Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (soluble liquid formulations of the substance that exceeds 1000 g active ingredient).

European/International Regulations: Hazard Symbol: T + , N; Risk phrases: R24; R28; R50/53; R68; Safety phrases: S1/2; S23; S36/37; S45-S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (CAS: 13171-21-6).

Description: Phosphamidon is a pale yellow oily liquid. Molecular weight = 299.72; Specific gravity (H_2O:1) = 1.22; Boiling point = 162°C at 1.5 mmHg; Freezing/Melting point = −45°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. This material is used as an insecticide on citrus, cotton, and deciduous fruit and nuts. It is also an acaricide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. Attacks metals, such as aluminum, iron, tin.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.06 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 0.3 mg/m^3

PAC-3: 60 mg/m^3

Determination in Water: Fish Tox = 1445.67277000 ppb (EXTRA LOW); FISH STV (Sediment Toxicity Value): LOW; Octanol−water coefficient: Log K_{ow} = <0.9.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. May affect the nervous system, causing convulsions, respiratory failure, and death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. This material is extremely toxic; the probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150-lb person. It is a cholinesterase inhibitor. Acute exposure to phosphamidon may produce pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory effects include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 0.14000 ppm (EXTRA HIGH).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a healthcare facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires: use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases, including phosphorous oxides, hydrogen chloride, and nitrogen oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be treated with alkali followed by landfill disposal. Large quantities should be incinerated with effluent gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Phosphine is a colorless gas that is shipped as liquefied compressed gas. Odorless when pure, it has the odor of garlic or the foul odor of decaying fish. The level at which humans detect the odor of phosphine (odor threshold) does not provide sufficient warning of dangerous concentrations. Phosphine presents an additional hazard in that it ignites at very low temperatures. Shipped as a liquefied compressed gas. The pure compound is odorless. The odor threshold is 0.14 ppm. Molecular weight = 34.00; Specific gravity (H_2O:1) = 0.8; Boiling point = −88°C; Freezing/Melting point = −133°C; Relative vapor density (air = 1): 1.18; Vapor pressure = 41.3 atm; >760 mmHg at 20°C; Flash point = (flammable gas) 104°C; Autoignition temperature (depends on concentration and diluent) = 38−100°C. Explosive limits: LEL = 1.8%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2. Slightly soluble in water; solubility = 25 mL/100 mL at 17°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Human Data. Phosphine is used as a fumigant; in the semiconductor industry, as a doping agent for electronic components (to introduce phosphorus into silicon crystals); in chemical synthesis; used as a polymerization initiator; as an intermediate for some flame retardants. Also, exposures may occur when acid or water comes in contact with metallic phosphides (aluminum phosphide, calcium phosphide). These two phosphides are used as insecticides or rodenticides for grain, and phosphine is generated during grain fumigation. When phosphine toxicity is suspected, but phosphine exposure is not obvious, one should suspect transdermal contamination and/or ingestion of phosphides. Phosphine may also evolve during the generation of acetylene from impure calcium carbide, as well as during metal shaving; sulfuric acid tank cleaning; rustproofing, ferrosilicon, phosphoric acid; and yellow phosphorus explosive handling.

Incompatibilities: Phosphine reacts with acids, air, copper, moisture, oxidizers, oxygen, chlorine, nitrogen oxides, metal nitrates, halogens, halogenated hydrocarbons, copper, and many other substances, causing fire and explosion hazard. Extremely explosive; may ignite spontaneously on contact with air at or about 100°C. Attacks many metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.39 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.3 ppm/0.4 mg/m^3 TWA.

NIOSH REL: 0.3 ppm/0.4 mg/m^3 TWA; 1 ppm/1 mg/m^3 STEL.

ACGIH TLV®[1]: 0.3 ppm/0.42 mg/m^3 TWA; 1 ppm/1.4 mg/m^3 STEL.

NIOSH IDLH: 50 ppm.

Protective Action Criteria (PAC) Phosphine*

TEEL-0: 0.3 ppm

PAC-1: 1 ppm

PAC-2: **2.0** ppm

PAC-3: **3.6** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)
ERPG-1: Inappropriate
ERPG-2: 0.5 ppm
ERPG-3: 3.5 ppm

DFG MAK: 0.1 ppm/0.14 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.3 ppm (0.4 mg/m^3), 1993; Australia: TWA 0.3 ppm (0.4 mg/m^3); STEL 1 ppm (1 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.15 mg/m^3), 1999; Belgium: TWA 0.3 ppm (0.42 mg/m^3); STEL 1 ppm (1.4 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.15 mg/m^3), 1999; Finland: TWA 0.1 ppm (0.15 mg/m^3); STEL 0.3 ppm (0.4 mg/m^3), 1999; France: VME 0.1 ppm (0.13 mg/m^3), VLE 0.3 ppm (0.4 mg/m^3), 1999; the Netherlands: MAC-TGG 0.4 mg/m^3, 2003; Norway: TWA 0.1 ppm (0.15 mg/m^3), 1999; the Philippines: TWA 0.3 ppm (0.4 mg/m^3), 1993; Poland: MAC (TWA) 0.1 mg/m^3; MAC (STEL) 0.8 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3, 1993; Sweden: NGV 0.3 ppm (0.4 mg/m^3), KTV 1 ppm (1.4 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.15 mg/m^3), KZG-W 0.2 ppm (0.3 mg/m^3), 1999; Thailand: TWA 0.3 ppm (0.4 mg/m^3), 1993; Turkey: TWA 0.3 ppm (0.4 mg/m^3), 1993; United Kingdom: STEL 0.3 ppm (intermittent 0.42 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 1 ppm. Several states have set guidelines or standards for phosphine in ambient air[60] ranging from 1.33 μg/m^3 (New York) to 4.0 μg/m^3 (Florida and North Dakota) to 6.7 μg/m^3 (Virginia) to 8.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Nevada and North Dakota) to 130 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1003, Phosphine, OSHA Analytical Method ID-180. See also NIOSH Analytical Method #6002.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 5.5 μg/L based on health effects.

Determination in Water: Phosphine cannot be used to contaminate water supplies; it breaks down in water. Octanol−water coefficient: Log K_{ow} = (estimated) −0.27.

Routes of Entry: Phosphine can be absorbed into the body by inhalation. Direct contact with phosphine liquid may cause frostbite.

Harmful Effects and Symptoms

Short Term Exposure: Severe irritation to the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Contact with the liquid may cause frostbite. May affect the central nervous system, cardiovascular system, heart, gastrointestinal tract, liver, and kidneys. Phosphine is a super-toxic gas with a probable oral lethal dose of 5 mg/kg or 7 drops for a 150-lb person. An air concentration of 3 ppm is safe for long-term exposure, 500 ppm is lethal in 30 min, and concentration of 1000 ppm is lethal after a few breaths. Acute exposure to phosphine usually results in headache, cough, tightness and pain in the chest, shortness of breath, dizziness, lethargy, and stupor. Fatigue, muscle pain, chills, tremors, loss of coordination, seizures, and coma may be seen. Pulmonary edema and cardiac arrhythmias are common. Gastrointestinal symptoms include nausea, vomiting, abdominal pain, and diarrhea. Renal (kidney) damage, hepatic (liver) damage; and jaundice may also occur.

Long Term Exposure: Chronic poisoning may cause toothache, swelling of the jaw, spontaneous fractures of bones. May cause anemia. May damage the liver and kidneys. The effects are cumulative. Can irritate the lungs; bronchitis may develop.

Points of Attack: Respiratory system, liver.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, if phosphides have been ingested, **do not induce emesis**. Phosphides will release phosphine in the stomach; therefore, watch for signs similar to those produced by phosphine inhalation. Administer a slurry of activated charcoal at 1 g/kg (usual adult dose: 60−90 g; child dose: 25−50 g). A soda can and a straw may be of assistance when offering charcoal to a child. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Metallic phosphides on clothes, skin, or hair can off-gas phosphine after contact with water or moisture, so a risk of secondary contamination may be present. Have the victim remove clothing; and seal contaminated clothes and personal belongings in a sealed double bag. For skin exposure to the metallic phosphides, scrape or brush all visible particles from the skin and hair. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Do not wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Persons exposed only to phosphine gas do not pose substantial risks of secondary contamination. Vomitus containing phosphides can also off-gas phosphine. Rinse the eyes, mucous membranes, or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 3 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 7.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 15 ppm:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 50 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Phosphine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides; permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric), oxygen, and halogenated hydrocarbons, since violent reactions occur. Store in tightly closed containers from physical damage. Use only nonsparking tools and equipment, especially when opening and closing containers of phosphine. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Phosphine requires a shipping label of “POISON GAS, FLAMMABLE GAS.” It falls in Hazard Class 2.3 and Packing Group I. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.5/2.4

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 2500/800
Then: Protect persons downwind (miles/kilometers)
Day 2.7/4.4
Night 5.6/8.9

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases and mists including oxides of phosphorus and phosphonic acid are produced in fire. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. If material is on fire or involved in a fire, do not extinguish unless flow can be stopped; use water in flooding quantities as fog; cool all affected containers with flooding quantities of water; apply water from as far a distance as possible; solid streams of water may be ineffective; use "alcohol" foam, carbon dioxide or dry chemical. Wear full protective clothing including self-contained breathing apparatus; rubber gloves; boots and bands around legs, arms, and waist. No skin surface should be exposed. For massive fires in cargo areas, use unmanned hose holders or monitor nozzles. Move containers from fire area. The gas is heavier than air and may travel along the ground to an ignition source. Container may explode in heat of fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Controlled discharges of Phosphine may be passed through 10% NAOH solution in a scrubbing tower. The product may be discharged to a sewer.[22]

Description: Phosphoric acid is a colorless, odorless, crystalline solid, or thick syrupy liquid. Physical state is strength and temperature dependent. Molecular weight = 98.00; Specific gravity (H_2O:1) = 1.87 (pure); 1.33 (50% solution) at 25°C; Boiling point = Decomposes below BP at 212.8°C; Freezing/Melting point = 42.2°C; Vapor pressure = 0.03 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2 (Corrosive). Highly soluble in water.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. Phosphoric acid is used in the manufacture of fertilizers, phosphate salts; polyphosphates, detergents, activated carbon; animal feed; ceramics, dental cement; pharmaceuticals, soft drinks; gelatin, rust inhibitors; wax, and rubber latex. Exposure may also occur during electropolishing, engraving, photoengraving, lithographing, metal cleaning; sugar refining; and water-treating.

Incompatibilities: The substance is a medium strong acid. Incompatible with strong caustics; most metals. Readily attacks and reacts with metals forming flammable hydrogen gas. *Do not mix with solutions containing bleach or ammonia.* Violently polymerizes on contact with azo compounds; epoxides, and other polymerizable compounds. Decomposes on contact with metals, alcohols, aldehydes, cyanides, ketones, phenols, esters, sulfides, halogenated organics; producing toxic fumes.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA.

NIOSH REL: 1 mg/m^3 TWA; 3 mg/m^3 STEL.

ACGIH TLV®[1]: 1 mg/m^3 TWA; 3 mg/m^3 STEL.

NIOSH IDLH: 1000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 2 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy risk Group C.

Arab Republic of Egypt: TWA 1 mg/m^3, 1993; Australia: TWA 1 mg/m^3; STEL 3 mg/m^3, 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 1 mg/m^3; STEL 3 mg/m^3, 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: TWA 1 mg/m^3; STEL 3 mg/m^3 [skin]1999; France: VME 1 mg/m^3, VLE 3 mg/m^3, 1999; Japan 1 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 3 mg/m^3, 1999; Sweden: NGV 1 mg/m^3, KTV 3 mg/m^3, 1999; Switzerland: MAK-W 1 mg/m^3, 1999; Thailand: TWA 1 mg/m^3, 1993; United Kingdom: STEL 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 mg/m^3. Several states have set guidelines or standards for phosphoric acid in ambient air[60] ranging from 1.4 μg/m^3 (Massachusetts) to 10−30 μg/m^3 (North Dakota) to 10−33 μg/m^3 (Virginia) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada) to 25.0 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #7903, Inorganic Acids; OSHA Analytical Method ID-165-SG.

Determination in Water: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Eye contact may cause permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Solid is especially irritating to skin in the presence of moisture. Corrosive if swallowed. May cause pain in the throat and stomach, nausea, vomiting, and intense thirst. Severe exposures may result in shock with clammy skin, weak and rapid pulse; shallow breathing; reduced urine output; and death. 1−5 mg/m^3 may cause irritation of nose and throat. 4−11 mg/m^3 may cause coughing. Inhalation of acid mist can cause lung irritation. 1−5 mg/m^3 may cause irritation of nose and throat. 4−11 mg/m^3 may cause coughing.

Long Term Exposure: Repeated or prolonged skin exposure may cause irritation, drying, cracking, and dermatitis. Can cause bronchitis to develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene™, nitrile + pvc, nitrile, Saranex™, and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-facepiece respirator with an N100, R100, or P100 filter) or

SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 mg/m*^{3}*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Phosphoric acid must be stored to avoid contact with metals, aldehydes, cyanides, mercaptans, and sulfides, because violent reactions occur.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Phosphoric acid is a noncombustible solid or liquid. Contact with common metals may form flammable hydrogen gas. Use extinguishing agent suitable for surrounding fire. Use water only to keep fire-exposed containers cool and to flush away spills. Poisonous gases are produced in fire, including oxides of phosphorus. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to solution of soda ash and slaked lime with stirring, then flush to sewer with large volumes of water.

Phosphorous acid P:0600

Molecular Formula: H_3O_3P

Common Formula: H_3PO_3

Synonyms: Orthophosphorus acid; Phosphonic acid; Phosphorous acid; Phosphorus trihydroxide; Trihydroxy

CAS Registry Number: 13598-36-2; 10294-56-1

RTECS® Number: SZ6475500

UN/NA & ERG Number: UN2834/154

EC Number: 237-066-7 [*Annex I Index No.:* 015-157-00-0]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol *(13598-36-2; 10294-56-1)*: C; Risk phrases: R22; R35; Safety phrases: S26; S36/3739; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Phosphonic acid is a white to yellow crystalline solid. Molecular weight = 82.00; Boiling point = about 200°C (decomposes); Freezing/Melting point = 74°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: Used in chemicals manufacture; a laboratory chemical.

Incompatibilities: Incompatible with aliphatic amines, alkanolamines, alkylene oxides; aromatic amines; amides, ammonia, ammonium hydroxide; bases, calcium oxide; epichlorohydrin, isocyanates. Unless it is stored in airtight containers it readily absorbs oxygen forming orthophosphoric acid. Attacks some metals.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.006 mg/m^3
PAC-1: 0.015 mg/m^3
PAC-2: 0.125 mg/m^3
PAC-3: 500 mg/m^3.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Orthophosphorous acid can affect you when breathed in. Contact can cause severe eye burns leading to permanent eye damage. Inhalation can irritate the eyes, skin, and respiratory tract.

Long Term Exposure: Highly irritating substances can cause lung effects; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to solid ortho phosphorous acid, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for high exposures of liquid ortho phosphorous acid, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. *o*-phosphorous acid must be stored in airtight containers away from incompatible materials listed above. Avoid contact with metals.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid or liquid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 (yellow or white) Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant, white, yellow dry, molten or in solution.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*7723-14-0*): Hazard Symbol: F,T,C,N; Risk phrases: R17; R26/28; R35; R50; Safety phrases: S1/2; S5; S26; S38; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phosphorus is a white to yellow, soft, waxy solid with acrid fumes in air. *White/yellow* phosphorus is either a yellow or colorless, volatile, crystalline solid which darkens when exposed to light and ignites in air to form white fumes and greenish light. It has a garlic-like odor. Usually shipped or stored in water. Molecular weight = 123.88; Boiling point = 280°C; Freezing/Melting point = (decomposes) 44°C; Vapor pressure = 0.026 mmHg at 20°C; 0.181 mmHg at 44.1°C; Autoignition temperature = 30°C. Hazard Identification (based on NFPA-704 M Rating System): (*white, red powder*) Health 4, Flammability 4, Reactivity 2. Insoluble in water.

Red phosphorus is a brick red, reddish-brown, or violet amorphous powder, frequently contaminated with a small amount of the yellow. Molecular weight = 30.97; Boiling point = 280°C (with ignition at 200°C); Freezing/Melting point = 416°C (sublimes); Flash point = 260°C; Autoignition temperature = 260°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description (white): Agricultural Chemical; Reproductive Effector; Human Data. White or yellow phosphorus is handled away from air so that exposure is usually limited. Phosphorus was at one time used for the production of matches or "lucifers" but has long since been replaced due to its chronic toxicity. It is used in the manufacture of munitions including tracer bullets, pyrotechnics, explosives, smoke bombs; and other incendiary agents; (because it spontaneously catches fire in air) and as a smoke agent (because it produces clouds of irritating white smoke). Phosphorus is used artificial fertilizers; rodenticides, phosphor bronze alloys; semiconductors, Electro-luminescent coating; and chemicals, such as phosphoric and metallic phosphides. RP is used as a choking/pulmonary agent.

Incompatibilities: Phosphorus spontaneously ignites on contact with air, producing toxic phosphorus oxide fumes.

Reacts with strong bases, releasing toxic phosphine gas. Phosphorus reacts violently with oxidizers, halogens, some metals, nitrites, sulfur, and many other compounds, causing a fire and explosion hazard. *White/yellow* reacts with air, halogens, halides, sulfur, oxidizers, alkali hydroxides (forming gas), and metals (forming reactive phosphides). *Red* is a combustible solid. Friction or contact with oxidizers can cause ignition. Incompatible with many other substances. Forms gas and phosphoric acid on contact with moisture. Opened packages of red phosphorus should be stored under inert gas blanket.

Permissible Exposure Limits in Air

OSHA PEL (*yellow*): 0.1 mg/m^3 TWA.

NIOSH REL (*yellow*): 0.1 mg/m^3 TWA.

ACGIH TLV®[1] (*yellow*): 0.02 ppm/0.1 mg/m^3 TWA.

NIOSH IDLH: 5 mg/m^3.

Protective Action Criteria (PAC) RP

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 3 mg/m^3

PAC-3: 5 mg/m^3

DFG MAK (*White/yellow/red*): 0.05 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(2); Pregnancy Risk Group C; *red:* No numerical value established.

Arab Republic of Egypt: TWA 0.1 mg/m^3, 1993; Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, 1999; Finland: STEL 0.1 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, VLE 0.3 mg/m^3, 1999; Hungary: TWA 0.3 mg/m^3; STEL 0.06 mg/m^3, 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; the Philippines: TWA 0.1 mg/m^3, 1993; Poland: MAC (TWA) 0.3 mg/m^3, 1993; Russia: STEL 0.03 mg/m^3, 1993; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.2 mg/m^3, 1999; Thailand: TWA 0.1 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3, 1993; United Kingdom: LTEL 0.1 mg/m^3; STEL 0.3 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3. The Czech Republic[35]: TWA 0.03 mg/m^3; 0.06 mg/m^3 STEL. Several states have set guidelines or standards for yellow phosphorus in ambient air[60] ranging from 0.33 μg/m^3 (New York) to 1.0 μg/m^3 (Florida) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada) to 10.0−30.0 μg/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #7905.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[35, 43] set a MAC of 0.1 μg/L in water bodies used for domestic purposes and zero in surface water used for fishery purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = (estimated) −0.27.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Yellow phosphorus can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Phosphorus is corrosive to the eyes, skin, and respiratory tract. Eye contact may lead to a total destruction of the eyes. Victims may experience spontaneous hemorrhaging of phosphorus-contaminated skin and mucous membranes. Sudden death, possibly due to irregular heartbeat, may occur after relatively minor (10−15%) burns. *Yellow:* Fumes are irritating to the respiratory tract and cause severe ocular irritation. On contact with the skin it may ignite and produce severe skin burns with blistering. Very high exposure may cause severe or fatal poisoning. *Red:* Irritates eyes. Corrosive if ingested. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the kidneys, liver. Exposure may result in death. Phosphorus is classified as super toxic. The probable lethal dose is less than 5 mg/kg (a taste or less than 7 drops) for a 70-kg (150 lb) person. Signs and symptoms of acute exposure to phosphorus may be severe and occur in three stages. The first stage will involve burns, pain, shock, intense thirst; nausea, vomiting, diarrhea, severe abdominal pain; and "smoking stools." The breath and feces may have garlicky odor. The second stage will be a symptom-free period of several days in which the patient appears to be recovering. The third stage may be severe and include nausea, bloody vomitus; diarrhea (may be bloody), jaundice, liver enlargement with tenderness; renal damage; hematuria (bloody urine), and either oliguria (little urine formation) or anuria (no urine formation). Headache, convulsions, delirium, coma, cardiac arrhythmias; and cardiovascular collapse may also occur. If phosphorus contacts the eyes, then severe irritation and burns, blepharospasm (spasmodic winking), lacrimation (tearing), and photophobia (heightened sensitivity to light) may occur.

Long Term Exposure: Phosphorus may affect the bones, causing bone degeneration (especially the jaw bone, known as "phossy" jaw), dental pain; salivation, jaw pain and swelling. This process can extend into one or both eye sockets. Repeated low exposure can cause low blood count (anemia), weight loss; and bronchitis. May cause jaundice; liver and kidney damage; cachexia. May cause nervous system damage.

Points of Attack: Respiratory system, liver, kidneys, jaw, teeth, blood, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: Complete Blood Count, anemia; Dental X-ray/Examination; liver function tests. Also consider EKG. Special consideration should be given to the skin, eyes, jaws, teeth, respiratory tract; and liver. Preplacement medical and dental examination with X-rays of teeth is highly recommended in the case of yellow phosphorus exposure. Poor dental hygiene may increase the risk in yellow phosphorus exposures, and any required dental work should be completed before workers are assigned to areas of possible exposure. Workers experiencing any jaw injury, tooth extraction; or any abnormal dental conditions should be removed from areas of exposure and observed. X-ray examinations may show necrosis; however, in order to prevent full development of sequestra, the disease should be diagnosed in earlier stages. Liver function should be evaluated periodically.

First Aid: There is no antidote for white phosphorus toxicity. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and brush all traces of dry chemical from skin. Submerge burning phosphorus (yellow) in water or 1% copper sulfate solution if embedded in skin, or wash exposed area with large amounts of water. Seek medical attention immediately. Skin burns from yellow phosphorus should be observed for 1−3 days for possible delayed effects. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 mg/m³:* Sa (APF = 10) (any supplied-air respirator). *2.5 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 mg/m³:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red Stripe (*7723-14-0*): Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Phosphorus must be stored in a cool, well-ventilated area away from heat, direct sunlight; air, organic materials; oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Always store away from alkaline materials because of the extreme fire hazard and because poisonous gas is produced. Always store yellow phosphorus under water and protect it from physical damage. Opened packages of red phosphorus should be stored under inert gas blanket. Sources of ignition, such as smoking and open flames, are prohibited where phosphorus is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Phosphorus white, molten, requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 4.2 and Packing Group III. Subsidiary Hazardous Class or Division 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep spilled material wet and cover with wet sand or dirt. Collect solidified material in the most convenient and safe manner and cover with water in sealed containers. Ventilate area after cleanup is complete. Keep phosphorus out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Phosphorus (white/yellow) is a flammable solid which ignites spontaneously in moist air. Combustion in a confined space will deplete oxygen causing asphyxiation. Poisonous gases are produced in fire, including oxides of phosphorus; and phosphoric acid if water is present. Fire may restart after it has been extinguished. *Small fires:* dry chemical, sand, water spray; or foam. *Large fires:* water spray, fog, or foam. Cool containers that are exposed to flames with water from the side until well after fire is out. *White/Yellow:* Deluge with water, taking care not to scatter, until fire is extinguished and phosphorus has solidified, then cover with wet sand or dirt. *Red:* Flood with water and when fire is extinguished, cover with wet sand or dirt. Extreme caution should be used during cleanup of the more hazardous white phosphorus. *White/Yellow:* Ignites at approximately 30°C in air; ignition temperature is higher when air is dry. *Black:* Does not catch fire spontaneously. *Red:* Catches fire when heated in air to approximately 260°C and burns with formation of the pentoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration followed by alkaline scrubbing and particulate removal equipment.

