash, poor appetite, abdominal pain, loss of sleep, and irritate the lungs. Higher levels can cause pulmonary edema, a medical emergency that can be delayed for several hours, irregular heartbeat which can cause death. High or repeated exposure may damage the liver, kidneys, and the heart muscle. If used near acid, a deadly stibine gas can be formed. Antimony may contain arsenic. It is a corrosive chemical. Contact can burn the skin or eyes. The oral LD_{50} for rat is 1115 mg/kg.[9]

Long Term Exposure: Repeated contact can cause ulcers or sores in the nose, kidney, liver, and heart damage.
Points of Attack: Kidneys, liver, heart, respiratory system.
Medical Surveillance: EKG, liver, and kidney function tests. Consider chest X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72−216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Antimony pentachloride must be stored to avoid contact with organic or combustible materials (such as wood, paper, and oil) since violent reactions occur. See incompatibilities. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.
Shipping: This chemical requires a shipping label of "CORROSIVE." The DOT/UN Hazard Class is 8, the Packing Group is II (liquid) and III (solutions). [19, 20]
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony pentachloride itself does not burn. Poisonous gases are produced in fire, including chlorine and hydrogen chloride. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Encapsulate and transfer to an approve landfill. If chemically treated and neutralized, the chemical is amenable to biological treatment at municipal sewage treatment plant. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Banned or Severely Restricted (New Zealand)[13] (many countries, especially in food) (UN).[35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: 42USC7412; Title I, Part A, §112 Hazardous Pollutants.

Clean Water Act: 40CFR401.15 Section 307, Toxic Pollutants.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed (as antimony compounds, n.o.s.).

Safe Drinking Water Act: MCL, treatment technique; MCL, 0.006 mg/L; MCLG, 0.006 mg/L; Regulated Chemical (47FR9352).

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

CERCLA/SARA Section 304 Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as antimony(V)pentafluoride; National Pollutant Release Inventory, as antimony compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Antimony pentafluoride is a noncombustible, oily, colorless liquid with a pungent odor. Molecular weight = 216.75; Boiling point = 143°C; Melting/Freezing point = 8.3°C; Specific gravity: 2.340 at 30°C; Liquid surface tension = (estimate) 0.020 N/m at 20°C; Latent heat of vaporization = (estimate) 1.8×10^5 J/kg; Vapor pressure = 1.33 kPa at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: It is used as a catalyst in chemical reactions or as a source of fluorine (fluorinating reagent) in fluorination reactions.

Incompatibilities: Water and other forms of moisture forms hydrofluoric acid, combustible organic and siliceous materials, phosphorus, and phosphate materials. Attacks glass, ceramic, lead, and copper in the presence of moisture.

Note: the OSHA PEL for fluorides (measured as fluorine) is 2.5 mg/m^3 TWA for an 8-h work shift.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Severe health hazard. May be fatal if inhaled or absorbed through the skin. The compound is corrosive and irritating to eyes, skin, and lungs. Contact with eyes or skin causes severe burns. Ingestion causes vomiting and severe burns of mouth and throat. Overexposure by any route can cause bloody stools, slow pulse, low blood pressure, coma, convulsions, and cardiac arrest. The probable oral lethal dose of 5−50 mg/kg or between 7 drops and a teaspoonful for a 150-lb person (antimony salts).

Long Term Exposure: Can damage the kidneys, liver, and heart. Repeated exposure may affect the lungs and cause an abnormal chest X-ray to develop.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system.

Medical Surveillance: EKG, liver, and kidney function tests. Consider lung function tests and chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

NIOSH: *(fluorides) 12.5 mg/m*^{3}: Qm (APF = 25) (any quarter-mask respirator). *25 mg/m*^{3}*:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m*^{3}*:* Sa:Cf (APF = 25) *† (any supplied-air respirator operated in a continuous-flow mode) or P*† *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 mg/m*$^{3:}$ HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m*^{3}*:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF^{+} (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent. Exposure to 500 mg/m^3 (IDLH) is immediately dangerous to life and health.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Antimony pentafluoride must be stored to avoid contact with phosphorus, phosphates, siliceous, and combustible or organic materials since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and heat. Outside or detached storage is preferred.

Shipping: Antimony pentafluoride requires a shipping label of "CORROSIVE/POISONOUS/TOXIC MATERIALS." The DOT/UN Hazard Class is 8 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. For *large spills*, dike far ahead. Absorb spills with noncombustible absorbent material, such as vermiculite, dry sand, earth, etc., and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Approach fire from upwind; avoid hazardous vapors and toxic decomposition products. Do not use water or foam on fire or on adjacent fires; extinguish with dry chemicals or carbon dioxide. Water spray may be used to reduce vapors. Poisonous gases are produced in fire, including hydrogen fluoride and antimony fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed (as antimony compounds, n.o.s.).

Safe Drinking Water Act: MCL, treatment technique; MCL, 0.006 mg/L; MCLG, 0.006 mg/L; Regulated Chemical (47FR9352).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (as antimony compounds).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Antimony potassium tartrate is an odorless, colorless, crystalline material, or white powder with a sweetish, metallic taste. Molecular weight = 635.88; Specific gravity (H_2O:1) = 2.6. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solution is slightly acidic.

Potential Exposure: It is used in medicine, in textile and leather dyeing, as an insecticide.

Incompatibilities: Solution will react with alkaline materials.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Sb]/m^3 TWA.

OSHA PEL: 0.5 mg[Sb]/m^3 TWA.

NIOSH REL: 0.5 mg[Sb]/m^3 TWA.

NIOSH IDLH: 50 mg[Sb]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1.37 mg/m^3

PAC-1: 4.11 mg/m^3

PAC-2: 6.86 mg/m^3

PAC-3: 137 mg/m^3

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006).

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia MAC value[43] is 0.3 mg/m^3.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Skin absorption, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Antimony potassium tartrate can affect you when breathed in and by passing through your skin. Eye and skin contact can cause irritation and skin rash. Exposure can cause poor appetite, abdominal pain, nausea, headaches, sore throat, and irritation of air passages, with cough. Higher levels can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may make the heartbeat irregular or stop. High or repeated exposure may damage the liver or heart muscle.

Long Term Exposure: Prolonged or repeated contact can cause ulcers or sores in the nose, kidney, liver, and heart damage.

Points of Attack: Skin, eyes, respiratory system, cardiovascular system, kidneys, liver.

Medical Surveillance: EKG. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72−216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: Antimony potassium tartrate requires a shipping label of “POISONOUS/TOXIC MATERIALS.” The Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony potassium tartrate itself does not burn. Poisonous gases are produced in fire, including potassium oxide and antimony. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (as antimony compounds).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Antimony tribromide is a nonflammable, colorless to yellow crystalline solid. Molecular weight = 361.51. Boiling point = 288°C at 749 mmHg; Freezing/Melting point = 96.6°C; Specific gravity = 4.148 at 23°C; Critical temperature = 904.5°C; Critical pressure = 5.67 MN/m^2; Heat of Vaporization = 53.2 kJ/mol at 560°C; Vapor pressure = <0.075 mmHg at 23°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water, forms an acid.

Potential Exposure: It is used to make antimony salts, in dyeing, and analytical chemistry.

Incompatibilities: Contact with water or light can cause decomposition, potassium, sodium, and bases. Heat forms toxic bromides. Contact with water form an acid, liberates hydrogen bromide and antimony trioxide.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Sb]/m^3 TWA.

OSHA PEL: 0.5 mg[Sb]/m^3 TWA.

NIOSH REL: 0.5 mg[Sb]/m^3 TWA.

NIOSH IDLH: 50 mg[Sb]/m^3.

No TEEL available.

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006).

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia MAC value[43] is 0.3 mg/m^3.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Harmful Effects and Symptoms

Short Term Exposure: Antimony tribromide can affect you when breathed and by passing though skin. Exposure can cause sore throat, skin rash, poor appetite, irritation of the air passages with cough. Higher exposures can cause pulmonary edema, a medical emergency, that can be delayed for several hours. This can cause death. This chemical can cause irregular heartbeat; this can cause death. High or repeated exposure may damage the liver and the heart muscle. Antimony tribromide is a corrosive chemical and contact can burn the skin and eyes, with burns and possible permanent damage. If used near acid, a deadly stibine gas can be released.

Long Term Exposure: Repeated exposure can cause liver, heart muscle damage, headaches, loss of appetite, dry throat, and sleep disturbance. Corrosive substances, such as antimony tribromide, have the potential for causing lung damage.

Points of Attack: Skin, eyes, respiratory system, cardiovascular system.

Medical Surveillance: EKG, liver function tests, urine tests for antimony, lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72-216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Antimony Tribromide must be stored to avoid contact with potassium, sodium, and bases (such as sodium hydroxide, potassium hydroxide, and ammonium hydroxide) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and heat.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony tribromide itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Encapsulate and bury at an approved chemical landfill. Unacceptable for disposal at sewage treatment plants. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Antimony trichloride is a noncombustible, clear, colorless, crystalline solid with an acrid, pungent odor. Molecular weight = 228.10; Boiling point = 223.3°C; Freezing/Melting point = 73°C; Specific gravity (H_2O:1) = 3.14 at 20°C; Heat of solution = -1.6×10^5 J/kg; Heat of fusion = 13.3 cal/g; Vapor pressure = 0.119 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2. Soluble in water; solubility = 10%[d]; reaction.

Potential Exposure: It is used to make antimony salts and drugs, to fireproof textiles, and as a catalyst in many organic reactions, as a reagent for chloral, aromatic hydrocarbons, vitamin A, and for drug identification.

Incompatibilities: Decomposes in water, forming hydrochloric acid and antimony oxychloride. Reacts violently with strong bases; ammonia, alkali metals; aluminum, potassium, sodium. Forms explosive mixture with perchloric acid when hot. Reacts with air forming hydrochloric acid. Attacks metals in the presence of moisture, forming explosive hydrogen gas.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Antimony trichloride can affect you when inhaled. Exposure can cause sore throat, skin rash, poor appetite, and irritation of the air passages, with cough. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Higher exposures can also cause irregular heartbeat; this can cause death. High or repeated exposure may damage the liver and the heart muscle. Antimony trichloride is a corrosive chemical and contact can burn the skin and eyes, with possible permanent damage. If used near acid, a deadly gas (stibine) can be released. The oral LD_{50} for rat is 525 mg/kg.[9]

Long Term Exposure: May cause mutations. May damage the developing fetus. Repeated exposure can cause liver, heart muscle damage, headaches, loss of appetite, dry throat, and sleep disturbance. Corrosive substances, such as antimony trichloride, have the potential for causing lung damage.

Points of Attack: Cardiovascular system, reproductive system, liver, heart, and lungs.

Medical Surveillance: EKG, liver function tests, urine test for antimony, lung function tests including chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72−216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers under nitrogen in a cool, well-ventilated area away from water or moisture, heat and incompatible substances, such as strong bases, aluminum, potassium, and sodium.

Shipping: This chemical requires a shipping label of "CORROSIVE MATERIAL." (solid) (liquid) The Hazard Class is 8 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony trichloride itself does not burn. Poisonous gases are produced in fire, including chlorine and antimony. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EPCRA Section 313: Includes any unique chemical substance that contains antimony as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (as antimony compounds).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: S23/24/25; R51/53; Safety phrases: S1/2; S7; S26; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Antimony trifluoride is a noncombustible, odorless, white to gray crystalline solid. Molecular weight = 178.75; Specific gravity = 4.38 at 21°C (solid); Boiling point = 376°C; Freezing/Melting point = 292°C; Vapor pressure = 3 mmHg at 17°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: It is used in dyeing, to make porcelain and pottery, and as a fluorinating agent.

Incompatibilities: Hot perchloric acid.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Sb]/m^3 TWA.

NIOSH REL: 0.5 mg[Sb]/m^3 TWA.

ACGIH TLV®[1]: 0.5 mg[Sb]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.734 mg/m^3

PAC-1: 0.734 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 73.4 mg/m^3

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Category 3B (2006).

NIOSH IDLH: 50 mg[Sb]/m^3.

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are lower than the limits listed above. Russia MAC value[43] is 0.3 mg/m^3.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Harmful Effects and Symptoms

Short Term Exposure: Antimony trifluoride can affect you when breathed in and by passing through your skin. Exposure can cause sore throat, skin rash, poor appetite, and irritate the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Antimony trifluoride can cause irregular heartbeat; this can cause death. High or repeated exposure may damage the liver and the heart muscle. Antimony trifluoride is a corrosive chemical and contact can burn the skin and eyes, causing damage. If used near acid, a deadly gas (Stibine) can be released. The oral LD_{50} for mouse is 804 mg/kg.[9]

Long Term Exposure: Repeated contact can cause ulcers and sores of the nose. Can damage the kidneys, liver, and heart. Repeated exposure may affect the lungs and cause an abnormal chest X-ray to develop.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system.

Medical Surveillance: EKG, liver, and kidney function tests. Consider lung function tests and chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or

authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72−216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

NIOSH: (fluorides) 12.5 mg/m^3: Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3*: Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or*† *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* HieF$^+$ (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). 250 mg/m^3: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF$^+$ (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent. Exposure to 500 mg/m^3 (IDLH) is immediately dangerous to life and health.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Antimony trifluoride itself does not burn. Poisonous gases are produced in fire, including fluorides and antimony. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Permissible Concentration in Water: As part of the priority toxic pollutant program, EPA[6] has set a limit of 146 μg/L of antimony to protect human health. EPA has also suggested[32] an ambient limit of 7 μg/L of antimony based on health effects.

Harmful Effects and Symptoms

Short Term Exposure: Antimony trioxide can affect you when breathed in. Exposure can cause sore throat, rash, poor appetite, and irritation of the airways, with cough. High or repeated exposure may damage the liver and the heart muscle. If used near acid, a deadly stibine gas can be released.

Long Term Exposure: There is an association between Antimony trioxide in smelting processes and increased lung cancer. There is some evidence that this chemical may damage the developing fetus and cause miscarriage. Can damage the kidneys, liver, and heart. Repeated exposure may affect the lungs and cause an abnormal chest X-ray to develop.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, kidneys, liver, reproductive system.

Medical Surveillance: Complete blood count (CBC), urine test for antimony, EKG, liver, and kidney function tests. Consider lung function tests and chest X-ray. Depending on the degree of exposure, periodic medical checkups are advisable.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Specific engineering controls are recommended for this chemical in the NIOSH criteria document Antimony Number 72−216. Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, strong oxidizers, acids. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS."

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use any agent suitable for surrounding fires. Poisonous gases are produced in fire, including toxic Sb fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

518-75-2 (Antimycin/Citrinin)

IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3.

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).[7]

Reportable Quantity (RQ): 1 lb (0.454 kg).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*Antimycin A*-).

Description: Antimycin (A_3 $C_{26}H_{36}N_2O_9$) and (Antimycin A_1) $C_{28}H_{40}N_2O_9$ are crystalline solids. Molecular weight = 512.8 (A); 520.64 (A_3-); 506.6 (A_4-); Freezing/Melting point = 170–175°C; 149–150°C (A_1); 174–175°C (A_3). They are complex 9-membered (2 oxygens and 7 carbons) ring derivatives with complex side chains. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Specific uses for antimycin A were not found, however, antimycin A_1 and antimycin A_3 are reported to be antibiotic substances produced by streptomyces for use as a fungicide, possible insecticide, and miticide. Registered as a pesticide in the United States.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) *Antimycin A; 1397-94-0*

TEEL-0: 0.35 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 1.8 mg/m^3

PAC-3: 12.5 mg/m^3

Routes of Entry: Ingestion, intramuscular.

Harmful Effects and Symptoms

Short Term Exposure: Subcutaneous, intravenous, and intraperitoneal route poisons. Moderately toxic by ingestion and intramuscular routes. The oral LD_{50} for rat is 28 mg/kg.[9]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention

immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: This material is not listed in the DOT list of materials for Performance-Oriented Packaging Standards.[19] However, 1397-94-0 (antimycin A-) may fit DOT number 2811 (toxic solids, organic, n.o.s.) which requires a shipping label of “POISONOUS/TOXIC MATERIALS.” This DOT number is in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources (Nonspecific—Pesticide, solid, n.o.s.). Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: (Nonspecific—Pesticide, solid, n.o.s.). *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA Gene-Tox Program, Positive: SHE—clonal assay; Inconclusive: Carcinogenicity—mouse/rat.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

US EPA Hazardous Waste Number (RCRA No.): P072.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

CERCLA/SARA Section 304 Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (as 1-naphthyl thiourea).

WGK (German Aquatic Hazard Class): No value assigned.

Description: ANTU is a noncombustible, white crystalline solid or gray powder. Odorless. Molecular weight = 202.29; Boiling point = (decomposes) 457°C; Freezing/Melting point = 198°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Human Data. ANTU or its formulations are used as a rodenticide.

Incompatibilities: Strong oxidizers, silver nitrate.

Permissible Exposure Limits in Air

OSHA PEL: 0.3 mg/m^3 TWA.

NIOSH REL: 0.3 mg/m^3 TWA.

ACGIH TLV®[1]: 0.03 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 100 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.3 mg/m^3

PAC-1: 0.9 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 100 mg/m^3

DFG MAK: 0.3 mg/m^3 inhalable aerosol; Peak Limitations Category 11(2).

Australia: TWA 0.3 mg/m^3, 1993; Austria: MAK 0.3 mg/m^3, 1999; Belgium: TWA 0.3 mg/m^3, 1993; Denmark: TWA 0.3 mg/m^3, 1999; Finland: TWA 0.3 mg/m^3, STEL 0.9 mg/m^3, 1999; France: VME 0.3 mg/m^3, carcinogen, 1999; the Netherlands: MAC-TGG 0.3 mg/m^3, 2003; the Philippines: TWA 0.3 mg/m^3, 1993; Switzerland: MAK-week 0.3 mg/m^3, KZG-week 1.5 mg/m^3, 1999; Turkey: TWA 0.3 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea. New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for ANTU in ambient air[60] ranging from 3 μg/m^3 (North Dakota) to 5 μg/m^3 (Virginia) to 6 μg/m^3 (Connecticut) to 7 μg/m^3 (Nevada).

Determination in Air: Collection on a filter and analysis by gas–liquid chromatography. Use NIOSH Analytical Method 5276.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 1.66$.

Routes of Entry: Inhalation, ingestion, and skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. Symptoms include seizures and dermal irritation. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ingestion may cause vomiting, shortness of breath, and bluish discoloration of the skin. ANTU is moderately toxic: probable oral lethal dose (human) 0.5–5 mg/kg, or between 1 oz and 1 pint (or 1 lb) for a 150-lb person. The LD_{50} for oral rat is 6 mg/kg.[9] Chronic sublethal exposure may cause antithyroid activity. Can produce hyperglycemia of 3 times normal in 3 h.

Long Term Exposure: May cause chronic dermatitis, increased production of white blood cells. A suspected carcinogen and a possible mutagen.

Group Points of Attack: Respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. People with chronic respiratory disease or liver disease may be especially at risk. Lung function tests. Consider chest X-ray following acute overexposure. Evaluation by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *3 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *7.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *15 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or

GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and silver nitrate. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Naphthylthiourea requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid inhalation and skin contact; wear proper respiratory protection and protective clothing. Do not touch spilled material, stay upwind, keep out of low areas. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: ANTU may burn but will not ignite readily. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Poisonous gases are produced in fire, including nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in a furnace equipped with an alkaline scrubber.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Argon A:1510

Molecular Formula: Ar

Synonyms: Argon-40; Argon, cryogenic; Liquid argon; R-740

CAS Registry Number: 7440-37-1

RTECS® Number: CF2300000

UN/NA & ERG Number: UN1006 (compressed gas)/121; UN1951 [argon, refrigerated liquid (cryogenic liquid)]/120

EC Number: 231-147-0

Regulatory Authority and Advisory Bodies

Most regulatory authorities and advisory organizations (such as ACGIH) list argon as a "simple asphyxiant" or "asphyxiant." (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: With the symbol A, argon is a nonflammable gas; one of the elements in the inert gas category. It is colorless. Molecular weight = 39.95; Boiling point = − 186°C; Freezing/Melting point = − 192°C; Vapor density (air = 1) = 1.66. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 3.5% at 20°C.

Potential Exposure: Argon is used in metal fabrication and steel making, as an inert gas shield in arc welding, as an inert atmosphere in electric lamps, as a blanketing agent in metals refining (especially titanium and zirconium).

Permissible Exposure Limits in Air

An asphyxiant at less than 18% oxygen by volume.

OSHA: (shipyards and construction) simple asphyxiant, inert gas, and vapor.

ACGIH: simple asphyxiant with no specified numerical TLV.

Protective Action Criteria (PAC)

TEEL-0: 65,000 ppm
PAC-1: 65,000 ppm
PAC-2: 230,000 ppm
PAC-3: 400,000 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: asphyxiant, 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Simple asphyxiant.

Routes of Entry: Inhalation and possibly skin contact with liquid argon.

Harmful Effects and Symptoms

Short Term Exposure: The gas is a simple asphyxiant as noted above. Contact with the liquid can cause frostbite. High levels or concentrations in the air can replace oxygen, resulting in headache, unconsciousness, or death.

First Aid: If contact with liquid argon occurs, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with warm water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Where exposure to cold equipment, vapors, or liquids may occur, employees should be equipped with special clothing designed to prevent the freezing of body tissues. Avoid skin contact with liquid argon. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear splash-proof chemical goggles where exposure to liquid argon can occur.

Respirator Selection: Color Code—Green: General storage may be used. Exposure to argon is dangerous because it can cause a deficiency of oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Storage areas should be well-ventilated. Protect vessels which contain argon from physical damage.