Phosphorus oxychloride P:0620

Molecular Formula: Cl_3OP
Common Formula: $POCl_3$
Synonyms: Fosforoxychlorid; Oxicloruro de fosforo (Spanish); Oxychlorid fosforecny; Phosphoric chloride; Phosphorus chloride oxide; Phosphorus oxytrichloride; Phosphoryl chloride; Phosphoryl trichloride
CAS Registry Number: 10025-87-3
RTECS® Number: TH4897000
UN/NA & ERG Number: UN1810/137
EC Number: 233-046-7 [*Annex I Index No.:* 015-009-00-5]
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (≥1.00% concentration). (1% concentration); *Theft hazard* 220 (≥80.00% concentration).
Sabotage/Contamination Hazard: A placarded amount (commercial grade).
Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.
Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 5000 lb (2270 kg).
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: T + , C; Risk phrases: R14; R22; R26; R35; R48/23; Safety phrases: S1/2; S7/8; S26; S36/37/39; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Phosphorus oxychloride is a clear, colorless to yellow, fuming, oily liquid with a pungent and musty odor. Molecular weight = 153.32; Specific gravity (H_2O:1) = 1.65 at 25°C; Boiling point = 105.6°C; Freezing/Melting point = 1.25°C; Vapor pressure = 40 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3₩ (Corrosive). Reacts with water; decomposes with heat.
Potential Exposure: Phosphorus oxychloride is used in the manufacture of pesticides, pharmaceuticals, plasticizers, gasoline additives; and hydraulic fluids.
Incompatibilities: A powerful oxidizer. Violently decomposes in water, forming heat and hydrochloric and phosphoric acids. Violent reaction with alcohols, phenols, amines, reducing agents; combustible materials; carbon disulfide; dimethylformamide, and many other materials. Rapid corrosion of metals, except nickel and lead.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 6.27 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 0.1 ppm/0.6 mg/m^3 TWA; 0.5 ppm/3 mg/m^3 STEL.
ACGIH TLV®[1]: 0.1 ppm/0.63 mg/m^3 TWA.
Protective Action Criteria (PAC)*
TEEL-0: 0.1 ppm
PAC-1: 0.479 ppm
PAC-2: 0.479 ppm
PAC-3: **0.85** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 0.2 ppm/1.3 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group C.
Australia: TWA 0.1 ppm (0.6 mg/m^3); STEL 0.5 ppm, 1993; Austria: MAK 0.2 ppm (1 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.63 mg/m^3); STEL 0.5 ppm, 1993; Denmark: TWA 0.1 ppm (0.6 mg/m^3), 1999; Finland: STEL 0.5 ppm (3 mg/m^3), [skin], 1999; France: VME 0.1 ppm (0.6 mg/m^3), 1999; the Netherlands: MAC-TGG 0.6 mg/m^3, 2003; Russia: STEL 0.05 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.1 ppm (0.6 mg/m^3), KZG-W 0.2 ppm (1.2 mg/m^3), 1999; Turkey: TWA 0.5 ppm (3 mg/m^3), 1993; United Kingdom: TWA 0.2 ppm (1.3 mg/m^3); STEL 0.6 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 ppm. Several states have set guidelines or standards for $POCl_2$ in ambient air[60] ranging from 6.0−30.0 $\mu g/m^3$ (North Dakota) to 12.0 $\mu g/m^3$ (Connecticut) to 14.0 $\mu g/m^3$ (Nevada).
Determination in Air: No method available.
Permissible Concentration in Water: No criteria set. ($POCl_2$ decomposes in water).
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Eye contact can cause permanent damage. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. This material is toxic by inhalation and ingestion and is strongly irritating to skin and tissues. It causes burns of the mucous membranes of the mouth and digestive tract; and may be fatal. Symptoms include burns and extensive reddening of eyes, pains in throat; coughing, labored breathing with a shortness of breath; dizziness, headache, weakness, nausea, vomiting, chest pain; bronchitis, bronchopneumonia, kidney, and liver damage.
Long Term Exposure: May cause nephritis; kidney damage. May cause liver damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys, liver.

Medical Surveillance: Lung function tests. Test for liver and kidney functions. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of “CORROSIVE, POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Keep material out of water sources and sewers; build dikes to contain flow as necessary; use water spray to knock down vapors; *Do not use water* on material itself; and neutralize spilled material with crushed limestone, soda ash; or lime. *For a land spill*, dig a pit, pond, lagoon, or holding area to contain liquid or solid material; dike surface flow using soil, sand bags; foamed polyurethane; or foamed concrete; absorb bulk liquid with fly ash or cement powder; neutralize with agricultural lime (slaked lime), crushed limestone; or sodium bicarbonate. *For a water spill*, neutralize with agricultural lime (slaked lime), crushed limestone; or sodium bicarbonate; use mechanical dredges or lifts to remove immobilized masses of pollutants and precipitates; adjust pH to neutral (pH 7). *For air spills* apply water spray or mist to knock down vapors; vapor knock down water is corrosive or toxic and should be diked for containment. Stop leak if you can do so without risk. Do not touch spilled material. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Clean up only under supervision of an expert. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 1.3/2.0

when spilled in water
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.4/2.3

Fire Extinguishing: This chemical reacts violently with moisture producing hydrochloric and phosphoric acids. Poisonous gases, including chlorides and phosphorus oxides, are produced in fire. *Do not use water* unless used in flooding quantities to control a large fire by wetting down combustibles burning in vicinity of this material. Use dry chemical, carbon dioxide, or dry sand; *Do not use water* on material itself. Use water spray to absorb vapors and cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible. Avoid breathing vapors; keep upwind. Wear self-contained breathing apparatus. Avoid bodily contact with the material. Wear boots, protective gloves, and goggles. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. If contact with the material is anticipated, wear full protective clothing. Keep unnecessary people away; isolate hazard area and deny entry. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour onto sodium bicarbonate. Spray with aqueous ammonia and add crushed ice. Neutralize and pour into drain with running water. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R14; R22; R26; R34; R48/20; Safety phrases: S1/2; S7/8; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phosphorus pentachloride is a pale yellow, fuming solid with an odor like hydrochloric acid. Molecular weight = 208.22; Specific gravity (H_2O:1) = 3.60 at 25°C; Boiling point = (sublimes) 160°C; Freezing/Melting point = (sublimes) 162°C; Vapor pressure = 1 mmHg at 55.6°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Reacts violently with water.

Potential Exposure: Phosphorus pentachloride is used as a chlorinating and dehydrating agent and as a catalyst. It is used in the manufacture of agricultural chemicals;

chlorinated compounds; gasoline additives, plasticizers, and surfactants; and in pharmaceutical manufacture.

Incompatibilities: A powerful oxidizer. Reacts with water (violent), magnesium oxide, chemically active metals, such as sodium and potassium, alkalis, amines. Hydrolyzes in water (even in humid air) to form hydrochloric acid and phosphoric acid. Corrosive to many metals, forming flammable and explosive hydrogen gas. Attacks plastic and rubber.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA.
NIOSH REL: 1 mg/m^3 TWA.
ACGIH TLV®[1]: 0.1 ppm/1 mg/m^3 TWA.
NIOSH IDLH: 70 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 70 mg/m^3

DFG MAK: 1 mg/m^3, measured as the inhalable fraction TWA; Peak Limitation Category I(1); Pregnancy Risk Group C.

Australia: TWA 0.1 ppm (1 mg/m^3), 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 0.1 ppm (0.85 mg/m^3), 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: STEL 1 mg/m^3, [skin], 1999; France: VME 0.1 ppm (1 mg/m^3), 1999; Japan 0.1 ppm (0.85 mg/m^3), 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Norway: TWA 0.1 mg/m^3, 1999; the Philippines: TWA 1 mg/m^3, 1993; Poland: MAC (TWA) 0.3 mg/m^3; MAC (STEL) 0.9 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 0.2 mg/m^3, [skin], 1993; Switzerland: MAK-W 1 mg/m^3, KZG-W 2 mg/m^3, 1999; Thailand: TWA 1 mg/m^3, 1993; Turkey: TWA 1 mg/m^3, 1993; United Kingdom: TWA 0.1 ppm (0.87 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 ppm Several states have set guidelines or standards for PCl_5 in ambient air[60] ranging from 10.0 μg/m^3 (North Dakota) to 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II(5), Method #S-257.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Corrosive if swallowed. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. Can cause death by pulmonary edema or circulation shock. Fumes cause irritation of eyes and respiratory passages. Upon ingestion, immediate pain in the mouth and throat, abdominal pain; nausea, vomiting of mucoid and "coffee-ground" material, intense thirst; clammy skin, weak and rapid pulse; shallow respiration, and circulatory shock occur.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May cause lung irritation; bronchitis may develop. May cause liver and kidney damage.

Points of Attack: Respiratory system, lungs, eyes, skin, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* Sa* (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 50 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 70 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color Code—Yellow Stripe (strong oxidizer): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all other combustible and oxidizable materials, and moisture. Where possible, automatically transfer material storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep material out of water sources and sewers. Use water spray to knock down vapors. *Do not use water* on material itself; neutralize spilled material with crushed limestone, soda ash, or lime. Avoid breathing vapors; keep upwind. Avoid bodily contact with the materials. Do not handle broken packages without protective equipment. Wash away any materials which may have contacted the body with copious amounts of water or soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.0/1.5

Fire Extinguishing: A noncombustible solid. If material is involved in fire then use dry chemical, carbon dioxide, or dry sand. *Do not use water* on material itself. If large quantities of combustibles are involved, use water in flooding quantities (i.e., spray or fog), and use water spray to absorb vapors. Avoid breathing vapors; keep upwind. Wear self-contained breathing apparatus. Avoid bodily contact with the material; wear boots, protective gloves, and goggles. Poisonous gases are produced in fire, including hydrogen chloride and phosphorus oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose with water, forming phosphoric and hydrochloric acids. Neutralize acids and dilute if necessary for discharge into the sewer system.

Common Formula: P_4S_{10}

Synonyms: Pentasulfure de phosphore (French); Phosphoric sulfide; Phosphorus pentasulfide; Phosphorus persulfide;

Phosphorus sulfide; Sulphur phosphide; Thiophosphoric anhydride

CAS Registry Number: 1314-80-3

RTECS® Number: TH4375000

UN/NA & ERG Number: UN1340 (free from yellow or white phosphorus)/139

EC Number: 215-242-4 [*Annex I Index No.:* 015-104-00-1]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U189.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xn, N; Risk phrases: R11; R20/22; R29; Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Phosphorus pentasulfide is a greenish-gray to yellow, crystalline solid with an odor of rotten eggs. The odor threshold is 0.005 ppm. Molecular weight = 222.24 (P_2S_5); 444.6 (P_4S_{10}); Specific gravity (H_2O:1) = 2.09; Boiling point = 513.8°C; Freezing/Melting point = 286°C; Vapor pressure = 1 mmHg at 300°C; Autoignition temperature (dry air) = 142°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity₩. Reacts with water.

Potential Exposure: Compound Description: Primary Irritant. Phosphorus pentasulfide is used as an intermediate in the manufacture of lubricant additives, insecticides, flotation agents, lubricating oil, ignition compounds, and matches. It is also used to introduce sulfur into rubber, and organic chemicals, such as pharmaceuticals.

Incompatibilities: Flammable solid; water reactive. Violent reaction with water, alcohols, strong oxidizers, acids, alkalis. Reaction with water to produce heat, hydrogen sulfide, sulfur dioxide, and phosphoric acid. May self-ignite in moist air.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA.

NIOSH REL: 1 mg/m^3 TWA; 3 mg/m^3 STEL.

ACGIH TLV®[1]: 1 mg/m^3 TWA; 3 mg/m^3 STEL.

NIOSH IDLH: 250 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Australia: TWA 1 mg/m^3; STEL 3 mg/m^3, 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 1 mg/m^3; STEL 3 mg/m^3, 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: STEL 1 mg/m^3, 1999; France: VME 1 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; the Philippines: TWA 1 mg/m^3, 1993; Poland: TWA 1 mg/m^3; STEL 3 mg/m^3, 1999; Switzerland: MAK-W 1 mg/m^3, KZG-W 2 mg/m^3, 1999; Thailand: TWA 1 mg/m^3, 1993; Turkey: TWA 1 mg/m^3, 1993; United Kingdom: TWA 1 mg/m^3; STEL 3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 mg/m^3. Several states have set guidelines or standards for P_2S_5 in ambient air[60] ranging from 10 μg/m^3 (North Dakota) to 16 μg/m^3 (Virginia) to 20 μg/m^3 (Connecticut) to 24 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates the eyes, skin, and respiratory tract. Inhalation of fumes produced by phosphorus compounds may cause irritation of pulmonary tissues with resultant acute pulmonary edema. The hazards of phosphorus pentasulfide are the same as for hydrogen sulfide to which it rapidly hydrolyzes in the presence of moisture. Symptoms include apnea, coma, convulsions, lacrimation (discharge of tears), photophobia (abnormal visual intolerance to light), kerato-conjunctivitis, corneal vesiculation, respiratory system irritation, dizziness, headaches, fatigue, irritability, insomnia, gastrointestinal disturbances.

Long Term Exposure: Chronic exposure may lead to lung irritation, cough, bronchitis, and pneumonia.

Points of Attack: Respiratory system, lungs, central nervous system, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3* Sa (APF = 10) (any supplied-air respirator).* *Up to 25 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 50 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 250 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* GmFS100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture, water, alcohols, strong oxidizers, acids, alkalis. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "DANGEROUS WHEN WET, FLAMMABLE SOLID." It falls in Hazard Class 4.3 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, sand. Consider the use of sodium chloride-base extinguisher suitable for metal fires. *Do not use water*. Poisonous gases are produced in fire, including phosphorus oxides and fluorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Decompose with water, forming phosphoric acid, sulfuric acid, and hydrogen sulfide. Provisions must be made for scrubbing hydrogen sulfide emissions. The acids may then be neutralized and diluted slowly to solution of soda ash and slaked lime with stirring, then flush to sewer with large volumes of water.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Active registration.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R35; Safety phrases: S1/2; S22; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Phosphorus pentoxide is a white crystalline solid. Molecular weight = 141.94; Freezing/Melting point = 340°C; it begins to sublime at 360°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩ (Corrosive). Reacts with water.

Potential Exposure: This material is used as an intermediate in organic synthesis; as a catalyst, condensing agent, dehydrating agent; in the preparation of acrylate esters, surfactants, sugar refining; in medicine, fire extinguishing, and special glasses.

Incompatibilities: Reacts violently with water, forming highly corrosive phosphoric acid. Phosphorus pentoxide reacts violently with the following: perchloric acid, ammonia, hydrofluoric acid, oxidizers, hydrogen fluoride, formic acid, oxygen difluoride, potassium, sodium, propargyl alcohol, calcium oxide, inorganic bases, sodium hydroxide, and chlorine trifluoride. Attacks many metals in the presence of water.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 1 mg/m^3

PAC-1: **1** mg/m^3

PAC-2: **10** mg/m^3

PAC-3: **50** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 mg/m^3, measured as inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Austria: MAK 1 mg/m^3, 1999; Denmark: ceiling 1 mg/m^3, 1999; France: VME 1 mg/m^3, 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, 1993; Norway: TWA 1 mg/m^3, 1999; Poland: MAC (TWA) 1 mg/m^3; STEL 3 mg/m^3, 1999; Russia: STEL 1 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Turkey: TWA 1 mg/m^3, 1993; United Kingdom: STEL 2 mg/m^3, 2000.

Permissible Concentration in Water: No criteria set (reacts with water).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Highly corrosive to the eyes, skin, and respiratory tract. Eye contact may lead to a total destruction of the eyes. Particles in contact with eyes react vigorously and even a small amount may cause permanent burns. Contact with the skin will cause severe burns. Corrosive if ingested; will damage the gastrointestinal tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Signs and symptoms of acute exposure to phosphorus pentoxide may include severe burns, pain, shock, intense thirst, nausea, vomiting, diarrhea, severe abdominal pain; and "smoking stools." The breath and feces may have a garlicky odor. A symptom-free period of several days may follow. Exposure to phosphorus pentoxide may also result in bloody vomitus and diarrhea, jaundice, liver enlargement with tenderness, renal damage, hematuria (bloody urine), and either oliguria (scanty urination) or anuria (suppression of urine formation). Headache, convulsions, delirium, coma, cardiac arrhythmias, and cardiovascular collapse may occur. If phosphorus pentoxide contacts the eyes, severe irritation and burns, blepharospasm (spasmodic winking), lacrimation (tearing), and photophobia (heightened sensitivity to light) may occur. Victims may experience spontaneous hemorrhaging of phosphorus pentoxide-contaminated skin and mucous membranes.

Long Term Exposure: Highly corrosive materials can cause lung damage; bronchitis may develop.

Points of Attack: Lungs, skin, eyes,

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to a health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Never pour water into this substance*; always add POX slowly to water when diluting or dissolving.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a

NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Keep unnecessary people away. Stay upwind. Keep out of low areas. Ventilate closed spaces before entering them. Stop leak if possible without risk. Do not touch spilled material. Use water spray to reduce vapors, but do not put water on leak or spill. Keep combustibles away from spilled material. Dike spilled area and keep water away from spill. Clean up requires supervision by an expert. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Does not support combustion. For small fires, use dry chemical, carbon dioxide, or sand. *Do not use water* or hydrous extinguishers. Wear positive pressure breathing apparatus and special protective clothing. Keep combustibles away from spilled material. Poisonous gases, including phosphorus oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. *For large fires*, flood fire area with water from a distance. Do not get solid stream of water on spilled material or in open containers. From a secure, explosion-proof location, use water spray to cool exposed containers long after flames have been extinguished. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose with water, forming phosphoric and hydrochloric acids. The acids may then be neutralized and diluted slowly to solution of soda ash and slaked lime with stirring then flush to sewer with large volumes of water.

Several states have set guidelines or standards for PCl_3 in ambient air[60] ranging from 15−30 μg/m^3 (North Dakota) to 30 μg/m^3 (Connecticut) to 36 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 6402.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive if swallowed. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. Very high levels of exposure to vapors can cause death. This material is highly toxic; it may cause death or permanent injury. Exposure may cause dizziness, headache, anorexia, respiratory difficulties, nausea, and vomiting. It can also cause liver and lung disturbances. Occupational exposure has caused coughs, bronchitis, pneumonia, and conjunctivitis.

Long Term Exposure: Highly corrosive materials can cause lung damage; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *25 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Phosphorus trichloride must be stored to avoid contact with acetic acid, aluminum, chromyl chloride, fluorine, alcohol, nitric acid, sodium, potassium, water, hydroxylamine, and lead dioxide since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water and moisture. Phosphorus trichloride corrodes most metals and will attack some forms of plastics, rubber, and coatings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in Hazard Class 6.1 and Packing Group I. A plus sign (+) indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.9/1.5
Night 1.9/3.1

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.7/2.7

Fire Extinguishing: This material may burn but does not easily ignite. Use carbon dioxide or dry chemical on fires involving phosphorus trichloride. *Do not use water.* Poisonous gases are produced in fire, including hydrogen chloride and phosphoric acid. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Spray cooling water on containers that are exposed to flames until well after fire is out. Do not get water inside containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose with water, forming phosphoric and hydrochloric acids. The acids may then be neutralized and diluted slowly to solution of soda ash and slaked lime with stirring, then flush to sewer with large volumes of water.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.055; Nonwastewater (mg/kg), 28.
Reportable Quantity (RQ): 5000 lb (2270 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: Hazard Symbol: Xi; Risk phrases: R22; R37/38; R41; R42/43; Safety phrases: S2; S23; S24/25; S26; S37/39; S46 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Phthalic Anhydride is moderately flammable, white solid (flake) or a clear, colorless, mobile liquid (molten) with a characteristic, acrid, choking odor. The odor threshold is 0.05 ppm. Molecular weight = 148.12 (flake); 1.20 (molten); Boiling point = (sublimes) 295°C; Freezing/Melting point = 130.6°C; Vapor pressure = 0.0015 mmHg at 20°C; Flash point = 151.7°C (cc); Autoignition temperature = 570°C. Explosive limits: LEL = 1.7%; UEL = 10.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; slow reaction.
Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Phthalic anhydride is used in plasticizers, in the manufacture of phthaleins, benzoic acid, alkyd and polyester resins, synthetic indigo, and phthalic acid; which is used as a plasticizer for vinyl resins. To a lesser extent, it is used in the production of alizarin, dye, anthranilic acid, anthraquinone, diethyl phthalate, dimethyl phthalate, erythrosine, isophthalic acid, methylaniline, phenolphthalein, phthalamide, sulfathalidine, and terephthalic acid. It has also found uses as a pesticide intermediate.
Incompatibilities: Dust forms an explosive mixture with air. Strong acids, caustics, ammonia, amines, strong oxidizers, water. Converted to phthalic acid in hot water. Reacts violently with copper oxide or sodium nitrite + heat.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 6.06 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 2 ppm/12 mg/m^3 TWA.
NIOSH REL: 1 ppm/6 mg/m^3 TWA.
ACGIH TLV®[1]: 1 ppm/6.1 mg/m^3 TWA; danger of sensitization; not classifiable as a human carcinogen.
NIOSH IDLH: 60 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 12 mg/m^3
PAC-1: 12 mg/m^3
PAC-2: 12 mg/m^3
PAC-3: 60 mg/m^3
DFG MAK: Danger of skin sensitization; No numerical value established. Data may be available.
Australia: TWA 1 ppm (6 mg/m^3), 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 1 ppm (6.1 mg/m^3), 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 0.2 mg/m^3, 1999; France: VLE 6 mg/m^3, 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, 1993; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Norway: TWA 2 mg/m^3, 1999; the Philippines: TWA 2 ppm (12 mg/m^3), 1993; Poland: MAC (TWA) 1 mg/m^3; STEL 2 mg/m^3 (vapors and aerosols), 1999; Russia: STEL 1 mg/m^3, [skin], 1993; Sweden: NGV 2 mg/m^3, TGV 3 mg/m^3, 1999; Switzerland: MAK-W 1 mg/m^3, KZG-W 2 mg/m^3, 1999; United Kingdom: TWA 4 mg/m^3; STEL 12 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[43] set a MAC of 0.1 mg/m^3 for ambient air in residential areas (100 μg/m^3). Several states have set guidelines or standards for phthalic anhydride in ambient air[60] ranging from 0.82 μg/m^3 (Massachusetts) to 60−240 μg/m^3 (North Dakota) to 100 μg/m^3 (Virginia) to 120 μg/m^3 (Connecticut) to 143 μg/m^3 (Nevada).
Determination in Air: Use NIOSH II(3), Method #S179; OSHA Analytical Method 90.
Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.58.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* May cause irritation of nose, throat, and mouth with coughing, sneezing, shortness of breath, and excessive discharge and bleeding from nose. Studies suggest that this will occur at about 4 ppm. *Skin:* Rapid chemical burns may occur on contact with wet skin. Molten material may cause severe burns unless removed immediately. *Eyes:* May cause severe irritation and chemical burns on contact or at dust levels above 5 ppm. *Ingestion:* May cause severe irritation to mouth and throat. Animal studies suggest that death may occur from ingestion of 4−8 oz.

Long Term Exposure: May cause irritation of nose, mouth, throat, and lungs. Repeated or prolonged contact may cause conjunctivitis, nasal ulcer bleeding. Allergy may develop in sensitive individuals which can lead to bronchial asthma. Repeated or prolonged skin contact may cause dermatitis, skin sensitization, and allergy. In animals: liver, kidney damage.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); urine (chemical/metabolite). Lung function tests may be normal if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, or wear dust-proof goggles when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *30 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *60 mg/m^3:* 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or 95F (APF = 10) (any air-purifying full-face-piece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100) or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter) or SA* (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White Stripe (*flake*): Contact Hazard; not compatible with materials in solid white category. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Phthalic anhydride must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) since violent reactions occur. Sources of ignition (such as smoking and open flames) are prohibited where phthalic anhydride is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 210-933-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: *m*-Phthalodinitrile is a needle-like, colorless to white, flaky solid with an almond-like odor. Molecular weight = 128.14; Specific gravity (H_2O:1) = 4.42; Boiling point = sublimes; Freezing/Melting point = 162°C (sublimes); Vapor pressure = 0.01 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Primary Irritant. This material is used as an intermediate in the manufacture of polyurethane paints and varnishes; in pharmaceuticals, for synthetic fibers, agricultural chemicals, rubber chemicals; an intermediate for phthalocyanine pigments and dyes, and for high-temperature lubricants and coatings; it may be used to produce phthalate esters.

Incompatibilities: Combustible solid. The dust is a severe explosion hazard. Strong oxidizers (e.g., chlorine, bromine, fluorine).

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3, measured as inhalable fraction and vapor, TWA.

No TEEL available.

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 20 mg/m^3, [skin], 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3. Several states have set guidelines or standards for *m*-phthalodinitrile in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: *m*-Phthalodinitrile can affect you when breathed in and by passing through your skin. High exposure may cause headache, nausea, weakness, confusion and may cause you to pass out. In animals: irritation of the eyes, skin.

Long Term Exposure: May cause headaches and nausea. No permanent effects are known at this time.

Points of Attack: Eyes, skin, central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential for exposures *over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a MSHA/NIIOSH approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. *m*-Phthalodinitrile is incompatible with strong oxidizers, such as chlorine, bromine, and fluorine. Store in tightly closed containers in a cool, well-ventilated area away from open flames and high temperatures. Sources of ignition, such as smoking and open flames, are prohibited where *m*-phthalodinitrile is used, handled, or stored in a manner that could create potential fire of explosion hazard. *m*-Phthalodinitrile dust is a severe explosion hazard. Use explosion proof equipment when handling *m*-phthalodinitrile.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.1
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.9

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including ammonia, hydrogen cyanide, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: React with alcoholic NaOH; after 1 h, evaporate alcohol and add calcium hypochlorite; after 24 h flush into sewer with large volumes of water.

Phylloquinone P:0690

Molecular Formula: $C_{31}H_{46}O_2$
Synonyms: Antihemorrhagic vitamin; Aqua mephyton; Combinal K_1; Kativ N; Kephton; Kinadion; Konakion; Mephyton; 2-Methyl-3-phythyl-1,4-naphthochinon (German); 2-Methyl-3-(3,7,11,15-tetramethyl-2-hexadecenyl)-1,4-naphthalenedione; Monodion; Phyllochinon (German); α-Phylloquinone; *trans*-Phylloquinone; Phytomenadione; Phytonadione; Vitamin K_1
CAS Registry Number: 84-80-0
RTECS® Number: QJ5800000
EC Number: 201-564-2
Regulatory Authority and Advisory Bodies
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: Dropped From Listing in 1988).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Phylloquinone is an odorless yellow viscous oil or crystals. Molecular weight = 450.77; Boiling point = 140−145°C at 0.001 mm; Freezing/Melting point = −4°C; −20° C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.
Potential Exposure: Phylloquinone is a dietary component essential for normal biosynthesis of several factors required for clotting of blood, as a therapeutic drug used to correct bleeding tendency, and as a food supplement.
Incompatibilities: Phylloquinone decomposes in sunlight and is destroyed by alkali hydroxides and reducing agents.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: High oral toxicity. Intravenous injection can cause toxic responses and occasionally death. Rapid intravenous administration of phylloquinone has produced flushing, irregular breathing, and chest pains. In newborns, it can cause hemolytic anemia and hemoglobinuria. In patients who have severe liver disease, administration of large doses of menadione or phylloquinone may further depress function of liver. Individuals resistant to coumarin may have unusual sensitivity to the antidotal effects of vitamin K.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkali hydroxides and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.
Spill Handling: Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Shut off ignition sources; no flares, smoking, or flames in hazard area. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch spilled material. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless

the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Irritating fumes are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Physostigmine P:0700

Molecular Formula: $C_{15}H_{21}N_3O_2$

Synonyms: Calabarine; Erserine; Eserine; Eserolein; Fisostigmina (Spanish); Methylcarbamate (ester); Methylcarbamic acid, ester with eseroline; Physostol

CAS Registry Number: 57-47-6

RTECS® Number: TJ2100000

UN/NA & ERG Number: UN2757(carbamate pesticides, solid, toxic)/151 see "Potential Exposure"

EC Number: 200-332-8 [*Annex I Index No.:* 614-020-00-8]

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P204.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R26/28; R1/2; Safety phrases: S25; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Physostigmine is an odorless white crystalline solid. Molecular weight = 275.39; Freezing/Melting point = 86−87°C (unstable form); 105−106°C (stable form). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water.

Potential Exposure: Material is used as a cholinergic (anticholinesterase) agent and as a veterinary medication. Listed as a carbamate pesticide; however, physostigmine is not registered in the United States as such.

Incompatibilities: Light and heat.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 4.5 mg/m^3

PAC-3: 4.5 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Super toxic. Probable oral lethal dose is less than 5 mg/kg for a 70-kg (150 lb) person. Material is a cholinesterase inhibitor. Effects of exposure may involve the respiratory, gastrointestinal, cardiovascular, and central nervous systems. Death occurs due to respiratory paralysis or impaired cardiac function. Time to death may vary from 5 min to 24 h, in severely poisoned patients, depending on factors, such as the dose and route. General symptoms include: increased secretions, fatigability and generalized weakness; involuntary twitching; severe weakness of skeletal muscles. Symptoms of exposure to material by major organ system: gastrointestinal: lack of appetite, nausea and vomiting, abdominal cramps, and diarrhea. Central nervous system: confusion, uncoordination, slurred speech, loss of reflexes, rapid irregular breathing, generalized convulsions, and coma. Cardiovascular: slowed heartbeat resulting in hypotension and fall in cardiac output.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Carbamate pesticides, solid, toxic, require a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. As for other carbamate pesticides, avoid breathing dusts and fumes from burning materials. Keep upwind. Avoid bodily contact with the material. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: As for other carbamate pesticides, extinguish fire using agent suitable for type of surrounding fire (material itself burns with difficulty). Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide, or dry chemical. Wear self-contained breathing apparatus when fighting fires. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Picloram P:0710

Molecular Formula: $C_6H_3Cl_3N_2O_2$

Synonyms: Amdon; Amdon grazon; 4-Aminotrichloropicolinic acid; 4-Amino-3,5,6-trichloro-2-picolinic acid; 4-Amino-3,5,6-trichloropicolinic acid; 4-Amino-3,5,6-trichloro-2-pyridinecarboxylic acid; 4-Amino-3,5,6-trichloropyridine-2-carboxylic acid; 4-Amino-3,5,6-trichlorpicolinsaeure (German); ATCP; Borolin; K-Pin; NCI-C00237; NSC 233899; Picolinic acid, 4-Amino-3,5,6-trichloro-; 2-Pyridine carboxylic acid, 4-amino-3,5,6-trichloro-; Tordon; Tordon 10K; Tordon 22K; Tordon 101 mixture; 3,5,6-Trichloro-4-aminopicolinic acid

CAS Registry Number: 1918-02-1

RTECS® Number: TJ7525000
UN/NA & ERG Number: UN2588/151
EC Number: 217-636-1
Regulatory Authority and Advisory Bodies
Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); equivocal evidence: rat; no evidence: mouse; IARC: Animal Limited Evidence; Human No Available Data, *not classifiable as carcinogenic to humans*, Group 3, 1991.
US EPA, FIFRA 1998 Status of Pesticides: RED completed.
Banned or Severely Restricted (Sweden) (UN).[13]
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Safe Drinking Water Act: MCL, 0.5 mg/L; MCLG, 0.5 mg/L; Regulated chemical (47 FR 9352) as pichloram.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Picloram is a colorless powder with a chlorine-like odor. Molecular weight = 241.46; Freezing/Melting point = (decomposes) 219.8°C; Vapor pressure = 6×10^{-7} mmHg at 36.7°C. Poor solubility in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Those involved in the manufacture, formulation, or application of the herbicide.
Incompatibilities: This material is acidic. Reacts with hot concentrated alkali (hydrolyzes), strong bases. Attacks some metals.
Permissible Exposure Limits in Air
OSHA PEL: 15 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.
NIOSH REL: See Appendix D of the *NIOSH Pocket Guide*.
ACGIH TLV®[1]: 10 mg/m^3 TWA; not classifiable as a human carcinogen.
No TEEL available.
Australia: TWA 10 mg/m^3; STEL 20 mg/m^3, 1993; Belgium: TWA 10 mg/m^3; STEL 20 mg/m^3, 1993; Denmark: TWA 10 mg/m^3, 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Russia: STEL 2 mg/m^3, 1993; Switzerland: MAK-W 10 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.
Russia set a MAC of 0.03 mg/m^3 for ambient air on a once-daily basis and 0.02 mg/m^3 on a daily average basis. Several states have set guidelines or standards for picloram in ambient air[60] ranging from 0.1−0.2 mg/m^3 (North Dakota) to 0.16 mg/m^3 (Virginia) to 0.2 mg/m^3 (Connecticut) to 0.238 mg/m^3 (Nevada).
Determination in Air: Filter; none; Gravimetric; NIOSH IV, Particulates NOR: Method #0500, total dust; Method #0600 (respirable dust).
Permissible Concentration in Water: The US EPA has set a lifetime health advisory of 0.49 mg/L. Russia set a MAC of 10.0 mg/L in surface water. States which have set guidelines for Picloram in drinking water[61] include Kansas at 0.175 mg/L and Maine at 0.3 mg/L.
Determination in Water: Fish Tox = 703.55815000 ppb (VERY LOW).
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause nausea.
Long Term Exposure: Picloram should be handled as a carcinogen—with extreme caution. It may damage the testes. May affect the kidneys and liver. In animals: liver, kidney changes. Human Tox = 500.00000 ppb (VERY LOW).
Points of Attack: Eyes, skin, respiratory system, liver, kidneys. Cancer site in animals: liver, uterus, pituitary gland.
Medical Surveillance: Liver and kidney function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures over *10 mg/m³*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and

storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, bases, and metals. A regulated, marked area should be established where this chemical is handled, used, or stored. The use of picloram has been restricted. Be sure that your operation follows regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This chlorinated brush killer is usually formulated with 2,4-D and the disposal problems are similar. Incineration at 1000°C for 2 s is required for thermal decomposition. Alternatively, the free acid can be precipitated from its solutions by addition of a mineral acid. The concentrated acid can then be incinerated and the dilute residual solution disposed in an area where several years' persistence in the soil can be tolerated.

Regulatory Authority and Advisory Bodies

(2-Picoline)

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

o-isomer:

US EPA Hazardous Waste Number (RCRA No.): U191.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*2-picoline*): Hazard Symbol: Xn; Risk phrases: R10; R20/21/22; R36/37; Safety phrases: S2; S26; S36; (*4-picoline*) Hazard Symbol: T; Risk phrases: R10; R20/22; R24; R36/37/38; Safety phrases: S1/2; S26; S36; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters (*all isomers*).

Description: Picolines are colorless liquids with a strong, unpleasant, pyridine-like odor. Odor threshold is 0.023 ppm. "Picoline" is often used as mixed isomers and physical data for the other isomers are listed. The *o*-isomer is the most heavily regulated (see above). Molecular weight = 93.14; Specific gravity (H_2O:1) = 0.96 at 25°C;

Boiling point = 129°C (*o*-isomer); 143−144°C (*m*-isomer); 145°C (*p*-isomer); Freezing/Melting point = −70°C (*o*-isomer); −18°C (*m*-isomer); 3.7°C (*p*-isomer); Flash point = 39°C (oc) (*o*-isomer); 37.8°C (cc) (*m*-isomer); 57°C (*p*-isomer); Autoignition temperature = 535°C (*o*-isomer). Explosive limits (*o*-isomer): LEL = 1.4%; UEL = 8.6%. Hazard Identification (based on NFPA-704 M Rating System): (*2-isomer*) Health 3, Flammability 2, Reactivity 0; *(3- and 4-isomer*s) Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description (*o*-isomer): Mutagen, Primary Irritant; (*m*-isomer): Tumorigen, Primary Irritant. Picolines are used as intermediates in pharmaceutical manufacture, pesticide manufacture, and in the manufacture of dyes and rubber chemicals. It is also used as a solvent.

Incompatibilities: Reacts with oxidants and strong acids. Attacks copper and its alloys.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

AIHA WEEL: 2 ppm, [skin] TWA; 5 ppm STEL (15 min) [skin], *as picolines.*

2-picoline

TEEL-0: 2 ppm

PAC-1: 5 ppm

PAC-2: 5 ppm

PAC-3: 300 ppm

3-picoline

TEEL-0: 2 ppm

PAC-1: 5 ppm

PAC-2: 125 ppm

PAC-3: 600 ppm

Russia: 5 mg/m^3.[43] (*o*-isomer)

Permissible Concentration in Water: There are no US criteria but the maximum allowable concentration in Class I waters for the production of drinking water has been set in Russia at 0.05 mg/L.[43] The EPA has suggested[32] a permissible ambient goal of 316 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.2 (all isomers)

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Exposure can cause nausea, vomiting, diarrhea, and abdominal pain. *Inhalation:* May cause irritation to mouth, nose, and throat. Odor is very disagreeable above 30 ppm. However, people often become insensitive to the odor after a period of time, so odor detection cannot be relied upon as an indication of exposure. Exposure far above the OEL may cause you to pass out. Levels of 8000 ppm caused death in all exposed rats within 1.5 h. *Skin:* Readily absorbed and may contribute to symptoms. Irritation with rash or burning sensation on contact. May cause severe irritation if not promptly removed. *Eyes:* May cause severe irritation. *Ingestion:* Irritation and upset of digestive system may occur. Muscle weakness, loss of coordination, diarrhea, and unconsciousness may result. Animal studies suggest that death may occur by ingestion of 1−2 fluid ounces for a 150-lb person.

Long Term Exposure: Repeated exposure to picoline can cause headache, dizziness, weakness, loss of coordination, double vision, and coma. Animal studies suggest that symptoms similar to those listed under ingestion would occur. Liver and kidney damage may also occur. Corrosive substances can irritate the lungs; bronchitis may develop.

Points of Attack: Skin, eyes, liver and kidneys, lungs.

Medical Surveillance: Liver and kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode. A respirator providing protection against organic vapors may be of use to sensitive individuals and during entry or escape from a contaminated area.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, acid chlorides, chloroformates, copper metals, and alloys. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Picolines require a shipping label of "FLAMMABLE LIQUID." They fall in DOT Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 201-865-9 [*Annex I Index No.:* 609-009-00-X]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

US EPA Gene-Tox Program, Inconclusive: *D. melanogaster* sex-linked lethal.

An OSHA Class A Explosive (1910.109).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: E, T; R3; R4; R23/24/25; Safety phrases: S1/2; S28; S35; R36/37; R45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Picric acid is a pale yellow, odorless solid. Usually found in solution with 10−20% water. *Must be kept wetted; the crystalline form is highly unstable.* The dry crystal form is explosive upon rapid heating or mechanical shock.

Molecular weight = 229.12; Specific gravity (H_2O:1) = 1.76 at 25°C; Boiling point = (explodes above 300°C); Freezing/Melting point = 122.2°C; Vapor pressure = 1 mmHg at 25°C; Flash point = 150°C; Autoignition temperature = (explodes) 300°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 4; (*wet*): Health 2, Flammability 2, Reactivity 2. Slightly soluble in water; solubility = 1%.

Potential Exposure: Compound Description: Mutagen. Picric acid is used in the synthesis of dye intermediates and in manufacturing picrates; in the manufacture of explosives, rocket fuels, fireworks, colored glass, matches, electric batteries, and disinfectants. It is also used in the pharmaceutical and leather industries, in copper and steel etching, forensic chemistry, histology, textile printing, and photographic emulsions.

Incompatibilities: Violent reaction with oxidizers and reducing materials. Air or oxygen is not required for decomposition. Shock-sensitive compounds can be formed on contact with plaster, concrete. An explosive mixture results when the aqueous solution crystallizes. May explosively decompose from heat, shock, friction, or concussion. Copper, lead, zinc and other metals, or their salts can form other salts that are initiators and much more sensitive to shock than this chemical. Corrodes metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.37 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 mg/m^3 TWA [skin].

NIOSH REL: 0.1 mg/m^3 TWA [skin]; 0.3 mg/m^3 STEL.

ACGIH TLV®[1]: 0.1 mg/m^3 TWA.

NIOSH IDLH: 75 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 75 mg/m^3

DFG MAK: 0.1 mg/m^3, inhalable fraction; [skin] danger of skin sensitization; Carcinogen Category 3B.

Australia: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 1993; Austria: MAK 0.1 mg/m^3, [skin], 1999; Belgium: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Finland: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; Hungary: TWA 0.1 mg/m^3; STEL 0.2 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Norway: TWA 0.1 mg/m^3, 1999; the Philippines: TWA 0.1 mg/m^3, [skin], 1993; Poland: MAC (TWA) 0.1 mg/m^3; MAC (STEL) 0.3 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.2 mg/m^3, [skin], 1999; Turkey: TWA 0.1 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3. Several states have set guidelines or standards for picric acid in ambient air[60] ranging from 0.33 μg/m^3 (New York) to 1.0 μg/m^3 (Florida, South Carolina) to 1.0−3.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada). Russia set a MAC of 10 μg/m^3 for ambient air on a once-daily basis.

Determination in Air: Collection on a mixed cellulose ester membrane filter, extraction with aqueous methanol measurement by high-performance liquid chromatography with UV detector. See NIOSH (II-4), Method #S-228.

Permissible Concentration in Water: To protect human health: no criteria set due to insufficient data.[6] Russia[35, 43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 2.0.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 200 mg/kg. Irritates the eyes, skin, and respiratory tract. Corneal injury may occur from exposure to picric acid dust and solutions. Dust or fume may cause eye irritation which may be aggravated by sensitization. Inhalation of high concentrations of dust by one worker caused temporary coma followed by weakness, myalgia, anuria, and later polyuria. Following ingestion of picric acid, there may be headache, vertigo, nausea, vomiting, diarrhea, yellow coloration of the skin, hematuria, and albuminuria. High doses may cause destruction of erythrocytes, hemorrhagic nephritis, and hepatitis. High doses which cause systemic intoxication will color all tissues yellow, including the conjunctive and aqueous humor, and cause yellow vision.

Long Term Exposure: Picric acid dust or solutions are potent skin sensitizers. The cutaneous lesions which appear usually on exposed areas of the upper extremities consist of dermatitis with erythema and vesicular eruptions. Desquamation may occur following repeated or prolonged contact. Skin usually turns yellow upon contact, and areas around nose and mouth as well as the hair are most often affected. May cause liver effects, hepatitis, hematuria (blood in the urine), albuminuria, kidney effects, nephritis.

Points of Attack: Eyes, skin, kidneys, liver, blood.

Medical Surveillance: NIOSH lists the following tests: liver function tests; urinalysis (routine). Preplacement and periodic medical examinations should focus on skin disorders (such as hypersensitivity, atopic dermatitis) and liver and kidney function. Examination by a qualified allergist. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene™, and Nitrile are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 mg/m^3*): 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators]. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 75 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or Sa: Pd,Pp (APF = 1000): ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Explosive. Color Code—Red (*wet*): Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in an explosion-proof refrigerator away from oxidizers, reducing agents, and metals. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Trinitrophenol or picric acid, dry or wetted with <30% water, by mass, requires a shipping label of "EXPLOSIVES" It falls in Hazard Class 4.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. More powerful than TNT, picric acid explodes above 572°F/300°C. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration in a rotary kiln incinerator equipped with particulate abatement and wet scrubber devices.[22]

Picrotoxin P:0740

Molecular Formula: $C_{30}H_{34}O_{13}$
Synonyms: Cocculin; Cocculus; Coques du levant (French); Fish berry; Indian berry; Oriental berry; Picrotin, compounded with picrotoxinin (1:1); Picrotoxine
CAS Registry Number: 124-87-8
RTECS® Number: TJ9100000
UN/NA & ERG Number: UN3172/153
EC Number: 204-716-6
Regulatory Authority and Advisory Bodies
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).
Reportable Quantity (RQ): 500 lb (227 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Picrotoxin is an odorless crystalline solid with a very bitter taste. Molecular weight = 602.64; Freezing/Melting point = 203°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in cold water; soluble in boiling water.
Potential Exposure: An alkaloid poison and convulsant. Used in medicine as a central nervous system stimulant and antidote for barbiturate poisoning. Reportedly, this material is not currently regarded as a useful therapeutic agent since it is not a selective respiratory stimulant.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 3 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 15 mg/m^3
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Highly toxic and a dose of 20 mg may produce symptoms of severe poisoning. A human lethal dose of 1.5 mg/kg has been reported. It is an alkaloid convulsant poison. Picrotoxin is a powerful stimulant and affects all portions of the central nervous system. At doses approaching convulsant levels, signs and symptoms include salivation, elevated blood pressure, frequent vomiting, rapid breathing.
Points of Attack: Central nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away. Where possible, automatically transfer material from drums or other storage containers to process containers.
Shipping: Toxins, extracted from living sources, require a shipping label of "POISONOUS/TOXIC MATERIALS". It falls in Hazard Class 6.1 and Packing Group I.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. If water pollution occurs, notify appropriate authorities. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly

trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam for small fires. Use water spray, fog, or foam for large fires. Move container from fire area if this can be done without risk. Isolate hazard area and deny entry. Wear positive pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pindone is a bright yellow crystalline solid. Almost odorless. Molecular weight = 230.28; Specific gravity (H_2O:1) = 1.06 at 25°C; Boiling point = decomposes; Freezing/Melting point = 110°C. Practically insoluble in water; solubility = 0.002% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical. Pindone is used as an anticoagulant and rodenticide. Those involved in manufacture, formulation, and application of this chemical.

Incompatibilities: None reported.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg/m^3 TWA.

NIOSH REL: 0.1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 mg/m^3 TWA.

NIOSH IDLH: 100 mg/m^3.

No TEEL available.

Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, 1999; France: VME 0.1 mg/m^3, 1999; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3. Several states have set guidelines or standards for pindone in ambient air[60] ranging from 1.0−3.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Nosebleeds (epistaxis), excessive bleeding of minor cuts and bruises, smoky urine, black tarry stools, abdominal and back pain. Reduced blood clotting which leads to hemorrhaging; symptoms resembling warfarin: depressed formation of prothrombin and capillary fragility; leading to hemorrhages.

Points of Attack: Blood prothrombin.

Medical Surveillance: NIOSH lists the following tests: blood plasma, Prothrombin Time; Complete blood count; urinalysis (routine), red blood cells/count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 mg/m³:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 mg/m³*): 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m³:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Shipping: Pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." (Packing Group III): It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Remove all sources of ignition and dampen spilled material with 60–70% ethanol to avoid airborne dust, then transfer material to a suitable container. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration) 0.1% (Piperazine and Piperazine dihydrochloride).

European/International Regulations: Hazard Symbol: Xn, C; Risk phrases: R34; R42/43; R62; R63; Safety phrases: S1/2; S22; S26; S36/37/39; S45; (*hydrochloride*): Hazard Symbol: Xn, C, N; Risk phrases: R36/38; R42/43; R62; R63; R52/53; Safety phrases: S1/2; S22; S36/37; S45; S61; S63 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Piperazine and Piperazine dihydrochloride, are white to cream-colored needles or powder with a characteristic ammonia-like odor. Combustible solids that do not easily ignite. Molecular weight = 86.16 (piperazine); 159.08 (dihydrochloride); Boiling point = 146°C; Freezing/Melting point = 106°C; 335°C (*dihydrochloride*); Flash point = 110°C. Hazard Identification (based on NFPA-704 M Rating System): (*piperazine*) Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description (Piperazine): Agricultural Chemical; Drug, Human Data; Primary Irritant; (dihydrochloride) Agricultural Chemical; Mutagen. Piperazine is used to manufacture anthelmintics, antifilarials, antihistamines, and tranquilizers; the dihydrochloride is used in the manufacture of fibers, pharmaceuticals, and insecticides. They are used as an intermediate in the manufacture of pesticides, rubber chemicals, and fibers. Also, piperazine is widely available, effective, and safe when used on an occasional basis against ascaride infections. It is also considerably cheaper than other anthelminthic drugs. In some countries where ascariasis is not endemic and where piperazine was used predominantly for the treatment of pinworn, it has been withdrawn from use on the grounds that other effective drugs are now available. Clinical dosages occasionally induce transient neurological signs and, in some circumstances, the drug may generate small amounts of *nitrosamine* in the stomach, which at considerably greater dosage in experimental animals has been demonstrated to have a carcinogenic potential.

Incompatibilities: Violent reaction with strong oxidizers and dicyanofurazan. Incompatible with nitrogen compounds, carbon tetrachloride. Attacks aluminum, copper, nickel, magnesium, and zinc.

Permissible Exposure Limits in Air

ACGIH TLV (*piperazine and piperazine dihydrochloride*): *2010 Notice of intended change*: 0.1 mg/m^3 measured as inhalable fraction and vapor TWA; Danger of sensitization; not classifiable as a human carcinogen.

NIOSH REL (*dihydrochloride*): 5 mg/m^3 TWA.

Piperazine

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK (*piperazine*): Danger of skin and airway sensitization.

Denmark: TWA 0.1 ppm (0.35 mg/m^3), 1999; Norway: TWA 0.1 ppm (0.3 mg/m^3), 1999; Sweden: NGV 0.1 ppm (0.3 mg/m^3), KTV 0.3 ppm (1 mg/m^3), 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003.

Dihydrochloride

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA.

DFG MAK: Danger of skin and airway sensitization; No numerical value established. Data may be available.

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3, 2003.

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Piperazine can affect you when breathed in and by passing through your skin. Piperazine is a corrosive chemical and eye contact can cause severe irritation and burns. Skin contact can cause irritation or a skin allergy, with rash at even very low exposure levels. Exposure can cause a lung allergy to develop, with cough and wheezing triggered by even low exposures. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High exposures can cause weakness, tremors, visual changes, and trigger seizures. It can also interfere with the ability of the blood to carry oxygen, causing headaches, dizziness, and cyanosis, a bluish color to the skin and lips.

Long Term Exposure: Repeated exposure to piperazine dihydrochloride can cause skin sensitization and asthma-like allergy.

Points of Attack: Lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Piperazine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where piperazine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Piperazine requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Piperazine is a combustible solid. Use dry chemical, water spray, or alcohol foam extinguishers. Piperazine dihydrochloride may burn but does not readily ignite. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases, including nitrogen oxides and hydrogen chloride (hydrochloride), are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: Hazard Symbol: F, T; Risk phrases: R11; R23/24; R34; Safety phrases: S1/2; S16; S26; S27; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Piperidine is a clear, colorless liquid with an amine-like odor. Molecular weight = 85.17; Boiling point = 106°C; Freezing/Melting point = −7°C; Flash point = 16°C. Soluble in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Primary Irritant. Piperidine is used in agriculture and pharmaceuticals; as an intermediate for rubber accelerators; as a solvent; as a curing agent for rubber and epoxy resins; catalyst for condensation reactions; as an ingredient in oils and fuels; as a complexing agent; in the manufacture of local anesthetics; in analgesics; pharmaceuticals, wetting agents; and germicides; in synthetic flavoring. Not registered as a pesticide in the United States.

Incompatibilities: Piperidine is a medium strong base. Reacts violently with oxidizers.

Permissible Exposure Limits in Air

AIHA WEEL: 1 ppm TWA [skin].

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **6.6** ppm

PAC-2: **33** ppm

PAC-3: **110** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

United Kingdom: TWA 1 ppm/3.5 mg/m^3 [skin].

Russia[43] MAC (work-place air) 0.2 mg/m^3.