Shipping: Argon must be labeled "NONFLAMMABLE, NONPOISONOUS GAS." It falls in Hazard Class 2.2 and has no designated Packing Group.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If sources of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air and allow cylinder to empty. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Argon is nonflammable and indeed can act as an extinguishing agent itself. Therefore, use extinguishing agents suited for surrounding fires. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Elemental arsenic, As, occurs to a limited extent in nature as a steel-gray, amorphous metalloid. Molecular weight = 74.9216. Boiling point = 613°C (sublimes); Freezing/Melting point = 814°C at 36 atm; 817°C at 28 atm; Critical temperature = 803°C; Critical pressure = 34.6 MN/m^2; Specific gravity (H_2O:1) = 5.727 at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0; (*arsenic compounds*) Health 4, Flammability 0, Reactivity 0. Insoluble in water. Arsenic in this entry includes the element and any of its inorganic compounds *excluding* arsine. Arsenic trioxide (As_2O_3), the principal form in which the element is used, is frequently designated as arsenic, white arsenic, or arsenous oxide. Arsenic is present as an impurity in many other metal ores and is generally produced as arsenic trioxide as a by-product in the smelting of these ores, particularly copper. Most other arsenic compounds are produced from the trioxide.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Arsenic compounds have a variety of uses. Arsenic and its compounds are used as an alloy additive, in electronic devices, in veterinary medicines, in agriculture as insecticides, herbicides, larvicides, and pesticides. Some arsenic compounds are used in pigment production; the manufacture of glass as a bronzing or decolorizing agent; the manufacture of opal glass and enamels, textile printing; tanning, taxidermy, antifouling paints; to control sludge formation in lubricating oils. Metallic arsenic is used as an alloying agent for heavy metals and in solders, medicines, herbicides. EPA has estimated that more than 6 million people living within 12 miles of major sources of copper, zinc, and lead smelters may be exposed to 10 times the average US atmospheric levels of arsenic. The agency says that 40,000 people living near some copper smelters may be exposed to 100 times the national atmospheric average.

Incompatibilities: Incompatible with strong acids; strong oxidizers; peroxides, bromine azide, bromine pentafluoride, bromine trifluoride; cesium acetylene carbide, chromium trioxide; nitrogen trichloride, silver nitrate. Can react vigorously with strong oxidizers (chlorine, dichromate, permanganate). Forms highly toxic fumes on contact with acids or active metals (iron, aluminum, zinc). Hydrogen gas can react with inorganic arsenic to form highly toxic arsine gas.

Permissible Exposure Limits in Air

Arsenic, and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min Ceiling Concentration. Limit exposure to lowest feasible level.

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA.

Arsenic, inorganic and organic compounds

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

NIOSH IDLH: 5 mg[As]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.01 mg/m^3

PAC-1: 0.35 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 5 mg/m^3

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: See Regulatory Authority and Advisory Bodies for US EPA levels. *To protect freshwater aquatic life:* total recoverable trivalent inorganic arsenic never to exceed 440 μg/L. *To protect saltwater aquatic life:* 508 μg/L on an acute basis. *To protect human health:* preferably zero. A value of 0.02 μg/L corresponds to a human health risk of 1 in 100,000. Allowable arsenic levels in drinking water have also been set by Russia[43] at 0.05 mg/L and in water for fishery purposes of 0.05 mg/L also. Maine (drinking water)[61] of 0.05 mg/L. Mexico 0.5 mg/L (reduce human exposure to a minimum).

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It has also been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate, an alternative is atomic absorption, another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation, through the skin, and ingestion of dust and fumes.

Harmful Effects and Symptoms

Local: Trivalent arsenic compounds are corrosive to the skin. Brief contact has no effect, but prolonged contact results in a local hyperemia and later vesicular or pustular eruption. The moist mucous membranes are most sensitive to the irritant action. Conjunctiva, moist and macerated areas of the skin, eyelids, the angles of the ears, nose, mouth, and respiratory mucosa are also vulnerable to the irritant effects. The wrists are common sites of dermatitis, as are the genitalia if personal hygiene is poor. Perforations of the nasal septum may occur. Arsenic trioxide and pentoxide are capable of producing skin sensitization and contact dermatitis. Arsenic is also capable of producing keratoses, especially of the palms and soles. Arsenic has been cited as a cause of skin cancer, but the incidence is low. *Systemic:* The acute toxic effects of arsenic are generally seen following ingestion of inorganic arsenical compounds. This rarely occurs in an industrial setting. Symptoms develop within 0.5−4 h following ingestion and are usually characterized by constriction of the throat followed by dysphagia, epigastric pain, vomiting, and watery diarrhea. Blood may appear in vomitus and stools. If the amount ingested is sufficiently high, shock may develop due to severe fluid loss, and death may ensue in 24 h. If the acute effects are survived, exfoliative dermatitis and peripheral neuritis may develop. Cases of acute arsenical poisoning due to inhalation are exceedingly rare in industry. When it does occur, respiratory tract symptoms—cough, chest pain, dyspnea, giddiness, headache, and extreme general weakness precede gastrointestinal symptoms. The acute toxic symptoms of trivalent arsenical poisoning are due to severe inflammation of the mucous membranes and greatly increased permeability of the blood capillaries. Chronic arsenical poisoning due to ingestion is rare and generally confined to patients taking prescribed medications. However, it can be a concomitant of inhaled inorganic arsenic from swallowed sputum and improper eating habits. Symptoms are weight loss, nausea, and diarrhea alternating with constipation, pigmentation and eruption of the skin, loss of hair, and peripheral neuritis. Chronic hepatitis and cirrhosis have been described. Polyneuritis may be the salient feature, but more frequently there are numbness and paresthesias of "glove and sticking" distribution. The skin lesions are usually melanotic and keratotic and may occasionally take the form of an intradermal cancer of the squamous cell type, but without infiltrative properties. Horizontal white lines (striations) on the fingernails and toenails are commonly seen in chronic arsenical poisoning and are considered to be a diagnostic accompaniment of arsenical polyneuritis. Inhalation of inorganic arsenic compounds is the most common cause of chronic poisoning in the industrial situation. This condition is divided into three phases based on signs and symptoms. *First Phase:* The worker complains of weakness, loss of appetite; some nausea, occasional vomiting, a sense of heaviness in the stomach, and some diarrhea. *Second Phase:* The worker complains of conjunctivitis, and a catarrhal state of the mucous membranes of the nose, larynx, and respiratory passages. Coryza, hoarseness, and mild tracheobronchitis may occur. Perforation of the nasal septum is common and is probably the most typical lesion of the upper respiratory tract in occupational exposure to arsenical dust. Skin lesions, eczematoid and allergic in type, are common. *Third Phase:* The worker complains of symptoms of peripheral neuritis, initially of hands and feet, which is essentially sensory. In more severe cases, motor paralyses occur; the first muscles affected are usually the toe extensors and the peronei. In only the most severe cases will paralysis of flexor muscles of the feet or of the extensor muscles of hands occur. Liver damage from chronic arsenical poisoning is still debated, and as yet the question is unanswered. In cases of chronic and acute arsenical poisoning, toxic effects to the myocardium have been reported based on EKG changes. These finding, however, are now largely discounted and the EKG changes are ascribed to electrolyte disturbances concomitant with arsenicalism. Inhalation of arsenic trioxide and other inorganic arsenical dusts does not give rise to radiological evidence of pneumoconiosis. Arsenic does have a depressant effect upon the bone marrow, with disturbances of both erythropoiesis and myelopoiesis. Evidence is now available incriminating arsenic compounds as a cause of lung cancer as well as skin cancer. Skin cancer in humans is causally associated with exposure to inorganic arsenic compounds in drugs, drinking water, and the occupational environment. The risk of lung cancer was increased 4−12 times in certain smelter workers who inhaled high levels of arsenic trioxide. However, the influence of other constituents of the working environment cannot be excluded in these studies. Case reports have suggested an association between exposure to arsenic compounds and blood dyscrasias and liver tumors.

Short Term Exposure: Skin contact can cause irritation, itching, burning sensation, and rash. Eye contact can cause irritation and burns. Inhalation can cause irritation of the respiratory tract. High exposure can cause poor appetite, nausea, vomiting, and muscle cramps. High exposure can cause nerve damage with numbness, “pins and needles” sensation, weakness of the arms and legs.

Long Term Exposure: Arsenic is a carcinogen, causes skin, lung, and lymphatic cancer, possible reproductive hazard (a teratogen in animals). Can cause an ulcer of the “bone” dividing the inner nose. It can cause hoarseness, sore eyes, nerve damage, thickening of the skin with patch areas of darkening and loss of pigment, liver damage and stomach problems. Small doses can accumulate in the body.

Points of Attack: Liver, kidneys, skin, lungs, lymphatic system.

Medical Surveillance: Before first exposure and every 6−12 months thereafter, OSHA 1910.1018 requires employers to provide (for persons exposed to 0.005 mg/m^3 of arsenic) a medical history and exam which shall include chest X-ray, exam of the nose, skin, and nails, sputum cytology examination, test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work-day). Levels should not be greater than 100 μg/g creatinine in the urine. Exam of the nervous system. After suspected overexposure, repeat these tests and consider complete blood count (CBC) and liver function tests. Also examine skin periodically for abnormal growths. Skin cancer from arsenic can easily be cured when detected early. Employees have a legal right to testing information under OSHA 1910.20.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). Oral *penicillamine (not penicillin)* has been used as a follow-up treatment or used instead of BAL for milder poisoning, with mixed success. Side effects may occur with such treatment and it is never a substitute for controlling exposure. Treatment can only be done under strict medical care.

Personal Protective Methods: Workers should be trained in personal hygiene and sanitation, the use of personal protective equipment, and early recognition of symptoms of absorption, skin contact irritation, and sensitivity. With the exception of arsine and arsenic trichloride, the compounds of arsenic do not have odor or warning qualities. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof chemical goggles and face shield when working with powder or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, “*Inorganic Arsenic*.”

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Workers should be permitted to leave the work area every 2 h to wash their faces and obtain clean respirators.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Arsenic must be stored in a cool, dry place away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric) since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The shipping label required for solid arsenic and inorganic compounds is "POISONOUS/TOXIC MATERIALS" (UN1558). These materials fall in Hazard Class 6.1 and Packing Group II for solid arsenic and I for solid arsenic compounds.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover the spill with dry lime or soda ash and collect powdered material in a safe manner and deposit in sealed containers. Alternatively, if the spill is a solid, place in suitable container without raising dust. Use a high efficiency particulate absolute (HEPA) filter vacuum (*not* a standard shop vac) or wet method to reduce dust during cleanups. *Do not dry sweep.* If the spill is a liquid, cover with an absorbent and sweep into a suitable container. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Arsenic metal is noncombustible, however arsenic dust can be flammable when exposed to heat or flame. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including arsine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Elemental arsenic wastes should be placed in long-term storage or returned to suppliers or manufacturers for reprocessing. Arsenic pentaselenide-wastes should be placed in long-term storage or returned to suppliers or manufacturers for reprocessing. Arsenic trichloride: hydrolyze to arsenic trioxide utilizing scrubbers for hydrogen chloride abatement. The trioxide may then be placed in long-term storage. Arsenic trioxide: long-term storage in large shiftproof and weatherproof silos. This compound may also be dissolved, precipitated as the sulfide, and returned to the suppliers. Arsenic-containing sewage may be decontaminated by pyrolusite treatment.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% as arsenic acid [CAS 7778-39-4].

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Arsenic acid is an odorless, noncombustible, white semi-transparent crystalline material or in a commercial grade that is a pale yellow syrup-like liquid. Molecular weight = 141.95; Boiling Point = (loses water) 160°C; Melting/Freezing point = 36°C; Specific gravity (H_2O:1) = 2.2 at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. It converts to As_2O_5 (arsenic pentoxide) when heated above 300°C. See also arsenic pentoxide.

Potential Exposure: It is used as a wood treatment, drying agent, soil sterilant, and to make other arsenates. It has been used as a cotton defoliant.

Incompatibilities: Incompatible with sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides, oxidizers, epichlorohydrin, vinyl acetate, amides. Avoid contact with chemically active metals. Corrodes brass, mild steel, and galvanized steel. Contact with acids or acid mists releases deadly arsine gas.

Permissible Exposure Limits in Air

Arsenic, and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min Ceiling Concentration. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

NIOSH IDLH: 5 mg[As]/m^3.

Protective Action Criteria (PAC)

7778-39-4

TEEL-0: 0.0189 mg/m^3

PAC-1: 0.4 mg/m^3

PAC-2: 3 mg/m^3

PAC-3: 9.5 mg/m^3

TEEL: CAS 1327-52-2 deleted in Ver. 26 September 2010

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United

Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: *To protect freshwater aquatic life:* total recoverable trivalent inorganic arsenic never to exceed 440 μg/L. *To protect saltwater aquatic life:* 508 μg/L on an acute basis. *To protect human health:* preferably zero. A value of 0.02 μg/L corresponds to a human health risk of 1 in 100,000. EPA has established a maximum arsenic level of 0.05 mg/L. This does not address carcinogenicity and is under review. Russia[43] has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It has also been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate, an alternative is atomic absorption, another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact can cause irritation, itching, burning sensation, and rash. Eye contact can cause irritation and burns. Inhalation can cause irritation of the respiratory tract. High exposure can cause poor appetite, nausea, vomiting, and muscle cramps. High exposure can cause nerve damage with numbness, "pins and needles" sensation, weakness of the arms and legs. The oral LD_{50} for rat is 48 mg/kg.[9] Ingestion of 130 mg of arsenic may be fatal to humans. Smaller doses may become fatal since arsenic accumulates in the body.

Long Term Exposure: Arsenic acid is a mutagen that may cause changes to genetic material and an animal teratogen. Can cause an ulcer of the "bone" dividing the inner nose. It can cause disturbed sleep, thickening of the skin with patch areas of darkening and loss of pigment, or the development of white lines in the nails.

Points of Attack: Liver, kidneys, skin, lungs, nervous system, lymphatic system.

Medical Surveillance: Examination of the nose, skin, eyes, nails, and nervous system. Test for urine arsenic. At NIOSH recommended exposure limits, urine arsenic should not be greater than 50−100 μg/L of urine. See also entry for "Arsenic."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. A regulated, marked area should be established where arsenic acid is handled, used, or stored. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full face-piece respiratory. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic.*"

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH* *conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Arsenic acid must be stored to avoid contact with heat and chemically active metals (such as potassium, sodium, magnesium, and zinc) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Arsenic acid requires a shipping label of “POISONOUS/TOXIC MATERIALS.” The Hazard Class is 6.1 and the Shipping Group is II for solid and I for the liquid form.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Neutralize spilled material with crushed limestone, soda ash, or lime. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area and wash spill site after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Arsenic acid itself does not burn. Poisonous gases are produced in fire, including arsine and oxides of arsenic. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Arsenic pentoxide is an odorless white lumpy solid or powder and nonflammable. It may be shipped as a concentrated water solution. Molecular weight = 229.84; Specific gravity (H_2O:1) = 4.32 at 25°C; 5.73[NIOSH] Boiling point = 499.8°C; Freezing/Melting point = 315°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Highly soluble in water; solubility = 66 g/100 mL.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Arsenic pentoxide is used in production of metal arsenates, as an herbicide, defoliant on cotton, as a chemical intermediate, as an ingredient in wood preservatives, and in glass. Other possible uses are as an insecticide and soil sterilant.

Incompatibilities: Decomposes above 315°C, forming oxygen and arsenic trioxide fumes. Arsenic pentoxide is an oxidizer; reacts violently with bromine pentafluoride and reducing agents. The solution in water is a weak acid. Incompatible with acids, strong alkalis, halogens, rubidium carbide, zinc. Corrosive to metals in the presence of moisture. Contact with acids or acid mists releases deadly arsine gas.

Permissible Exposure Limits in Air

Arsenic, and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min Ceiling Concentration. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

NIOSH IDLH: 5 mg[As]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0153 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7.7 mg/m^3

PAC-3: 7.7 mg/m^3

DFG TRK: DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/ L in urine/end-of-shift; Carcinogen Category 1.

NIOSH IDLH: 5 mg[As]/m^3.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: *To protect freshwater aquatic life:* total recoverable trivalent inorganic arsenic never to exceed 440 μg/L. *To protect saltwater aquatic life:* 508 μg/L on an acute basis. *To protect human health:* preferably zero. A value of 0.02 μg/L corresponds to a human health risk of 1 in 100,000. EPA has established a maximum arsenic level of 0.05 mg/L. This does not address carcinogenicity and is under review. Russia[43] has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It has also been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate, an alternative is atomic absorption, another is inductively coupled plasma (ICP) optical emission spectrometry. Octanol−water coefficient: Log K_{ow} = (estimated) 0.68.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: It is irritating to eyes, nose, and respiratory system. This chemical can be absorbed through the skin, thereby increasing exposure. Skin contact can cause irritation, burning, itching, and a rash. Symptoms usually appear 0.5−1 h after ingestion, but may be delayed. Symptoms include a sweetish, metallic taste and garlicky odor of breath, difficulty in swallowing, abdominal pain, vomiting and diarrhea, dehydration, feeble heart beat, dizziness and headache, and eventually coma, sometimes convulsions, general paralysis, and death. The oral LD_{50} for rat is 8 mg/kg.[9] This material is extremely toxic; the probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and a teaspoonful for a 150-lb person.

Long Term Exposure: Arsenic pentoxide is a carcinogen in humans. It has been shown to cause skin cancer. May damage the male reproductive glands. Chronic exposure may cause nerve damage to the extremities, alter cellular composition of the blood, and cause structural changes in blood components. Repeated exposure can cause an ulcer in the "bone" dividing the inner nose. Long-term skin contact can cause thickened skin and pigmentation changes. Some persons develop white lines in the finger nails.

Points of Attack: Liver, kidneys, skin, respiratory system, lymphatic system.

Medical Surveillance: See entry under "Arsenic and Inorganic compounds."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Reduce contact to lowest possible level. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full face-piece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wash thoroughly immediately after exposure to arsenic pentoxide and at the end of the work shift. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry, well-ventilated area away from metals, acids, and other incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Arsenic pentoxide requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1, the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material. Neutralize spilled material with crushed limestone, soda ash, or lime. Absorb small liquid spills with sand or other noncombustible absorbent material and place into containers for later disposal. For *large spills*, dike far ahead of spill for later disposal. Ventilate area and wash spill site after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: As_2O_5 may burn but does not readily ignite. Poisonous gases, including arsenic trioxide fumes, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S.[22] If needed, seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548−8730 (24-h response line). Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Arsenic trioxide is a noncombustible, odorless, white powder or colorless crystalline solid. Molecular weight = 197.84; Boiling point = 460−465°C; Freezing/Melting point = 312°C (sublimes at 193°C). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Arsenic trioxide, a primary raw material for other arsenic compounds, is used in manufacture of pesticides, glass, industrial chemicals, and drugs. It is an intermediate for insecticides, herbicides, and fungicides. The material is used as a wood and tanning preservative and a decoloring and refining agent in glass manufacture. It is also used in pharmaceuticals and in the purification of synthetic gas.

Incompatibilities: Sodium chlorate, sodium hydroxide, sulfuric acid, fluorine, chlorine trifluoride, chromic oxide, aluminum chloride, phosphorus pentoxide, hydrogen fluoride, oxygen difluoride, tannic acid, infusion cinchona and other vegetable astringent infusions and decoctions, iron in solution. Contact with acids or acid mists releases deadly arsine gas.

PAC-3: **9.1** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) and ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Australia: carcinogen, 1993; Austria: carcinogen, 1999; Belgium: carcinogen, 1993; Denmark: TWA 0.05 mg(As)/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, carcinogen, 1999; Japan: carcinogen, 1999; Norway: TWA 0.01 mg(As)/m^3, 1999; the Philippines: TWA 0.1 mg/m^3, carcinogen, 1993; Poland: TWA 0.01 mg(As)/m^3, 1999; Sweden: TWA 0.03 mg(As)/m^3, carcinogen, 1999; Switzerland: MAK-week 0.1 mg(As)/m^3, carcinogen, 1999; United Kingdom: TWA 0.1 mg(As)/m^3, carcinogen, SEP2000; United Kingdom: TWA 0.1 mg(Se)/m^3, SEP2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed human carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.0002^3 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: To protect freshwater aquatic life: total recoverable trivalent inorganic arsenic never to exceed 440 μg/L. To protect saltwater aquatic life: 508 μg/L on an acute basis. To protect human health: preferably zero. A value of 0.02 μg/L corresponds to a human health risk of 1 in 100,000. EPA has established a maximum arsenic level of 0.05 mg/L. This does not address carcinogenicity and is under review. Russia[43] has set MAC values for inorganic arsenic compounds in water for domestic purposes at 0.05 mg/L and in water bodies for fishery purposes of 0.5 mg/L also.

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact can cause burning, itching, and rash. Inhalation can cause respiratory irritation. Eye contact can cause irritation and possible permanent damage. High exposures can cause an abnormal EKG. Symptoms of acute poisoning may take from half-an-hour to several hours after ingestion to appear. They may include sweetish metallic taste; garlicky odor of breath and feces; constriction in throat and difficulty in swallowing; burning and colicky pains in esophagus, stomach and bowel; vomiting and profuse painful diarrhea (stools are watery initially, later becoming bloody); dehydration with intense thirst and muscular cramps; bluing of skin; feeble pulse and cold extremities; vertigo, frontal headache; stupor, delirium and mania (these symptoms may occur without concurrent or preceding gastric symptoms); fainting, coma, convulsions, general paralysis; and then possible death. This material is considered super toxic; probable oral lethal dose (human) is less than 5 mg/kg, i.e., a taste (less than 7 drops) for a 70-kg (150 lb) person. Material causes acute gastrointestinal and central nervous system symptoms.

Long Term Exposure: Arsenic trioxide is a human carcinogen; causes skin and liver cancer. Renal and hepatic damage have been observed. Chronic exposure to material has led to nasal septum perforation, dermatological symptoms (lesions, necrosis, etc.) and an increase in the incidence of lung and lymphatic cancers. Appreciable exposure to respiratory irritant promoters, such as metal oxide fumes, elicits a carcinogenic response from arsenic trioxide. Repeated or high exposure can cause nerve damage with "pins and needles" sensation, burning, numbness, and weakness in the extremities. Exposure can cause skin allergy to develop.

Points of Attack: Skin, liver, kidneys, lungs, lymphatic system.

Medical Surveillance: See entry under "Arsenic and Inorganic Arsenic Compounds."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with large amounts of soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Note to physician: For severe poisoning, BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. A regulated, marked area should be established where Arsenic Trioxide is handled, used, or stored. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full face-piece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wash thoroughly immediately after exposure to Arsenic trioxide and at the end of the work shift. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic.*"

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry well-ventilated area away from contact with incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Wear full protective clothing including gloves and eye protection. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be

properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Avoid breathing dusts and fumes from burning materials. Keep upwind. Wear self-contained breathing apparatus. Extinguish fire using agent suitable for type of surrounding fire (material itself does not burn or burns with difficulty). Use water in flooding quantities as fog. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S.[22] If needed, seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Carcinogenicity: IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1987; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; NTP: Known to be a human carcinogen; EPA: Human Carcinogen; OSHA: Carcinogen (CFR 1910.1018, inorganic compounds).

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR1910.1018, inorganic compounds).

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR1910.1018).

Banned or Severely Restricted (In Agricultural, Pharmaceutical, and Industrial Chemicals) (many countries).[13, 35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act, 42USC7412; Title I, Part A, §112 Hazardous Pollutants.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants; 40CFR423, Appendix A Priority Pollutants; §313 Priority Chemicals.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

Safe Drinking Water Act: 47FR9352 Regulated chemical: MCL, 0.05 mg/L (Section 141.11) applies only to community water systems.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313: Form R *de minimis* concentration reporting level: 0.1% (inorganic arsenic compounds).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Arsenic trisulfide is a noncombustible, odorless, yellow or orange powder or red needles (changes to a different "red" form at 170°C). Molecular weight = 246.04; Specific gravity: 3.43 at 20°C; Boiling point = 707°C; Freezing/Melting point = 300−327°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Arsenic trisulfide is used in the manufacture of glass, oil cloth, linoleum, electrical semi-conductors, fireworks, and used as a pigment.

Incompatibilities: Avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and potassium nitrate mixed with sulfur, since violent reactions occur. Water contact forms hydrogen sulfide.

Incompatible with acids, halogens. Contact with acids or acid mists releases deadly arsine gas.

Permissible Exposure Limits in Air

Arsenic and inorganic compounds

OSHA PEL: 0.01 mg[As]/m^3 TWA; Cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 15 min. Ceiling Concentration. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

NIOSH IDLH: 5 mg[As]/m^3.

No TEEL available.

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.0002^3 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects of exposure to arsenic through ingestion of water and contaminated aquatic organisms, the ambient water concentration is zero. Concentrations of arsenic estimated to result in additional lifetime cancer risks ranging from no additional risk to an additional risk of 1 in 100,000 are presented in the Criterion Formulation section of this document. The EPA is considering setting criteria at an interim target risk level in the range of 10^{-5}, 10^{-6}, or 10^{-7} with corresponding criteria of 0.02, 0.002, and 0.0002 μg/L, respectively.[6]

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation of dust, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Arsenic trisulfide can affect you when breathed in and may enter the body thought the skin. Arsenic trisulfide is a carcinogen; handle with extreme caution. Contact can cause burning, itching, thickened skin, rash, and color changes. Exposure can irritate the nose and throat and may cause an ulcer or hole in the inner nose. High or repeated exposures can cause disturbed sleep, "pins and needles," and numbness and weakness of arms and legs. High or repeated exposure can cause poor appetite, nausea, vomiting, diarrhea, and death.

Long Term Exposure: Arsenic trisulfide is a carcinogen in humans; it has been shown to cause skin, liver, and lung cancer. It may be a teratogen, causing reproductive damage, such as reduced fertility and interference with the menstrual cycle. May cause liver damage and lower the red blood cell count. Repeated skin contact can cause thickened skin and pigmentation changes. Some persons develop white lines on the fingernails. High or repeated exposure can cause nerve damage with burning, "pins and needles" sensation and weakness of the extremities.

Points of Attack: Skin, respiratory system, nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: examination of the nose, skin, eyes, nails, and nervous system. Complete blood count (CBC). Examination of the nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). At NIOSH recommended exposure levels, urine arsenic should not be greater than 50−100 μg/L of urine. After suspected overexposure, repeat these tests. Also examine your skin periodically for abnormal growths. Skin cancer from arsenic is easily cured with early detection.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Avoid skin contact with arsenic trisulfide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operations. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Eye protection is included in the recommended respiratory protection. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic.*"

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Avoid contact with the incompatible materials cited above. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Arsenic sulfide requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep water and acids away from spilled Arsenic trisulfide. Collect powdered materials using a vacuum equipped with a high-efficiency particulate filter (do not use a standard shop vacuum) or wet cleaning methods and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Arsenic trisulfide may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases and fumes are produced in a fire, including hydrogen sulfide, arsine, sulfur oxides, and arsenic fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class) severe hazard to water: (estimate) 3.

Description: Arsenous trichloride is a noncombustible, colorless or pale yellow oily, fuming liquid. The odor is described as pungent and acrid. Molecular weight = 181.27; Boiling point = 130.2°C; Freezing/Melting point = − 16°C; Specific gravity = 2.156 at 25°C; Latent heat of vaporization = 49.06 cal/g; Heat of solution = (estimate) -0.42×10^5 J/kg; Vapor pressure = 8.4 mmHg. Decomposes in water, forming hydrogen chloride.

Potential Exposure: Compound Description: Mutagen. Arsenic chloride is used in the ceramics industry, in the synthesis of chlorine-containing arsenicals, as a chemical intermediate for arsenic insecticides, pharmaceuticals, and has been used in chemical warfare agents.

Incompatibilities: Contact with sodium, potassium, or powdered aluminum may cause a violent reaction. It is decomposed in water, forming arsenic hydroxide and hydrogen chloride. Exposure to light forms toxic gas. Violent reaction with anhydrous ammonia, strong acids, strong oxidizers, and halogens. Incompatible with alkali metals; active metals, such as arsenic, iron, aluminum, zinc. Corrodes metals in the presence of moisture and forms flammable and explosive hydrogen gas.

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of

Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: See the entry under "Arsenic and Inorganic Compounds."

Determination in Water: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause burns, possibly causing permanent damage. Exposure to vapors causes spasm of eyelids, tearing, pain, and reddening. Exposure above the occupational exposure limits can cause death. In acute exposures, it is extremely toxic and caustic, owing not only to the poisonous nature of arsenic, but also to the release of hydrochloric acid in the presence of water. Exposure to the skin causes local irritation and blisters. Inhalation or ingestion causes hemorrhagic gastroenteritis resulting in loss of fluids and electrolytes, collapse, shock, and death. The fatal human dose is 70−180 mg depending on the weight of the victim. Symptoms usually appear 30 min to 1 h after ingestion. Symptoms include a sweetish metallic taste, garlicky odor on the breath and stools, constriction in throat, difficulty in swallowing, abdominal pain, vomiting, diarrhea, bluing of the skin, weak pulse, dizziness, headaches, coma, and convulsions.

Long Term Exposure: Chronic poisoning can lead to peripheral disturbed sleep, skin conditions, liver damage. Arsenic and certain arsenic compounds have been implicated in the induction of skin and lung cancer. Based on several related arsenic compounds, arsenic trichloride may be a mutagen and teratogen.

Points of Attack: Liver, kidneys, skin, lungs, reproductive system.

Medical Surveillance: See entry under "Arsenic and Inorganic Compounds."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. A regulated, marked area should be established where arsenous trichloride is handled, used, or stored. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full face-piece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic*."

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Arsenous trichloride, $AsCl_3$, should be stored in tightly closed containers in a cool, well-ventilated area away from heat, water, and any possible contact with active metals or other incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Inhalation Hazard Zone B: $AsCl_3$ should be labeled "POISONOUS/TOXIC MATERIALS."[19] It falls in Hazard Class 6.1 and Shipping Group I.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into sealed containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Arsenous trichloride is not flammable so agents must be used which are suitable for surrounding fire. Poisonous gases are produced in fire, including arsine and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a minimum of concentrated hydrochloric acid. Dilute with water until white precipitate forms. Add HCl to dissolve. Saturate with H_2S; filter and wash precipitate and return to supplier. Alternatively, precipitate with heavy metals, such as lime or ferric hydroxide in lieu of H_2S.[22] If needed, seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line). In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

EPCRA Section 313: Form R *de minimis* concentration reporting level: 0.1% (inorganic arsenic compounds).

California Proposition 65 Chemical: Cancer 2/27/87.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Arsine (SA) is an extremely flammable, colorless, liquefied compressed gas with a slight garlic-like odor. SA is nonirritating, produces no immediate symptoms, and odor is not an adequate indicator of arsine's (SA) presence, so persons exposed to hazardous levels may be unaware of its presence. The established PEL is 10 times lower than the concentration at which people begin to smell SA (odor threshold of 0.5 ppm and above)[NIOSH]. Molecular weight = 77.95. Boiling point = − 62°C; Freezing/Melting point = − 117.2°C; Relative vapor density (air = 1) = 2.69; Vapor pressure = 14.9 atm at 21.1°C; >760 mmHg at 20°C[NIOSH]; Flash point = flammable gas. Explosive Limits: LEL = 5.1%; UEL = 78%. NFPA 704 M Hazard Identification (based on NFPA-704M Rating System): Health 4, Flammability 4, Reactivity 2. It has an odor threshold of <1.0 ppm, but the odor cannot be relied on. Decomposes at 300°C. Solubility in water = 20% at 20°C.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Human Data. Arsine is used in making electronic and semiconductor components, in organic syntheses, and in making lead−acid storage batteries. Arsine may be generated by side reactions or unexpectedly; e.g., it may be generated in metal pickling operations, metal drossing operations, or when inorganic arsenic compounds contact sources of nascent hydrogen. It has been known to occur as an impurity in acetylene. Most occupational exposure occurs in chemical, smelting, and refining industries. It has been used as a poison gas. Cases of exposure have come from workers dealing with zinc, tin, cadmium, galvanized coated aluminum, and silicon and steel metals. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. SA is used as a military poison gas (blood agent). It forms cyanide in the body.

Incompatibilities: SA reacts with strong oxidizers, nitric acid, causing an explosion hazard. Thermally unstable; shock, friction, and concussion sensitive; can explosively decompose. Can explode on contact with warm, dry air. Violent reaction with acids, halogens, mixtures of potassium and ammonia. Decomposes to metallic arsenic (fumes) on exposure to light, moisture, or upon decomposition from heat or ignition.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.19 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.05 ppm/0.2 mg/m^3 TWA.

NIOSH REL: 0.002 mg/m^3 [15 min.] Ceiling level, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.005 ppm/0.01mg/m^3 TWA.

NIOSH IDLH: 3 ppm, Potential occupational carcinogen.

Protective Action Criteria (PAC) SA*

TEEL-0: 0.005 ppm

PAC-1: 0.025 ppm

PAC-2: **0.17** ppm

PAC-3: **0.50** ppm

*AEGLs (Acute Emergency Guideline Levels) and ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1: Inappropriate

ERPG-2: 0.5 ppm

ERPG-3: 1.5 ppm

Arab Republic of Egypt: TWA 0.05 ppm (0.2 mg/m^3), 1993; Australia: TWA 0.05 ppm (0.2 mg/m^3), 1993; Austria: MAK 0.05 ppm (0.2 mg/m^3), 1999; Denmark: TWA 0.01 ppm (0.03 mg/m^3), 1999; France: VME 0.05 ppm (0.2 mg/m^3), VLE 0.2 ppm (0.8 mg/m^3), 1999; Hungary: TWA 0.05 mg/m^3, STEL 0.1 mg/m^3, [skin], 1993; Japan: 0.01 ppm (0.032 mg/m^3), 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, 2003; Norway: TWA 0.003 ppm (0.01 mg/m^3), 1999; the Philippines: TWA 0.05 ppm (0.5 mg/m^3), 1993; Poland: MAC (time-weighted average) 0.2 mg/m^3; MAC (STEL) 0.6 mg/m^3, 1999; Russia: TWA 0.05 ppm, STEL 0.1 mg/m^3, 1993; Sweden: NGV 0.02 ppm (0.05 mg/m^3), 1999; Switzerland: MAK-week 0.05 ppm (0.16 mg/m^3), KZG-week 0.25 ppm, 1999; Thailand: TWA 0.05 ppm (0.2 mg/m^3), 1993; Turkey: TWA 0.05 ppm (0.2 mg/m^3), 1993; United Kingdom: TWA 0.05 ppm (0.16 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 ppm. Several states have set guidelines or standards for arsine in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 1.0 μg/m^3 (Connecticut) to 2.0 μg/m^3 (Florida and North Dakota) to 3.3. μg/m^3 (Virginia) to 5.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 6001, OSHA Analytical Method ID-105, ID-125G.

Permissible Concentration in Water: No criteria set, but EPA[32] cites the same limits as earlier proposed for arsenic by EPA of 50 μg/L based on health effects and 10 μg/L based on ecological effects.

Determination in Water: Since arsine is a gas, water pollution is unlikely to be a problem. Still, warn pollution control authorities just in case. Octanol—water coefficient: Log K_{ow} = (estimated) 0.68.

Routes of Entry: Inhalation of gas, ingestion, skin contact.

Harmful Effects and Symptoms

Arsine is an extremely toxic gas that can be fatal if inhaled in sufficient quantities. Acute poisoning is marked by a triad of main effects caused by massive intravascular hemolysis of the circulating red cells. Early effects may occur within an hour or two and are commonly characterized by general malaise, apprehension, giddiness, headache, shivering, thirst, and abdominal pain with vomiting. In severe acute cases the vomitus may be blood stained and diarrhea ensues as with inorganic arsenical poisoning. Pulmonary edema has occurred in severe acute poisoning. Invariably, the first sign observed in arsine poisoning is hemoglobinuria, appearing with discoloration of the urine up to port wine hue (first to the triad). Jaundice (second of triad) sets in on the second or third day and may be intense, coloring the entire body surface a deep bronze hue. Coincident with these effects is a severe hemolytic-type anemia. Severe renal damage may occur with oliguria or complete suppression of urinary function (third of triad), leading to uremia and death. Severe hepatic damage may also occur, along with cardiac damage and EKG changes. Where death does not occur, recovery is prolonged. In cases where the amount of inhaled arsine is insufficient to produce acute effects, or where small quantities are inhaled over prolonged periods, the hemoglobin liberated by the destruction of red cells may be degraded by the reticuloendothelial system and the iron moiety taken up by the liver, without producing permanent damage. Some hemoglobin may be excreted unchanged by the kidneys. The only symptoms noted may be general tiredness, pallor, breathlessness on exertion, and palpitations as would be expected with severe secondary anemia.

Short Term Exposure: Inhaling arsine can irritate the lungs, causing shortness of breath and coughing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High exposure can cause hemolysis (destruction of red blood cells), causing anemia with headache, weakness, nausea, vomiting, and abdominal pain. Acute kidney failure may follow; this can cause death. High concentrations of arsine gas will cause damage to the eyes; however, many experts agree that before this occurs systemic effects can be expected. Skin or eye contact with compressed gas can cause frostbite.

Long Term Exposure: Arsine is carcinogenic to humans and should be treated as a teratogen. Repeated exposure may damage the nerves, causing weakness, "pins and needles" sensation, and weakness in the limbs with loss of coordination. May cause kidney, liver, and heart damage.

Points of Attack: Blood, kidneys, liver, lungs.

Medical Surveillance: NIOSH lists the following tests: liver function tests, pulmonary function tests, reticulocyte count, urine (chemical/metabolite) hemoglobin, urinalysis (routine), white blood cell count/differential. In preemployment physical examinations, special attention should be given to past or present kidney disease, liver disease, and anemia. Periodic physical examinations should include tests to determine arsenic levels in the blood and urine, complete blood count (CBC) with reticulocyte count, kidney and liver function tests, urine hemoglobin, examination of the nervous system, and chest X-ray (following acute exposure). Since arsine gas is a by-product of certain production processes, workers should be trained to recognize the symptoms of exposure and to use appropriate personal protective equipment.

First Aid: If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. *Dimercaprol* treatment is indicated and blood transfusions may be necessary. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention immediately. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination*:* Since arsine is a gas, you do not have to decontaminate victims or yourself. If you do not have the equipment and training, do not enter the hot zone to rescue and treat victims. And, be aware that arsine may be trapped in the victim's clothing.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. In most cases, arsine poisoning cannot be anticipated except through knowledge of the production processes. Where arsine is suspected in concentration above the acceptable standard, the worker should be supplied with a supplied air full-face respirator or a self-contained positive pressure-respirator with full face-piece. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash. Prevent possible skin freezing from direct liquid contact.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. At any concentrations above the NIOSH REL, or where* *there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Arsine must be stored to avoid contact with incompatible materials including oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Outside, detached storage is preferred. Arsine decomposes and deposits Arsenic on exposure to light and moisture. Sources of ignition, such as smoking and open flames, are prohibited where arsine is handled, used, or stored. Metal containers involving the transfer of arsine should be grounded and bonded.

Shipping: Arsine requires a shipping label of "POISON GAS, FLAMMABLE GAS." The Hazard Class 2.3 and the Packing Group is unlisted.[19, 20] It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: No flares, smoking, or flames in area. Use water spray to reduce vapors. Isolate area until arsine gas has dispersed. Stay upwind; keep out of low areas. Ventilate area of leak to disperse the gas if it can be done without placing personnel at risk. Wear positive pressure breathing apparatus and full protective clothing. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stop the flow of gas if it can be done safely, with undue risk. If the source of the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Use large amounts of water to disperse vapors; contain runoff. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

SA, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)

Day	1.3/2.0
Night	3.4/5.5

Large Spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)

Day	5.7/9.2
Night	7.0 + /11.0 +

Arsine (for SA see above)

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)

Day	0.7/1.1
Night	2.5/4.1

Large Spills (From a large package or from many small packages)

First: Isolate in all directions(feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)

Day	4.4/7.0
Night	7.0 + /11.0 +

Fire Extinguishing: Containers may explode when heated. Containers may rocket. In case of fire, *do not put out the fire.* Arsine is so bad that the fire is safer than the unburned arsine. If you cannot shut off the flow of gas do not do anything else—let the fire burn out. Poisonous gases, including arsenic and nitrogen oxides, are produced in fire. In the unlikely situation where there is a tank of arsine adjacent to a fire, cool the tank with large amounts of water, but first evacuate the area—if the tank ruptures from heating, arsine could kill. Again, arsine gives off toxic gases in a fire or when heated, but these are not as bad as the arsine itself. You can use a water spray to "knock down" the toxic gases coming from an arsine fire. This chemical is a highly flammable gas. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Approach fire from upwind. Fight fire from protected location or maximum possible distance. Let small fires burn out, if possible. Use water spray or foam extinguishers. For massive fire in cargo area use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Cool containers that are exposed to flames with water from the side until well after fire is out. See isolation distances above if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Arsine may be disposed of by controlled burning. When possible, cylinders should be sealed and returned to suppliers.[22] Seek guidance from regulatory agencies as to proper disposal. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: White or greenish (chrysotile), blue (crocidolite), or gray-green (amosite) fibrous, odorless solids; Freezing/Melting point = 600°C (Decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water. Asbestos is a generic term that applies to a number of naturally occurring, hydrated mineral silicates incombustible in air and separable into filaments. The most widely used in industry in the United States is chrysotile, a fibrous form of serpentine. Other types include amosite, crocidolite, tremolite, anthophyllite, and actinolite.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Natural Product. Most asbestos is used in the construction industry. Much of it is firmly bonded, i.e., the asbestos is "locked in" in such products as floor tiles, asbestos cements, and roofing felts, and shingles; while the remaining 8% is friable or in powder forms present in insulation materials, asbestos cement powders, and acoustical products. As expected, these latter materials generate more airborne fibers than the firmly bonded products. The asbestos used in nonconstruction industries is utilized in such products as textiles, friction material including brake linings and clutch facings, paper, paints, plastics, roof coatings, floor tiles, and miscellaneous other products. Significant quantities of asbestos fibers appear in rivers and streams draining from areas where asbestos-rock outcroppings are found. Some of these outcroppings are being mined. Asbestos fibers have been found in a number of drinking water supplies, but the health implications of ingesting asbestos are not fully documented. Emissions of asbestos fibers into water and air are known to result from mining and processing of some minerals. Exposure to asbestos fibers may occur throughout urban environments perhaps resulting from asbestos from brake linings and the flaking of sprayed asbestos insulation material. In recent years, much effort has been put into removal of asbestos insulation, particularly from schools and other public buildings where worn or exposed asbestos causes public exposure.