Permissible Concentration in Water: Russia[43] set a MAC of 0.06 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Sore throat, coughing, labored breathing, and dizziness occur after inhalation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may cause increased blood pressure. May cause permanent injury after short exposure to small amounts. Ingestion may involve both irreversible and reversible changes. 30−60 mg/kg may cause symptoms in humans. Symptoms upon oral administration include weakness, nausea, vomiting, salivation, labored respiration, muscular paralysis, and asphyxiation. Redness, pain, and burns occur upon contact with skin.

Long Term Exposure: Irritating substances may cause lung irritation; bronchitis may develop. May affect the liver and kidneys.

Points of Attack: Lungs, blood, liver, kidneys.

Medical Surveillance: Monitor blood pressure. Lung function tests. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Piperidine requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors; do not get water inside container. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. *Small fires:* dry chemical, carbon dioxide, water spray, or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if you can do it without risk. Do not get water inside container. Cool containers that are exposed to flames with water from the side until well after fire is out. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low area. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Poisonous gases, including nitrogen oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R21; R25; R50/53; Safety phrases: S1/2; S23; S36/37; S45S; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pirimifos-ethyl is a straw-colored liquid. Molecular weight = 333.43; It decomposes at 130°C; no boiling point can be determined; Vapor pressure = 0.0003 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Decomposes in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this organophosphate soil insecticide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 60 mg/m^3

Determination in Water: Fish Tox = 1.70268000 ppb MATC (HIGH)

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: As with other organophosphorus pesticides, symptoms are secondary to cholinesterase inhibition: headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Other signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox; 1.40000 ppb (HIGH).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. As with other organophosphorus pesticides, stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Remove all ignition sources. Ventilate area of spill or leak. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day	0.3/0.4
Night	0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200

Then: Protect persons downwind (miles/kilometers)

Day	1.6/2.6
Night	2.8/4.5

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases, including nitrogen oxide, phosphorus oxides, and sulfur oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Carcinogenicity (Platinum(IV) chloride): EPA Gene-Tox Program, Positive: *B. subtilis* rec assay; *D. melanogaster* sex-linked lethal.

WGK (German Aquatic Hazard Class): Nonwater polluting agent. (*metal*)

Description: Platinum is a soft, ductile, malleable, silver-white metal. It is found in the metallic form and as the arsenide, sperrylite. It forms complex soluble salts, such as Na_2PtCl_6. It also forms halides. Metallic platinum is insoluble in water. Platinum(IV) chloride is red-brown crystals or powder. Molecular weight = 195.09; 336.89 [Platinum(IV) chloride] Freezing/Melting point = (decomposes) 370°C. Soluble in water.

Potential Exposure: Compound Description (metal): Drug, Tumorigen, (platinum(IV) chloride) Mutagen; Reproductive Effector; Primary Irritant. Platinum and its alloys are utilized because of their resistance to corrosion and oxidation, particularly at high temperatures; their high electrical conductivity; and their excellent catalytic properties. They are used in relays, contacts and tubes in electronic equipment, in spark plug electrodes for aircraft, and windings in high-temperature electrical furnaces. Platinum alloys are used for standards for weight, length, and temperature measurement. Platinum and platinum catalysts (e.g., hexachloroplatinic acid, H_2PtCl_6) are widely used in the chemical industry in persulfuric, nitric, and sulfuric acid production, in the synthesis of organic compounds and vitamins, and for producing higher octane gasoline. They are coming into use in catalyst systems for control of exhaust pollutants from automobiles. They are used in the equipment for handling molten glass and manufacturing fibrous glass; in laboratory, medical, and dental apparatus; in electroplating; in photography; in jewelry; and in X-ray fluorescent screens. Because platinum complexes are used as antitumor agents, the potential for carcinogenic activity is present; tests to clarify this aspect should be conducted. While low levels of emissions of platinum particulate have been observed from some catalyst-equipped automobiles, the major potential source of Pt is from the disposal of spent catalysts.

Incompatibilities: Platinum metal is incompatible with aluminum, acetone, arsenic, ethane, hydrazine, hydrogen peroxide, lithium, phosphorus, selenium, tellurium, various fluorides. Platinum(IV) chloride and finely divided powders are incompatible with oxidizers.

Permissible Exposure Limits in Air

OSHA PEL (*soluble salts, as Pt*) 0.002 mg[Pt]/m^3 TWA.

NIOSH REL (*metal*): 1 mg/m^3; (*soluble salts, as Pt*): 0.002 mg[Pt]/m^3 TWA.

ACGIH TLV®[1] (*soluble salts, as Pt*): 1 mg/m^3 (metal); 0.002 mg[Pt]/m^3 TWA.

NIOSH IDLH: 4 mg [Pt]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 4 mg/m^3

DFG MAK (*chloroplatinates*): 0.002 mg[Pt]/m^3 Ceiling Concentration (peak should not be exceeded); danger of skin and airway sensitization.

Protective Action Criteria (PAC) 16941-12-1, Dihydrogen hexachloroplatinate.

TEEL-0: 0.0042 mg/m^3

PAC-1: 0.25 mg/m^3

PAC-2: 1.5 mg/m^3

PAC-3: 8.4 mg/m^3

Australia: TWA 1 mg/m^3, 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 1 mg/m^3, 1993; Finland: TWA 1 mg/m^3, 1999; France: VME 1 mg/m^3, 1999; Hungary: TWA 0.001 mg/m^3; STEL 0.002 mg/m^3, 1993; Norway: TWA 0.002 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Switzerland: MAK-W 0.002 mg[Pt]/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg/m^3. Several states have set guidelines or standards for platinum in ambient air[60] ranging from 0.1 μg/m^3 (Nevada) to 0.4−20.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (North Dakota) to 330.0 μg/m^3 (Virginia).

Platinum(IV)chloride

Arab Republic of Egypt: TWA 0.002 mg[Pt]/m^3 (*dust*), 1993; Australia: TWA 0.002 mg[Pt]/m^3, 1993; Austria: MAK 0.002 mg[Pt]/m^3, 1999; Belgium: TWA 0.002 mg [Pt]/m^3, 1993; Hungary: STEL 0.002 mg[Pt]/m^3, 1993; Norway: TWA 0.002 mg[Pt]/m^3, 1999; the Philippines: TWA 0.002 mg[Pt]/m^3, 1993; Switzerland: MAK-W 0.002 mg[Pt]/m^3, 1999; United Kingdom: LTEL 0.002 mg [Pt]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.002 mg[Pt]/m^3

Platinum cyanide

Protective Action Criteria (PAC)

TEEL-0: 0.00253 mg/m^3

PAC-1: 0.0076 mg/m^3

PAC-2: 0.0127 mg/m^3

PAC-3: 5.07 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) #7300, #7303, Elements by ICP; #8310, Metals in urine; #8005, Elements in blood or tissue, OSHA Analytical Method ID-121; ID-130-SG; NIOSH II(7), Method S-19, Soluble salts.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Metal dust and fume may cause irritation of the eyes, skin, and respiratory tract. Metal particles in the eye can cause scratching and possible damage. Hazards arise from the dust, droplets, spray, or mist of complex salts of platinum but not from the metal itself. These salts are sensitizers of the skin, nasal mucosa, and bronchi, and cause allergic phenomena. One case of contact dermatitis from wearing a ring made of platinum alloy is recorded.

Long Term Exposure: Characteristic symptoms of poisoning occur after 2−6 months of exposure and include pronounced irritation of the throat and nasal passages, which results in violent sneezing and coughing; bronchial irritation, which causes respiratory distress; and irritation of the skin, which produces cracking, bleeding, and pain. Respiratory symptoms can be so severe that exposed individuals may develop status asthmaticus. After recovery, most individuals develop allergic symptoms and experience further asthma attacks when exposed to even minimal amounts of platinum dust or mists. Mild cases of dermatitis involve only erythema and urticaria of the hands and forearms. More severe cases affect the face and neck. All pathology is limited to allergic manifestations. EPA research efforts indicate that platinum is more active biologically and toxicologically than previously believed. It methylates in aqueous media, establishing a previously unrecognized biotransformation and distribution mechanism.

Points of Attack: Respiratory system, skin, eyes.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); biologic tissue/biopsy; urine (chemical/metabolite). In preemployment and periodic physical examinations, the skin, eyes, and respiratory tract are most important. Any history of skin or pulmonary allergy should be noted, as well as exposure to other irritants or allergens, and smoking history. Periodic assessment of pulmonary function may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When chloroplatinic acid has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear appropriate splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (for soluble Pt salts): *Up to 0.05 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.1 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 4 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye iritation and damage; eye protection needed.

Storage: Color Code—White (*chloroplatinic acid)*: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Chloroplatinic acid, solid, is the only soluble salt cited. This compound requires a shipping label of “CORROSIVE.” It falls in Hazard Class 8 and Packing Group III. Fulminating platinum is also cited. Its Hazard class is “FORBIDDEN.”

Dry powder, in bulk, requires a shipping label of “SPONTANEOUSLY COMBUSTIBLE.” It falls in Hazard Class 4.2 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemicals appropriate for metal fires. *Do not use water*. Poisonous gases are produced in fire, including Pt. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Catalyst disposal is expected to be the largest contributor of Pt to the environment. The value of the metal would help to offset the cost of reclaiming the Pt from discarded catalysts. If direct vehicular emissions of Pt are found to be significant, particulate taps, which are available at reasonable cost, may provide a technological solution. In any event, recovery and recycling is the preferred technique for both health and economic reasons. Details of platinum recovery and recycling from plating wastes, platinum metal refinery effluents, spent catalysts, and precious metals scrap have been published.

WGK (German Aquatic Hazard Class): No value assigned.

Description: PBBs do not occur as natural products. Hexabromobiphenyl is the predominant isomer. These materials are heavy, highly brominated compounds. Typical is hexabromobiphenyl, $Br_3C_6H_2{-}C_6H_2Br_3$: Molecular weight = 627.62; decomposes at 300°C to 400°C. It will be used as an illustrative example of such compounds. PBBs are produced by direct bromination of biphenyl, and it could be anticipated that very complex mixtures of compounds differing from each other both in number of bromine atoms per molecule and by positional isomerism are formed. The possibility also exists (analogous to the PCBs) that halogenated dibenzofurans (e.g., Brominated dibenzofurans) may be trace contaminants in certain PBB formulations. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0.

Potential Exposure: The polybrominated biphenyls (PBBs) are inert substances and have been employed, primarily as fire retardants. For example, the PBBs were incorporated into thermoplastics at a concentration of about 15% to increase the heat stability of the plastic to which it is added. In 1973, 1−2 tons of PBBs, a highly toxic flame retardant, were accidentally mixed with an animal feed supplement and fed to cattle in Michigan. Contamination also resulted from traces of PBBs being discharged into the environment at the manufacturing site and at other facilities involved in handling PBBs. Approximately 250 dairy and 500 cattle farms were quarantined, tens of thousands of swine and cattle and more than one million chickens were destroyed, and lawsuits involving hundreds of millions of dollars were instituted. Before the nature of the contamination was recognized, many of the contaminated animals had been slaughtered, marketed, eaten; and eggs and milk of the contaminated animals were also consumed. Thus, large numbers of people have been exposed to PBBs; they are persistent in the environment and are concentrated in body fat. While commercial manufacture and distribution of PBBs have currently ceased, the full extent of the problem has not yet been assessed.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

The accidental contamination, in 1973, of animal feed and livestock throughout Michigan by polybrominated biphenyl flame retardants (Firemaster BP-6) has stimulated extensive studies of the potential for water contamination, transport, bioaccumulation, biological and toxicological nature of this class of environmental agent. While no immediate adverse health effects were noted in several thousand Michigan farm families that consumed milk and dairy products contaminated with PBBs, it is not possible to determine at this date any chronic or delayed effects that might be attributed to the PBBs or the potential ability of this chemical to cause birth defects.

Firemaster FF-1 (Firemaster BP-6 containing 2% of calcium trisilicate)—a mixture of pentabromobiphenyl, hexabromobiphenyl, and heptabromobiphenyl, with hexabromobiphenyl being the major component—administered by gavage produced neoplastic nodules and hepatocellular carcinomas in female Sherman strain rats. In another bioassay, Firemaster FF-1, also administered by gavage, was carcinogenic to Fisher 344 rats and B6C3F1 mice of each sex, inducing neoplastic nodules, hepatocellular carcinomas, and chloangiocarcinomas in rats and hepatocellular carcinomas in mice.

Long Term Exposure: Confirmed carcinogen. Experimental teratogenic and reproductive effects. Mutation data reported.

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Polyhalogenated biphenyls, liquid, require a shipping label of "CLASS 9." They fall in Hazard Class 9 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire, including bromine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical: Cancer 10/1/89; Reproductive toxin 1/1/91; (containing ≥60% chlorine by molecular weight) 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

Note: The EPA requires the following: All PCB transformer locations must be cleared of stored combustible materials (solvents, paints, paper, etc.). All PCB transformers must be registered with the local fire department. All PCB-containing equipment must be posted with a large yellow label and the exterior door of the vault, machinery room door and any other means of exit must also be marked with PCB yellow ID labels. All PCB-containing transformers must be inspected every 3[3] weeks; leaks must be repaired within 2[2] days and reported to the EPA within 5[5] days. In order to prevent fires, EPA recently required that high-voltage network transformers be removed and that enhanced electrical protection be added on many types of PCB transformers in commercial buildings.

List of Stockholm Convention POPs: Annex A (Elimination); Annex C (Unintentional production and release) *as PCBs*.

European/International Regulations: Hazard Symbol (*PCB*): Xn, N; Risk phrases: R33; R50/53; Safety phrases: S2; S35; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Arochlor 1242 is a colorless to light yellow-colored viscous liquid with a mild, hydrocarbon odor. Molecular weight = 258 (approx.); Specific gravity (H_2O:1) = 1.39 at 25°C; Boiling point = 325−366°C; Freezing/Melting point = −18°C; Vapor pressure = 0.001 mmHg at 25°C. Insoluble in water. Arochlor 1254 is a colorless to pale-yellow, viscous liquid (resinous state) or solid (below 10°C) with a mild, hydrocarbon odor. Molecular weight = 326 (approx.); Specific gravity (H_2O:1) = 1.39 at 25°C; Boiling point = 365−390°C; Freezing/Melting point = −18°C; Vapor pressure = 0.00006 mmHg at 25°C. Insoluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. $C_{12}H_{10-x}Cl_x$, diphenyl rings, in which one or more hydrogen atoms are replaced by a chlorine atom. Most widely used are chlorodiphenyl (42% chlorine), containing 3 chlorine atoms in unassigned positions, and chlorodiphenyl (54% chlorine) containing 5 chlorine atoms in unassigned positions. These compounds are light, straw-colored liquids with typical chlorinated aromatic odors; 42% chlorodiphenyl is a mobile liquid and 54% chlorodiphenyl is a viscous liquid. Insoluble in water. Polychlorinated biphenyls are prepared by the chlorination of biphenyl and hence are complex mixtures containing isomers of chlorobiphenyls with different chlorine contents. It should be noted that there are 209 possible compounds obtainable by substituting chlorine for hydrogen from 1−10 different positions on the biphenyl ring system. An estimated 40−70 different chlorinated biphenyl compounds can be present in each of the higher chlorinated commercial mixtures. For example, Aroclor 1254 contains 69 different molecules, which differ in the number and position of chlorine atoms. It should also be noted that certain PCB commercial mixtures (no longer produced in the United States) but produced in France, Germany, and Japan have been shown to contain other classes of chlorinated derivatives, e.g., chlorinated naphthalenes and chlorinated dibenzofurans. The possibility that naphthalene and dibenzofuran contaminate the technical biphenyl feedstock used in the preparation of the commercial PCB mixtures cannot be excluded.

Potential Exposure: Compound Description (Aroclor 1242): Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; (Aroclor 1254) Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. PCBs are mixtures of individual chemicals which are no longer produced in the United States but are still found in the environment. Chlorinated diphenyls are used alone and in combination with chlorinated naphthalenes. They are stable, thermoplastic, and nonflammable; they are used in heat transfer and hydraulic fluids, lubricants, and insecticide formulations; they found use in insulation for electric cables and wires; in the production of electric condensers; as additives for extreme pressure lubricants; and as a coating in foundry use. Polychlorinated biphenyls (PCBs, first introduced into commercial use more than 45 years ago) are one member of a class of chlorinated aromatic organic compounds which are of increasing concern because of their apparent ubiquitous dispersal, persistence in the environment, and tendency to accumulate in food chains, with possible adverse effects on animals at the top of food webs, including man.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

1336-36-3 (Aroclor PCBs); (42% Cl)
TEEL-0: 0.04 mg/m^3

PAC-3: 500 mg/m^3
OSHA PEL: 1 mg/m^3 TWA [skin]
NIOSH REL: 0.001 mg/m^3 TWA (The REL also applies to other PCBs); A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 1 mg/m^3 TWA [skin].
DFG MAK: 0.1 ppm/1.1 mg/m^3 TWA; Peak Limitation Category II(8) [skin]; Carcinogen Category 3B; Pregnancy Risk Group B.
NIOSH IDLH: potential occupational carcinogen 5 mg/m^3.
Australia: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], carcinogen, 1993; Austria: MAK 0.1 ppm (1 mg/m^3), [skin], suspected carcinogen, 1999; Belgium: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], 1993; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 1993; France: VME 1 mg/m^3, [skin], 1999; Japan: 0.1 mg/m^3, [skin], 2A carcinogen, 1999; the Netherlands: MAC-TGG 1 mg/m^3, [skin], 2003; the Philippines: TWA 1 mg/m^3, [skin], 1993; Poland: MAC (TWA) 1 mg/m^3, 1999; Sweden: NGV 0.01 mg/m^3, KTV 0.3 mg/m^3, [skin], carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (1 mg/m^3), [skin], 1999; United Kingdom: TWA 0.1 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg/m^3 [skin]
54% chlorine
OSHA PEL: 0.5 mg/m^3 TWA [skin].
NIOSH REL: 0.001 mg/m^3 (applies to all PCBs) TWA [skin]. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
DFG MAK: 0.05 ppm/0.70 mg/m^3 TWA; Peak Limitation Category II(8) [skin]; Carcinogen Category 3B; Pregnancy Risk Group B.
NIOSH IDLH: 5 mg/m^3.
Australia: TWA 0.5 mg/m^3; STEL 1 mg/m^3, [skin], Carcinogen, 1993; Austria: MAK 0.05 ppm (0.5 mg/m^3), [skin], suspected carcinogen, 1999; Belgium: TWA 0.5 mg/m^3; STEL 1 mg/m^3, [skin], 1993; France: VME 0.5 mg/m^3, [skin], 1999; Japan: 0.1 mg/m^3, [skin], 2A carcinogen, 1999; Norway: TWA 0.01 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, [skin], 2003; Poland: MAC (TWA) 1 mg/m^3, 1999; Sweden: NGV 0.1 mg/m^3, KTV 0.3 mg/m^3, [skin], carcinogen, 1999; Switzerland: MAK-W 0.05 ppm (0.5 mg/m^3), [skin], 1999; Turkey: TWA 1 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic has set a TWA of 0.5 mg/m^3 and a ceiling value of 1.0 mg/m^3.
PCB oxide
0.5 mg/m^3, inhalable fraction [skin].
Several states have set guidelines or standards for PCB's in ambient air[60] as follows (all in μg/m^3).

Determination in Air: Use NIOSH Analytical Method #5503, Polychlorobiphenyls; #8004, Polychlorobiphenyls in serum; #PV-2089, Chlorodiphenyl (42% Chlorine); #PV-2088, Chlorodiphenyl (54% Chlorine).

Permissible Concentration in Water: To protect freshwater aquatic life: 0.014 μg/L as a 24-h average. To protect saltwater aquatic life: 0.030 μg/L as a 24-h average. To protect human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 0.00079 μg/L.[6] The EPA has set a maximum contaminant level of 0.0005 milligrams PCBs per liter of drinking water (0.0005 mg/L). The EPA requires that spills of 1 lb or more of PBCs be reported to the EPA.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 6.25 (54% Chlorine) (estimated).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Inhalation of fume or vapor and percutaneous absorption of liquid, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May produce irritation to nose, throat, and lungs. The vapors can cause coughing and/or difficulty in breathing. Levels above 10 mg/m^3 are reported to be unbearable. Inhalation may contribute significantly to all symptoms of long-term exposure. *Skin:* Absorption moderate. Contributes significantly to all symptoms of long-term exposure. Sensitized individuals may develop a rash after 2 days exposure by contact or inhalation. *Eyes:* May produce irritation and burns. Levels of

10 mg/m^3 are severely irritating. *Ingestion:* Absorption in digestive system contributes significantly to all symptoms of long-term exposure. There are no reported deaths of humans due to a single ingestion. However, experiments in animals suggest that ingestion of 6−10 fluid ounces would cause death to a healthy a 150-lb adult.

Long Term Exposure: Repeated or prolonged contact with skin may cause acne-like skin rash (chloroacne). The substance may cause liver damage. High exposure can damage the nervous system. PCBs are readily absorbed into the body by all routes of exposure. They may persist in tissues for years after exposure stops. The symptoms below may be due to PCBs or to chemical contaminants. High levels of PCB vapor, 1−10 mg/m^3, may produce burning feeling in eyes, nose, and face; dry throat; lung and throat irritation; nausea, dizziness, and aggravation of acne. These may be felt immediately or be delayed weeks or months. Chemical acne, black heads, dark patches on skin, and unusual eye discharge have been reported by all routes of exposure. Although some sensitive individuals have reported these effects after 2 days, onset may not occur for months. These effects may last for months. Digestive disturbance have been reported in some individuals. PCBs may impair the function of the immune system. High levels of PCBs have been shown to produce cancer and birth defects in laboratory animals. Whether PCBs produce these effects in humans is not known.

Points of Attack: Liver, skin, nervous system. Cancer site in animals: liver.

Medical Surveillance: NIOSH lists the following tests: Adipose Tissue; whole blood (chemical/metabolite); blood serum; blood plasma; liver function tests. Before beginning employment and at regular times after that, the following are recommended: Serum Triglycerides level. Examination of the skin. Examination of the nervous system. Nerve conduction studies should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. *Chlorodiphenyl* (42% chlorine) 53469-21-9. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm/min): butyl rubber gloves, suits, boots; Neoprene™ rubber gloves, suits, boots; Teflon™ gloves, suits, boots; Viton™ gloves, suits; Saranex™ coated suits, Barricade™ coated suits; Responder™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. *Chlorodiphenyl* (54% chlorine) 11097-69-1. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm/min): butyl rubber gloves, suits, boots; Neoprene™ rubber gloves, suits, boots; Teflon™ gloves, suits, boots; Viton™ gloves, suits, Saranex™ coated suits, Barricade™ coated suits; Responder™ suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document: #77-225, *Occupational Exposure to Polychlorinated Biphenyls.*

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) (any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with these chemicals you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Polychlorinated biphenyls require a shipping label of “CLASS 9.” They fall in DOT Hazard Class 9 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Spills of 1[1] lb or more must be reported to the EPA.

Fire Extinguishing: PCBs may burn but do not easily ignite. Poisonous gases, including dioxin and chlorinated dibenzofurans, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration at 1648°C with scrubbing to remove any chlorine-containing products. In addition, some chemical waste landfills have been approved for PCB disposal. More recently, treatment with metallic sodium has been advocated which yields a low molecular weight polyphenylene and sodium chloride.

Portland cement P:0830

Molecular Formula: Ca_2O_4Si; $Al_2Ca_3O_6$; Ca_3O_5Si; $Al_2Ca_4Fe_2O_{10}$

Common Formula: $2CaO \cdot SiO_2$; $3CaO \cdot Al_2O_3$; $3CaO \cdot SiO_2$; $4CaO \cdot Al_2O_3 \cdot Fe_2O_3$

Synonyms: Cement; Hydraulic cement; Portland cement silicate

CAS Registry Number: 65997-15-1; 68475-76-3 (flue dust, portland cement)

RTECS® Number: VV8770000

EC Number: 266-043-4; 270-659-9 (flue dust, portland cement)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Description: Portland cement is a class of hydraulic cements containing tri- and dicalcium silicate in addition to varying amounts of alumina, tricalcium aluminate, and iron oxide. The quartz content of most is below 1%. The average composition of regular Portland cement is as follows: CaO (64.0%); SiO_2 (21.0%); Al_2O_3 (5.8%); Fe_2O_3 (2.9%); MgO (2.5%); Alkali oxides (1.4%); SO_3 (1.7%). Freezing/Melting point = >1050°C. Reacts with water.

Potential Exposure: Cement is used as a binding agent in mortar and concrete (a mixture of cement, gravel, and sand). Potentially hazardous exposure may occur during both the manufacture and use of cement.

Incompatibilities: None reported.

Permissible Exposure Limits in Air

OSHA PEL: 50 mppcf TWA or 15 mg/m^3, total dust TWA; 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 10 mg/m^3, total dust TWA; 5 mg/m^3 TWA, respirable fraction.

ACGIH TLV®[1]: 1 mg/m^3, respirable fraction TWA the value is for particulate matter containing no asbestos and <1% crystalline silica (free SiO_2), not classifiable as a human carcinogen.

NIOSH IDLH: 5000 mg/m^3.

No TEEL available.

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Sweden: NGV 10 mg/m^3 (total dust), 1999; Sweden: NGV 5 mg/m^3 (respirable dust), 1999; Switzerland: MAK-W 6 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3, total inhalable dust, 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3 for particulate matter containing no asbestos and <1% crystalline silica (free SiO_2).