Incompatibilities: None.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 asbestos fiber (>5 μm long)/cc; 1 f/cc/30 min excursion; carcinogen. [0.1 fiber (longer than 5 μm and having a length-to-diameter ratio of at least 3 to 1) per cubic centimeter of air (0.1 fiber/cm^3), as determined by the membrane filter method at approximately 400 × magnification with phase-contrast illumination. No worker should be exposed in excess of 1 fiber/cm^3 (excursion limit) as averaged over a sampling period of 30 min; Cancer and Lung Disease Hazard].

NIOSH REL: 0.1 f/cc (fibers>5-μm long)/400 L; carcinogen. [NIOSH considers asbestos to be a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration. For asbestos fibers >5 μm in length: 1×10^5 fibers/m^3/0.1 fiber/cm^3 as determined by a 400-L air sample collected over 100 min (see NIOSH Analytical Method #7400)].

ACGIH TLV®[1]: (all forms) 0.1 f/cc TWA; Confirmed Human Carcinogen.

European OEL: 0.1 asbestos fibers/cc (2003).

DFG MAK: Carcinogen Category 1, Confirmed Human carcinogen, (2004).

Austria: carcinogen, 1999; France: VME 0.3 fiber/mL, carcinogen, 1999; Norway: TWA 0.1 fiber/cm^3, 1999; Switzerland: MAK-week 0.25 fiber/mL, carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Several states have set guidelines or standards for asbestos in ambient air[60] ranging from zero (Massachusetts, Nevada, North Carolina, North Dakota, South Carolina) to 0.001 μg/m^3 (Connecticut) to 0.005 μg/m^3 (Pennsylvania) to 0.005 μg/m^3 (Nevada) to 2.0 μg/m^3 (Virginia) to 5.0 μg/m^3 (New York).

Determination in Air: NIOSH Analytical Method #9002, asbestos (bulk) by PLM, #7402, by PCM #7402, by TEM (Transmission Electron Microscopy), OSHA Analytical Methods ID-160, asbestos in Air, and ID-191, Polarized Light Microscopy of asbestos. NIOSH Analytical Method #9000, asbestos, chrysotile by XRD.

Permissible Concentration in Water: To protect freshwater and saltwater aquatic life: no criteria have been established due to insufficient data. *To protect human health:* preferably zero. A lifetime cancer risk of 1 in 100,000 corresponds to concentrations of 300,000 fibers/L.[6] A maximum level in drinking water of 7 million fibers/L has been proposed by EPA.[62] In addition, Kansas and Minnesota have set guidelines for asbestos in drinking water.[61] Mexico drinking water ecological criteria is 3000 mg/L.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: There is no known acute health effects. Persons who develop serious and fatal diseases later in life may feel fine at the time of exposure.

Long Term Exposure: Asbestosis (chronic exposure): dyspnea (breathing difficulty), interstitial fibrosis, restricted pulmonary function, finger clubbing, irritation of eyes (Potential occupational carcinogen). Available studies provided conclusive evidence that exposure to asbestos fibers causes cancer and asbestosis in humans. Lung cancers and asbestosis have occurred following exposure to chrysotile, crocidolite, amosite, and anthophyllite. Mesotheliomas, lung and gastrointestinal cancers have been shown to be excessive in occupationally exposed persons, while mesotheliomas have developed also in individuals living in the neighborhood of asbestos factories and near crocidolite deposits, and in persons living with asbestos workers. Asbestosis has been identified among persons living near anthophyllite deposits. Likewise, all commercial forms of asbestos are carcinogenic in rats, producing lung carcinomas and mesotheliomas following their inhalation and mesotheliomas after intrapleural (i.p.) injection. Mesotheliomas and lung cancers were induced following even 1-day exposure by inhalation. The size and shape of the fibers are important factors; fibers less than 0.5 μm in diameter are most active in producing tumors. Other fibers of a similar size including glass fibers can also produce mesotheliomas following intrapleural or i.p. injection. There are data that show that the lower the exposure, the lower the risk of developing cancer. Excessive cancer risks have been demonstrated at all fiber concentrations studied to date. Evaluation of all available human data provides no evidence for a threshold or for a "safe" level of asbestos exposure.

Points of Attack: Respiratory system, eyes, lungs [cancer site].

Medical Surveillance: OSHA mandates the following: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); NIOSH lists the following tests: chest X-ray, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), radiography, sputum cytology, tuberculin skin test. Medical surveillance is required, except where a variance from the medical requirements of this proposed standard have been granted, for all workers who are exposed to asbestos as part of their work environment. For the purposes of this requirement the term "exposed to asbestos" will be interpreted as referring to TWA exposures above 1 fiber/c or peak exposures above 5 fibers/c. The major objective of such surveillance will be to ensure proper medical management of individuals who show evidence of reaction to past dust exposures, either due to excessive exposures or unusual susceptibility. Medical management may range from recommendations as to job placement, improved work practices, cessation of smoking, to specific therapy for asbestos-related disease or its complications. Medical surveillance cannot be a guide to adequacy of current controls when environmental data and medical examinations only cover recent work experience because of the prolonged latent period required for the development of asbestosis and neoplasms. Required components of a medical surveillance program include periodic measurements of pulmonary function [forced vital capacity (FVC) and forced expiratory volume for one second (FEV_1)], and periodic chest X-ray (postero-anterior 14 × 17 in.). Additional medical requirement components include a history to describe smoking habits and details on past exposures to asbestos and other dusts and to determine presence or absence of pulmonary, cardiovascular, and gastrointestinal symptoms, and a physical examination, with special attention to pulmonary rales, clubbing of fingers, and other signs related to cardiopulmonary systems. Chest X-rays and pulmonary function tests should be performed at least every 2 years in all employees exposed to asbestos. Such tests should be made annually in individuals: (a) who have a history of 10 or more years of employment involving exposure to asbestos or (b) who show X-ray findings (such as small opacities, pleural plaques, pleural thickening, or pleural calcification) which suggest or indicate pneumoconiosis or other reactions to asbestos or (c) who have changes in pulmonary function which indicate restrictive or obstructive lung disease. Preplacement medical examinations and medical examinations on the termination of employment of asbestos-exposed workers are also required.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water.

Personal Protective Methods: Prevent skin contact and any barrier that will prevent contamination from the fiber. Use of respirators can be decided on the basis of TWA or peak concentration. When the limits of exposure to asbestos dust cannot be met by limiting the concentration in the workplace, the employer must utilize a program of respiratory protection and furnishing of protective clothing to protect every worker exposed. *Protective clothing*: (1) The employer shall provide each employee subject to exposure in a variance area with coveralls or similar full body protective clothing and hat, which shall be worn during the working hours in areas where there is exposure to asbestos dust. Nondisposable clothing should be placed in plastic bags for laundering or decontamination. (2) The employer shall provide for maintaining and laundering of the solid protective clothing, which shall be stored, transported and disposed of in-sealed nonreusable containers marked "Asbestos—Contaminated Clothing" in easy-to-read letters. (3) Protective clothing shall be vacuumed before removal. Clothes shall not be cleaned by blowing dust from the clothing or shaking. (4) If laundering is to be done by a private contractor, the employer shall inform the contractor of the potentially harmful effects of exposure to asbestos dust and of safe practices required in the laundering of the asbestos-soiled work clothes. (5) Resin-impregnated paper or similar protective clothing can be substituted for fabric-type of clothing. (6) It is recommended that in tightly contaminated operations (such as insulation and textiles) provisions be made for separate change rooms.

Respirator Selection: NIOSH *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with asbestos workers *must* be, by law, trained in its proper handling and storage. Asbestos should be stored wet with special surfactants and water. Keep asbestos in closed, impermeable, sealed containers. Protect against physical damage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The label requirement for asbestos is "CLASS 9." The Hazard Class is 9 and the Packing Group is II for UN2212 [Blue asbestos (crocidolite)] or Brown asbestos (amosite, mysorite)] and III for NA2212 and UN2590 [White asbestos (chrysotile, actinolite, anthophyllite, tremolite)].[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Proper procedures for repair or removal of the material must be followed by trained personnel. Strict hygiene is required; keep dust under control. Wear a protective equipment, use a wet mop, or special high efficiency HEPA vacuum to clean area. Do not use common shop vacuum cleaner. *Note:* Avoid blowing, sweeping or dry brushing, and dry mopping, all of which may raise dust levels. Do not shovel. For storing asbestos wastes, use heavy-gauge impervious plastic bags. For final disposal contact your local environmental authority. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Asbestos itself does not burn. Care should be taken to contain asbestos materials disturbed in a fire. Becomes powder-like and loses its hazardous properties when heated above 1200°C. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Asbestos may be recovered from waste asbestos slurries as an alternative to disposal. Landfilling is an option[22] for disposal if carefully controlled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
California Proposition 65 Chemical: (*if present as coke oven emissions*) Cancer 2/27/87.
WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Asphalt fumes are flammable when hot and may contain hydrogen sulfide and human carcinogen, such as benzo(a)pyrene and dibenz(a,h)anthracene. Fumes generated during the production or application of asphalt (a dark-brown to black cement-like substance manufactured by the vacuum distillation of crude petroleum oil). Molecular weight = variable 1000−2600; Boiling point = >300°C; Freezing/Melting point = 55−175°C; Flash point ≤10−225°C (as a general rule, the more liquid the type of asphalt, the lower the flashpoint; cutback <10°C; typical asphalt 225°C); Autoignition = >400°C. Hazard Identification (based on NFPA-704 M Rating System) (typical asphalt): Health 0, Flammability 1, Reactivity 0. However, *asphalt cutback* has a flammability rating of 3. Insoluble in water. Hazard Identification (based on NFPA-704 M Rating System): *roofer's flux and straight run residue*: Health 0, Flammability 1, Reactivity 0.

Asphalt fumes have been defined by NIOSH as the nimbose effusion of small, solid particles created by condensation from the vapor state after volatilization of asphalt. In addition to particles, a cloud of fume may contain materials still in the vapor state. The major constituent groups of asphalt are asphaltenes, resins, and oils made up of saturated and unsaturated hydrocarbons. The asphaltenes have molecular weights in the range of 1000−2600, those of the resins fall in the range of 370−500, and those of the oils is in the range of 290−630. Asphalt has often been confused with tar because the two are similar in appearance and have sometimes been used interchangeably as construction materials. Tars are, however, produced by destructive distillation of coal, oil or wood, whereas asphalt is a residue from fractional distillation or crude oil. The amounts of benzo(a) pyrene found in fumes collected from two different plants that prepared hot mix asphalt ranged from 3 to 22 ng/m^3; this is approximately 0.03% of the amount in coke oven emissions and 0.01% of that emitted from coal-burning home furnaces.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Occupational exposure to asphalt fumes can occur during the transport, storage, production, handling, or use of asphalt. The composition of the asphalt that is produced is dependent on the refining process applied to the crude oil, the source of the crude oil, and the penetration grade (viscosity) and other physical characteristics of the asphalt required by the consumer. The process for production of asphalt is essentially a closed-system distillation. Refinery workers are therefore potentially exposed to the fumes during loading of the asphalt for transport from the refinery during routine maintenance, such as leaning of the asphalt storage tanks, or during accidental spills. Most asphalt is used out of doors, in paving, and roofing. The workers' exposure to the fumes is dependent on environmental conditions, work practices, and other factors. These exposures are stated to be generally intermittent and at low concentrations. Workers are potentially exposed also to skin and eye contacts with hot, cut-back, or emulsified asphalts. Spray application of cut-back or emulsified asphalts may involve respiratory exposure also.

Incompatibilities: None reported. *Note:* Asphalt becomes molten at about 93°C.

Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 5 mg/m^3 15-min Ceiling concentration; NIOSH considers asphalt fumes to be a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration. See Pocket guide, Appendix A.
ACGIH TLV®[1]: 0.5 mg/m^3 not to be exceeded at any time; not classifiable as a human carcinogen [asphalt (bitumen) fume(8052-42-)] *as benzene-soluble aerosol*; BEI issued (1999).
Protective Action Criteria (PAC) *asphalt; bitumen 8052-42-4*
TEEL-0: 0.5 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3
Petroleum asphalt
TEEL-0: 1.25 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 125 mg/m^3
DFG MAK: [skin] Carcinogen Category 2, *as bitumen, vapor and aerosol*.
Arab Republic of Egypt: TWA 5 mg/m^3, 1993; Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Norway: TWA 5 mg/m^3, 1999; Poland: TWA 5 mg/m^3 (fume), STEL 15 mg/m^3 (fume), 1999; United Kingdom

LTEL 5 mg/m^3, STEL 10 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Not classifiable as a human carcinogen.

Occupational exposure to asphalt fumes is defined as exposure in the workplace at a concentration of one-half or more of the recommended occupational exposure limit. If exposure to other chemicals also occurs, as is the case when asphalt is mixed with a solvent, emulsified, or used concurrently with other materials, such as tar or pitch, provisions of any applicable standard for the other chemicals shall also be followed. Occupational exposure to asphalt fumes shall be controlled so that employees are not exposed to the airborne particulates at a concentration greater than 5 mg/m^3 (measured as total particulates) of air, determined during any 15-min period (NIOSH Ceiling Concentration). Several states have set guidelines or standards for asphalt fumes in ambient air[60]: 50 μg/m^3 (North Dakota), 80 μg/m^3 (Virginia), 100 μg/m^3 (Connecticut), 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 5042 "Benzene-soluble fraction and total particulate (asphalt fume)." The total particulate portion of this method is based on NIOSH Analytical Method 0500. Other methods applicable to asphalt fume are NIOSH Analytical Method #5800, Polycyclic Aromatic Compounds (PAC), and NIOSH Analytical Method #2550, Benzothiazole in Asphalt Fume.

Routes of Entry: Inhalation of dusts and fumes. Skin exposure can cause thermal burns from hot asphalt.

Harmful Effects and Symptoms

Short Term Exposure: The principal adverse effects on health from exposure to asphalt fumes are irritation of the serous membranes of the conjunctivae and the mucous membranes of the respiratory tract. Hot asphalt can cause burns of the skin and release vapors that irritate the eyes, throat, and possible bronchial tubes and lungs.

Long Term Exposure: In animals, there is evidence that asphalt left on the skin for long periods of time may result in local carcinomas, but there have been no reports of such effects of human skin that can be attributed to asphalt alone.

Points of Attack: Skin, respiratory system. Cancer site in animals: skin.

Medical Surveillance: Lung function tests. Details of recommended preplacement and periodic physical examinations and record keeping have been set forth by NIOSH in the Criteria Document cited below.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Employees shall wear appropriate protective clothing, including gloves, suits, boots, face shields (8-in. minimum), or other clothing as needed, to prevent eye and/or skin contact with asphalt. NIOSH recommends thermally insulated gloves if working with hot asphalt, long-sleeve shirts, long-cuffless trousers, and metal-toed shoes. All protective clothing should be clean and available each day, and put on prior to the work shift.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter, ck-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Engineering controls shall be used when needed to keep concentrations of asphalt fumes below the recommended exposure limit. The only conditions under which compliance with the recommended exposure limit may be achieved by the use of respirators are (a) during the time required to install or test the necessary engineering controls; (b) for operations, such as nonroutine maintenance or repair activities, causing brief exposure at concentrations above the environmental limit; (c) during emergencies when concentrations of asphalt fumes may exceed the environmental limit. When a respirator is permitted above, it shall be selected from a list of respirators approved by NIOSH. See the Criteria Document cited below.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Asphalt is normally shipped solid in steel drums. Fumes are encountered only in asphalt melting operations. Wherever lighter or liquid forms of asphalt are used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Tars, liquid, including road asphalt and oils, bitumen, and cut-backs require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group III. The Hazard Class is 3 and the Packing Group III[19, 20] for asphalt at or above its flashpoint.

Spill Handling: Spilled asphalt is allowed to cool and solidify whereupon it is recovered, melted, and used if clean. Ventilate area of spill or leak. Absorb liquid asphalt with sand or other noncombustible absorbent material and place in containers for disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The lighter, more liquid forms are flammable (especially cutback). The heavier, more solid forms may give off flammable gas when heated. Poisonous gases are produced in fire, including hydrogen sulfide. For heavy forms of asphalt, use dry chemical, carbon dioxide, or foam extinguishers. For light forms, use dry chemical, fog, or water mist. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Asphalt solids may be landfilled.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Atrazine is a white, odorless, crystalline solid or powder which is often mixed with a flammable liquid. Molecular weight = 215.72; Boiling point = decomposes; Freezing/Melting point = 175−177°C; Specific gravity (H_2O:1) = 1.19; Vapor pressure = 2.9×10^{-7}. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water; solubility 0.003%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Atrazine is an herbicide and plant growth regulator used for season-long-weed control in corn, sorghum, and certain other crops.

Incompatibilities: Strong oxidizers, acids.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

NO TEEL available.

DFG MAK: 2 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(8) (2004).

Australia: TWA 5 mg/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 0.2 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Switzerland: MAK-week 2 mg/m^3, 1999; United Kingdom LTEL 10 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards[60] for atrazine in ambient air ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use OSHA versatile sampler-2; Reagent; Gas chromatography/Electron capture detection; NIOSH #5602.

Permissible Concentration in Water: A maximum level (MCL and MCGL) in drinking water of 0.003 mg/L has been set by EPA.[62] The Canadian Drinking Water IMAC is 0.06 mg/L. A suggested no-adverse-effect-level in drinking water has been calculated by NAS/NRC as 0.15 mg/L. An acceptable daily intake (ADI) of 0.0215 mg/kg/day has been calculated for atrazine.[46] A limit of 0.5 mg/L of atrazine has been specified by Russia[43] in water bodies used for domestic purposes. Also, several states have set guidelines for atrazine in drinking water[61] ranging from 0.093 μg/L (Massachusetts) to 15 μg/L (California) to 25 μg/L (New York) to 43 μg/L (Maine) to 150 μg/L (Kansas).

Determination in Water: Analysis of atrazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen−phosphorus-containing pesticides in water samples. In this method, approximately 1:1 sample is extracted with methylene chloride. The extract is concentrated, and the compounds are separated using capillary column GC. Measurement is made using a nitrogen phosphorus detector. The method detection limit has not been determined for this compound, but it is estimated that the detection limits for the method analytes are in the range of 0.1 2 μg/L. Fish Tox: 88.31816000 ppb MATC (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = 2.3.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Atrazine is possibly carcinogenic to humans (IARC: 2B). There is inadequate evidence to confirm carcinogenicity of atrazine in humans. However, there is the increased risk for tumors known to be associated with hormonal factors. These have been observed in both animals and human beings, and are consistent with the known effects of atrazine on the hypothalamic pituitary gonadal axis.

Short Term Exposure: Contact may cause skin and severe eye irritation.

Long Term Exposure: Atrazine may be a carcinogen in humans since it has been shown to cause mammary and uterine cancers in animals. There is limited evidence that atrazine may damage the developing fetus. Atrazine may cause skin allergy. Human Tox: 3.00000 ppb (HIGH).

Human Tox Type: MCL.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver.

Medical Surveillance: Evaluation by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof (for liquid) or dust-proof (for powders or dust) chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Should be stored in tightly closed containers away from strong acids.

Shipping: Triazine pesticides, solid, toxic, n.o.s. require a shipping label of “POISONOUS/TOXIC MATERIALS.” Triazines fall in Hazard Class 6.1 and Packing Group I to III.[19, 20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Collect spilled dry material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing atrazine in vermiculite, dry sand, earth, or similar material. Treatment technologies which will remove atrazine from water include activated carbon adsorption, ion exchange, reverse osmosis, ozone oxidation, and ultraviolet irradiation. Conventional treatment methods have been found to be ineffective for the removal of atrazine from drinking water. Limited data suggest that aeration would not be effective in atrazine removal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index $K_{oc} = 100$.

Fire Extinguishing: Extinguish fire using an agent suitable for the type of surrounding fire; atrazine itself does not burn. Poisonous gases are produced in fire, including hydrogen chloride and nitrogen oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Atrazine is hydrolyzed by either acid or base.[22] The hydroxy compounds are generally herbicidally inactive, but their complete environmental effects are uncertain. However, the method appears suitable for limited use and quantities of triazine. Atrazine underwent >99% decomposition when burned in a polyethylene bag, and combustion with a hydrocarbon fuel would appear to be a generally suitable method for small quantities. Combustion of larger quantities would probably require the use of a caustic wet scrubber to remove nitrogen oxides and HCl from the product gases.[22]

Auramine A:1620

Molecular Formula: $C_{17}H_{21}N_3$

Common Formula: $(CH_3)_2N{-}C_6H_4CNH{-}C_6H_4{-}N(CH_3)_2$; $(CH_3)_2{-}N{-}C_6H_4{-}(C{=\!=}NH){-}C_6H_4{-}N{-}(CH_3)_2 \cdot H_2O$

Synonyms: Apyonine auramarine base; Auramina (Spanish); Auramine; Auramine base; Auramine N base; Auramine OAF; Auramine O base; Auramine SS; Basic yellow 2; Baso yellow 124; Benzeneamine, 4,4′-cabonimidoylbis(N-dimethyl-); Brilliant oil yellow; 4,4′-Carbonimidoylbis(*N*,*N*-dimethylbenzenamine); C.I. 41000B; C.I. basic yellow 2, free base; C.I. Solvent yellow 34; 4,4′-Dimethylaminobenzophenonimide; Fat Yellow A; Glauramine; 4,4-(Imidocarbonyl)bis (*N*,*N*-dimethylaniline); Tetramethyldiaminodiphenylacetimine; Waxoline yellow O; Yellow pyoctanine

CAS Registry Number: 492-80-8 (technical grade); 2465-27-2 (*hydrochloride*)

RTECS® Number: BY3500000; BY3675000 (hydrochloride salt)

UN/NA & ERG Number: UN3143 (dyes, solid, toxic, n.o.s. [or] dye intermediates, solid, toxic, n.o.s.)/151; UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 207-762-5 [*Annex I Index No.:* 612-096-00-7]; 219-567-2 (*hydrochloride*)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, Human Sufficient Evidence, *carcinogenic to humans*, Group 1; *Technical grade*: Human Possibly Carcinogenic, *possibly carcinogenic to humans*, Group 2B, 1998.