Determination in Air: NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust; OSHA Analytical Method ID-207, Portland cement (total dust).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and nose with cough, expectoration, exertional dyspnea (breathing difficulty), wheezing.

Long Term Exposure: May cause chronic bronchitis. Exposure may produce cement dermatitis which is usually due to primary irritation from the alkaline, hygroscopic, and abrasive properties of cement. Chronic irritation of the eyes and nose may occur. In some cases, cement workers have developed an allergic sensitivity to constituents of cement, such as hexavalent chromate. It is not unusual for cement dermatitis to be prolonged and to involve covered areas of the body. No documented cases of pneumoconiosis or other systemic manifestations attributed to finished Portland cement exposure have been reported. Conflicting reports of pneumoconiosis from cement dust appear related to exposures that occurred in mining, quarrying, or crushing silica-containing raw materials.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). Preemployment and periodic medical examinations should stress significant respiratory problems, smoking history, and allergic skin sensitivities. The eyes should be examined. Patch test studies may be useful in dermatitis cases.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent prolonged skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 50 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 100 mg/m^3:* 95XQ (APF = 10) (any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100) or Sa (APF = 10) (any supplied-air respirator). *Up to 250 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 500 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 5000 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishers suitable for surrounding fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill. In some cases, recovery of cement from cement kiln dust or ready-mix concrete residues may be economic, and the technology is available.

Potassium metal P:0840

Molecular Formula: K

Synonyms: Elemental potassium; Kalium

CAS Registry Number: 7440-09-7

RTECS® Number: TS6460000

UN/NA & ERG Number: UN2257/130; UN1420 (metal alloys)/138; metal powder, in bulk, may be pyrophoric: UN3089 (Metal powder, flammable, n.o.s.)/170

EC Number: 231-119-8 [*Annex I Index No.:* 019-001-00-2]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R14; R34; Safety phrases: S1/2; S5 (If appropriate); S8; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Potassium is a soft silvery metal. Molecular weight = 39.10; Boiling point = 774°C; Freezing/Melting point = 64°C; Autoignition temperature = 441°C. Hazard Identification (based on NFPA-704 M Rating System) *(lump)*: Health 3, Flammability 3, Reactivity 3₩. Reacts violently with water.

Potential Exposure: Used as a reagent and in sodium–potassium alloys which are used as high-temperature heat transfer media.

Incompatibilities: Air contact causes spontaneous ignition. Violent reaction with water, forming heat, spattering, corrosive potassium hydroxide, and explosive hydrogen. The heat from the reaction can ignite the hydrogen that is generated. A powerful reducing agent. Violent reaction with oxidizers, organic materials, carbon dioxide, heavy metal compounds, carbon tetrachloride, halogenated hydrocarbons, easily oxidized materials, and many other substances. Store under nitrogen, mineral oil, or kerosene. Oxidizes and forms unstable peroxides under storage conditions. Potassium metal containing an oxide coating is an extremely dangerous explosion hazard and should be removed and destroyed.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.075 mg/m^3

PAC-1: 0.2 mg/m^3

PAC-2: 1.5 mg/m^3

PAC-3: 300 mg/m^3

Permissible Concentration in Water: No criteria set. (Reacts with water).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium can affect you when breathed in. Inhalation of dusts or mists can irritate the eyes, nose, throat, and lungs with sneezing, coughing, and sore throat. Higher exposures may cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. Skin and eye contact can cause severe burns leading to permanent damage.

Long Term Exposure: Prolonged exposure to fumes can cause sores of the inner nose and nasal septum. Fumes can irritate the lungs; bronchitis may develop.

Points of Attack: Lungs, skin

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water. Continue without stopping for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately.

Skin Contact: Quickly remove contaminated clothing. Immediately wash area with large amounts of water. Seek medical attention immediately.

Breathing: Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to potassium, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive mode or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe (*lump*): Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium must be stored to avoid contact with carbon monoxide and moisture, compounds of heavy metals (such as silver oxide and silver chloride) and carbon tetrachloride since violent reactions occur. Store under nitrogen, mineral oil, or kerosene. Sources of ignition, such as smoking and open flames, are prohibited where potassium metal is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Potassium requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group II. Potassium, metal alloys, requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group II. For Metal powder, flammable, n.o.s. the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall in Hazard Class 4.2 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium is spontaneously combustible. Use dry chemical, dry graphite, soda ash, or lime extinguishers. *Do not use water*, carbon dioxide, or foam. Potassium may ignite in the presence of moisture or itself if exposed to air. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium arsenate P:0850

Molecular Formula: AsH_2KO_4

Common Formula: KH_2AsO_4

Synonyms: Arsenic acid, Monopotassium salt; Arseniato potasico (Spanish); Macquer's salt; Monopotassium arsenate; Monopotassium dihydrogen arsenate; Potassium acid arsenate; Potassium arsenate, monobasic; Potassium dihydrogen arsenate; Potassium hydrogen arsenate

CAS Registry Number: 7784-41-0

RTECS$^{®}$ Number: CG1100000

UN/NA & ERG Number: UN1677/151

EC Number: 232-065-8

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence*, carcinogenic to humans*, Group 1, 1987.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

As arsenic compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds.

Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganics 0.1%; organics 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

California Proposition 65 Chemical: (*inorganic arsenic*) Cancer 2/27/87.

Canada: Priority Substance List & Restricted Substances/Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Potassium arsenate is a colorless to white crystalline solid. Molecular weight = 180.04; Specific gravity = 3.74; Boiling point = 463°C; Freezing/Melting point = 288°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1.

Potential Exposure: Compound Description: Tumorigen. Potassium arsenate is used in the textile, tanning, preserving hides; in the textile printing and paper industries; and as an insecticide in fly baits, especially for fly paper; as laboratory reagent.

Incompatibilities: A weak base. Reacts with strong oxidizers, bromine azide, acids and decomposes on contact with strong acids producing acetic acid fumes. Arsine, a very deadly gas, can be released in the presence of acid, acid mists, or hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled. See [1910.1018].

NIOSH REL: 0.002 mg[As]/m^3 15 min Ceiling Concentration. A potential occupational carcinogen. Limit exposure to lowest feasible concentration; See Appendix A.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen.

NIOSH IDLH: potential occupational carcinogen 5 mg [As]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.024 mg/m^3

PAC-1: 0.35 mg/m^3

PAC-2: 2.5 mg/m^3

PAC-3: 12 mg/m^3

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/end-of-shift; Carcinogen Category 1.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on a daily average basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105.

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons but has set a guideline of 50 μg/L[61] for drinking water.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Potassium arsenate can affect you when breathed, and may enter through skin. Potassium arsenate is a carcinogen; handle with extreme caution. Eye contact causes irritation, burns and red, watery eyes. Skin contact can cause burning, itching, and rash. Breathing can cause irritation with sneezing and coughing. High or repeated exposures can cause disturbed sleep, with numbness and weakness of arms and legs; and can cause poor appetite; nausea, cramps, and if severe, vomiting and diarrhea.

Long Term Exposure: Long-term exposure can cause ulcer or hole in the nasal septum; hoarseness and sore eyes also occur. Repeated exposure can cause nervous system damage. Repeated skin contact can cause thickened skin and/or patchy area of darkening and loss of pigment.

Points of Attack: Nervous system, skin.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: examination of the nose, skin, eyes, nails, nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). At NIOSH recommended exposure levels, urine arsenic should not be greater than 50−100 μg/L of urine. After suspected overexposure, repeat these tests. Also, examine your skin periodically for abnormal growths. Skin cancer from arsenic is easily cured when detected early.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL has been used. For milder poisoning penicillamine (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposures. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where potassium arsenate is handled, used, or stored as required by OSHA Standard 29 CFR 1910.1018 for inorganic arsenic. Potassium arsenate must be stored to avoid contact with acids. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Potassium arsenate itself does not burn. Poisonous gases are produced in fire, including arsenic trioxide and potassium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Highly water polluting.

Description: Potassium arsenite is a white crystalline solid. Decomposes below Freezing/Melting point at 300°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Human Data. Potassium metaarsenite is used in veterinary medicine; and for chronic dermatitis in man. Potassium arsenite reduces silver salt to metallic silver during mirror silvering. Currently, it is probably not being used for this purpose.

Incompatibilities: A weak base. Reacts with acids and decomposes on contact with strong acids producing acetic acid fumes. Arsine, a very deadly gas, can be released in the presence of acid or acid mist. Incompatible with alkaloidal salts, strong oxidizers, bromine azide, hypophosphites, sulfites in acid solution, iron salts, heavy metals and heavy metal compounds. Hydrogen gas can react with inorganic arsenic to form the highly toxic gas, arsine.

Permissible Exposure Limits in Air

Russia[43] set a MAC of 0.003 mg/m^3 on a daily average basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air: [60] 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (inorganic arsenic): #7300, #7301, #7303, #7900, #9102; OSHA Analytical Methods ID-105.

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic on a human health basis. EPA[61] has set a guideline for drinking water of 50 μg/L of arsenic.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can cause irritation with a burning sensation; itching. High exposure can cause loss of appetite; garlic or metallic taste; nausea, vomiting, and muscle cramps. May affect the central nervous system, digestive tract, circulatory system, causing loss of fluids and electrolytes; may cause collapse, shock, and death. Very toxic: probable oral lethal dose in humans is 50−500 mg/kg, or between 1 teaspoonful and 1 oz for a 150-lb adult. Nausea, vomiting, and diarrhea result from arsenic ingestion. Patient may go into collapse and shock with weak, rapid pulse, cold sweat, coma, and death. Exposure at low level may result in death.

Long Term Exposure: May cause liver damage, cirrhosis, jaundice. A skin allergen. Repeated or prolonged contact may cause skin sensitization. Itching or skin pigmentation changes may occur. May affect the peripheral nervous system, causing weakness in the hands and feet. May cause an ulcer in the inner nose, perforation of the nasal septum, and cirrhosis. This substance is carcinogenic to humans. Chronic arsenic poisoning may manifest itself by loss of appetite; cramps, nausea, constipation, or diarrhea.

Points of Attack: Liver, skin.

Medical Surveillance: Liver function testing. Examination of the nervous system. Examination of the nose, eyes, nails, and skin. Test for urine arsenic. Arsenic should not be greater than 100 μg/g of creatinine in the urine. Tests are most accurate at the end of a workday and may be inaccurate within 2 days of eating shellfish. If abnormal growths are detected on the skin, they can be easily cured when detected early.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where potassium arsenite is handled, used, or stored as required by OSHA Standard 29 CFR 1910.1018 for inorganic arsenic. Store in tightly closed containers in a cool, well-ventilated area away from acids, acid fumes, alkaloidal salts, strong oxidizers, bromine azide, hypophosphites, sulfites in acid solution, iron salts, heavy metals and heavy metal compounds. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Potassium arsenite (solid) requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid inhalation and skin contact. Dike far ahead of spill for later disposal. Do not touch spilled material; stop leak if you can do it without risk. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agents suitable for surrounding fire. Potassium arsenite itself does not burn. Keep unnecessary people away; stay upwind; keep out of low areas. Wear full protective clothing and self-contained breathing apparatus. Poisonous gases are produced in fire, including arsenic, phosgene, and potassium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium bromate P:0870

Molecular Formula: $BrKO_3$

Common Formula: $KBrO_3$

Synonyms: Bromato potasico (Spanish); Bromic acid, potassium salt

CAS Registry Number: 7758-01-2

RTECS® Number: EF8725000

UN/NA & ERG Number: UN1484/140

EC Number: 231-829-8 [*Annex I Index No.:* 035-003-00-6]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1999; EPA: Likely to produce cancer in humans (inhalation, as bromates); Available data are inadequate for an assessment of human carcinogenic potential (oral route, as bromates); Limited evidence of carcinogenicity based on epidemiologic studies.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

California Proposition 65 Chemical: Cancer 1/1/90.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

European/International Regulations: Hazard Symbol: T, O; Risk phrases: R45; R9; R25; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Potassium bromate is a white crystalline solid. Molecular weight = 167.01; Decomposes at 370°C; Freezing/Melting point = 350°C; also reported at 435°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3 (Oxidizer). Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. Potassium bromate is used as animal feed additive, food additive; flavor and packaging material; as a laboratory reagent; and oxidizing agent.

Incompatibilities: A strong oxidizer. Reacts violently with combustibles, organics, reducing agents, powdered metals, metal sulfides, carbon, sulfur, phosphorus, ammonium salts, oxidizers. Incompatible with aluminum, copper.

Permissible Exposure Limits in Air

AIHA WEEL: 0.1 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 60 mg/m^3

United Kingdom: carcinogen, 2000.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium bromate can affect you when breathed in and may enter the body through the skin. Skin and eye contact can cause irritation, and burns may occur with prolonged contact. Breathing the mist or dust can irritate the nose, throat, and bronchial tubes, causing sneezing and coughing. Overexposure can cause kidney damage. Ingestion may affect the gastrointestinal tract and central nervous system.

Long Term Exposure: This substance is possibly carcinogenic to humans. May affect the nervous system causing headache, irritability, impaired thinking, and personality changes. May cause kidney damage. May cause lung irritation; bronchitis may develop.

Points of Attack: Lungs, kidneys, nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: kidney function tests. Examination of the nervous system. Interview for brain damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to potassium bromate, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium bromate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and other incompatible materials listed above since violent reactions can occur. Protect storage containers against physical damage. Avoid storage on wood floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium bromate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use only water. Do not use chemical or carbon dioxide extinguishers. Poisonous gases are produced in fire, including bromine, potassium oxide, and oxygen, which increases fire hazard. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium chlorate P:0880

Molecular Formula: $ClKO_3$

Common Formula: $KClO_3$

Synonyms: Berthollet's salt; Chlorate de potassium (French); Chlorate of potash; Chloric acid, Potassium salt; Fekabit; Kaliumchlorat (German); Oxymuriate of potash; Pearl ash; Potash chlorate; Potassium (chlorate de) (French); Potassium oxymuriate; Potcrate; Salt of tartar

CAS Registry Number: 3811-04-9

RTECS$^®$ Number: FO0350000

UN/NA & ERG Number: UN2427 (solution)/140; UN1485 (solid)/140

EC Number: 223-289-7[017-004-00-3]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

FDA—over-the-counter drug.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Potassium chlorate is a white crystalline solid. Molecular weight = 122.55; Boiling point = decomposes below BP at 400°C; Freezing/Melting point = 360°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1 (Oxidizer). Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Human Data. Potassium chlorate is used in the manufacture of soap, glass, pottery, and many potassium salts; as an oxidizing agent, in explosives, matches, textile printing; disinfectants, and bleaching.

Incompatibilities: A strong oxidizer. Decomposes on heating above 400°C, on contact with strong acids producing toxic fumes including chlorine dioxide, chlorine fumes, and oxygen. Violent reaction with combustibles, oxidizers, strong acids, and reducing materials. Attacks many metals in the presence of water.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 12.5 mg/m^3
PAC-1: 40 mg/m^3
PAC-2: 300 mg/m^3
PAC-3: 350 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium chlorate can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Prolonged contact can cause eye and skin burns and possible permanent damage. Exposure lowers the ability of the blood to carry oxygen (methemoglobinemia). This can result in a bluish color to skin and lips, headache, dizziness, collapse, and even death. Breathing the dust or mist can cause nose and throat irritation with sneezing, coughing, and sore throat. High exposure may cause kidney damage.

Long Term Exposure: May cause lung damage; bronchitis may develop. Repeated exposures may affect the kidneys and central nervous system.

Points of Attack: Lungs, kidneys, nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: A blood test for methemoglobin level. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to potassium chlorate, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium chlorate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Protect storage containers from physical damage. Avoid storage on wood floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Potassium chlorate requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II. Potassium chlorate, *aqueous solution*, requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use water spray only. Do not use dry chemical, halon, foam, or carbon dioxide extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Potassium tetrachloroplatinate(II), K_2PtCl_4 is a ruby-red crystalline solid and Potassium hexachloroplatinate (IV), K_2PtCl_6 is an orange-yellow solid. Molecular weight = 485.89 (*hexa-*); 415.09 (*tetra-*); Freezing/Melting point = (decomposes) at 250°C (*hexa-*). Hazard Identification (based on NFPA-704 M Rating System): (*hexa-*) Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: These materials are used in photography.

Permissible Exposure Limits in Air

OSHA PEL: 0.002 mg[Pt]/m^3 TWA

NIOSH REL: 0.002 mg[Pt]/m^3 TWA

ACGIH TLV®[1]: 1 0.002 mg[Pt]/m^3 TWA

NIOSH IDLH: 4 mg [Pt]/m^3

No TEEL available

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.

Several states have set guidelines or standards for platinum in ambient air[60] ranging from 0.1 μg/m^3 (Nevada) to 0.4-20.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (North Dakota) to 330.0 μg/m^3 (Virginia).

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts)

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium chloroplatinates can affect you when breathed in. Severe allergy can develop to potassium chloroplatinates. Symptoms include asthma (with cough, wheezing, and/or shortness of breath), runny nose, and/or skin rash, sometimes with hives. If allergy develops, even small future exposure can trigger significant symptoms. Some persons exposed to this type of chemical have developed lung scarring. Family members can develop allergy to dust carried home on work clothing. It may irritate the eyes, nose, and throat. High exposure may cause irritability and even seizures.

Long Term Exposure: May cause skin sensitization and dermatitis and/or asthma-like allergy. Tetrachloroplatinates are mutagens.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray every 3 years should be considered if above tests are not normal. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (for soluble Pt salts): *Up to 0.05 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.1 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 4 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

* Substance cause eye irritation and damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic solid, corrosive, inorganic, n.o.s., (*Platinium (IV) potassium chloride*) requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in DOT/UN Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals may burn but do not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chlorides and potassium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations (*chromate*): Hazard Symbol: T+, N; Risk phrases: R49; R46; R36/37/38; R43; R50/53; Safety phrases: S53; S45; S60; S61; (*dichromate*). Hazard Symbol: T+, N; Risk phrases: R45; R46; R60; R61; R8; R21; R25; R26; R34; R42/43;R48/23; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Potassium chromate(VI) is a yellow crystalline solid. Molecular weight = 194.20; Freezing/Melting point = 971°C. Soluble in water. Potassium dichromate(VI) is a yellowish-red crystalline solid. Molecular weight = 294.20; Boiling point = decomposition at 500°C; Freezing/Melting point = 398°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3 (Oxidizer). Soluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Natural Product; Primary Irritant. Potassium chromate is used in printing, photomechanical processing, chrome-pigment production, and wool preservative methods; to make dyes, pigments, inks, and enamels; as an oxidizing agent, analytical reagent; in electroplating, explosives.
Incompatibilities: A powerful oxidizer. Violent reactions with combustibles, organics, powdered metals, or easily oxidizable substances. Contact with hydrazine causes explosion.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.0187 mg/m^3
PAC-1: 2 mg/m^3
PAC-2: 12.5 mg/m^3
PAC-3: 56 mg/m^3
OSHA PEL: 0.1 mg[CrO_3]/m^3 Ceiling Concentration.
NIOSH REL: 0.001mg[CrO_3]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid; *tert*-butyl chromate; zinc chromate; and chromyl chloride) to be potential occupational carcinogens.
ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.
DFG MAK: Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.
NIOSH IDLH: 15 mg[Cr(VI)]/m^3.
United Kingdom: carcinogen, 2000; the former USSR-UNEP/IRPTC joint project[43] give a MAC of 0.01 mg/m^3 in work-place air. Connecticut[60] has set a guideline of 0.25 μg/m^3 for chromium trioxide in ambient air; Sweden[35] for potassium chromate at 0.02 mg/m^3 as a TWA in work-place air. North Carolina[60] has set a guideline of zero for ambient air for both compounds.
7778-50-9 (dichromate)
Protective Action Criteria (PAC)
TEEL-0: 0.0141 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 42.4 mg/m^3
Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.
Permissible Concentration in Water: The EPA[6] has designated chromium as a priority toxic pollutant. To protect human health, the limits are trivalent chromium (in chromates): 170 μg/L and hexavalent chromium (in dichromates) 50 μg/L.
Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by

colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium (VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μm filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium chromates can affect you when breathed in. It can also pass into inner layers of the skin. Eye contact can cause severe damage with possible loss of vision. Irritation of nose, throat, and bronchial tubes can occur, with cough and/or wheezing. Skin contact can cause severe irritation, deep ulcers, or an allergic skin rash.

Long Term Exposure: Potassium chromate is a human carcinogen. Potassium chromates can cause a sore or perforated nasal septum; with bleeding, discharge or crusting. May cause skin allergy. Can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: examination of the nose and skin. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Also, check your skin daily for little bumps or blisters, the first sign of "chrome ulcers." If not treated early, these can last for years after exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. (As chromic acid and chromates) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 $\mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation, For *potassium dichromate*, Neoprene™ and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium chromates must be stored to avoid contact with combustible, organic, or other easily oxidized materials (such as paper, wood, sulfur, aluminum, hydrazine, and plastics) since violent reactions occur. A regulated, marked area should be established where potassium chromate is handled, used, or stored. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Oxidizing solid, n.o.s. requires a shipping label of "OXIDIZER." They fall in DOT Hazard Class 5.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Ventilate area after cleanup is complete. Keep potassium dichromate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chromium and potassium oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants, as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as cyanide compounds, inorganic, n.o.s.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Potassium cyanide is available as white lumps, granular powder, or colorless solution. It may be shipped as capsules, tablets, or pellets. Toxic hydrogen cyanide gas released by potassium cyanide has a distinctive, mild, bitter almond odor, but many people cannot detect it; the odor does not provide adequate warning of hazardous concentrations. Molecular weight = 65.12; Specific gravity (H_2O:1) = 1.55 at 20°C; Boiling point = 1625°C; Freezing/Melting point = 633.9°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Soluble in water; solubility = 72% at 25°C.

Potential Exposure: Compound Description: Organometallic, Mutagen; Reproductive Effector; Human Data. Used in electroplating, steel hardening, extraction of precious metals form ores, as a fumigant, in insecticides, a reagent in analytical chemistry.

Incompatibilities: Potassium cyanide decomposes on contact with water, humidity, carbon dioxide, strong acids (such as hydrochloric, sulfuric, and nitric acids), and acid salts, producing highly toxic and highly flammable hydrogen cyanide gas. Potassium cyanide absorbs water from air (is hygroscopic or deliquescent); the aqueous solution is a strong base. Incompatible with organic anhydrides, isocyanates, alkylene oxides, epichlorohydrin, aldehydes, alcohols, glycols, phenols, cresols, caprolactum, strong oxidizers, nitrogen trichloride, sodium chlorate. Attacks aluminum, copper, zinc in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

Protective Action Criteria (PAC)*

TEEL-0: 5.3 mg/m^3

PAC-1: **5.3** mg/m^3

PAC-2: **19** mg/m^3

PAC-3: **40** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

NIOSH IDLH: 25 mg[CN]/m^3.

Skin contact may contribute significantly in overall exposure. Australia: TWA 5 mg/m^3, [skin], 1993; Austria: MAK 5 mg [CN]/m^3, [skin], 1999; Denmark: TWA 5 mg/m^3, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, KZG-W 10 mg/m^3, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 mg/m^3 [skin]. Russia[43] has set a MAC value of 0.009 mg/m^3 for ambient air in residential areas on a momentary basis and 0.004 mg/m^3 on a daily average basis. Several states have set guidelines or standards for cyanides in ambient air[60] ranging from 16.7 μg/m^3 (New York) to 50.0 μg/m^3 (Florida and North Dakota) to 80.0 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut and South Dakota) to 125 μg/m^3 (South Carolina) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen cyanide.[18]

Permissible Concentration in Water: In 1976 the EPA criterion was 5.0 μg/L for freshwater and marine aquatic life and wildlife. As of 1980, the criteria are: *To protect freshwater aquatic life:* 3.5 μg/L as a 24-h average, never to exceed 52.0 μg/L. *To protect saltwater aquatic life:* 30.0 μg/L on an acute toxicity basis; 2.0 μg/L on a chronic toxicity basis. *To protect human health:* 200 μg/L. The allowable daily intake for man is 8.4 mg/day.[6] On the international scene, the South African Bureau of Standards has set 10 μg/L, the World Health Organization (WHO) 10 μg/L, and Germany 50 μg/L as drinking water standards. Other international limits[35] include an EEC limit of 50 μg/L; Mexican limits of 200 μg/L in drinking water and 1.0 μg/L in coastal waters; and a Swedish limit of 100 μg/L. Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes and 50 μg/L in water for fishery purposes. The US EPA[49] has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 μg/L. States which have set guidelines for cyanides in drinking water[61] include Arizona at 160 μg/L and Kansas at 220 μg/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Potassium cyanide is corrosive to the eyes, skin, and the respiratory tract. Contact can cause skin and eye burns, and possible permanent eye damage. Inhalation can cause lung irritation with coughing, sneezing, and difficult breathing; slow gasping respiration. Corrosive if swallowed. These substances may affect the central nervous system. Symptoms include headaches, confusion, nausea, pounding heart, weakness, unconsciousness, and death.

Long Term Exposure: Repeated or prolonged contact with potassium cyanide may cause thyroid gland enlargement and interfere with thyroid function. May cause nosebleed and sores in the nose; changes in blood cell count. May cause central nervous system damage with headache, dizziness, confusion; nausea, vomiting, pounding heart, weakness in the arms and legs, unconsciousness, and death. May affect liver and kidney function.

Points of Attack: Liver, kidneys, skin, cardiovascular system, central nervous system, thyroid gland.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Blood cyanide levels. Complete blood count (CBC). Evaluation of thyroid function. Liver function tests. Kidney function tests. Central nervous system tests. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep under observation for 24−48 h as symptoms may return. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or Sa: Pd,Pp (APF = 1000): ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. *Note to physician:* For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care. *Note to physician:* For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, acid salts, oxidizers, light, and moisture. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Potassium cyanide require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and in Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. This chemical has a lower explosive limit; ventilate closed spaces before entering them. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line). UN 1680 (Potassium cyanide) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: KCN is not combustible itself but it decomposes in the presence of moisture, damp air, or carbon dioxide, producing highly toxic and flammable hydrogen cyanide gas and oxides of nitrogen. NO acidic dry chemical extinguishers. NO hydrous agents. NO water. NO carbon dioxide. Use dry chemical and foam on surrounding fires. Vapors are heavier than air and may collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not allow water to enter open containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA

1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Add strong alkaline hypochlorite and react for 24 h. Then flush to sewer with large volumes of water.[22]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R31; R36/37; R50/53; Safety phrases: S2; S8; S26; S41; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Potassium dichloroisocyanurate is a white crystalline solid with a chlorine odor. Molecular weight = 237.07; Freezing/Melting point = (decomposes) 250°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2. Oxidizer. Reacts with water; Slightly soluble; solubility = 10−50 mg/mL at 20°C.[NTP]

Potential Exposure: Potassium dichloroisocyanurate is used in household bleaches, dishwashing compounds, and detergents.

Incompatibilities: A strong oxidizer; violent reaction with reducing agents, combustibles, organics, easily chlorinated or oxidized materials, ammonia, urea, other nitrogen compounds, calcium hypochloride, other alkalies, and moisture.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium dichloroisocyanurate can affect you when breathed in. Exposure can severely irritate the eyes. It can also irritate the nose, throat, and air passages. Contact can cause skin and eye irritation.

Long Term Exposure: May cause lung irritation and damage.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to potassium dichloroisocyanurate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing

apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustibles (like wood, paper, and oil), ammonia, urea, other nitrogen compounds, calcium hypochlorite, other alkalis, and moisture. Do not store on wooden floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.
Shipping: Dichloroisocyanuric acid, dry requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. *Do not use water*. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Potassium dichloroisocyanurate is not flammable. Potassium dichloroisocyanurate is a strong oxidizer and a dangerous fire hazard on contact with combustibles (such as wood, paper, and oil). Poisonous gases are produced in fire, including chlorine gas, potassium oxide, and oxides of nitrogen. Use dry chemical, or CO_2 extinguishers. Use water to keep fire-exposed containers cool. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services. (May 2002). *Hazardous Substances Fact Sheet: Potassium Dichloroisocyanurate*. Trenton, NJ

Potassium ferrocyanide P:0930

Molecular Formula: $C_6K_4N_6Fe$
Common Formula: $K_4Fe(CN)_6$
Synonyms: Ferrate(4-), hexacyano-, tetrapotassium; Ferrate (4-), hexakis(cyano-C)-, tetrapotassium, (OC-6-11)-; Potassium ferrocyanate; Potassium ferrocyanide; Potassium hexacyanoferrate; Potassium hexacyanoferrate(II); Tetrapotassium ferrocyanide; Tetrapotassium hexacyanoferrate; Tetrapotassium hexacyanoferrate(II); Tetrapotassium hexacyanoferrate(4-)
CAS Registry Number: 13943-58-3
RTECS® Number: LI8219000
UN/NA & ERG Number: Not regulated.
EC Number: 237-722-2

Regulatory Authority and Advisory Bodies

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or Ca(CN)2. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Tetrapotassium hexacyanoferrate is a lemon-yellow crystalline solid. Molecular weight = 368.37; Boiling point = (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 2.
Potential Exposure: Used in dyeing, tempering steel, explosives, process engraving, and lithography.
Incompatibilities: Acids or acid fumes may cause release of highly toxic cyanide fumes. Reacts violently with ammonia, copper nitrate; sodium nitrite or chromate.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 11.8 mg/m^3

PAC-1: 35.4 mg/m^3
PAC-2: 59 mg/m^3
PAC-3: 59 mg/m^3
OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.
NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min Ceiling Concentration.
ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.
DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.
NIOSH IDLH: 25 mg[CN]/m^3.

Determination in Air: Use NIOSH Analytical Method #7904, Cyanides.

Permissible Concentration in Water: As of 1980, the criteria are: *To protect freshwater aquatic life:* 3.5 μg/L as a 24-h average, never to exceed 52.0 μg/L. *To protect saltwater aquatic life:* 30.0 μg/L on an acute toxicity basis; 2.0 μg/L on a chronic toxicity basis. *To protect human health:* 200 μg/L. The allowable daily intake for man is 8.4 mg/day.[6] On the international scene, the South African Bureau of Standards has set 10 μg/L, the World Health Organization (WHO) 10 μg/L and Germany 50 μg/L as drinking water standards. Other international limits[35] include an EEC limit of 50 μg/L; Mexican limits of 200 μg/L in drinking water and 1.0 μg/L in coastal waters and a Swedish limit of 100 μg/L. Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes and 50 μg/L in water for fishery purposes. The US EPA[49] has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 μg/L. States which have set guidelines for cyanides in drinking water[61] include Arizona at 160 μg/L and Kansas at 220 μg/L.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Insufficient data are available on the effect of this substance on human health. However, this is a cyanide compound; therefore, utmost care must be taken. May cause eye irritation. May be harmful if swallowed. Animal studies suggest that the lethal dose is 4−8 oz for an adult.

Long Term Exposure: No information available.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved half-face, dust/mist respirator. *For emergencies or instances where the exposure levels are not known*, use a full-face positive-pressure, air-supplied respirator operated in the positive-pressure mode, or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode. *Note:* Air-purifying respirators do not protect workers in oxygen-deficient atmospheres.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store away from incompatible materials listed above. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium fluoride P:0940

Molecular Formula: FK

Common Formula: KF

Synonyms: Fluorure de potassium (French); Potassium fluorure (French)

CAS Registry Number: 7789-23-3

RTECS® Number: TT0700000

UN/NA & ERG Number: UN1812/154

EC Number: 232-151-5 [*Annex I Index No.*: 009-005-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Potassium fluoride is a white crystalline solid. Molecular weight = 58.10; Boiling point = 1505°C; Freezing/Melting point = 860°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Potassium fluoride is used in etching glass, as a preservative, and as an insecticide.

Incompatibilities: Strong acids.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC)

TEEL-0: 7.65 mg/m^3

PAC-1: 7.65 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Russia[43] has set a MAC value of 0.03 mg/m^3 for soluble fluorides in ambient air in residential areas on a momentary basis and 0.01 mg/m^3 on a daily average basis. Several states have set limits for fluoride in ambient air[60] ranging from as low as 2.85 μg/m^3 (Iowa) to as high as 60,000 μg/m^3 (Kentucky). The reader is referred to the entry on "Fluorides" for more detail.

Permissible Concentration in Water: Fluoride is a safe drinking water act-regulated chemical (47FR9352, 56FR 3594); MCL = 4.0 mg/L; MCLG = 4.0 mg/L; SMCL = 2.0 mg/L. The state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium fluoride can affect you when breathed in. Inhalation of dust or mist can cause severe irritation and burns of the eyes and skin. May cause permanent eye damage. Inhalation can cause irritation of the nose and throat causing sneezing, coughing, and sore throat. High exposure can irritate the lungs, causing a buildup of fluid in the lungs. This can cause death.

Long Term Exposure: These effects do not occur at the levels of fluorides used in water to prevent cavities. Repeated exposure can cause fluoride to buildup in the body. Can irritate the lungs; bronchitis may develop. Repeated exposure can cause fluoride to build up in the body causing stiffness, brittle bones, and crippling. Prolonged contact can cause sores in the nose and perforated septum.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium fluoride must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) since violent reactions occur. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including potassium oxide and fluorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium hydroxide P:0950

Molecular Formula: HKO
Common Formula: KOH
Synonyms: Caustic potash; Hidroxido potasico (Spanish); Hydroxide de potassium (French); Kaliumhydroxid (German); KOH; LYE; Potassa; Potasse caustique (French); Potassium hydrate; Potassium (hydrixyde de) (French)
CAS Registry Number: 1310-58-3
RTECS® Number: TT2100000
UN/NA & ERG Number: UN1813 (solid)/154; UN1814 (solution)/154
EC Number: 215-181-3 [*Annex I Index No.:* 019-002-00-8]
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Reportable Quantity (RQ): 1000 lb (454 kg).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Potassium hydroxide is a white deliquescent solid. Molecular weight = 56.11; Specific gravity (H_2O:1) = 2.04 at 25°C; Boiling point = 1324°C; Freezing/Melting point = 380°C; also reported at 405°C (varies with water content). Hazard Identification (based on NFPA-704 M Rating System) (*45%*): Health 3, Flammability 0, Reactivity 1. Soluble in water; solubility = 107% at 15°C; reaction.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Primary Irritant. Used in the manufacture of other potassium compounds and in the general use of KOH as an alkali.

Incompatibilities: A strong base. Violent reaction with acids, water, metals (when wet), halogenated hydrocarbons, maleic anhydride. Heat is generated if KOH comes in contact with water and carbon dioxide from the air. Corrosive to zinc, aluminum, tin, and lead in the presence of moisture, forming a combustible/explosive hydrogen gas. Can absorb water from air and give off sufficient heat to ignite surrounding combustible materials.

Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 2 mg/m^3 Ceiling Concentration.
ACGIH TLV®[1]: 2 mg/m^3 Ceiling Concentration.
Protective Action Criteria (PAC)
TEEL-0: 0.1 mg/m^3
PAC-1: 0.3 mg/m^3
PAC-2: 2 mg/m^3
PAC-3: 125 mg/m^3
Australia: TWA 2 mg/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: STEL 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3, 1999; Japan: STEL 2 mg/m^3, 1999; Norway: TWA 2 mg/m^3, 1999; the Netherlands: MAC 2 mg/m^3, 2003; Switzerland: MAK-W 2 mg/m^3, 1999; United Kingdom: STEL 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 2 mg/m^3. Several states have set guidelines or standards for KOH in ambient air[60] ranging from 16.0 μg/m^3 (Virginia) to 20 μg/m^3 (North Dakota) to 48 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7401, alkaline Dusts.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: Potassium hydroxide can affect you when breathed in. Potassium hydroxide is highly corrosive. Eye contact causes immediate severe burns and can lead to blindness. Skin contact causes severe skin burns. Exposure can irritate the nose, throat, and airways, causing sneezing, coughing, and sores in the nose. Higher levels can irritate the lungs and cause a buildup of fluid (pulmonary edema). This can cause death. Ingestion may be fatal; causes epigastrium, hermatemesis, collapse, and stricture of esophagus.

Long Term Exposure: May cause sores in the nose and perforation of the nasal septum. May cause lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 45 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For solutions of 30−70%, natural rubber; Neoprene™, nitrile, nitrile + PVC, Neoprene™ + natural rubber, and polyethylene are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, or wear dust-proof goggles and face shield when working with powders or dusts unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 2 mg/m^3, use a NIOSH/MSHA- or European Standard EN 149-approved full-face-piece respirator with a high-efficiency particulate filter. More protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White Stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium hydroxide must be stored to avoid contact with water or moisture and metals since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids, explosives, combustible materials, and organic peroxides. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: Potassium hydroxide, solid or solution, requires a shipping label of "CORROSIVE." The solid falls in DOT Hazard Class 8 and Packing Group II. The solution falls in DOT Hazard Class 8 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium hydroxide may ignite surrounding material if it absorbs water. Extinguish fire using an agent suitable for type of surrounding fire. Potassium hydroxide itself does not burn. Poisonous gases are produced in fire, including potassium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilute with large volume of water, neutralize and flush to sewer.[22]

Potassium nitrate P:0960

Molecular Formula: KNO_3

Synonyms: Kaliumnitrat (German); Niter; Nitre; Nitric acid, potassium salt; Saltpeter; Vicknite

CAS Registry Number: 7757-79-1

RTECS® Number: TT3700000

UN/NA & ERG Number: UN1486/140

EC Number: 231-818-8

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Potassium nitrate is an odorless, white or colorless crystalline powder with a salty taste. Molecular weight = 179.31; Boiling point = (decomposes) 400°C; Freezing/Melting point = 334°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3 (Oxidizer). Highly soluble in water; solubility = 36% at 25°C.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector. Used to make explosives, gunpowder, fireworks, rocket fuel, matches, fertilizer, fluxes, glass manufacture; and as a diuretic.

Incompatibilities: A powerful oxidizer. Dangerously reactive and friction- and shock-sensitive when mixed with organic materials and many materials. Violent reactions with reducing agents, chemically active metals, charcoal, trichloroethylene.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.4 mg/m^3
PAC-1: 1.25 mg/m^3
PAC-2: 7.5 mg/m^3
PAC-3: 500 mg/m^3
Russia: STEL 5 mg/m^3, 1993.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation. Inhalation can cause respiratory tract irritation, coughing, and wheezing. High levels of exposure can interfere with the blood's ability to carry oxygen, causing headache, dizziness, cyanosis, methemoglobinemia, with blue color to the skin and lips. Higher levels can cause breathing difficulty, collapse, and death.

Long Term Exposure: There is limited evidence that this chemical can damage the developing fetus.

Points of Attack: Blood.

Medical Surveillance: Blood test for methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all other materials. Do not store on wooden floors. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. See also 29 CFR 1910.101 for specific regulations on storage of compressed gas cylinders.

Shipping: Potassium nitrate requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium nitrite P:0970

Molecular Formula: KNO_2

Synonyms: Kaliumnitrat (German); Niter; Nitre; Nitrous acid, Potassium salt; Saltpeter; Vicknite

CAS Registry Number: 7758-09-0

RTECS® Number: TT3750000

UN/NA & ERG Number: UN1488/140

EC Number: 231-832-4 [*Annex I Index No.*: 007-011-00-X]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R22; R35; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Potassium nitrite is a white to yellowish crystalline solid. Molecular weight = 85.11; Boiling point = decomposition starts at 350°C; explosion at 535°C; Freezing/Melting point = 441°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 2 (Oxidizer). Soluble in water; solubility = 280 g/100 mL.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Human Data. Potassium nitrite is used in chemical analysis, as a food additive; in fertilizers; in medications as a vasodilator and as antidote for cyanide poisoning.

Incompatibilities: A strong oxidizer. Reacts violently with combustible and reducing materials. Heat above 530°C may cause explosion. Incompatible with cyanide salts; boron, ammonium sulfate, potassium amide, and acids. Decomposes on contact with even weak acids, producing toxic nitrogen oxide fumes.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.04 mg/m^3

PAC-1: 0.1 mg/m^3

PAC-2: 0.75 mg/m^3

PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium nitrite can affect you when breathed in. Contact can cause eye and skin burns. Breathing the dust or mist can irritate the nose, throat, and lungs, and may cause cough with phlegm. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High levels can affect the vascular system and interfere with the ability of the blood to carry oxygen (methemoglobinemia), causing headaches, weakness, dizziness, and cyanosis, a bluish color to the skin and lips. Higher levels can cause troubled breathing, collapse, and even death.

Long Term Exposure: Repeated skin contact causes dermatitis, drying, and cracking. May cause lung irritation; bronchitis may develop. There is limited evidence that potassium nitrite may damage the developing fetus.

Points of Attack: Eyes, skin, blood, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin. Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to potassium nitrite, use a NIOSH/MSHA- or European

Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, cyanide salts, boron, ammonium sulfate, and potassium amide. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Potassium nitrite requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium nitrite out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Does not burn but may ignite other combustible materials. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Potassium permanganate P:0980

Molecular Formula: $KMnO_4$

Synonyms: Cairox; Chameleon mineral; C.I. 77755; Condy's crystals; Kaliumpermanganat (German); Permanganic acid, potassium salt; Permanganate de potassium (French); Permanganate of potash; Permanganato potasico (Spanish); Potassium (permanganate de) (French); Purple salt

CAS Registry Number: 7722-64-7

RTECS® Number: SD6475000

UN/NA & ERG Number: UN1490/140

EC Number: 231-760-3 [*Annex I Index No.:* 025-002-00-9]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

US EPA Gene-Tox Program, Negative: *In vitro* cytogenetics—nonhuman; *N. crassa*—reversion; Negative: *B. subtilis* rec assay.

US EPA, FIFRA 1998 Status of Pesticides: Pesticide subject to registration or re-registration.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: O, Xn, N; Risk phrases: R8; R22; R36/37/38; R42/43; Safety phrases: S2; S22; S24; S26; S37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Potassium permanganate is a dark purple crystalline solid. Molecular weight = 158.04; Freezing/Melting point = (decomposition, with evolution of oxygen) <240°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3 (Oxidizer). Highly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Potassium permanganate is used in solutions as a disinfectant, topical antibacterial agent; deodorizer, bleaching agent; and in air and water purification.

Incompatibilities: Potassium permanganate is a powerful oxidizing agent, that is, it will initiate a fire or explosion if brought into contact with reducing materials, combustibles, organic materials; strong acids; or oxidizable solid, liquid, or gas; glycerine, ethylene glycol, polypropylene, hydroxylamine, hydrogen trisulfide, antimony, arsenic, sulfuric acid, hydrogen peroxide, phosphorus, and any finely divided combustible material. It will decompose, and release oxygen if brought into contact with heat, alcohol, acids, ferrous salts, iodides and oxalates.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration.

NIOSH: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL.

ACGIH TLV®[1]: TWA 0.2 mg[Mn]/m^3, inorganic compounds.

NIOSH IDLH: 500 mg[Mn]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.575 mg/m^3

PAC-1: 8.63 mg/m^3

PAC-2: 14.4 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C.

Australia: TWA 5 mg[Mn]/m^3, 1993; Belgium: TWA 5 mg [Mn]/m^3, 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 0.5 mg[Mn]/m^3, 1999; Hungary: TWA 0.3 mg[Mn]/m^3, short-term exposure limit 0.6 mg[Mn]/m^3, 1993; Japan: 0.3 mg[Mn]/m^3, respirable dust, 1999; Poland: MAC (TWA) 0.3 mg[Mn]/m^3; MAC 5 mg[Mn]/m^3, 1999; Sweden: NGV 1 mg[Mn]/m^3, KTV 2.5 mg[Mn]/m^3 (respirable dust), 1999; Sweden: NGV 2.5 mg[Mn]/m^3, KTV 5 mg[Mn]/m^3 (total dust), 1999; United Kingdom: LTEL 5 mg[Mn]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg[Mn]/m^3.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Irritates the respiratory tract, causing coughing and chest tightness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Concentrated solutions may cause severe irritation and burns. Dilute solutions can cause brown staining of the skin and hardening of outer skin layer. Penetration is poor. *Eyes:* Concentrated solution or crystalline material can cause severe irritation and damage that may be permanent. *Ingestion:* Dilute solutions (1%) may cause burning of the throat, nausea, vomiting, and stomach pain. Concentrations of 2–3% may cause anemia and swelling of the throat with a possibility of suffocation. More concentrated solutions may result in above symptoms plus the onset of kidney damage and circulatory collapse. The probable lethal dose is 1½ teaspoons (10 g) for a 150-lb (70 kg) adult.

Long Term Exposure: May cause mutations and might pose a cancer risk or reproduction hazard. May cause lung effects.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests (for manganese and fume): whole blood (chemical/metabolite); biologic tissue/biopsy; Complete blood count; chest X-ray; pulmonary function tests; urine (chemical/metabolite); urinalysis (routine). For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give egg whites and milk. A tracheotomy may be required if swelling in throat blocks air. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium permanganate must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), any organic material, or any other combustible or oxidizable solid, liquid, or gas since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Potassium permanganate requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Liquid:* Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Dry material:* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. *Large spills:* Clean up should be performed by trained personnel. Cover the weak reducing agents, such as sodium thiosulfate, bisulfites, or ferrous salts. Bisulfites or ferrous salts need an additional promoter of three molar sulfuric acids to accelerate reaction. Transfer slurry or sludge to large container of water and neutralize with soda ash. Keep potassium permanganate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Potassium permanganate does not burn. However, it is a powerful oxidizer. Potassium permanganate decomposes at 240°C/464°F and releases oxygen which will greatly intensify an ongoing fire. Use dry chemical or carbon dioxide extinguishers. Poisonous gases are produced in fire, including potassium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: React with reducing agent, neutralize and flush to sewer.[22]

Potassium persulfate P:0990

Molecular Formula: $K_2O_8S_2$

Common Formula: $K_2S_2O_8$

Synonyms: Anthion; Dipotassium peroxodisulphate; Dipotassium persulfate; Potassium persulphate; Potassium peroxydisulphate; Potassium peroxydisulfate; Peroxydisulfuric acid, Disodium salt

CAS Registry Number: 7727-21-1

RTECS$^{®}$ Number: SE0400000

UN/NA & ERG Number: UN1492/140

EC Number: 231-781-8 [*Annex I Index No.:* 016-061-00-1] [dipotassium peroxodisulphate]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: O, Xn; Risk phrases: R8; R22; R36/37/38; R42/43; Safety phrases: S2; S22; S24; S26; S37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Potassium persulfate is a colorless or white, odorless crystalline material. Molecular weight = 272.34; Boiling point = 109.5°C; Freezing/Melting point = (decomposes) $<100°C$. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3. Oxidizer. Soluble in water.

Potential Exposure: Potassium persulfate is used as a bleaching and oxidizing agent; it is used in redox polymerization catalysts; in the defiberizing of wet strength paper and in the desizing of textiles. Soluble in water.

Incompatibilities: A strong oxidizer. Combustible, organic or other readily oxidizable materials, sulfur, metallic dusts, such as aluminum dust, chlorates, and perchlorates. Attacks chemically active metals. Keep away from moisture.

Permissible Exposure Limits in Air

ACGIH: 0.1 mg $[S_2O_8]/m^3$ TWA *as persulfates*.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 350 mg/m^3

Permissible Concentration in Water: No criteria set. (Aqueous solution decomposes even at room temperature).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium persulfate can affect you when breathed in. Breathing the dust or mist can cause eye, nose, and throat irritation with sneezing, coughing, and sore throat. Contact with skin and eyes can cause burns and permanent damage. Prolonged or repeated exposures may lead to sores of the inner nose. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause sores of the inner nose. Skin contact may cause skin rash, with dryness and cracking. May cause lung irritation.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA- or European Standard EN 149-approved dust mask when dust is encountered. Where there is potential for exposures *over 5 mg/m³*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium persulfate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong oxidizers (such as chlorine, bromine, and fluorine), and chemically active metals (such as potassium, sodium, magnesium, and zinc) since violent reactions occur. Protect storage against physical damage. Store in tightly closed containers in a cool, well-ventilated area away from moisture. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Potassium persulfate requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep potassium persulfate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including oxides of sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use large volumes of reducing agents (e.g., bisulfites). Neutralize with soda ash and drain into sewer with abundant water.

Potassium silver cyanide P:1000

Molecular Formula: AgC_2KN_2

Common Formula: $KAg(CN)_2$

Synonyms: Cianuro de plata y potasio (Spanish); Dicyano potassium argentate; Potassium dicyanoargentate; Silver potassium cyanide

CAS Registry Number: 506-61-6

RTECS® Number: TT5775000

UN/NA & ERG Number: UN1588/157

EC Number: 208-047-0 (potassium dicyanoargentate)

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P099.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants, as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or Ca(CN)2. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, Cyanide compounds, inorganic, n.o.s.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Silver compounds:

Clean Water Act: Section 307 Toxic Pollutants as silver and compounds.

RCRA Section 261 Hazardous Constituents, as silver compounds, n.o.s., waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains silver as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Potassium silver cyanide is a white crystalline solid. Molecular weight = 199.01; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Potassium silver cyanide is used in silver plating; as a bactericide; and in the manufacture of antiseptics. Not registered as a pesticide in the United States.

Incompatibilities: Contact with acid, acid fumes, water, steam, or when heated to decomposition emits toxic and flammable cyanide vapors. May be light sensitive.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

NIOSH IDLH: 25 mg[CN]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0184 mg/m^3

PAC-1: 2.5 mg/m^3
PAC-2: 18.4 mg/m^3
PAC-3: 18.4 mg/m^3
DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen cyanide.[18]

Permissible Concentration in Water: In 1976 the EPA criterion was 5.0 μg/L for freshwater and marine aquatic life and wildlife. As of 1980, the criteria are: *To protect freshwater aquatic life:* 3.5 μg/L as a 24-h average, never to exceed 52.0 μg/L. *To protect saltwater aquatic life:* 30.0 μg/L on an acute toxicity basis; 2.0 μg/L on a chronic toxicity basis. *To protect human health:* 200 μg/L. The allowable daily intake for man is 8.4 mg/day.[6]

On the international scene, the South African Bureau of Standards has set 10 μg/L, the World Health Organization (WHO) 10 μg/L, and Germany 50 μg/L as drinking water standards. Other international limits[35] include an EEC limit of 50 μg/L; Mexican limits of 200 μg/L in drinking water and 1.0 μg/L in coastal waters; and a Swedish limit of 100 μg/L. Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes and 50 μg/L in water for fishery purposes.