Banned or Severely Restricted (Italy, Sweden) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U014 (as C.I. Solvent Yellow 34).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg).

California Proposition 65 Chemical: Cancer.

CERCLA/SARA 40CFR372.65: Form R *de minimis* Concentration Reporting Level: 0.1%.

European/International Regulations (*492-80-8 and salts*): Hazard Symbol: Xn, N; Risk phrases: R22; R36; R40; R51/53; Safety phrases: S2; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Auramine is a yellow crystalline powder or flaky material. Molecular weight = 267.4; Freezing/Melting point = 136°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0; (*hydrochloride*) Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Auramine is used industrially as a dye or dye intermediate for coloring textiles, paper, and leather. Also used as an antiseptic (a powerful antiseptic in ear and nose surgery and in treatment of gonorrhea) and fungicide. Human exposure to auramine occurs principally through skin absorption or inhalation of vapors. Low-level dermal exposure to the consumer may occur but would be limited to any migration of auramine from fabric, leather, or paper goods.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

2465-27-2

TEEL-0: 2.5 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 60 mg/m^3

Technical grade and hydrochloride

DFG MAK: [skin] Carcinogen Category 2

No numerical occupational exposure limits (OELs) have been established. However auramine may be a carcinogen; there may be no safe level of exposure. This chemical can be absorbed through the skin, thereby increasing the potential for exposure. Zero in New York, North Dakota[60] in ambient air.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes, and may cause damage. Skin absorption may result in dermatitis and burns, nausea, and vomiting.

Long Term Exposure: Commercial auramine is carcinogenic in mice and rats after oral administration, producing liver tumors; after subcutaneous injection in rats, producing local sarcomas. The manufacture of auramine (which also involves exposure to other chemicals) has been shown in one study to be causally associated with an increase in bladder cancer. The actual carcinogenic compound(s) has not been specified precisely.

Points of Attack: Liver, bladder.

Medical Surveillance: Monthly urinalysis. Physical examination every 6 months focused on bladder.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with auramine you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Auramine *per se* is not on the DOT list.[19] It is used as a dye intermediate, pesticide, and as an antiseptic; it is an environmental hazard and a carcinogen. Dyes, solid, toxic, n.o.s. or dye intermediates, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover with sand and soda ash. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use water, carbon dioxide, powdered agents, or alcohol foam on auramine fires. Poisonous gases are produced in fire, including nitrogen oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incinerate in furnace with afterburner and scrubber.[24]

Azathioprine A:1630

Molecular Formula: $C_9H_7N_2O_2S$

Synonyms: Azanin azatioprin; Azothioprine; BW 57-322; Ccucol; Imuran; Imurek; Imurel; 6-(1′-Methyl-4′-nitro-5′-imidazolyl)-mercaptopurine; Methylnitroimidazolylmercaptopurine; 6-(1-Methyl-*p*-nitro-5-imidazolyl)-thiopurine; 6-(1-Methyl-4-nitroimidazol-5-ylthio)purine; 6-(Methyl-*p*-nitro-5-imidazolyl)-thiopurine; 6-[(1-Methyl-4-nitro-1H-imidazol-5-yl)thio]-1H-purine; 6-[(1-Methyl-4-nitroimidazol-5-yl)thio]purine; NCI-C03474; NSC-39084; Rorasul

CAS Registry Number: 446-86-6

RTECS® Number: UO8925000

UN/NA & ERG Number: UN2811/154

EC Number: 207-175-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1998; NTP 11th Report on Carcinogens, Known to be a Human Carcinogen; NTP: Known to be a human carcinogen.

California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Azathioprine is a complex heterocyclic compound which forms pale yellow crystals. Molecular weight = 277.3; Freezing/Melting point = 243−244°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0.

Potential Exposure: Azathioprine is an immunosuppressive agent, generally used in combination with a corticosteroid to prevent rejection following renal homotransplantations. It also is used following transplantation of other organs. Other uses of azathioprine include the treatment of a variety of presumed autoimmune diseases, including rheumatoid arthritis; ankylosing spondylitis; systemic lupus erythematosus; dermatonyositis, periarteritis nodosa, scleroderma, refractory thombocytopenic purpura; autoimmune hemolytic anemia; chronic active liver disease; regional enteritis; ulcerative colitis; various autoimmune diseases of the eye; acute and chronic glomerulonephritis; the nephritic syndrome; Wegener's granulomatosis; and multiple sclerosis.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Human exposure to azathioprine occurs because of its widespread use, since the 1970s, to prevent rejection following organ transplantation and to treat a variety of autoimmune diseases. Azathioprine is readily absorbed from the gut and is known to cross the human placenta.

Harmful Effects and Symptoms

There is sufficient evidence that azathioprine is carcinogenic in humans. Two large prospective studies of kidney transplant patients (receiving azathioprine and prednisone almost routinely) showed that these patients experienced increased incidences of non-Hodgkin's lymphomas, cancer of the skin, hepatobiliary carcinoma, and other tumors. Patients treated with azathioprine, but not transplant recipients, showed an increased incidence of the same cancers as patients with transplants, but to a lesser extent. Mice receiving azathioprine by intraperitoneal, subcutaneous, or intramuscular injection had suggestive evidence of induced lymph system neoplasms. Rats given azathioprine orally had suggestive evidence of induced ear cancers. Results of the animal studies provide limited evidence of carcinogenicity. Among reported symptoms of azathioprine exposure are bone-marrow depression, especially leukopenia[52]; toxic hepatitis and jaundice, stomatitis, dermatitis, hair loss; fever; anorexia, vomiting, and diarrhea. It is a developmental toxicant and suspected toxicant of the following systems: cardiovascular or blood, respiratory, gastrointestinal, liver, kidney, musculo-skeletal.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate with water or normal saline immediately for at least 20−30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere.[52] A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: It will require a label of "POISONOUS/TOXIC MATERIALS" and falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid airborne dust. Seal the accumulated wastes in vapor-tight plastic bags for eventual disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 220-147-6 [*Annex I Index No.:* 015-056-00-1]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (UN).[35]

Very Toxic Substance (World Bank).[15]

CERCLA/SARA 40CFR302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: T +, N; Risk phrases R24; R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Azinphos-ethyl is a colorless crystalline substance; Freezing/Melting point = 53°C. Molecular weight = 345.4. Boiling point = 111°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: It is a nonsystemic organophosphate insecticide and miticide with good ovicidal properties and long persistence. It is not registered for use in the United States. Among other crops, it is used on cotton, citrus, vegetables, potatoes, tobacco, rice, and cereals to control caterpillars, beetles, aphids, spiders, and many other insects.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.9 mg/m^3

PAC-3: 150 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: The symptoms are similar to parathion. Nausea is often the first symptom followed by vomiting, abdominal cramps, diarrhea, and excessive salivation. Also common in inhalation exposure are headache, giddiness, vertigo and weakness, nasal discharge, and a sensation of tightness in the chest. Other symptoms include blurring or dimness of vision; tearing, eye muscle spasm, and pain; pinpoint pupils, loss of muscle coordination; slurring of speech; muscle twitching (especially tongue and eyelids); difficulty in breathing; excessive secretions of mucous in mouth, nose, and respiratory tract; convulsions and coma. It is an extremely potent systemic toxicant via ingestion, inhalation, and skin contact. It may cause death or permanent injury after very short exposure to small quantities. The oral LD_{50} for rat is 7 mg/kg.[9] A cholinesterase inhibitor. Like similar organic phosphorus poisons, guthion-ethyl may act as an irreversible inhibitor of the enzyme cholinesterase. This enzyme allows the accumulation of large amounts of acetylcholine. Death can be caused when a critical level of cholinesterase depletion is reached. Recovery may be complete when the poisoned victim has time to recover and regenerate cholinesterase.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent any reasonable probability of skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately when skin is wet or contaminated. Work clothing should be changed daily if it is at all possible that clothing is contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH; however, where the potential exists for exposure, the following might be considered: *for reference* (*Azinphos-methyl*). *Up to 2 mg/m^3*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 10 mg/m^3*: CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge (s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, and sources of ignition. Although this compound is chemically stable in storage, it is decomposed at elevated temperatures with evolution of gas, and rapidly decomposed in cold alkali to form anthranilic acid and other decomposition products.[22]

Shipping: This chemical is an organophosphorus pesticide, solid, toxic. The required label is “POISONOUS/TOXIC MATERIALS.” It is in Hazard Class 6.1.

Spill Handling: Do not touch spilled material. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Use water spray to reduce vapors. Remove all ignition sources. If spill is wet, take up with diatomite, clay, expanded mineral, foamed glass, or synthetic absorbent material and deposit in sealed containers. For *small dry spills* use a high-efficiency particulate absolute (HEPA) filter vacuum, *not* a standard shop vacuum, or wet method to reduce dust during cleanups. *Do not dry sweep or create airborne dust.* Wash spill area with common household detergent. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is noncombustible. Wear protective clothing and equipment. Use dry chemical, carbon dioxide, water spray, or standard foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides, sulfur oxides, phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Azinphos-methyl is a brown, waxy solid, or colorless, crystalline material. Its technical form is a brown waxy solid. Molecular weight = 317.34; Freezing/Melting point = 73−74°C; Vapor pressure = 2.0×10^{-7} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Personnel engaged in the manufacture, formulation, and application of this organophosphorus insecticide and acaricide.
Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.
Permissible Exposure Limits in Air
OSHA PEL: 0.2 mg/m^3 TWA; [skin].
NIOSH REL: 0.2 mg/m^3 TWA; [skin].
ACGIH TLV®[1]: 0.2 mg/m^3 TWA; [skin], not classifiable as a human carcinogen; BEI: Cholinesterase activity in red cells = 70% of individual's baseline, sample time discretionary.
NIOSH IDLH: 10 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 0.7 mg/m^3
PAC-3: 10 mg/m^3
DFG MAK: 0.2 mg/m^3, inhalable fraction; [skin] Peak limitation II(8).
Australia: TWA 0.2 mg/m^3, [skin], 1993; Austria: MAK 0.2 mg/m^3, [skin], 1999; Belgium: TWA 0.2 mg/m^3, [skin],

Determination in Air: NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: For the protection of freshwater and marine aquatic life, a criterion of 0.01 μg/L has been suggested by EPA. For the protection of human health, a no-adverse-effect-level in drinking water has been calculated by NAS/NRC[46] as 0.088 mg/L. An allowable daily intake of 0.0125 mg/kg/day was calculated. Canada's maximum allowable concentration (MAC) in drinking water is 0.02 mg/L. The state of Maine[61] has set a guideline of 25 μg/L for azinphos-methyl in drinking water.

Determination in Water: Pesticide residue methods which should be applicable involve hydrolysis with KOH in isopropanol to give anthranilic acid, which is diazotized and coupled to give a measurable color. Fish Tox: 0.28636000 ppb MATC (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Symptoms include nausea, vomiting, diarrhea, excessive salivation; blurring of vision and other signs of cholinesterase inhibition; loss of muscle coordination; twitching of muscles, confusion, troubled breathing; convulsions and death. The oral LD_{50} for rat is 11 mg/kg. The acute toxicity rating is extremely toxic. Probable oral lethal dose in humans is 5−50 mg/kg or between 7 drops and 1 teaspoon for a 70-kg (150 lb) person. This is a potent cholinesterase inhibitor which can cause death.

Short Term Exposure: Exposure can cause rapid, fatal organophosphorus poisoning. Inhalation can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system causing weakness, "pins and needles," and poor coordination in arms and legs with repeated exposure, resulting in convulsions and respiratory failure. May cause liver damage. Repeated exposure may cause personality changes of depression, anxiety, or irritability. Human Tox: 10.50000 ppb Health Advisory (INTERMEDIATE).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Prevent skin contact. **8 h** (More than 8 h of resistance to breakthrough >0.1micron->g/cm^2/min): Neoprene™, nitrile rubber gloves, suits, boots. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately when skin is wet or contaminated. Work clothing should be changed daily if it is at all possible that clothing is contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Note: Recommendations are NOT valid for very thin Natural rubber, Neoprene^{TM}, nitrile, and PVC gloves (<0.3 mm thick).

Respirator Selection: *Up to 2 mg/m^3*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 10 mg/m^3*: CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge (s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, and sources of ignition. Although this compound is chemically stable in storage, it is decomposed at elevated temperatures with evolution of gas; rapidly decomposed in cold alkali to form anthranilic acid and other decomposition products.[22]

Shipping: This chemical is an organophosphorus pesticide, solid, toxic. The required label is “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 1000.

Fire Extinguishing: This product may burn but does not readily ignite. Poisonous gases, including carbon monoxide, nitrogen oxides, and sulfur, are produced in fire. Fight fire from maximum distance. On small fires use dry chemical, carbon dioxide, water spray, or standard foam extinguishers. On large fires use water spray, fog, or foam. Dike fire control water for later disposal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Azobenzene A:1660

Molecular Formula: $C_{12}H_{10}N_2$
Common Formula: $C_6H_5N{=}NC_6H_5$
Synonyms: Azobenzide; Azobenzol; Azobisbenzene; Azodibenzene; Azodibenzeneazofume; Benzeneazobenzene; Diazobenzene; 1,2-Diphenyldiazene; Diphenyldiazene; Diphenyldiimide; NCI-C02926
CAS Registry Number: 103-33-3
RTECS® Number: CN1400000
UN/NA & ERG Number: UN2811/Toxic solids, organic, n.o.s./154
EC Number: 203-102-5 [*Annex I Index No.:* 611-001-00-6]
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Bioassay (feed); clear evidence: rat; no evidence: mouse; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.
Banned or Severely Restricted (Great Britain) (UN).[13]
California Proposition 65 Chemical: Cancer.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R20/22; R48/22; R68; R50/53 Safety phrases: S53; S46; S60; S62 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Azobenzene is a combustible, orange-red crystalline solid. Molecular weight = 182.2; Boiling point = 293°C (decomposes); Freezing/Melting point = 68°C; Vapor pressure = 7.6×10^{-5}. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.
Potential Exposure: Those engaged in azobenzene use in dye, rubber, chemical, and pesticide manufacturing.
Incompatibilities: Strong oxidizers.
Permissible Exposure Limits in Air
No standards or TEEL available.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.8$.
Routes of Entry: Inhalation, ingestion, skin absorption.
Harmful Effects and Symptoms
Short Term Exposure: Azobenzene irritates the eyes, skin, and respiratory tract. In serious cases there is a risk of unconsciousness and death. The consumption of alcohol may exacerbate toxic effects. The oral LD_{50} for rat is 1000 mg/kg.
Long Term Exposure: A potential carcinogen. Can affect the blood and cause liver disorders.
Medical Surveillance: Liver function tests. Complete blood count (CBC).
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:
At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store under an inert atmosphere in a freezer or

refrigerator. Protect from air and light.[52] Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Azobenzene may be classified as Toxic solids, organic, n.o.s. and requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Transfer to vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including Nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Azodiisobutyronitrile A:1670

Molecular Formula: $C_8H_{12}N_4$

Common Formula: $NCC(CH_3)_2N{=}NC(CH_3)_2CN$

Synonyms: Aceto azib; AIBN; α,α′-Azobisisobutylonitrile; 2,2′-Azobis(isobutyronitrile); Azobisisobutyronitrile; 2,2′-Azobis(2-methylpropionitrile); α,α′-Azodiisobutyronitrile; 2,2′-Azodiisobutyronitrile; Azodiisobutyronitrile; 2,2′-Dicyano-2,2′-azopropane; Poly-Zole AZDN; Porofor 57; Vazo 64

CAS Registry Number: 78-67-1

RTECS® Number: UG0800000

UN/NA & ERG Number: UN2952/150

EC Number: 201-132-3 [*Annex I Index No.:* 608-019-00-1]

Regulatory Authority and Advisory Bodies

US EPA TSCA Section 8(e) Risk Notification, 8EHQ-0892-8909.

European/International Regulations: Hazard Symbol: E, Xn, N; Risk phrases: R2; R11; R20/22; R52/53; Safety phrases: S2; S39; S41; S47; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Azobisisobutylonitrile is a white crystalline compound. Molecular weight = 164.21; Specific gravity (H_2O:1) = 1.11 at 25°C; Boiling point = decomposes; Freezing/Melting point = 99−103°C (decomposes); Autoignition temperature = 63°C. NFPA 704 M Hazard Identification (based on NFPA-704M Rating System): Health 3, Flammability 2, Reactivity 2. Insoluble in water.

Potential Exposure: Azobisisobutylonitrile is used as a polymerization initiator, free radical generator (or initiator), as a catalyst in vinyl polymerizations, and as a blowing agent for elastomers and plastics.

Incompatibilities: Highly flammable. Unstable and easily oxidized martial; keep away from oxidizers, strong acids. Keep at temperature not exceeding 30°C (may vary by manufacturer). Risk of explosion from heat, shock, friction. Warming causes production of tetramethylsuccinonitrile and cyanide fumes. Keep away from acetone and other ketones, alcohols, lithium, aluminum, aldehydes, and hydrocarbons, such as heptane.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 7.5 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 300 mg/m^3

NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.

Determination in Air: NIOSH Analytical Method #7904 (Cyanides). See also NIOSH Criteria Document 212 *Nitriles*.

Permissible Concentration in Water: No criteria set. May be harmful to aquatic organisms.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.10.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Azodiisobutyronitrile can affect you by passing through your skin. Contact can cause irritation to the eyes and skin. Inhalation can irritate the nose and throat, causing wheezing and coughing. High exposure can cause dizziness, vomiting, abdominal pain, flushing, headache, shortness of breath, and coma. Convulsions and death may follow.

Long Term Exposure: Azodiisobutyronitrile may cause liver and kidney damage.

Points of Attack: Respiratory system, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood cyanide level. Liver and kidney function tests. Consider thyroid evaluation and complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential for exposures to azodiisobutyronitrile, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

NIOSH (*as cyanides*): *25 mg/m*^{3}: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin--style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Azodiisobutyronitrile must be stored to avoid contact with acetone, lithium, aluminum hydride, and water, since violent reactions occur. Azodiisobutyronitrile is self-reactive and will explode at elevated temperatures. It should be stored under nitrogen, dry ice, or ice. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Self-reactive solid type C, temperature controlled materials must be labeled "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not sweep or raise dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Do not use water or wet method.* Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Azodiisobutyronitrile may self-ignite at elevated temperatures. Use dry chemical, CO_2, water spray, or foam extinguishers. Use water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire, including oxides of nitrogen, tetramethylsuccinonitrile, and cyanide fumes. Containers may explode in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

B

Bacitracin B:0050

Molecular Formula: $C_{66}H_{103}N_{17}O_{16}S$

Synonyms: Ayfivin; Baciguent; Baci-Jel; Baciliquin; Bacitek ointment; Fortracin; Parentracin; Penitracin; Topitracin; Zutracin

CAS Registry Number: 1405-87-4

RTECS® Number: CP0175000

UN/NA & ERG Number: UN3249 (medicine, solid, toxic, n.o.s.)/151

EC Number: 215-786-2

Regulatory Authority and Advisory Bodies

Listed on the TSCA inventory.

List of Acutely Toxic Chemicals, Chemical Emergency Preparedness Program (EPA) and formerly on CERCLA/SARA 40CFR302, Table 302.4 Extremely Hazardous Substances List. Dropped from listing in 1988.

Listed on Canada's DSL List.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bacitracin is a white to light tan powder which is odorless or having a slight odor and very bitter taste. Molecular weight = 1422.69; Freezing/Melting point: 221−224°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Highly soluble in water.

Potential Exposure: Bacitracin is used as an ingredient in antibiotic ointments to treat or prevent topical or eye infections. Commercial Bacitracin is a mixture of at least 9 bacitracins. Also used as a feed and drinking water additive in animals; as an additive in food for human consumption.

Incompatibilities: Oxidizers, such as peroxides, perchlorates, chlorates, nitrates, chlorine, bromine, and fluorine.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Through the skin, inhalation.

Harmful Effects and Symptoms

LD_{50} = (oral-mouse) 25 mg/kg (highly toxic). This data has been questioned, however, and it has been stated that as a result of a mathematical miscalculation, bacitracin was wrongly included in a list of hazardous chemicals drafted several years ago by the National Institute of Occupational Safety and Health. The mistake was remedied in 1988 when the substance was removed from the EHS list as noted above.

Short Term Exposure: Bacitracin can be absorbed through the skin, thereby increasing exposure. May cause eye irritation. Hypersensitivity reactions may result from application of this compound to the skin but this is uncommon. Exposure may cause nausea, vomiting, and diarrhea.

Long Term Exposure: May cause liver damage and skin allergy.

Points of Attack: Liver, skin.

Medical Surveillance: Evaluation by a qualified allergist. Kidney function tests.

First Aid: In case of large-scale exposure, the directions for medicines (nonspecific, n.o.s.) would be applied as follows: Move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 min. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Storage: Color Code—Green: General storage may be used.

Shipping: The DOT category of medicine, solid, toxic, n.o.s. calls for the label of "POISONOUS/TOXIC MATERIALS." Bacitracin would fall in Hazard Class 6.1 and in Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide, nitrogen oxides, and sulfur oxides. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Save fire control water for later disposal, do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Mexico, Drinking Water 1.0 mg/L.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Barium is a flammable, silver white or yellowish metal in various forms including powder. Barium may ignite spontaneously in air in the presence of moisture, evolving hydrogen. Molecular weight = 137.34; Boiling point = 1640°C; Freezing/Melting point = 725°C; Vapor pressure = 10 mmHg at 1049°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 3₩ (water reactive).
Potential Exposure: Metallic barium is used for removal of residual gas in vacuum tubes and in alloys with nickel, lead, calcium, magnesium, sodium, and lithium. Barium compounds are used in the manufacture of lithopone (a white pigment in paints), chlorine, sodium hydroxide, valves, and green flares; in synthetic rubber vulcanization; X-ray diagnostic work, glassmaking, papermaking, beet-sugar purification; animal and vegetable oil refining. They are used in the brick and tile, pyrotechnics, and electronics industries. They are found in lubricants, pesticides, glazes, textile dyes, and finishes; pharmaceuticals; in cements which will be exposed to saltwater; and barium is used as a rodenticide, a flux for magnesium alloys, a stabilizer and mold lubricant in the rubber and plastics industries, an extender in paints; a loader for paper, soap, rubber, and linoleum; and as a fire extinguisher for uranium or plutonium fires.
Incompatibilities: Barium powder may spontaneously ignite on contact with air. It is a strong reducing agent and reacts violently with oxidizers and acids. Reacts with water, forming combustible hydrogen gas and barium hydroxide. Reacts violently with halogenated hydrocarbon solvents, causing a fire and explosion hazard.
Permissible Exposure Limits in Air
OSHA PEL: 0.5 mg[Ba]/m^3 TWA.
NIOSH REL: 0.5 mg[Ba]/m^3 TWA.
ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.
NIOSH IDLH: 50 mg Ba/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 50 mg/m^3
Soluble compounds only
DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2); Pregnancy Risk Group D.
Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, 1993; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3, 1999; Hungary STEL 0.5 mg/m^3, 1993; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (time-weighted average) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Sweden: TWA 0.5 mg/m^3, 1999; Switzerland: MAK-week 0.5 mg/m^3, 1999; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: LTEL 0.5 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Methods (IV) #7056, Barium, soluble compounds. Collection on a cellulose membrane filter, workup with hot water, analysis by atomic absorption. Use NIOSH Analytical Method #8310, Metals in urine. OSHA ANALYTICAL METHOD ID-121.
Permissible Concentration in Water: EPA allows 2 ppm. See Regulatory Authority and Advisory Bodies for Canadian and Mexican levels. Russia[43] set a MAC of

4.0 mg/L in water bodies used for domestic purposes. Also, these states have set standards for barium in drinking water[61]: a standard of 100 μg/L in Massachusetts and guidelines of 1000 μg/L in Maine and 1500 μg/L in Minnesota.

Determination in Water: Conventional flame atomization does not have sufficient sensitivity to determine barium in most water samples; however, a barium detection limit of 10 μg/L can be achieved if a nitrous oxide flame is used. A concentration procedure for barium uses thenoyltrifluoroacetone−methylisobutylketone extraction at a pH of 6.8. With a tantalum liner insert, the barium detection limit of the flameless atomic absorption procedure can be improved to 0.1 μg/L according to NAS/NRC.[46]

Routes of Entry: Ingestion or inhalation of dust or fume, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Alkaline barium compounds, such as the hydroxide and carbonate, may cause local irritation to the eyes, nose, throat, and skin. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: Barium poisoning is virtually unknown in industry although the potential exists when the soluble forms are used. When ingested or given orally, the soluble, ionized barium compounds exert a profound effect on all muscles and especially smooth muscles, markedly increasing their contractility. The heart rate is slowed and may stop in systole. Other effects are increased intestinal peristalsis; vascular constriction; bladder contraction, and increased voluntary muscle tension. The inhalation of the dust of barium sulfate may lead to deposition in the lungs in sufficient quantities to produce "baritosis" (a benign pneumoconiosis). This produces a radiologic picture in the absence of symptoms and abnormal physical signs. X-rays, however, will show disseminated nodular opacities throughout the lung fields, which are discrete, but sometimes overlap. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Heart, lungs, central nervous system, skin, respiratory system, eyes.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If a soluble barium compound gets into the eyes, remove any contact lenses at once and irrigate immediately. If a soluble barium compound contacts the skin, flush with water immediately. If a person breathes in large amounts of a soluble barium compound, move the exposed person to fresh air at once and perform artificial respiration. When a soluble barium compound has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician (poisoning from barium compounds): If ingested, there are treatment considerations available including the following: Gastric emptying, a warm aqueous solution of 1−3% soluble sulfates of magnesium sulfate or sodium sulfate administered orally as a gastric lavage (forms insoluble barium sulfate). Atropine sulfate, 0.5−1.0 mg, to decrease colic. Small doses of morphine may be necessary to control abdominal pain. If low potassium (hypokalemia) is present, treat with IV of potassium.

Personal Protective Methods: Employees should receive instruction in personal hygiene and the importance of not eating in work areas. Good housekeeping and adequate ventilation are essential. Dust masks, respirators, or goggles may be needed where amounts of significant soluble or alkaline forms are encountered, as well as protective clothing.

Respirator Selection: *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Barium metal should be stored in a dry area, separated from halogenated solvents, strong oxidants, acids, in tightly-closed containers under an inert gas blanket, petroleum, or oxygen-free liquid. Rubber gloves, rubber protective clothing and apron, goggles and gas-filter mask should be worn when working in a barium storage area.

Shipping: Barium metal requires a shipping label of "DANGEROUS WHEN WET." The metal falls in

UN/DOT shipping class 4.3 and Packing Group II.[19, 20] It should be noted that "Barium Alloys" have the same caveats but "Barium Alloys, Pyrophoric" require a "SPONTANEOUSLY COMBUSTIBLE" label. They fall in Hazard Class 4.2.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Small quantities of barium metal may be dissolved in large quantities of water. Soda ash is added and the solution then neutralized with HCl. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium powder is a flammable solid. Reacts violently with fire extinguishing agents, such as water, bicarbonate, powder, foam, and carbon dioxide. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Barium in solution (see spill handling) may be precipitated with soda ash and the sludge may be landfilled.

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

No TEEL available.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: No criteria set for barium azide. See entry under "Barium."

Permissible Concentration in Water: No criteria set for barium azide. EPA allows 2 ppm for barium. See entry under "Barium."

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short Term Exposure: Barium azide irritates the eyes, nose, and respiratory tract; with coughing. Overexposure can cause a drop in blood pressure, with dizziness; blurred vision; headaches; and unconsciousness. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: Repeated exposure to the dust can cause spots on chest X-ray without lung scarring. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If weakness or fainting is present, lay the person down flat with feet elevated. See also First Aid section in "Barium" entry.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- (for liquid) or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (as soluble barium compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Barium azide must be stored to avoid contact with carbon disulfide since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area from anything which could disturb or shock barium azide. Sources of ignition, such as smoking and open flames are prohibited where barium azide is handled, used, or stored. Keeping barium azide wet greatly reduces its fire and explosion hazard. Wherever barium azide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Barium azide wetted with not $<50\%$ water, by mass, requires a shipping label of "FLAMMABLE SOLID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 4.1 and Packing Group I.[19, 20] Barium azide dry or wetted with $<50\%$ water, by mass must be labeled "EXPLOSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 1.1A and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of

potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium azide will explode when heated or when shocked. If fire or explosion occurs, evacuate the area. Fight the fire from an explosion-resistant location as containers may explode in fire. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Barium bromate B:0120

Molecular Formula: $BaBr_2O_6$

Common Formula: $Ba(BrO_3)_2$

Synonyms: Bromato barico (Spanish); Bromic acid, barium salt

CAS Registry Number: 13967-90-3

RTECS® Number: EF8715000

UN/NA & ERG Number: UN2719/141

EC Number: 237-750-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Likely to produce cancer in humans (inhalation, as bromates); Available data are inadequate for an assessment of human carcinogenic potential (oral route, as bromates); Limited evidence of carcinogenicity based on epidemiologic studies.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Barium bromate is a white crystalline powder. Molecular weight = 411.2; Boiling point: explodes at 300°C; Freezing/Melting point = 260°C (decomposes). Slightly soluble in water.

Potential Exposure: This material is used as an analytical reagent, oxidizer, and corrosion inhibitor.

Incompatibilities: A strong oxidizer; keep away from reducing agents. Keep away from oxidizable materials; aluminum, arsenic, carbon, copper, metal sulfides; phosphorus, sulfur, organic, and combustible materials (such as wood, paper, oil, fuels) since violent reactions occur.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

No TEEL available.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry under "Barium."

Permissible Concentration in Water: No criteria set for barium bromate *per se*. EPA allows 2 ppm for barium. See entry under "Barium."

Routes of Entry: Inhalation, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Barium bromate can affect you when breathed in. Contact can irritate and even burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: After repeated exposure, barium may show up as spots on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Repeated exposure to Barium bromate can cause bromine to build up in the body. Consult the sheet on "Bromine" entry. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated skin contact can cause chronic dryness and cracking.

Points of Attack: Lungs, skin.

Medical Surveillance: Serum bromide levels. Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where barium bromate is handled, used, or stored. Avoid any possible contact with incompatible materials. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Barium bromate requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 5.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium bromate explodes at 275−300°C. Extinguish fire using an agent suitable for type of surrounding fire. Barium bromate itself does not burn. Poisonous gases are produced in fire, including bromine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Barium chlorate B:0130

Molecular Formula: $BaCl_2O_6$
Common Formula: $Ba(ClO_3)_2$
Synonyms: Barium chlorate (monohydrate); Chloric acid, barium salt; Clorato barico (Spanish)
CAS Registry Number: 13477-00-4 (monohydrate); 10326-27-7 (dihydrate)
RTECS® Number: FN9770000; CQ 8751000 (dihydrate)
UN/NA & ERG Number: UN1445
EC Number: 236-760-7 [*Annex I Index No.:* 017-003-00-8] (monohydrate); dihydrate not found.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s.

European/International Regulations (*monohydrate*): Hazard Symbol: O, Xn, N; Risk phrases: R9; R20/22; R51/53; Safety phrases: S2; S13; S27; S61; European/International Regulations (*dihydrate*): not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Barium chlorate is a combustible, colorless to white crystalline solid or powder. Molecular weight = 304.24; 244.3 (dihydrate); Freezing/Melting point = monohydrate decomposes below 250°C; dihydrate at 120°C (loss of water of crystallization). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1, Oxidizer. Soluble in water; solubility = 27 g/100 mL.

Potential Exposure: It is used in fireworks and explosives manufacture; in textile dyeing and in the manufacture of other perchlorates.

Incompatibilities: A strong oxidizer. When heated above 250°C, it begins to give off oxygen and will increase risk of fire. Barium chlorate is a reactive chemical and is an explosion hazard. Violent reaction may occur with reducing materials, strong acids, powdered metals. Contact with combustible materials will increase activity in fire.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

No TEEL available.

Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, 1993; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3, 1999; Hungary STEL 0.5 mg/m^3, 1993; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (time-weighted average) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Sweden: TWA 0.5 mg/m^3, 1999; Switzerland: MAK-week 0.5 mg/m^3, 1999; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: LTEL 0.5 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry for "Barium."

Permissible Concentration in Water: No criteria set for barium chlorate *per se*. EPA allows 2 ppm for barium. See entry for "Barium."

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes. Higher exposures can damage red blood cells. Symptoms include headache, weakness, abdominal pain, dark urine, and jaundice. The symptoms of paralysis may be delayed for several hours. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: After repeated exposure, barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. See entry for "Silica quartz." Chlorates can damage red blood cells, leading to kidney damage, or cause methemoglobin to form in the blood, reducing oxygen supply to body organs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated skin contact can cause chronic dryness and skin cracking.

Points of Attack: Lungs, blood cells, skin.

Medical Surveillance: Lung function tests, complete blood count (CBC), test for methemoglobin. Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including

resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of paralysis do not become obvious until some hours have passed. Keep under medical observation for 24–48 h. See also First Aid section in "Barium" entry.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure to barium chlorate. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of barium chlorate to potentially exposed workers.

Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Barium chlorate must be stored to avoid contact with organic or combustible materials (such as wood, paper, oil, fuels, and starch) and other easily oxidizable materials (such as sulfur, aluminum, copper, metal sulfides, ammonium salts, etc.) since violent reactions occur. Store in tightly closed containers on nonwood floors in a cool, well-ventilated area. Wherever barium chlorate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This chemical requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." The Hazard Class is 5.1 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar nonorganic material and deposit in sealed containers. May also be covered with weak reducing agents; resulting sludge neutralized and flushed to sewer. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May explode when heated. Contact with combustible, organic, or other easily oxidizable materials, such as paper, oil, fuels or sawdust can cause fires. Rubbing of these mixtures can cause explosions. Use water to extinguish the fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use large volumes of reducing agent (bisulfite or ferrous salt) solutions. Neutralize and flush to sewer with large volumes of water.[24]

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or Ca(CN)2; Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s. and Cyanide compounds, inorganic, n.o.s.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R28; R32; R50/53; Safety phrases: S1/2; S7/8; S23; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Barium cyanide is a white crystalline powder. Often used in solution. Molecular weight = 139.4; Heat of combustion = -60.5×10^5 J/kg; Heat of solution = (exothermic) = -6.19×10^5 J/kg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 80 g/100 cc at 14°C.

Potential Exposure: Barium cyanide is used in electroplating and in metallurgy.

Incompatibilities: Violent reactions may occur on contact with acids, acid salts, and strong oxidizers.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

NIOSH IDLH: 50 mg [Ba]/m^3.

Protective Action Criteria (PAC)
TEEL-0: 0.69 mg/m^3
PAC-1: 2.07 mg/m^3
PAC-2: 3.5 mg/m^3
PAC-3: 69 mg/m^3

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

Australia: TWA 5 mg/m^3, [skin], 1993; Austria: MAK 5 mg [CN/m^3, [skin], 1999; Denmark: TWA 5 mg/m^3, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, KZG-W 10 mg/m^3, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 mg/m^3 [skin]. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Permissible Concentration in Water: No criteria set for barium cyanide *per se*. EPA allows 2 ppm for barium. See entry under "Barium." See also entry under "Cyanides."

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Barium cyanide is a deadly poison; can affect you when breathed and by passing through skin. Exposure can cause confusion, weakness, headaches, nausea, vomiting, gasping for air, collapse and even death from cyanide poisoning. On contact with acids, acid mists, or acid salts, flammable hydrogen cyanide gas is formed which can cause rapid poisoning. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Can interfere with the normal functioning of the thyroid gland, causing goiter (enlarged thyroid).

Points of Attack: Thyroid.

Medical Surveillance: Blood cyanide level. Thyroid function tests. Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *If cyanide poisoning is confirmed*, use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- (for liquid) or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Barium cyanide must be stored to avoid contact with acids; acid salt (such as potassium bisulfate, calcium biphosphate and calcium nitrate); carbon dioxide and strong oxidizers (such as nitrates, chlorates and chlorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is I.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers.

Fire Extinguishing: Barium cyanide does not burn, but contact with acids, acid salts, or carbon dioxide in air may produce highly flammable hydrogen cyanide gas. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire, including cyanide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Precipitate barium with sulfate. Then add with stirring to alkaline calcium hypochlorite solution. Let stand 24 h, then flush to sewer.

Barium hypochlorite B:0150

Molecular Formula: $BaCl_2O_2$

Common Formula: $Ba(OCl)_2$

Synonyms: Hypochlorous acid, barium salt

CAS Registry Number: 13477-10-6

RTECS® Number: NH3480000

UN/NA & ERG Number: UN2741 (barium hypochlorite, with more than 22% available chlorine)/141

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Barium hypochlorite is a colorless, sand-like, crystalline solid, often used in solution. A strong oxidizer. There is not much information available on this compound. Reacts with water.

Potential Exposure: This material is used as a bleaching agent and as an antiseptic.

Incompatibilities: Barium hypochlorite is a strong oxidizer. Avoid contact with reducing agents, organic and combustible materials (such as wood, oil, paper, and fuels), acids, and urea since violent reactions occur. Keep away from water or steam.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

No TEEL available.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry under "Barium."

Permissible Concentration in Water: No standards set for Barium Hypochlorite *per se*. EPA allows 2 ppm for barium. See entry under "Barium."

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Barium hypochlorite can affect you when breathed in and may enter the body through the skin. Contact can irritate and even burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: After repeated exposure, barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated skin contact can cause chronic dryness and cracking.

Points of Attack: Lungs, skin.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure to barium hypochlorite and at the end of the work shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of barium hypochlorite to potentially exposed workers. See also First Aid section in "Barium" entry.

Respirator Selection: (BA soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers in a cool, well-ventilated area away from water and steam. Sources of ignition, such as smoking and open flames, are prohibited where Barium Hypochlorite is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Avoid any possible contact with the incompatible materials cited above. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Barium hypochlorite (with more than 22% available chlorine) requires an "OXIDIZER" label. It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Do not use water. Extinguish fire using an agent suitable for type of surrounding fire. Barium hypochlorite itself does not burn. Poisonous gases are produced in fire, including chlorine and chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Barium nitrate B:0160

Molecular Formula: BaN_2O_6

Common Formula: $Ba(NO_3)_2$

Synonyms: Barium dinitrate; Nitrate de baryum (French); Nitrato barico (Spanish); Nitric acid, barium salt

CAS Registry Number: 10022-31-8

RTECS® Number: CQ9625000

UN/NA & ERG Number: UN1446/141

EC Number: 233-020-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Barium nitrate is a shiny, white crystalline solid. Molecular weight = 261.36; Specific gravity (water = 1) = 3.24 at 23°C; Boiling point = 210°C (decomposes); Freezing/Melting point = 590°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2, Oxidizer. Soluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Barium nitrate is used in fireworks (in green fire pyrotechnics), signal lights, ceramics; and in the electronics industry to make BaO_2. Once used in the vacuum tube industry.

Incompatibilities: A strong oxidizer. Decomposes in heat; may detonate if confined in elevating temperatures. Keep away from strong acids, reducing agents. Contact with organic and combustible materials (such as wood, paper, oil, and fuels) and aluminum−magnesium alloys since violent reactions occur. Contact with sulfur powder and finely divided metals can form a shock-sensitive compounds.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg [Ba]/m^3.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry for "Barium."

Permissible Concentration in Water: No criteria set for barium nitrate *per se*. EPA allows 2 ppm for barium. See entry for "Barium."

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Barium nitrate can affect you when breathed in. Inhaling dust or mist can cause irritation of the respiratory system, causing cough and phlegm. Contact can irritate and even burn the eyes and skin. Exposure can irritate the eyes, nose, and throat. Very high exposure (such as swallowing or extremely high dust exposure) can cause barium poisoning with symptoms of vomiting and diarrhea, irregular heartbeat, paralysis, and death. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders. LD_{50} = (oral-rat) 355 mg/kg.

Long Term Exposure: Repeated high exposure can irritate the lungs, causing cough and phlegm, and may cause an abnormal chest X-ray. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, nervous system, heart.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator).

12.5 mg/m^3: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers in a cool, well-ventilated area. Avoid any possible contact with incompatible materials cited above. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This chemical requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." The Hazard Class is 5.1 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Barium nitrate itself does not burn but heating causes decomposition and gives off oxygen; thereby increasing the intensity of an existing fire. Use flooding amounts of water in early stages of fire; in large fires, the material may melt and water could scatter the molten material. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve waste in 6-M HCl. Neutralize with NH_4OH. Precipitate with excess sodium carbonate. Filter, wash, and dry precipitate and return to supplier.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical's infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Barium oxide is a white to yellowish-white, odorless powder. Molecular weight = 153.34; Freezing/Melting point = 1923°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Reacts violently with water.

Potential Exposure: It is used to dry gases and solvents and in producing detergents for lubricating oils.

Incompatibilities: Reacts with water, forming barium hydroxide. Violent reactions occur on contact with hydrogen sulfide, carbon dioxide; hydroxylamine, nitrogen tetroxide or sulfur trioxide. Reacts with triuranium.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.558 mg/m^3

PAC-1: 1.67 mg/m^3

PAC-2: 2.79 mg/m^3

PAC-3: 55.8 mg/m^3

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry for "Barium."

Permissible Concentration in Water: No criteria set for barium oxide *per se*. EPA allows 2 ppm for barium. See entry for "Barium."

Determination in Water: Harmful to the environment.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Barium oxide can affect you when breathed in. Contact can irritate the skin and burn the eyes, causing loss of vision. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. High exposure may cause pulmonary edema, a medical emergency, that can be delayed for several hours. This can cause death. Exposure to this chemical can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: May cause lung irritation and bronchitis. After repeated exposure, barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, nervous system, heart.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a dry, cool, well-ventilated area away from water and the incompatible substances cited above.

Shipping: Barium oxide requires a shipping label of “POISONOUS/TOXIC MATERIALS.” This material falls in Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. NEVER pour water into this substance; when dissolving or diluting always add it slowly to the water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Barium oxide itself does not burn. Do not use water. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

RCRA 40CFR261, Appendix 8; 40CFR261.11 Hazardous Constituents.

EPCRA Section 313: Includes any unique chemical substance that contains barium as part of that chemical’s infrastructure. This category does not include barium sulfate (7727-43-7). Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) (Ba compounds, soluble, n.o.s.).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s.

European/International Regulations: Hazard Symbol: O, Xn; Risk phrases: R9; R20/22; Safety phrases: S2; S27 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Barium perchlorate is a white crystalline solid. Molecular weight = 336.2; Freezing/Melting point = 400°C (trihydrate); 505°C (anhydrous). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Highly soluble in water; solubility = 200 g/100 mL at 33°C.