The US EPA[49] has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 μg/L. States which have set guidelines for cyanides in drinking water[61] include Arizona at 160 μg/L and Kansas at 220 μg/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: The primary health hazard is as a cyanide. It is poisonous and may be fatal if inhaled, swallowed, or absorbed through the skin. Fire may produce irritating or poisonous gases. As a cyanide, massive doses may produce, without warning, sudden loss of consciousness and prompt death from respiratory arrest. Smaller but still lethal doses result in illness that may be prolonged for one or more hours. Other symptoms may include numbness in throat, salivation, nausea, anxiety, dizziness, irregular breathing, odor of bitter almonds may be noted on breath, blood pressure may rise, slowing of the heartbeat, sensation of constriction in the chest, unconsciousness followed by violent convulsions and paralysis. LD_{50} = (oral-rat) 21 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Cyanides, inorganic, solid, n.o.s. require a shipping label of “POISONOUS/TOXIC MATERIALS.” They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered

material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam for *small fire*s; and water spray, fog, or foam for *large fires*. Move containers of this material away from fire area if this can be done without risk. Isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Fight fire from maximum distance. Dike fire control water for later disposal. Do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

US Environmental Protection Agency. (November 30, 1987). *Chemical Hazard Information Profile: Potassium Silver Cyanide*. Washington, DC: Chemical Emergency Preparedness Program

Potassium sulfide P:1010

Molecular Formula: K_2S

Synonyms: Dipotassium monosulfide; Dipotassium sulfide; Hepar sulfurous; Potassium monosulfide

CAS Registry Number: 1312-73-8

RTECS® Number: TT6000000 (anhydrous); TT6008000 (hydrated)

UN/NA & ERG Number: UN1382 (anhydrous)/135; UN1847 (hydrated)/153

EC Number: 215-197-0 [*Annex I Index No.:* 016-006-00-1]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: C; Risk phrases: R31; R34; R50; Safety phrases: S1/2; S26; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Potassium sulfide is a brownish-red crystalline solid. Molecular weight = 110.26; Freezing/Melting point = 840°C. Soluble in water.

Potential Exposure: Potassium sulfide is used as a reagent in analytical chemistry; and in pharmaceutical preparations.

Incompatibilities: May explosively decompose from shock, friction, or concussion. May spontaneously ignite on contact with air. The aqueous solution is a strong base; reacts violently with strong acids and acid fumes. The solid material decomposes on contact with acids producing hydrogen sulfide, and oxidizers producing sulfur dioxide.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Potassium sulfide can affect you when breathed in. Breathing the dust or mist can irritate the eyes, nose, and throat with sneezing, coughing, and sore throat. Potassium sulfide is a corrosive chemical and contact with skin and eyes can cause burns. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Corrosive materials can cause lung problems; bronchitis may develop. Prolonged exposure can lead to sores or ulcers of the inner lining of the nose.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to potassium sulfide use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposures and liquid potassium sulfide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Potassium sulfide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where potassium sulfide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Protect storage against physical damage.

Shipping: Anhydrous potassium sulfide requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 4.2 and Packing Group II. Potassium sulfide, hydrated with not <30% water of crystallization requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen sulfide and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Procarbazine & procarbazine hydrochloride P:1020

Molecular Formula: $C_{12}H_{19}N_3O$

Common Formula: $CH_3NHNHCH_2C_6H_4CONHCH(CH_3)_2$

Synonyms: Ibenzmethyzine; 2-(*p*-Isopropyl carbamoyl benzyl)-1-methylhydrazine; *N*-Isopropyl-α-(2-methylhydrazino)-*p*-toluamide N isopropyl; Matulane; 4-[(2-Methylhydrazino)methyl]-*N*-isopropylbenzamide; 1-[Methyl-2-(-isopropylcarbamoyl)benzyl]hydrazine; MIH; Natulan; NSC-77213; PCB; RO 4-6467

hydrochloride: Ibenzmethyzine hydrochloride; Ibenzmethyzin hydrochloride; IBZ; 1-(*p*-Isopropylcarbamoylbenzyl)-2-methylhydrazine hydrochloride; 2-[*p*-(Isopropylcarbamoyl)benzyl]-1-methylhydrazine hydrochloride; *N*-Isopropyl-*p*-(2-methylhydrazinomethyl)benzamidehydrochloride; *N*-Isopropyl-α-(2-methylhydrazino)-*p*-toluamide hydrochloride; Matulane; MBH; *N*-(1-Methylethyl)-4-[(2-methylhydrazino)methyl]benzamide monohydrochloride; *p*-(*N*′-Methylhydrazinomethyl)-*N*-isopropylbenzamide hydrochloride; 1-Methyl-2-*p*-(isopropylcarbamoyl)-benzohydrazine hydrochloride; 1-Methyl-2-(*p*-isopropylcarbamoylbenzyl)hydrazine hydrochloride; MIH hydrochloride; Nathulane; Natulan; Natulanar; Natulan hydrochloride; NCI-C01810; NSC-77213; PCBhydrochloride; Procarbazin (German); RO 4-6467

CAS Registry Number: 671-16-9; 366-70-1 (hydrochloride)

RTECS® Number: XS4550000; XS472000 (hydrochloride)

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 211-582-2; 206-678-6 (hydrochloride)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: (hydrochloride) Animal Sufficient Evidence; Human Limited Evidence, *probably carcinogenic to humans*, Group 2A, 1998; NTP: Reasonably anticipated to be a human carcinogen; NTP: Report on Carcinogens, 2004; NCI: Carcinogenesis Studies (ipr); clear evidence: mouse, rat 1979.

California Proposition 65 Chemical: Cancer (methylhydrazine and its salts) 7/1/92; (procarbazine) 1/1/88; (procarbazine hydrochloride) cancer 1/1/88; Developmental/Reproductive toxin 7/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Procarbazine is a white to pale yellow crystalline powder with a slight odor. Molecular weight = 221.34. The hydrochloride has a similar description. Molecular weight = 257.80; Freezing/Melting point = 223−236°C (hydrochloride). Soluble in water.

Potential Exposure: Procarbazine is available in capsule form. The primary use of this drug is as an antineoplastic agent in the treatment of advanced Hodgkin's disease and oat-cell carcinoma of the lung. The hydrochloride compound is used in treatment. The FDA approved use of procarbazine hydrochloride in 1969 and indicated that the drug should be used as an adjunct to standard therapy. Possible exposure occurs during manufacture of the drug and direct exposure during its subsequent administration to patients. Some of the metabolites of procarbazine hydrochloride are both carcinostatic and carcinogenic.

Incompatibilities: When heated to decomposition, it produces hydrogen chloride and nitrogen oxides. Incompatible with strong acids, strong alkalies.

Permissible Exposure Limits in Air: No standard set.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Laboratory exposure of animals to procarbazine was studied by IP (intraperitoneal) injection. In rats, malignant lymphoma, adenocarcinoma of the mammary gland, and olfactory neuroblastomas were induced in statistically significant numbers. In mice, malignant lymphoma or leukemia, olfactory neuroblastomas, alveolar/bronchiolar adenoma, and adenocarcinoma of the uterus were induced in statistically significant numbers. Can cause nausea, vomiting, diarrhea, stomach pain, loss of appetite, and weight loss. Symptoms of exposure include[52]: nausea, vomiting, anorexia, dry mouth, dysphagia, diarrhea, constipation, chills and fever, sweating, weakness, edema, cough, dermatitis, jaundice, headache, insomnia, coma.

Long Term Exposure: A probable human carcinogen. There is some evidence that it causes cancer of the nervous system, blood-forming organs, breast, lung, uterus, and blood or bone marrow in humans. It has been shown to cause cancer in the same sites in animals. May damage the testes. The hydrochloride is a teratogen in animals and may decrease the body's ability to produce blood cells, causing reduced white blood cells with increased infection and general weakness, reduced platelets, causing bleeding when cut or bruised, and/or reduced blood cells (anemia).

Points of Attack: Blood.

Medical Surveillance: Complete blood count (CBC).

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or mild to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Dampen spilled material with water to avoid dust, than transfer material to a suitable container. Use absorbent dampened with water to pick up remaining material. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Promecarb P:1030

Molecular Formula: $C_{12}H_{17}NO_2$

Common Formula: $C_6H_3(CH_3)(OCONHCH_3)CH(CH_3)_2$

Synonyms: Carbamic acid, methyl-, *m-cym*-5-yl ester; Carbamic acid, 3-methyl-5-(1-methylethyl)phenyl-, methyl ester; Carbamic acid, *N*-methyl-, 3-methyl-5-isopropropylphenyl ester; Carbamult; Carbanilic acid, 3-isopropyl-5-methyl-, methyl ester; *m-cym*-5-yl-methylcarbamate; ENT27,300; ENT 27,300-A; EP316; 3-Isopropyl-5-methylcarbamic acid methyl ester; 3-Isopropyl-5-methylphenyl *N*-methylcarbamate; 5-Isopropyl-*m*-tolyl methyl-carbamate; Methylcarbamic acid *m-cym*-5-yl ester; *N*-Methylcarbamic acid 3-methyl-5-isopropylphenyl ester; 5-Methyl *m*-cumenyl methylcarbamate; 3-Methyl-5-isopropyl-*N*-methyl carbamate; (3-Methyl-5-isopropylphenyl)-*N*-methylcarbamat (German); 3-Methyl-5-isopropylphenyl-*N*-methyl carbamate; 3-Methyl-5-(1-methylethyl)phenol methylcarbamate; 3-Methyl-5-(1-methylethyl)phenyl-carbamic acid methyl ester; Minacide; Morton EP-316; Phenol, 3-methyl-5-(1-methylethyl)-, methylcarbamate; Schering 34615; UC 9880; Union Carbide UC-9880

CAS Registry Number: 2631-37-0

RTECS® Number: FB8050000

UN/NA & ERG Number: UN2757/151

EC Number: 220-113-0 [*Annex I Index No.:* 006-037-00-9]

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P201.

Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06,Vol 71, No. 158] Reportable Quantity (RQ): 1000 lb (454 kg).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R25; R50/53; Safety phrases: S1/2; S24; S37; 45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Promecarb is a colorless, odorless, crystalline solid. Molecular weight = 207.30; Freezing/Melting point = 87−88°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, or application of this nonsystemic contact insecticide.

Incompatibilities: Alkalis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 16 mg/m^3

PAC-3: 25 mg/m^3

Determination in Water: Fish Tox = 33.48370000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Promecarb is highly toxic by ingestion and is absorbed through the intact skin. It is a reversible cholinesterase inhibitor and its effects are related to action on the nervous system. Diarrhea, nausea, vomiting, excessive salivation, headache, pinpoint pupils, and uncoordinated muscle movements are all common symptoms of exposure to carbamate insecticides.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous

system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox; 350.00000 ppb (VERY LOW).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline materials.

Shipping: Promecarb falls into the class of Carbamate pesticides, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Keep unnecessary people away; isolate hazard areas and deny entry. Stay upwind and keep out of low areas. Do not touch spilled material or breathe the dusts, vapors, or fumes from burning materials. Use water spray to reduce vapors. Do not handle broken packages without protective equipment. Wash away any material that may have contacted the body with soap and water. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. Dike far ahead of *large spills* for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Soil Adsorption Index (K_{oc}) = 200 (estimate).

Fire Extinguishing: Extinguish fire using an agent suitable for the surrounding fire, as the material itself burns with difficulty. Use water in flooding quantities as a fog. Use alcohol foam, carbon dioxide, or dry chemical. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *Small quantities:* treat with alkali and then bury. *Large quantities:* incineration.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (USA) (UN).[13]

US EPA Hazardous Waste Number (RCRA No.): U192.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.093; Nonwastewater (mg/kg), 1.5.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 5/1/96.

Hazard Symbols: Xn, N, Risk phrases: R40; R50/53, Safety phrases: S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pronamide is a colorless crystalline solid. Molecular weight = 256.14; Freezing/Melting point = 155−156°C; Vapor pressure = 0.0001 mmHg at 25°C. Insoluble in water; solubility = 15 mg/L.

Potential Exposure: Those involved in the manufacture, formulation, and application of this selective herbicide.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: The EPA has derived a lifetime health advisory of 0.052 mg/L (52 μg/L).

Determination in Water: Extraction with methylene chloride, separation by capillary-column gas chromatography; then measurement using a nitrogen−phosphorus detector. Fish Tox = 13901.63079000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. Inhalation can cause irritation of the respiratory tract with cough, phlegm, and/or chest tightness. The acute oral LD_{50} for male rats is 8350 mg/kg and for female rats is 5620 mg/kg (insignificantly toxic in both cases).

Long Term Exposure: Applying the criteria described in EPA's final guidelines for assessment of carcinogenic risk, pronamide has tentatively been classified in Group C: possible human carcinogen. This category is for substances with limited evidence of carcinogenicity in animals in the absence of human data. There is limited animal evidence of liver cancer. Human Tox = 22.72727 ppb (INTERMEDIATE).

Points of Attack: Cancer site in animals: liver.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 200.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, or water spray extinguishers. Poisonous gases are produced in fire, including hydrogen chloride and oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 217-638-2 [*Annex I Index No.:* 616-008-00-8]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 2/27/01.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R36; R43; R50/53; Safety phrases: S2; S24; S37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propachlor is a light tan solid. Molecular weight = 211.71; Boiling point = 110°C at 0.03 mm; Freezing/Melting point = 67−76°C; Flash point = about 316°C. Slightly soluble in water.

Potential Exposure: Those engaged in the manufacture, formulation, and application of this preemergence herbicide, which is used to combat annual grasses and broad-leaved weeds in corn, soybeans, cotton, sugar cane, and vegetable crops.

Incompatibilities: Incompatible with alkaline materials, strong acids; strong oxidizers. Attacks carbon steel.

Permissible Exposure Limits in Air Russia[35, 43] set a MAC of 0.5 mg/m^3 in work-place air.

Permissible Concentration in Water: Russia[35, 43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes and of zero in water for fishery purposes. The EPA has set a lifetime health advisory of 0.092 mg/L (92 μg/L). States which have set guidelines for propachlor in drinking water include Kansas at 700 μg/L and Maine at 200 μg/L.

Determination in Water: Fish Tox = 17.92643000 ppb MATC (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The maximal tolerated dosage of propachlor without adverse effect is reported as 133.3 mg/kg/day in both rats and dogs. Other workers reported slight organ pathology in rats, mice, and rabbits at 100 mg/kg/day or higher; this agrees approximately with the former data. Apparently, no long-term toxicity studies have been completed that would contribute information on reproductive effects or carcinogenic potential of propachlor or its degradation products, which include aniline derivatives. These studies are needed.

Long Term Exposure: May be a mutagen. Human Tox = 10.93750 ppb; Chronic Human Carcinogen Level (INTERMEDIATE).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 80.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis would yield *N*-isopropylaniline. However, incineration at 850°C together with flue gas scrubbing is the preferred disposal method.[22]

Propadiene P:1050

Molecular Formula: C_3H_4

Common Formula: $H_2C{=}C{=}CH_2$

Synonyms: Allene; Allylenel; Dimethylenemethane; 1,2-Propadiene; Propadieno (Spanish)

CAS Registry Number: 463-49-0

RTECS® Number: BA040000

UN/NA & ERG Number: UN2200/116

EC Number: 207-335-3 (allene)

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propadiene is a colorless, flammable gas or liquid with a sweet odor. Molecular weight = 40.07; Boiling point = −32°C; Freezing/Melting point = −137°C. Explosive limits: LEL = 2.1%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 3. Insoluble in water.

Potential Exposure: Used in chemical synthesis and as a component in mixtures with methyl acetylene, which make up specialty welding gases.

Incompatibilities: Violent reaction with strong oxidizers, strong acids, nitrogen oxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 40 ppm

PAC-1: 125 ppm

PAC-2: 750 ppm

PAC-3: 4000 ppm

Determination in Air: Use NIOSH Analytical Method (IV) #1500, Hydrocarbons.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propadiene can affect you when breathed in. Exposure can cause irritation of the eyes, nose, and throat. Very high levels can cause you to feel dizzy, lightheaded, and to pass out. Extremely high levels could cause death. Contact with the liquid may cause frostbite.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to propadiene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Propadiene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), and nitrogen oxides since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where propadiene is handled, used, or stored. Wherever propadiene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store cylinders in well-ventilated areas away from potential heat sources. Protect cylinders from physical damage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Propadiene, inhibited, requires a shipping label of “FLAMMABLE GAS.” It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Propane P:1060

Molecular Formula: C_3H_8

Common Formula: $CH_3CH_2CH_3$

Synonyms: A-108; Dimethylmethane; Hydrocarbon propellent A-108; *n*-Propane; Propano (Spanish); Propyl hydride

CAS Registry Number: 74-98-6

RTECS® Number: TX2275000

UN/NA & ERG Number: UN1978/115; UN1075 (liquefied)/115

EC Number: 200-827-9 [*Annex I Index No.*: 601-003-00-5]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 60,000. *Note*: Facilities are not required to count propane in tanks of 10,000 lb or less. The higher threshold of 60,000 lb is set to focus on the screening of high-volume propane users; not on nonindustrial propane users.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: Hazard Symbol: F + ; Risk phrases: R12; Safety phrases: S2; S9; S16 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Propane is a colorless gas that is odorless when pure (a foul-smelling odorant is often added). The odor threshold is 2700 ppm. Molecular weight = 44.11; Boiling point = –42.2°C; Freezing/Melting point = −187.8°C; Relative vapor density (air = 1) = 1.55; Vapor pressure = 8.4 atm at 21; Flash point = flammable gas (−104°C); Autoignition temperature = 450°C. Explosive limits: LEL = 2.1%°C; UEL = 9.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 0.01%.

Potential Exposure: Compound Description: Agricultural Chemical. Propane is used as a household, industrial, and vehicle fuel; it is used as a refrigerant and aerosol propellant; it is used as an intermediate in petrochemical manufacture.

Incompatibilities: Flammable gas. Strong oxidizers may cause fire and explosions. Liquid attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.80 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/1800 mg/m^3 TWA.

NIOSH REL: 1000 ppm/1800 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm TWA as aliphatic hydrocarbon gas (C_1–C_4).

NIOSH IDLH: 2100 ppm [LEL].

Protective Action Criteria (PAC)*

TEEL-0: 1000 ppm

PAC-1: **5500** ppm

PAC-2: **17,000** ppm

PAC-3: **33,000** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 1000 ppm/1800 mg/m^3 TWA; Peak Limitation Category II(4); Pregnancy Risk Group D.

Australia: asphyxiant, 1993; Austria: MAK 1000 ppm (1800 mg/m^3), 1999; Belgium: asphyxiant, 1993; Denmark: TWA 1000 ppm (1800 mg/m^3), 1999; Finland: TWA 800 ppm (1100 mg/m^3), 1999; Hungary: asphyxiant, 1993; the Philippines: TWA 1000 ppm (1800 mg/m^3), 1993; Switzerland: MAK-W 1000 ppm (1800 mg/m^3), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2500 ppm.

Determination in Air: By combustible gas meter NIOSH (II-2) Method #S-87; OSHA Analytical Methods PV-2077.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 120,000 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Very high levels may produce the following symptoms, primarily due to lack of oxygen: dizziness, lightheadedness, disorientation, headache, numbness, vomiting, unconsciousness, and death from suffocation. Narcotic at high levels. Contact with the liquid can cause frostbite.

Long Term Exposure: No effects reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, nitrile + PVC, Polyurethane, and polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2100 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where propane is handled, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of propane. Wherever propane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Propane; or Petroleum gases, liquefied; or Liquefied petroleum gas Propane, requires a shipping label of "FLAMMABLE GAS."$LD_{50 =}$ (oral-rat). They fall in DOT Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Propane sultone is a white crystalline solid or a colorless liquid above 30°C. It releases a foul odor as it melts. Molecular weight = 122.15; Specific gravity (H_2O:1) = 1.39 at 25°C; Boiling point = 180°C at 30 mm; 155−157°C at 14 mm; Freezing/Melting point = 31°C; Flash point >113°C.[50] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water; solubility = 10%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Those involved in use of this chemical intermediate to introduce the sulfopropyl group ($-CH_2CH_2CH_2SO_3-$) into molecules of other products.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: Exposures by all routes should be carefully controlled to levels as low as possible. Confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.15 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 250 mg/m^3

DFG MAK: [skin] Carcinogen Category 2.

NIOSH IDLH: Not determined. Potential occupational carcinogen.

Austria [skin], carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for propane sultone in ambient air[60] ranging from zero (North Dakota) to 0.03 μg/m^3 (New York) to 3.0 μg/m^3 (Virginia).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory system. More irritating if heated.

Long Term Exposure: Potential occupational carcinogen. Other long-term effects are unknown at this time.

Points of Attack: Eyes, skin, respiratory system. Cancer site in animals: skin, blood or bone marrow, brain or spine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Safe Drinking Water Act: Priority List (55 FR 1470) as DCPA (and its acid metabolites).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R50; Safety phrases: S2; S22; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Propanil is a colorless solid. The technical product is a brown crystalline solid. Molecular weight = 218.09; Specific gravity (H_2O:1) = 1.22 at 25°C; Freezing/Melting point = 92−93°C (pure); 88−91°C (technical grade); Freezing/Melting point (pure) = 89−92°C (pure); 85−89°C (technical grade). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water. Commercial formulations use carrier solvents that may change the physical properties shown.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Propanil is used as a postemergent herbicide for rice and spring wheat. Those involved in the manufacture, formulation, and application of this contact herbicide.

Permissible Exposure Limits in Air

No TEEL available.

Russia[43] set a MAC of 0.1 mg/m^3 in work-place air and has set a MAC value of 0.005 mg/m^3 for ambient air in residential areas on a once-daily basis and 0.001 mg/m^3 on a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.

Determination in Water: Fish Tox = 0.48990000 ppb (EXTRA HIGH). Octanol−water coefficient: Log K_{ow} = 3.1.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propanil is well tolerated by experimental animal on a chronic basis, and there is little or no indication of mutagenic or oncogenic properties of the compound. The highest no-adverse-effect concentration of propanil based on reproduction in the rat and acute, subchronic, and chronic studies in rats and dogs is 400 ppm in the diet. Based on this data, an ADI was calculated at 0.02 mg/kg/day. LD50 (oral-rat) 2756 mg/kg (male); 2343 mg/kg (female).

Long Term Exposure: Human Tox = 35.00000 ppb (INTERMEDIATE).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 149.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis in acidic or basic media yields the more toxic substance, 3,4-dichloraniline, and is not recommended.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R10; R23/24/25; R34; R51/53; Safety phrases: S1/2; S26; S28; S36; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Propargyl alcohol is a colorless liquid with a geranium-like odor. Molecular weight = 56.07; Specific gravity (H_2O:1) = 0.97 at 25°C; Boiling point = 119.9°C; Freezing/Melting point = −52°C; Flash point = 36°C. Explosive limits: LEL = 3.4%; UEL = 70%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. Propargyl alcohol is used as a corrosion inhibitor, soil fumigant, solvent, stabilizer, and chemical intermediate.

Incompatibilities: Violent reaction with phosphorus pentoxide, oxidizers. May polymerize under the influence of heat, oxidizers, peroxides, light. Attacks many plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.29 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1 ppm/2 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 1 ppm/2.3 mg/m^3 TWA [skin].

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **2.5** ppm

PAC-2: **16** ppm

PAC-3: **74** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm; 4.7 mg/m^3 TWA; Peak Limitation Category I(2); [skin]; Pregnancy Risk Group D.

Australia: TWA 1 ppm (2 mg/m^3), [skin], 1993; Austria: MAK 2 ppm (9 mg/m^3), [skin], 1999; Belgium: TWA 1 ppm (2.3 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (2.5 mg/m^3), [skin], 1999; Finland: TWA 1 ppm (2 mg/m^3); STEL 3 ppm (6 mg/m^3), [skin], 1999; France: VME 1 ppm (2 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 2 mg/m^3, [skin], 2003; the Philippines: TWA 1 ppm (1 mg/m^3), [skin], 1993; Russia: STEL 1 mg/m^3, 1993; Switzerland: MAK-W 1 ppm (2 mg/m^3), [skin], 1999; United Kingdom: TWA 1 ppm (2.3 mg/m^3); STEL 3 ppm, [skin], 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm [skin].

Determination in Air: Use OSHA Analytical Method 97.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propargyl alcohol can affect you when breathed and by passing through skin. Irritates the eyes, skin, and respiratory tract. Contact can severely burn the eyes, causing permanent damage. Skin contact can irritate the skin and allow dangerous amounts to enter the body. Affects the central nervous system. Exposure can cause you to feel dizzy, lightheaded, and to have trouble concentrating. High exposures can cause liver and kidney damage, coma, and death.

Long Term Exposure: Propargyl alcohol may damage the liver and kidneys.