Potential Exposure: It is used to make explosives and in experimental rocket fuels.

Incompatibilities: An oxidizing agent. Contact with organic and combustible materials (such as paper, wood, and oil), finely divided metals (specifically magnesium and aluminum), sulfur, calcium hydride, and strontium hydride since violent reactions occur.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

No TEEL available.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 $\mu g/m^3$ (New York) to 5.0 $\mu g/m^3$ (Florida and North Dakota) to 8.0 $\mu g/m^3$ (Virginia) to 10.0 $\mu g/m^3$ (Connecticut) to 12.0 $\mu g/m^3$ (Nevada).

Determination in Air: See entry for "Barium."
Permissible Concentration in Water: No criteria set for Barium perchlorate *per se*. EPA allows 2 ppm for barium. See entry for "Barium."
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Barium perchlorate can affect you when breathed in. Contact can cause severe irritation and burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. Overexposure can cause methemoglobinemia, causing dizziness, bluish color to the skin and lips. Higher levels can cause difficult breathing, collapse, and even death.
Long Term Exposure: After repeated exposure, Barium may show up as spots in the lungs on X-ray. Some Barium chemicals are contaminated with silica, which scars the lungs. Perchlorates can interfere with thyroid function, affect the red blood cells (methemoglobinemia) or damage bone marrow (aplastic anemia). Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.
Points of Attack: Lungs, red blood cells.
Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination. Thyroid function tests, complete blood count (CBC), tests for methemoglobin.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine. See also First Aid section in "Barium" entry.
Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers in a cool, well-ventilated area away from heat sources, sources of shock, or the incompatible materials cited above. Sources of ignition, such as smoking and open flames, are prohibited where Barium perchlorate is handled, used, or stored. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.
Shipping: Barium perchlorate requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 5.1 and Packing Group II.[19, 20]
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in

vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium perchlorate does not burn, but contact with organic and combustible materials or heat or shock may cause fires or explosions. In case of fire, evacuate the area and fight the fire from a safe, protected location. Poisonous gases are produced in fire, including Chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

NIOSH IDLH: 50 mg Ba/m^3.

Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry for "Barium."

Permissible Concentration in Water: No criteria set for barium permanganate *per se*. EPA allows 2 ppm for barium. See entry for "Barium."

Routes of Entry: Inhalation.

Short Term Exposure: Skin and eye contact can cause severe irritation and burns. Barium permanganate can affect you when breathed in. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: After repeated exposure, Barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with Silica, which scars the lungs. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time. Repeated contact may cause chronic drying and cracking skin.

Points of Attack: Lungs, skin.

Medical Surveillance: Consideration should be given to the skin, eye, heart, and lung in any placement or periodic examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. See also First Aid section in "Barium" entry.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Barium permanganate to potentially exposed workers.

Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers is a cool, well-ventilated area. Keep away from incompatible materials cited above. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Barium permanganate requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 5.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. Molecular weight = 169.34; Specific gravity (H_2O:1) = 4.98; Boiling point = 800°C (decomposes below this point); Freezing/Melting point = 450°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2, ₩, Oxidizer. Very slightly soluble in water.

Potential Exposure: Is used as a bleaching agent; in making hydrogen peroxide, oxygen; in aluminum welding; in textile dyeing and for bleaching fibers; animal substances.

Incompatibilities: A strong oxidizer. Keep away from organic and combustible materials (such as wood, paper, oil, fuels, and other easily oxidized materials) and peroxyformic acid, hydrogen sulfide, and hydroxylamine solutions since violent reactions occur.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg[Ba]/m^3 TWA; not classifiable as a human carcinogen.

OSHA PEL: 0.5 mg[Ba]/m^3 TWA.

NIOSH REL: 0.5 mg[Ba]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.617 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 61.7 mg/m^3

DFG MAK: 0.5 mg[Ba]/m^3, inhalable fraction TWA; Peak limitation II(2).

NIOSH IDLH: 50 mg Ba/m^3.

Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, 1993; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3, 1999; Hungary STEL 0.5 mg/m^3, 1993; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (time-weighted average) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Sweden: TWA 0.5 mg/m^3, 1999; Switzerland: MAK-week 0.5 mg/m^3, 1999; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: LTEL 0.5 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for barium in ambient air[60] ranging from 0.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: See entry under "Barium."

Permissible Concentration in Water: No criteria set for Barium peroxide *per se*. EPA allows 2 ppm for barium. See entry under "Barium."

Determination in Water: Environmental hazard for aquatic organisms.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Barium peroxide can affect you when breathed in. Contact can irritate and burn the eyes and skin. Breathing the dust or mist can irritate the nose, throat, and bronchial tubes, causing cough and phlegm. Exposure to this chemical can affect the nervous system and cause hypokalemia, which can cause heart disorders.

Long Term Exposure: After repeated exposure, Barium may show up as spots in the lungs on chest X-ray. Some barium chemicals are contaminated with silica, which scars the lungs. Repeated contact may cause chronic drying and cracking skin. Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.

Points of Attack: Lungs, skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (Ba soluble compounds) *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture, and away from contact with the incompatible materials cited above. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This chemical requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 5.1 and Shipping Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover material with sand/soda ash 9:1 mixture. Mix thoroughly and while stirring, add slowly to sodium bisulfite solution with plastic implements. Neutralize with dilute H_2SO_4. After setting, decant the solution with flushing water and transport the sand to a sanitary landfill.[24] Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Barium peroxide does not burn, but mixtures of Barium peroxide and combustible, organic, or easily oxidized materials, such as wood, fuels, paper, and charcoal will burn or explode if rubbed or contact a small amount of water. Use large amounts of water to extinguish the fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See Spill Handling.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as barium compounds, n.o.s., waste number not listed.
EPCRA Section 313: This does *not* cover barium sulfate (7727-43-7).
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Barium, water-soluble compounds, n.o.s.
WGK (German Aquatic Hazard Class): Nonwater polluting agent.
Description: Barium sulfate is a white crystalline solid. Molecular weight = 233.40; Freezing/Melting point = 1580°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.
Potential Exposure: Barium sulfate is used as an opaque medium in radiography; as a mud weighting material in oil well drilling; in paper coating; as a paint pigment.
Incompatibilities: Aluminum powder, phosphorus.
Permissible Exposure Limits in Air
OSHA PEL: 15 mg/m^3, total dust TWA; 5 mg/m^3, respirable fraction TWA.
NIOSH REL: 10 mg/m^3, total dust TWA; 5 mg/m^3, respirable fraction TWA.
ACGIH TLV®[1]: 10 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 350 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: 1.5 mg/m^3 respirable fraction (previously "fine dust"); 4 mg/m^3 inhalable fraction (previously "total dust"). Pregnancy Risk group C.
Australia: TWA 10 mg/m^3, 1993; Austria: MAK 0.5 mg(Ba)/m^3, 1999; Belgium: TWA 10 mg/m^3 (respirable dust), 1993; Denmark: TWA 0.5 mg(Ba)/m^3, 1999; Finland: TWA 0.5 mg (Ba)/m^3, 1999; Norway: TWA 0.5 mg(Ba)/m^3, 1999; Sweden: TWA 0.5 mg(Ba)/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg(Ba)/m^3; MAC-TGG 1.5 mg/m^3 (respirable dust), 2003; MAC-TGG 4 mg/m^3 (total dust), 2003; United Kingdom: TWA (respirable dust) 4 mg(Ba)/m^3, 2000; United Kingdom: TWA 10 mg(Ba)/m^3 (total dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3.
Determination in Air: Barium sulfate may be determined by filtration and gravimetric measurement.
Permissible Concentration in Water: EPA allows 2 ppm for barium.
Routes of Entry: Inhalation of dust; ingestion.
Harmful Effects and Symptoms
Short Term Exposure: Irritates eyes and respiratory tract. Exposure to either form can affect the nervous system and cause hypokalemia, which can cause heart disorders.
Long Term Exposure: Lungs may be affected by repeated or prolonged exposure to dust particles, resulting in baritosis (a form of benign pneumoconiosis) (WHO). Animal studies have found increased blood pressure and changes in the heart from ingesting barium over a long time.
Points of Attack: Lungs, nervous system, heart.
Medical Surveillance: Consideration should be given to the skin, eyes, heart, and lung in any placement or periodic examination.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention immediately due to the possibility of barium poisoning. See also "First Aid" section in "Barium" entry.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *12.5 mg/m^3:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *25 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Barium sulfate requires a shipping label of "POISONOUS/TOXIC MATERIALS." Barium compounds, n.o.s. fall in Hazard Class 6.1 and Shipping Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Bendiocarb B:0220

Molecular Formula: $C_{11}H_{13}NO_4$

Synonyms: AI3-27695; Bencarbate; Bendiocarbe; 1,3-Benzodioxole, 2,2-dimethyl-1,3-benzodioxol-4-ol methylcarbamate; 1,3-Benzodioxole, 2,2-dimethyl-4-(N-methylcarbamato)-; 1,3-Benzodioxol-4-ol, 2,2-dimethyl-, methylcarbamate; Bicam ULV; Carbamic acid, methyl-, 2,3-(dimethylmethylenedioxy)phenyl ester; Carbamic acid, methyl-, 2,3-(isopropylidenedioxy)phenyl ester; 2,2-Dimethylbenzo-1,3-benzodioxol-4-yl *N*-methylcarbamate; 2,2-Dimethyl-1,3-benzodioxol-4-yl *N*-methylcarbamate; 2,2-Dimethylbenzo-1,3-dioxol-4-yl methylcarbamate; 2,2-Dimethyl-4-(N-methylaminocarboxylato)-; 2,2-Dimethyl-4-(N-methylaminocarboxylato)-1,3-benzodioxole; Dycarb; Ficam; Ficam 80W; Ficam D; Ficam ULV; Ficam W; Fuam; Garvox; Garvox 3G; 2,3-Isopropylidene-dioxyphenyl methylcarbamate; MC 6897; Methylcarbamic acid 2,3-(isopropylidenedioxy)phenyl ester; Multamat; Multimet; NC 6897; Niomil; OMS-1394; Rotate; Seedox; Seedox SC; Tattoo; Turcam

CAS Registry Number: 22781-23-3

RTECS$^®$ Number: FC1140000

UN/NA & ERG Number: UN2757/151

EC Number: 245-216-8 [*Annex I Index No.:* 006-046-00-8]

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): U278.

Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06,Vol 71, No. 158] Reportable Quantity (RQ): 100 lb (45.4 kg).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada: Drinking Water Quality Level Set.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R21; R23/24/25; R50/55; Safety phrases: S1/2; S22; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bendiocarb is a white odorless crystalline powder. Molecular weight = 223.3; Freezing/Melting point = 129−130°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this carbamate insecticide which is used against household pests, in agriculture in seed treatment, and as a foliar spray.

Incompatibilities: Keep away from flammable materials and sources of heat and flame.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: Canada's Drinking Water Quality is 0.04 mg/L MAC.

Determination in Water: Fish Tox = 379.47332000 ppb MATC (LOW).

Routes of Entry: Inhalation, skin, contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Bendiocarb is a toxic carbamate chemical. Bendiocarb can affect you when inhaled. Exposure can cause rapid poisoning, with headaches, sweating, nausea, and vomiting, diarrhea, loss of concentration, and death. Eye contact can cause irritation and blurred vision.

Long Term Exposure: Similar carbamates can affect the central nervous system. Human Tox: 35.00000 ppb Health Advisory (INTERMEDIATE).

Medical Surveillance: Before starting work, at regular times after that, and if symptoms develop or overexposure occurs, the following is recommended: Serum and RBC cholinesterase levels (a test for the body substance affected by bendiocarb). For this substance, these tests are accurate only if done within about 2 h of exposure and can return to normal before the person feels well.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with Bendiocarb. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. The *Farm Chemicals Handbook* recommends polyvinyl chloride or rubber as a protective material. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures to bendiocarb, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a pesticide cartridge. Increased protection is obtained from full face-piece air purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator for pesticides with a full face-piece operated in the positive-pressure mode, or with a full face-piece hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Color Code—Green: General storage may be used. Prior to working with Bendiocarb you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from food, fertilizers, other pesticides, flammable materials, and sources of heat and flame.

Shipping: Carbamate pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group I, II, or III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped.

OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 570.

Fire Extinguishing: Bendiocarb may burn but does not readily ignite. Use dry chemical, carbon dioxide, halon, water spray, or standard foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and methyl isocyanate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Dispose in accordance with 40CFR165 recommendations for the disposal of pesticides and pesticide containers.

California Proposition 65 Chemical: Developmental/Reproductive toxin (male) 7/1/91.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as dustable powder formulations containing a combination of: Benomyl at or >7%; carbofuran at or >10%; thiram at or >15%).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R46; R60; R61; R37/38; R43; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Benomyl is a white crystalline solid with a faint acrid odor. Molecular weight = 290.36. Boiling point = decomposes without melting; Freezing/Melting point = ≥ 300°C (decomposes); Vapor pressure = 1×10^{-10} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 1.9 mg/L at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Primary Irritant. Benomyl is used as an agricultural chemical and pesticide, pharmaceutical, and veterinary drug.

Incompatibilities: Strong bases [forms toxic oxides of nitrogen], strong acids, peroxides, and oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 total dust, TWA; 5 mg/m^3 respirable fraction, TWA.

NIOSH REL: None established. See Appendix D of the *NIOSH Pocket Guide*.

ACGIH TLV®[1]: 10 mg/m^3 TWA; not classifiable as a human carcinogen.

No TEEL available.

DFG MAK: [skin] possible sensitization of skin; Germ Cell Mutagen Group: 3A (2005).

Australia: TWA 0.8 ppm (10 mg/m^3), 1993; Belgium: TWA 0.84 ppm (10 mg/m^3), 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 0.8 ppm (10 mg/m^3), STEL 2.4 ppm (30 mg/m^3), [skin], 1993; France: VME 0.8 ppm (10 mg/m^3), 1999; Switzerland: MAK-week 0.8 ppm (10 mg/m^3), 1999; United Kingdom: TWA 10 mg/m^3, STEL 15 mg/m^3, 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Colombia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[43] has set a limit in ambient air of 0.35 mg/m^3 on a once-a-day basis and 0.05 mg/m^3 on an average daily basis. Several states have set guidelines or standards for benomyl in ambient air[60] ranging from 100 μg/m^3 (North Dakota and Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500, total dust, #0600 (respirable)].

Permissible Concentration in Water: Russia set a MAC of 0.5 mg/L in surface water of benomyl.[35]

Determination in Air: Fish Tox: 2.19089000 ppb MATC (HIGH).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Benomyl is generally felt to have a low order of acute and chronic toxicity.[53] However, a rebuttable presumption against registration for benomyl was issued on December 6, 1978 by US EPA on the basis of reduction in nontarget species, mutagenicity, teratogenicity, reproductive effects, and hazard to wildlife. The ADI for man is 0.02 mg/kg.[23]

Short Term Exposure: The substance irritates the skin, eyes, and upper respiratory system. Exposure could cause depression of the central nervous system and lack of muscular coordination.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Human mutation data reported. Also experimental and reproductive effect. May damage the male reproductive system; cause heritable genetic damage in humans. Animal tests show that this substance possibly causes birth defects in human babies, miscarriage, or cancer. Human Tox: 17.50000 ppb Health Advisory (INTERMEDIATE).

Points of Attack: Eyes, skin, respiratory system; reproductive system.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place or in a refrigerator[52] away from strong bases, strong acids, heat.

Shipping: FLAMMABLE SOLID, N.O.S., Hazard Class 4.1, Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust, then transfer material to a suitable container. Use absorbent paper dampened with toluene to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal.[52] Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 1900.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Extinguish fires using an agent suitable for the type of surrounding fire; benomyl itself does not burn.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

RTECS® Number: DK9900000

UN/NA & ERG Number: UN2588/151

EC Number: 246-585-8 [*Annex I Index No.*: 613-012-00-1]; 256-735-4 (sodium bentazon)

Regulatory Authority and Advisory Bodies

Safe Drinking Water Act, 55FR1470 Priority List.

European/International Regulations (*25057-89-0*): Hazard Symbol: Xn, N; Risk phrases: R22; R36; R43; R52/53; Safety phrases: S2; S24; S37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Bentazon is a colorless to white crystalline powder. Molecular weight = 240.3; Boiling point = 200°C (decomposes); Freezing/Melting point = 137−139°C; Vapor pressure = 10^{-3} at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Very slightly soluble in water; solubility = 490 mg/L at 20°C.

Potential Exposure: Those involved in the manufacture, formulation, or application of this selective postemergent herbicide.

Incompatibilities: Keep away from flammable materials, heat, and flame. Risk of fire and explosion if formulations contain flammable/explosive solvents.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: A no-observed adverse-effect-level (NOAEL) of 2.5 mg/kg/day has been determined by EPA based on the absence of prostatic effects in dogs. This led to the determination of a long-term health advisory of 0.875 mg/L for a 70-kg adult. It also led to the establishment of a lifetime health advisory of 0.0175 mg/L. In addition, California[61] has set a guideline in drinking water of 8.0 μg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.48$. Fish Tox (sodium bentazon): 40423.03894000 (VERY LOW).

Fish Tox Type: MATC

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 1100 mg/kg (slightly toxic). Avoid eye contact; may cause severe irritation or injury. May cause skin burns.

Long Term Exposure: May be a reproductive hazard. Human Tox (sodium bentazon): 200.00000 Health Advisory (VERY LOW).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved [for pesticides] self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from flammable materials, sources of heat and fire.

Shipping: Pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (sodium bentazon) $K_{oc} = 34$.

Fire Extinguishing: Bentazon is not combustible but may support combustion under fire conditions. Risk of fire and explosion if formulations contain flammable/explosive solvents. Stay upwind of fire. Use dry chemical, carbon dioxide, water spray, or standard foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Bentonite B:0250

Molecular Formula: $Al_2H_2O_{12}Si_4$

Common Formula: $Al_2O_3 \cdot 4SiO_2 \cdot H_2O$

Synonyms: Albagel premium USP 4444; Bentonite magma; Entonite 2073; Hi-Jel; Imvite I.G.B.A; Magbond; Montmorillonite; Panther Creek bentonite; Southern bentonite; Tixoton; Volclay; Volclay bentonite BC; Wilkinite

CAS Registry Number: 1302-78-9

RTECS® Number: CT9450000

EC Number: 215-108-5

Regulatory Authority and Advisory Bodies

NTP: Carcinogenesis studies; selected, October 2000.

FDA—proprietary drug.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bentonite is a light yellow, creamy, pale brown or gray to black powder or granules. These chemicals contain 1−24% crystalline silica (O_2Si). Specific gravity (H_2O:1) = 2.5. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used as Fuller's earth; as a mineral, natural or synthetic fiber; as an emulsifier for oils; as a base for plasters; in cosmetics, in polishes, and in abrasives; as a food additive; and others. Bentonites are aluminate silicate and can contain crystalline silica. The content varies widely from less than 1% to about 24%.[WHO]

Incompatibilities: Substance is a weak acid in water; avoid contact with strong alkaline material.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 30 mg/m^3

Inasmuch as this material can contain up to 24% crystalline silica, the OSHA PEL is listed for reference: crystalline silica (as respirable quartz): either 250 mppcf /%SiO_2 + 5 or 10 mg/m^3/[%SiO_2 + 2] TWA. Also under study by ACGIH.[1]

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Dust may cause irritation to nose, throat, and lungs. Dust may cause eye irritation. The intravenous LD_{50} (inh, rat) = 35 mg/kg.[9]

Long Term Exposure: Repeated inhalation of dust can cause irritation and bronchial asthma. Bentonite contains crystalline silica and may cause silicosis.

Points of Attack: Lungs.
Medical Surveillance: Lung function tests.
First Aid: *Inhalation:* Move person to fresh air. Seek medical attention if necessary. *Skin:* Wash with water. *Eyes:* Wash with water as needed. Seek medical attention if necessary. *Ingestion:* Seek medical attention if necessary.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Wear dust mask.
Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area
Shipping: Bentonite is not cited in the DOT Performance-Oriented Packaging Standards.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen dry material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. Dispose with normal trash. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Not combustible. Use extinguishers suitable for surrounding fires. Poisonous gases are produced in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Landfill disposal.

WGK (German Aquatic Hazard Class): No value assigned.
Description: Benz(a)anthracene is a colorless plate-like material which is recrystallized from glacial acetic acid or a

light yellow to tan powder. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 228.30; Boiling point = 435°C (sublimates); Freezing/Melting point = 158−162°C; Vapor pressure = 4.9×10^{-9} mmHg at 20. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Benz(a)anthracene is a contaminant and does not have any reported commercial use or application although one producer did report the substance for the Toxic Substances Control Act Inventory. Benz(a)anthracene has been reported to be present in cigarette smoke condensate, automobile exhaust gas, soot, and the emissions from coal and gas works and electric plants. Benz(a)anthracene also occurs in the aromatic fraction of mineral oil, commercial solvents, waxes, petrolatum, creosote, coal tar, petroleum asphalt, and coal tar pitch. Microgram quantities of benz(a) anthracene can be found in various foods, such as charcoal broiled, barbecued, or smoked meats and fish, certain vegetables and vegetable oils, roasted coffee, and coffee powders. Human subjects are exposed to Benz(a)anthracene through either inhalation or ingestion. Workers at facilities with likely exposure to fumes from burning or heating of organic materials have a potential for exposure to benz(a) anthracene. Consumers can be exposed to this chemical through ingestion of various foods, with concentrations of 100 μg/kg in some instances. Cigarette smoke condensate has quantities of benz(a)anthracene that range from 0.03 to 4.6 μg/g. Benz(a)anthracene is found in the atmosphere at levels that vary with geography and climatology. These values can range from up to 136 μg/1000 m^3 in summer to 361 μg/1000 m^3 in winter. Drinking water samples may contain up to 0.023 μg/L benz(a)anthracene, and surface waters have been found to contain 0.004−0.185 μg/L. The soil near industrial centers has been shown to contain as much as 390 μg/kg of benz(a)anthracene, whereas soil near highways can have levels of up to 1500 μg/kg, and areas polluted with coal tar pitch can reach levels of 2500 mg/kg.

Incompatibilities: Oxidizing agents. Powder can form an explosive mixture with air.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines “coal tar pitch volatiles” in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen; BEIp assigned *as Polycyclic Aromatic Compounds (PAHs).*

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)
TEEL-0: 006 mg/m^3
PAC-1: 0.02 mg/m^3
PAC-2: 0.15 mg/m^3
PAC-3: 15 mg/m^3

DFG MAK: [skin] Carcinogen Category 2; Pregnancy Risk Group 3A.

France: carcinogen, 1993; Norway: TWA 0.04 mg/m^3, 1999.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: Water quality criteria document for polynuclear aromatic hydrocarbons published in final 11/28/80. Total PAH addressed. A concentration of 2.8 mg (PAH)/L is estimated to limit cancer risk to one in a million (EPA). Kansas[61] has set a guideline in drinking water of 0.029 μg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 5.58−5.6. Bioaccumulation can take place in the food chain, especially seafood.

Determination in Water: Extraction with methylene chloride followed by gas chromatography/mass spectrometry (EPA Methods 625 and 1625) are summarized in the EPA Toxicological Profile cited below.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Benz(a)anthracene is absorbed by the oral and dermal routes of exposure; no direct evidence is available for absorption of B(a)A via the lungs. Following oral absorption, B(a)A is distributed to several tissues and accumulates preferentially in the adipose and mammary tissues. It is metabolized to conjugated derivatives and eliminated. It is expected that absorbed B(a)A will be excreted predominantly in the feces, as is true for other PAHs. B(a)A is metabolized to reactive derivatives that are thought to be responsible for its mutagenic activity in experimental systems. B(a)A is a weak experimental carcinogen by the dermal route of exposure. There is some evidence that it is carcinogenic by the oral route as well. Its carcinogenicity by the inhalation route has not been studied. Mutation is thought to be a necessary (although insufficient) step for the carcinogenic activity of B(a)A.

Short Term Exposure: No acute health effects known at this time.

Long Term Exposure: May be a carcinogen in humans. Has shown to cause bladder and skin cancer in animals. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (Category 1) in animal studies.

Points of Attack: Skin, respiratory system, bladder, liver, kidneys as PAH.

Medical Surveillance: Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the workplace. Complete blood count, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests are recommended for coal tar pitch volatiles.[2]

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place away from oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Poisonous solids, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. In Packing Group II, The Hazard Class is 6.1.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Atomize into incinerator with a flammable liquid.[22]

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R22; R23; R37/38; R40; R41; Safety phrases: S1/2; S36/37; S38; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Benzal chloride is a combustible, fuming, colorless, oily liquid; fumes on exposure to air. Faint, pungent odor. Molecular weight = 161.03; Specific gravity (H_2O:1) = 1.3; Boiling point = 205−207°C; Freezing/Melting point = −16°C; Specific gravity (H_2O:1) = 1.2557 at 14°C; Relative vapor density (air = 1) = 5.6; Latent heat of vaporization = 2.9×10^5 J/kg; Vapor pressure = 0.30 mmHg at 20°C; Flash point = 93°C; Autoignition temperature = 585°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Insoluble in water; biodegrades.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Benzal chloride is used almost exclusively for the manufacture of benzaldehyde. It can also be used to prepare cinnamic acid and benzoyl chloride.

Incompatibilities: Forms explosive mixture with air. Reacts with water, air, or heat, forming fumes of hydrochloric acid. Reacts (possibly violently) with acids, bases, strong oxidizers; many metals; potassium, sodium, aluminum. Attacks plastics and coatings.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 2.3 mg/m^3

PAC-3: 30 mg/m^3

DFG MAK: [skin] Carcinogen Category 2 *as benzyl dichloride*.

Note: DFG MAK: [skin] Carcinogen Category 1, Confirmed Human Carcinogen (α-chlorinated toluenes, mixtures of Benzoyl and various Benzyl chlorides).

Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data.

Austria: Carcinogen, 1999; Finland: carcinogen, 1993; Russia: STEL 0.5 mg/m^3, 1993; Sweden: carcinogen, 1999.

Permissible Concentration in Water: No criteria set. Benzal chloride hydrolyzes to benzaldehyde and HCl on contact with water.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.2$. Biodegrades in water.

Routes of Entry: Inhalation, ingestion, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Benzal chloride can affect the nervous system; and may be fatal if inhaled, swallowed, or absorbed through the skin. Benzal chloride is irritating to the skin and eyes, causing excessive tearing. Irritates the respiratory tract causing shortness of breath and cough. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Benzal chloride may cause skin cancer. This chemical was found to induce carcinomas, leukemia, and papillomas in mice. Benzal chloride was shown to possess a longer latency period than benzotrichloride before the onset of harmful effects. May affect the central nervous system.

Points of Attack: Central nervous system; skin.

Medical Surveillance: Lung function and nervous system tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, flammable materials, sources fire as this material is combustible. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Benzylidene chloride requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and in Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not breathe vapors. Wear eye protection and proper respiratory protection. Wear full protective clothing. Do not touch material. Stop leak if possible. Use water spray to reduce vapors. For *small spills*, take up with sand or other noncombustible material and place in containers for later disposal. For *small dry spills*, place material in clean dry container with shovel and move containers from spill area. For *large spills*, dike far ahead of spills for later disposal.

Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration at 816°C, 0.5 s minimum for primary combustion; 1204°C, 1.0 s for secondary combustion; elemental chlorine formation may be alleviated through injection of steam or methane into the combustion process.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; Safety phrases: S2; S24 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Benzaldehyde is a clear to yellowish liquid with an almond odor. The odor threshold is 0.042 ppm. Molecular weight = 106.13; Specific gravity (H_2O:1) = 1.1; Boiling point = 179°C; Freezing/Melting point = − 56°C; Flash point = 63°C (cc); Vapor pressure = 0.99 mmHg at 20°C; Autoignition temperature = 190°C. Explosive limits: LEL = 1.4%, UEL = 13.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Practically insoluble in water; solubility = 0.3 g/100 mL.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen, Human Data; Primary Irritant. In manufacture of perfumes, dyes, and cinnamic acid; as solvent; in flavors.

Incompatibilities: The substance reacts with air, forming explosive peroxides. Reacts violently with performic acid, oxidants, aluminum, iron, bases, and phenol, causing fire and explosion hazard. May self-ignite if absorbed in combustible material with large surface area or otherwise dispersed over large areas. Reacts with rust, amines, alkalies, strong bases, reducing agents.

Permissible Exposure Limits in Air

AIHA WEEL: 2 ppm TWA; 4 ppm STEL (15-min.), Potential for dermal sensitization.

Protective Action Criteria (PAC)

TEEL-0: 2 ppm

PAC-1: 4 ppm

PAC-2: 4 ppm

PAC-3: 150 ppm

DFG MAK: [skin] May cause dermal sensitization.

Hungary: TWA 5 mg/m^3, STEL 10 mg/m^3, 1993; Poland: TWA 10 mg/m^3, STEL 40 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; United Kingdom: carcinogen, 2000.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.5.

Routes of Entry: Inhalation, ingestion and skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Anyone with a history of asthma must avoid all contact with this chemical. Absorbed through the skin, thereby increasing exposure. The substance irritates the eyes, skin, and the respiratory tract, causing coughing and shortness of breath. May cause asthma symptoms; this may take hours to develop; physical activity and/or alcohol consumption can aggravate the symptoms. May cause contact dermatitis. Acts as a narcotic in high concentrations; exposure can cause dizziness; and, at higher levels, unconsciousness. LD_{50} = (oral-rat) 1300 mg/kg.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization, rashes, and kidney damage. Causes mutations; may cause cancer or reproductive risks.

Points of Attack: Skin, central nervous system, kidneys.

Medical Surveillance: Examination by a qualified dermatologist and allergist. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers recommend polyvinyl alcohol gloves; styrene−butadiene rubber (SBR), butyl rubber; and polethylene coated materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store under nitrogen in an area away from steam or water, See also, Incompatibilities section. Keep away from strong acids and oxidizers.

Shipping: Benzaldehyde requires "CLASS 9" label. It falls in Hazard Class 9 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzaldehyde is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; add combustible solvent and spray into incinerator with afterburner.[22]

Regulatory Authority and Advisory Bodies

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Benzamide is a combustible, colorless to beige, off-white, crystalline solid; Freezing/Melting point = 132−133°C. Molecular weight = 121.15; Specific gravity = 1.34; Boiling point = 288°C; Freezing/Melting point = 130°C; Vapor pressure = (estimate) 1.60×10^{-4} mmHg. Water solubility = 1.34 g in 100 mL; Flash point = 180°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water; solubility = 13 g/L.

Potential Exposure: Benzamide is used in organic synthesis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 350 mg/m^3

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.64. Fish Tox (benzamide) LC_{50} (fathead minnow, 96 h) = 661 mg/L.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, nose, and throat. May produce gastric pain, nausea, and vomiting.[52] The oral LD_{50} (mouse) = 1160 mg/kg (slightly toxic).

Long Term Exposure: Similar chemicals cause methemoglobinemia and liver damage, but it is not known if benzamide has these effects.

Medical Surveillance: Completed blood count (CBC), liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *Where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Green: General storage may be used. Store in a refrigerator or a cool, dry place.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60–70% ethanol to avoid dust and transfer to vapor-tight plastic bags for eventual disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: A combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Benzenamine, 3-(trifluoro-methyl)- B:0300

PAC-2: 4.4 mg/m^3
PAC-3: 150 mg/m^3
DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

Permissible Concentration in Water: The former USSR-UNEP/IRPTC/IRPTC joint project[43] set a MAC of 0.02 mg/L in water used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. May be poisonous if inhaled, swallowed, or absorbed through the skin. LD_{50} = (oral-rat) 480 mg/kg; the oral LD_{50} mouse is 220 mg/kg.

Long Term Exposure: Repeated exposure to fluoride chemicals may cause stiffness in muscles or ligaments and even crippling. Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 mg/m^3 or higher. Mottling of the teeth may occur at this level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit.
NIOSH: (*fluorides*) *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or*† *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Green: General storage may be used. Store in tightly closed, light-resistant containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: 3-Trifluoromethylaniline requires a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Wear positive-pressure breathing apparatus and special protective clothing. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Benzene is a clear, volatile, colorless, highly flammable liquid with a pleasant, characteristic odor. Molecular weight = 78.12; Boiling point at 1 atm = 80.1°C; Melting/Freezing point = 5.5°C; Critical temperature = 288.9°C; Critical pressure = 710 psia; Specific gravity (H_2O:1) = 0.879 at 20°C; Liquid surface tension = 0.0289 N/m at 20°C; Liquid water interfacial tension = 0.035 N/m at 20°C; Relative vapor density (air = 1) = 2.7; Latent heat of vaporization = 3.94×10^5 J/kg; Heat of combustion = -406.0×10^5 J/kg; Vapor pressure = 75 mmHg at 20; Electrical conductivity = 3.8 pS/m; Flash point = −11°C; Autoignition temperature = 498°C. Explosive limits: LEL = 1.2%, UEL = 7.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. The odor threshold in air is 4.9 mg/m^3; the odor threshold in water is 2.0 mg/L. Very slightly soluble in water; solubility = 0.18 g/100 mL.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Benzene is used as a constituent in motor fuels; as a solvent for fats; inks, oils, paints, plastics, and rubber, in the extraction of oils from seeds and nuts; in photogravure printing. It is also used as a chemical intermediate. By alkylation, chlorination, nitration, and sulfonation, chemicals such as styrene, phenols, and malefic anhydride are produced. Benzene is also used in the manufacture of detergents, explosives, pharmaceuticals; in the manufacture of cyclohexane and ethylbenzene; and dyestuffs. Increased concern for benzene as a significant environmental pollutant arises from public exposure to the presence of benzene in gasoline and the increased content in gasoline due to requirements for unleaded fuels for automobiles equipped with catalytic exhaust converters.

Incompatibilities: Strong oxidizers, many fluorides and perchlorates, nitric acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.19 mg/m^3 at 25°C & 1 atm

OSHA PEL: 1 ppm TWA; 5 ppm STEL, cancer hazard. See Appendix F of the *NIOSH Pocket Guide*.

NIOSH REL: 0.1 ppm TWA; 1 ppm STEL, potential carcinogen. Limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.5 ppm TWA; 2.5 ppm [skin] STEL, Confirmed Human Carcinogen; BEI: 25 μg [*S*-Phenylmercapturic acid]/g creatinine in urine/end-of-shift; 500 μg[*t*,*t*-Muconic acid]/g creatinine in urine/end-of-shift.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **52** ppm

PAC-2: **800** ppm

PAC-3: **4000** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1: 50 ppm

ERPG-2: 150 ppm

ERPG-3: 1000 ppm

DFG MAK: [skin], Carcinogen Category 1; Germ Cell Mutagen Group: 3A; TRK: 1 mL/m^3/3.3 mg/m^3; 5 μg [Benzene]/L in whole blood/end-of-shift; 0.045 mg[*S*-Phenylmercapturic acid]/g creatinine in urine/end-of-shift; 2 mg[*trans*,*trans*-Muconic acid]/L in urune/end-of-shift, Class 1, human carcinogen.

Australia: TWA 5 ppm (16 mg/m^3), carcinogen, 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 10 ppm (32 mg/m^3), carcinogen, 1993; Denmark: TWA 5 ppm (16 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (15 mg/m^3), STEL 10 ppm (30 mg/m^3), [skin], carcinogen, 1993; United Kingdom: TWA 3 ppm (9.6 mg/m^3), carcinogen, 2000; Hungary: STEL 5 mg/m^3, [skin], carcinogen, 1993; the Netherlands: MAC-TGG 3.25 mg/m^3, [skin], 2003; Japan: 10 ppm (32 mg/m^3), Group 1 carcinogen, 1999; Norway: TWA 1 ppm (3 mg/m^3), 1999; the Philippines: TWA 25 ppm (80 mg/m^3), [skin], 1993; Poland: MAC (time-weighted average) 10 mg/m^3; MAC (STEL) 40 mg/m^3, 1999; Russia: TWA 10 ppm (5 mg/m^3), STEL 25 ppm (15 mg/m^3), [skin], carcinogen, 1993; Sweden: NGV 0.5 ppm (1.5 mg/m^3), KTV 3 ppm (9 mg/m^3), [skin], carcinogen, 1999; Switzerland: MAK-week 1 ppm (3.2 mg/m^3), [skin], carcinogen, 1999; Thailand: TWA 10 ppm (30 mg/m^3), STEL 25 ppm (75 mg/m^3), 1993; Turkey: TWA 20 ppm (64 mg/m^3), [skin], 1993; United Kingdom: LTEL 10 ppm (30 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 2.5 ppm [skin]. Russia[43] set a MAC in ambient air in residential areas on a momentary basis and 0.8 mg/m^3 in residential air on a daily average basis. Several States have set guidelines or standards for benzene in ambient air[60] ranging from zero (North Dakota) to 0.12 μg/m^3 (North Carolina) to 0.14 μg/m^3 (Michigan) to 1.2 μg/m^3 (Massachusetts) to 72 μg/m^3 (Pennsylvania) to 100 μg/m^3 (New York and Rhode Island) to 150 μg/m^3 (Connecticut and South Carolina) to 300 μg/m^3 (Virginia).

The final OSHA benzene standard in 1910.1028 applies to all occupational exposures to benzene except some subsegments of industry where exposures are consistently under the action level (i.e., distribution and sales of fuels, sealed containers and pipelines, coke production, oil and gas drilling and production, natural gas processing; and the percentage exclusion for liquid mixtures); *for the excepted subsegments, the benzene limits in Table Z-2 apply* (i.e., an 8-h TWA of 10 ppm, an acceptable ceiling of 25 ppm, and 50 ppm for a maximum duration of 10 min as an acceptable maximum peak above the acceptable ceiling).

Determination in Air: NIOSH Analytical Method #1500, Hydrocarbons, BP = 36−126°C, #1501, Hydrocarbons, aromatic; #3700, Benzene, by portable GC, #3800, OSHA Analytical Method 12.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 5300 μg/L on an acute basis. *To protect saltwater aquatic life:* 5100 μg/L on an acute basis. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 results from a concentration of 6.6 μg/L.[6] Several states have set standards and guidelines for benzene in drinking water.[61] The standards range from 1.0 μg/L (Florida and New Jersey) to 10.0 μg/L (New Mexico). A 10-day health advisory for benzene has been calculated[48] at 0.235 mg/L for a 10 kg child. A lifetime health advisory for humans cannot be calculated because of the carcinogenic potency of benzene. Russia[43] set a MAC of 0.5 mg/L of benzene in water bodies used for domestic purposes and the same limit in water used for fishery purposes. The WHO has recommended a limit of 10 μg/L of benzene in drinking water.[35] Canada's drinking water quality: MAC 0.005 mg/L. Mexico's drinking water ecological criteria is 0.01 mg/L.

Determination in Water: Gas chromatography (EPA Method 602) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 1.9-2.1$

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation of Benzene may produce both nerve and blood effects. Irritation of the nose, throat, and lungs may occur (3000 ppm may be tolerated for only 30−60 min). Lung congestion may occur. Nerve effects may include an exaggerated feeling of well-being, excitement, headache, dizziness, and slurred speech. At high levels, slowed breathing and death may result. Death has occurred at 20,000 ppm for 5−10 min or 7500 ppm for 30 min. Skin contact: Irritation may occur, with redness and blistering if not promptly removed. Benzene is poorly absorbed. Whole body exposure for 30 min has been reported with no health effects. Eye contact may cause severe irritation. Ingestion may cause irritation of mouth, throat, and stomach. Symptoms are similar to those listed under inhalation. One tablespoon may cause collapse, bronchitis, pneumonia, and death. Use of alcoholic beverages enhances the harmful effect.

Long Term Exposure: Benzene is a known human carcinogen. Exposure has been linked to increased risk of several forms of leukemia. The liquid defats the skin. The substance may have effects on the blood forming organs, liver, and immune system. May cause loss of appetite, nausea, weight loss, fatigue, muscle weakness, headache, dizziness, nervousness, and irritability. Mild anemia has been reported from exposures of 25 ppm for several years and 100 ppm for 3 months. At levels between 100 and 200 ppm for periods of 6 months, or more, severe irreversible blood changes and damage to liver and heart may occur. Temporary partial paralysis has been reported.

Points of Attack: Eyes, skin, respiratory system, blood, central nervous system, bone marrow. *Cancer site:* leukemia.

Medical Surveillance: OSHA mandates the following: complete blood count: leukocyte count, thrombocyte count, hematocrit, hemoglobin, erythrocyte count; pulmonary function tests. NIOSH lists the following tests: complete blood count including leukocyte count, thrombocyte count, hematocrit, hemoglobin, erythrocyte count; white blood cell count/differential; whole blood (chemical/metabolite)*; whole blood (chemical/metabolite), prior to next shift, expired air, expired air*, next shift, prior to next shift; urine (chemical/metabolite)*; urine (chemical/metabolite), during exposure, end-of-shift, end-of-work-week, pre- & postshift*; no time specified. Preplacement and periodic examinations should be concerned especially with effects on the blood and bone marrow and with a history of exposure to other myelotoxic agents or drugs or of other diseases of the blood. Preplacement laboratory exams should include (a) complete blood count (hematocrit, hemoglobin, mean corpuscular volume, white blood count, differential count, and platelet estimation); (b) reticulocyte count; (c) serum bilirubin; and (d) urinary phenol. The type and frequency of periodic hematologic studies should be related to the data obtained from biologic monitoring and industrial hygiene studies, as well as any symptoms or signs of hematologic effects. Recommendations for proposed examinations have been made in the criteria for a recommended standard. Examinations should also be concerned with other possible effects, such as those on the skin, central nervous system, and liver and kidney functions. Biologic monitoring should be provided to all workers subject to benzene exposure. It consists of sampling and analysis of urine for total phenol content. The objective of such monitoring is to be certain that no worker absorbs an unacceptable amount of benzene. Unacceptable absorption of benzene, posing a risk of benzene poisoning, is considered to occur at levels of 75 mg phenol per liter of urine (with urine specific gravity, corrected to 1.024), when determined by methods specified in the NIOSH "Criteria for Recommended Standard—Benzene." Alternative methods shown to be equivalent in accuracy and precision may also be useful. Biological monitoring should be done at quarterly intervals. If environmental sampling and analysis are equal to or exceed accepted safe limits, the urinary phenol analysis should be conducted every 2 weeks. This increased monitoring frequency should continue for at least 2 months after the high environmental level has been demonstrated. Two follow-up urines should be obtained within 1 week after receipt of the original results, one at the beginning and the other at the end of the work week. If original elevated findings are confirmed, immediate steps should be taken to reduce the worker's absorption of benzene by improvement in environment control, personal protection, personal hygiene, and administrative control.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth, get medical attention. Do not induce vomiting.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; CPF3® suits; Responder™ suits; Trychem 1000™ suits; **4 h:** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots; Viton™ gloves, suits. Also, safety equipment suppliers/manufacturers can also provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