Points of Attack: Skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propargyl alcohol must be stored to avoid contact with alkalis, mercury(II) sulfate; oxidizing materials and phosphonic anhydride since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where propargyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propargyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Propargyl alcohol. Wherever propargyl alcohol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a

secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Propargyl bromide P:1100

Molecular Formula: C_3H_3Br

Common Formula: $BrCH_2C{\equiv}CH$

Synonyms: γ-Bromoallylene; 3-Bromopropyne; 3-Bromo-1-propyne; Bromuro de propargilo (Spanish)

CAS Registry Number: 106-96-7

RTECS® Number: UK4375000

UN/NA & ERG Number: UN2345/130

EC Number: 203-447-1

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Propargyl bromide is a colorless liquid with a sharp odor. Molecular weight = 118.97; Boiling point = 89−90°C; Freezing/Melting point = −61.07°C; Flash point = 10°C; Autoignition temperature = 324°C. Explosive limits: LEL = 3.0%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 4. Insoluble in water.

Potential Exposure: This material is used as a soil fumigant. Not registered as a pesticide in the United States.

Incompatibilities: Violent reaction with oxidizers. Becomes shock- or heat-sensitive when mixed with trichloronitromethane or chloropicrin. Detonates when heated to 220°C, or when heated while confined. May explode on contact with copper, copper alloys, mercury, silver.

Permissible Exposure Limits in Air

AIHA WEEL: 0.1 ppm TWA [skin]

Protective Action Criteria (PAC)

TEEL-0: 0.03 mg/m^3

PAC-1: 0.03 mg/m^3

PAC-2: 0.03 mg/m^3

PAC-3: 20 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is very poisonous if swallowed. If inhaled, may be harmful. Skin and eye contact may cause burns. Symptoms of exposure include skin irritation and tearing of the eyes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained

on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including bromine, are produced in fire. Wear self-contained breathing apparatus and full protective clothing. Move container from fire area if you can do it without risk. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R40; R50/53; Safety phrases: S2; S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propazine is a colorless crystalline solid. Molecular weight = 229.75; Freezing/Melting point = 214°C; Vapor pressure = 1.3×10^{-7} mmHg at 20°C. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen; Reproductive Effector. Those involved in the manufacture, formulation, and application of this preemergence selective herbicide used to control annual broadleaf weeds and grasses.

Permissible Exposure Limits in Air

Russia[43] set a MAC of 5.0 mg/m^3 in work-place air and a MAC of 0.04 mg/m^3 in ambient air in residential areas both on a momentary and a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes. The US EPA has determined a lifetime health advisory of 0.014 mg/L (14 μg/L) (see "References" below). States which have set guidelines for propazine in drinking water[61] include Kansas at 325 μg/L and Maine at 93 μg/L.

Determination in Water: Analysis of propazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen- and phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen–phosphorus detector. The method detection limit has not been determined for propazine, but it is estimated that the detection limits for analytes included in this method are in the range of 0.1–2 μg/L. Fish Tox = 938.12580000 ppb (VERY LOW). Octanol–water coefficient: Log $K_{ow} = 2.9$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. May be absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: May cause eye irritation. Contact dermatitis was reported in workers involved in propazine manufacturing. Poisonous if ingested. No other information on the health effects of propazine in humans was found in the available literature.

Long Term Exposure: May cause skin allergy. Human Tox = 10.00000 ppb (INTERMEDIATE).

Points of Attack: Skin.

Medical Surveillance: Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Triazine pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and Packing Group is III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 154.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human No Available Data*, not classifiable as carcinogenic to humans*, Group 3, 1987.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U363.

Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06, Vol 71, No. 158] Reportable Quantity (RQ): 1000 lb (454 kg).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propham is a colorless crystalline solid. Molecular weight = 179.24; Freezing/Melting point = 87−88°C; 84°C (technical grade). Decomposition temperature = 150°C. Insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this grass-control herbicide.

Permissible Exposure Limits in Air: Russia[43] set a MAC of 2.0 mg/m^3 in work-place air and a MAC of 0.02 mg/m^3 in ambient air of residential areas both on a momentary and a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.2 mg/L in water bodies used for domestic purposes. The EPA has set a lifetime health advisory of 0.12 mg/L.

Determination in Water: Analysis of propham is by a high-performance liquid chromatographic (HPLC) method applicable to the determination of certain carbamate and urea pesticides in water samples. This method requires a solvent extraction of approximately 1 L of sample with methylene chloride using a separatory funnel. The methylene chloride extract dried and concentrated to a volume of 10 mL or less. Compounds are separated by HPLC, and measurement is conducted with a UV detector. The method detection limit has not been determined for propham, but it is estimated that the detection limits for analytes included in this method are in the range of 1−5 μg/L. Fish Tox = 5112.55273000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Doses of 2000 mg/kg to rats produced loss of righting reflex, ptosis, piloerection, decreased locomotor activity, chronic pulmonary disease, rugation and irregular thickening of the stomach. The acute oral LD_{50} values in male and female rats were reported to be 3000 ± 232 mg/kg and 2360 ± 118 mg/kg, respectively. Carbamates are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 100.00000 ppb (VERY LOW).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a

full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Carbamate pesticides, solid, toxic, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 200 (estimate).

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 200-340-1[*Annex I Index No.:* 606-031-00-1]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; IARC: Human No Adequate Data, Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1999; NIOSH: Potential occupational carcinogen; OSHA: Potential human carcinogen.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat; SHE—focus assay; Positive: Cell transform.—SA7/SHE; Positive: *D. melanogaster*—reciprocal translocation; Positive: Host-mediated assay; L5178Y cells *In vitro*—TK test; Positive: *N. crassa*—forward mutation; *N. crassa*—reversion; Positive: *E. coli* polA without S9; Histidine reversion—Ames test; Positive: *D. melanogaster* sex-linked lethal; Positive: *In vitro* UDS—human fibroblast; Positive: *S. cerevisiae* gene conversion; *S. cerevisiae*—homozygosis; Positive: *S. cerevisiae*—reversion; Positive/dose response: *In vitro* SCE—nonhuman; Negative: Sperm morphology—mouse; Inconclusive: Mammalian micronucleus; Positive: CHO gene mutation.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1013).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

European/International Regulations: Hazard Symbol: T+; Risk phrases: R45; R26; R36/38; Safety phrases: S53; S45. (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: β-Propiolactone is a colorless liquid which slowly hydrolyzes to hydracrylic acid and must be cooled to remain stable. Molecular weight = 72.07; Specific gravity (H_2O:1) = 1.15 at 25°C; Boiling point = (decomposes) 161.7°C; Freezing/Melting point = −33.3°C; Vapor pressure = 3 mmHg at 25°C; Flash point = 75°C. Explosive limits: LEL = 2.9%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0. Soluble in water; solubility = 37%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. β-Propiolactone is used as a chemical intermediate in synthesis of acrylic acid and esters, acrylate plastics; as a vapor sterilizing agent; phase disinfectant; and a viricidal agent.

Incompatibilities: Acetates, halogens, thiocyanates, thiosulfates, strong oxidizers, strong bases. May polymerize upon storage or due to warming. Stable if kept under refrigeration at 40−50°F/5−10°C.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.5 ppm/1.5 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: Not determined. Potential occupational carcinogen.

Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 0.509 ppm
PAC-2: 5.09 ppm
PAC-3: 150 ppm

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 0.5 ppm (1.5 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.5 ppm (1.5 mg/m^3), carcinogen, 1993; Denmark: TWA 0.1 ppm (1.5 mg/m^3), 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Poland: MAC (TWA) 1 mg/m^3, 1999; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.5 ppm (1.5 mg/m^3), carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for propiolactone in ambient air[60] ranging from zero (North Dakota) to 5.0 μg/m^3 (New York) to 7.5 μg/m^3 (South Carolina) to 15 μg/m^3 (Florida and Virginia) to 22.5 μg/m^3 (Connecticut) to 36.0 μg/m^3 (Nevada).

Routes of Entry: Inhalation, ingestion, skin absorption, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes. May cause corneal opacity and blindness. Irritates the respiratory tract. Contact with skin causes irritation, burns, and blistering; fluid from blisters may cause additional blistering of adjacent skin. Ingestion causes burns of mouth and stomach. The toxicity potential of this material via inhalation or ingestion is high; may cause death or permanent injury after very short exposures to small quantities.

Long Term Exposure: A potential occupational carcinogen. May cause frequent urination, dysuria, hematuria (blood in the urine). May affect the liver and kidneys.

Points of Attack: Kidneys, skin, lungs, eyes, liver. Cancer site in animals: liver, skin, and stomach.

Medical Surveillance: Based on its high toxicity and carcinogenic effects in animals, preplacement and periodic examinations should include a history of exposure to other carcinogens, alcohol and smoking habits, medication, and family history. The skin, eye, lung, liver, and kidney should be evaluated. Sputum cytology may be helpful in evaluating the presence or absence of carcinogenic effects. Kidney and liver function tests. Periodic lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required for this chemical. Refer to OSHA Standard: *beta-Propiolactone, 29 CFR 1910.1013.*

Respirator Selection: Employees engaged in handling operations involving this chemical must be provided with, and required to wear and use, a half-mask filter-type respirator for dusts, mists, and fumes. A respirator affording higher levels of protection than this respirator may be substituted. *At any detectable concentration:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a refrigerator or a freezer in glass containers and protect from air and light. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic liquids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Inadequate Information to assess carcinogenic potential.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36/37/38; Safety phrases: S2; S9; S16; S29 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Propionaldehyde is a colorless liquid with a strong fruity odor. Molecular weight = 58.09; Boiling point = 49°C; Freezing/Melting point = −81°C; Flash point = −30°C; −9°C (oc); Autoignition temperature = 207°C. Explosive limits: LEL = 2.6%; UEL = 17%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Used as a synthetic flavoring; as a disinfectant and preservative; to make propionic acid; in plastic and rubber manufacturing; to make alkyl resins and plasticizers.

Incompatibilities: Incompatible with strong acids, amines. Violent reaction with strong oxidizers. Strong caustics; reducing agents can cause explosive polymerization. Can self-ignite if finely dispersed on porous or combustible material, such as fabric. Heat or ultraviolet light can cause decomposition.

Permissible Exposure Limits in Air
AIHA WEEL: 20 ppm TWA.
ACGIH TLV®[1]: 20 ppm/48 mg/m^3 TWA.
Protective Action Criteria (PAC)*
TEEL-0: 20 ppm
PAC-1: **45** ppm
PAC-2: **260** ppm
PAC-3: **840** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Determination in Air: NIOSH Analytical Method #2539, aldehydes, screening.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: Irritates the skin causing a burning sensation and rash on contact. Inhalation can irritate the respiratory tract and may cause nosebleeds, sore throat, cough, and phlegm. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can irritate the lungs; bronchitis may develop. Testing has not been completed to determine the carcinogenicity of propionaldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function test. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Propionaldehyde requires a label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. *Do not use water*. Use dry chemical, carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Pesticide subject to registration or re-registration.

FDA—over-the-counter drug.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R34; Safety phrases: S1/2; S23; S36; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Propionic acid is a colorless liquid with a pungent odor. The odor threshold is 0.16 ppm. Molecular weight = 74.09; Specific gravity (H_2O:1) = 0.99 at 25°C; Boiling point = 141°C; Freezing/Melting point = –21°C; Vapor pressure = 3 mmHg at 25°C; Flash point = 52.2°C (cc); 57°C (oc); Autoignition temperature = 465°C. Explosive limits: LEL = 2.9%; UEL = 12.1%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Primary Irritant. Propionic acid is used in the manufacture of inorganic propionates and propionate esters which are used as mold inhibitors, electroplating additives, emulsifying agents, flavors, and perfumes. It is an intermediate in pesticide manufacture, pharmaceutic manufacture; and in the production of cellulose propionate plastics. Also, used as grain preservative.

Incompatibilities: The substance is a medium strong acid. Incompatible with sulfuric acid, strong bases, ammonia, isocyanates, alkylene oxides, epichlorohydrin. Reacts with bases, strong oxidizers, and amines, causing fire and explosion hazard. Attacks many metals forming flammable/explosive hydrogen gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.03 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 10 ppm/30 mg/m^3 TWA; 15 ppm/45 mg/m^3 STEL.

ACGIH TLV®[1]: 10 ppm/30 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 15 ppm

PAC-2: 15 ppm

PAC-3: 350 ppm

DFG MAK: 10 ppm/31 mg/m^3 TWA; Peak Limitation Category I(2); [skin]; Pregnancy Risk Group C.

Australia: TWA 10 ppm (30 mg/m^3); STEL 15 ppm, 1993; Austria: MAK 10 ppm (30 mg/m^3), 1999; Belgium: TWA 10 ppm (30 mg/m^3); STEL 15 ppm, 1993; Denmark: TWA 10 ppm (30 mg/m^3), 1999; Finland: TWA 10 ppm, [skin], 1999; France: VME 10 ppm (30 mg/m^3), 1999; the Netherlands: MAC-TGG 31 mg/m^3, 2003; Russia: STEL 20 mg/m^3, 1993; Sweden: NGV 10 ppm (30 mg/m^3), KTV 15 ppm (45 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (30 mg/m^3), KZG-W 20 ppm (60 mg/m^3), 1999; United Kingdom: TWA 10 ppm (31 mg/m^3); STEL 15 ppm (46 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm. Russia[43] set a MAC of 0.015 mg/m^3 for ambient air in residential areas (15 μg/m^3) on a momentary basis. Several states have set guidelines or standards for propionic acid in ambient air[60] ranging from 300−450 μg/m^3 (North Dakota) to 500 μg/m^3 (Virginia) to 600 μg/m^3 (Connecticut) to 714 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.31$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause severe eye burns, leading to permanent damage. Skin contact causes skin burns. Inhalation can cause irritation of the respiratory tract with mild cough; asthmatic response was found in medical reports of acute exposure of workers.

Long Term Exposure: May cause an asthma-like allergy. May irritate the lungs; may lead to lung damage.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if person is not having an attack at the time of the test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends Neoprene™, nitrile rubber and polyvinyl chloride as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece powered air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in containers made of aluminum or stainless steel. Propionic acid will corrode steel. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), ignition sources, or heat. Outside or detached storage is preferred. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover spilled material with soda ash or sodium bicarbonate. Mix and add water. Neutralize and drain to sewer with plenty of water. Use water spray to dilute spill and disperse vapor. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with flammable solvent.

New Jersey Department of Health and Senior Services. (April 2001). *Hazardous Substances Fact Sheet: Propionic Acid*. Trenton, NJ

Propionic anhydride P:1160

Molecular Formula: $C_6H_{10}O_3$

Synonyms: Methylacetic anhydride; Propanoic anhydride; Propionic acid anhydride; Propionyl oxide

CAS Registry Number: 123-62-6

RTECS® Number: UF9100000

UN/NA & ERG Number: UN2496/156

EC Number: 204-638-2 [*Annex I Index No.:* 607-010-00-X]

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

European/International Regulations: Hazard Symbol: C; Risk phrases: R34; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Propionic anhydride is a colorless liquid with a strong unpleasant odor. Molecular weight = 130.16; Boiling point = 167−169°C; Freezing/Melting point = −45°C; Flash point = 63°C; Autoignition temperature = 285°C. Explosive limits: LEL = 1.3%; UEL = 9.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Decomposes in water.

Potential Exposure: Used in the manufacture of perfumes, flavorings, alkyd resins; dyestuffs, pharmaceuticals; as an esterifying agent for fats, oils, and cellulose; dehydrating medium for nitrations and sulfonations.

Incompatibilities: Oxidizers, strong acids, strong bases, reducing agents, alcohols, and metals. Contact water forms propionic acid.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 500 mg/m^3

Permissible Concentration in Water: High concentrations are dangerous to aquatic life. May be dangerous if it enters water intakes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause burns and permanent damage. Contact with liquid causes burns of skin. Ingestion causes burns of the mouth and stomach. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause skin allergy. Can irritate the lungs; bronchitis may develop.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Propionic anhydride requires a shipping label of “CORROSIVE” It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or polymer alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerator with afterburner.

Common Formula: CH_3CH_2CN

Synonyms: Cianuro de etilo (Spanish); Cyanoethane; Ether cyanatus; Ethyl cyanide; Hydrocyanic ether; Propanenitrile; Propionic nitrile propylnitrile

CAS Registry Number: 107-12-0

RTECS® Number: UF9625000

UN/NA & ERG Number: UN2404/131

EC Number: 203-464-4

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).
US EPA Hazardous Waste Number (RCRA No.): P101.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
RCRA 40CFR264, Appendix 9; TSD Facilities Ground.
Water Monitoring List. Suggested test method(s) (PQL μg/L): 8015 (60); 8240 (5).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
Reportable Quantity (RQ): 10 lb (4.54 kg).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Propionitrile is a colorless liquid with a pleasant, sweetish, ethereal odor. Molecular weight = 55.09; Specific gravity (H_2O:1) = 0.78 at 25°C; Boiling point = 97.2°C; Freezing/Melting point = − 91.7°C; Flash point = 2.2°C (cc). Explosive limits: LEL = 3.1%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1. Soluble in water; solubility = 12%.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Primary Irritant. Used as a solvent in petroleum refining, as a chemical intermediate, a raw material for drug manufacture, and a setting agent.

Incompatibilities: Strong oxidizers and reducing agents; strong acids and bases. Hydrogen cyanide is produced when propionitrile is heated to decomposition. Reacts with acids, steam, warm water, producing toxic and flammable hydrogen cyanide fumes.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 2.25 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: TWA 6 ppm/14 mg/m^3.
ACGIH TLV®[1]: None.
Protective Action Criteria (PAC)*
TEEL-0: 6 ppm
PAC-1: 6 ppm
PAC-2: **7** ppm
PAC-3: **37** ppm

Determination in Air: Use NIOSH Analytical Method (IV).
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**. #1606.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. May affect the iron metabolism, causing asphyxia. It is highly toxic. Forms cyanide in the body. This super toxic compound has a probable oral lethal dose in humans of less than 5 mg/kg or a taste (less than 7 drops) for a 70-kg (150 lb) person. Exposure results in headache, dizziness, rapid pulse, deep, rapid breathing, nausea, vomiting, unconsciousness, convulsions, and possible death. May cause cyanosis (blue coloration of skin and lips caused by lack of oxygen).

Long Term Exposure: Chronic exposure over long periods may cause fatigue and weakness. Can cause same general symptoms as hydrogen cyanide but onset of symptoms is likely to be slower. May cause liver and kidney damage.

Points of Attack: In animals: liver, kidney damage.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. For engineering controls, see NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: *60 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] or Sa (APF = 10) (any supplied-air respirator). *150 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *300 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in an explosion-proof refrigerator. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of ""FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen cyanide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alcoholic NaOH followed by calcium hypochlorite may be used. Incineration is also recommended.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Propoxur is a colorless crystalline powder with a faint characteristic odor. Molecular weight = 209.27; Boiling point = N/A (decomposes); Freezing/Melting point = 91°C; Flash point ≥ 149°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Poor solubility in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Personnel engaged in the manufacture, formulation, and application of this carbamate agricultural chemical and pesticide.

Incompatibilities: Strong oxidizers, alkalis, heat, and moisture. Emits highly toxic methyl isocyanate fumes when heated to decomposition.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.5 mg/m^3 TWA.

ACGIH TLV®[1]: 0.5 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans. BEI$_A$ issued for Acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 2.5 mg/m^3

PAC-3: 20 mg/m^3

DFG MAK: 2 mg/m^3 measured as the, inhalable fraction TWA; Peak Limitation Category II(8).

Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, 1999; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, 1993; France: VME 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; Poland: MAC (TWA) 0.5 mg/m^3; MAC (STEL) 2 mg/m^3, 1999; Switzerland: MAK-W 0.5 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for Baygon in ambient air[60] ranging from 5−20 μg/m^3 (North Dakota) to 8 μg/m^3 (Virginia) to 10 μg/m^3 (Connecticut) to 12 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Fish Tox = 168.01099000 MATC (LOW). Octanol−water coefficient: Log K_{ow} = 1.5.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propoxur can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic carbamate chemical. Exposure can cause severe carbamate poisoning, with symptoms of headaches, sweating, nausea and vomiting, diarrhea, muscle twitching, loss of coordination, and even death. May affect the nervous system, liver, kidneys. A cholinesterase inhibitor.

Long Term Exposure: Propoxur may cause mutations. Handle with extreme caution. It may damage the developing fetus. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 94.85095 ppb CHCL (Chronic Human Carcinogen Level) (LOW).

Points of Attack: Central nervous system, liver, kidneys, gastrointestinal tract, blood cholinesterase.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum and RBC cholinesterase levels (a test for the enzyme in the body affected by propoxur). These tests are useful only if done 1−2 hours after exposure and can return to normal before the person feels well. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 0.5 mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, moisture, oxidizers, alkaline environments. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Carbamate pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 30.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Highly toxic gases are produced in fire, including methyl isocyanate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

New Jersey Department of Health and Senior Services. (July 2005). *Hazardous Substances Fact Sheet: Propoxur*. Trenton, NJ

n-Propyl acetate P:1190

Molecular Formula: $C_5H_{10}O_2$

Common Formula: $CH_3COOCH_2CH_2CH_3$

Synonyms: Acetate de propyle normal (French); Acetic acid, propyl ester; Acetic acid, *n*-propyl ester; 1-Acetoxypropane; Propyl acetate; *n*-Propyl acetate; 1-Propyl acetate; Propylacetate

Isopropyl Acetate—see separate record

CAS Registry Number: 109-60-4
RTECS® Number: AJ3675000
UN/NA & ERG Number: UN1276/129
EC Number: 203-686-1 [*Annex I Index No.:* 607-024-00-6]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F; Risk phrases: R1; R 36; R66; R67; Safety phrases: S2; S16; S26; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: *n*-Propyl acetate is a colorless liquid with a mild, fruity odor. The odor threshold is 70 mg/m^3[41] and 2.8 mg/m^3 (New Jersey Fact Sheet). Molecular weight = 102.15 (both isomers); Specific gravity (H_2O:1) = 0.84 at 25°C; Boiling point = 101.7°C; Freezing/Melting point = −92.2°C; Vapor pressure = 25 mmHg at 25°C; Flash point = 13°C; Autoignition temperature = 450°C. Explosive limits: LEL = 1.7% at 38°C; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: Compound Description (both isomers): Human Data; Primary Irritant. Propyl acetate is a used as a solvent for plastics and cellulose ester resins; perfume ingredient; component of food flavoring. It is also used as a chemical intermediate.

Incompatibilities: Contact with nitrates, strong oxidizers, strong alkalis, strong acids; may pose risk of fire and explosions. Attacks plastic.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.18 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 200 ppm/840 mg/m^3 TWA.

NIOSH REL: 200 ppm/840 mg/m^3 TWA; 250 ppm/1050 mg/m^3 STEL.

ACGIH TLV®[1]: 200 ppm/835 mg/m^3 TWA; 250 ppm/1040 mg/m^3 STEL.

NIOSH IDLH: 1700 ppm.

Protective Action Criteria (PAC)
TEEL-0: 200 ppm
PAC-1: 250 ppm
PAC-2: 250 ppm
PAC-3: 1700 ppm

DFG MAK: 100 ppm/420 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Australia: TWA 200 ppm (840 mg/m^3); STEL 250 ppm, 1993; Austria: MAK 200 ppm (840 mg/m^3), 1999; Belgium: TWA 200 ppm (835 mg/m^3); STEL 250 ppm (1040 mg/m^3), 1993; Finland: TWA 200 ppm (840 mg/m^3); STEL 250 ppm (1050 mg/m^3), 1993; France: VME 200 ppm (840 mg/m^3), 1999; Hungary: TWA 200 mg/m^3; STEL 600 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 420 mg/m^3, 2003; Norway: TWA 100 ppm (420 mg/m^3), 1999; the Philippines: TWA 200 ppm (840 mg/m^3), 1993; Poland: MAC (TWA) 200 mg/m^3; MAC (STEL) 1000 mg/m^3, 1999; Russia: TWA 200 ppm; STEL 200 mg/m^3, 1993; Switzerland: MAK-W 200 ppm (840 mg/m^3), KZG-W 400 ppm, 1999; Turkey: TWA 200 ppm (840 mg/m^3), 1993; United Kingdom: TWA 200 ppm (849 mg/m^3); STEL 250 ppm (1060 mg/m^3); Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 250 ppm.

Several states have set guidelines or standards for propyl acetate in ambient air[60] ranging from 8.4−10.5 mg/m^3 (North Dakota) to 14 mg/m^3 (Virginia) to 16.8 mg/m^3 (Connecticut) to 20 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1401, alcohols II; #1405, alcohols, Combined; OSHA Analytical Method 7, Organic Vapors.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.23.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *n*-Propyl acetate can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. Very high levels are narcotic and may affect the nervous system and cause you to feel dizzy, lightheaded, and to pass out.

Long Term Exposure: Prolonged or repeated contact can cause drying and cracking of the skin.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: There is no special test for this substance. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber, polyvinyl alcohol, and Silvershield™ are recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1700 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. *n*-Propyl acetate must be stored to avoid contact with nitrates, strong oxidizers (such as chlorine, bromine, and fluorine), and strong acids (such as hydrochloric, sulfuric, and nitric) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. *n*-Propyl acetate will dissolve some plastics and resins. Sources of ignition, such as smoking and open flames, are prohibited where *n*-propyl acetate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of *n*-propyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of *n*-propyl acetate.

Shipping: *n*-Propyl acetate requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: *In vitro* SCE—nonhuman.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R47; R67; Safety phrases: S2; S7; S16; S26; S39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: The two isomers of propyl alcohol are *n*-propyl alcohol and isopropyl alcohol. The odor threshold is 5.3 ppm[41] and 2.6 ppm (NJ). Both are colorless, volatile liquids. Isopropyl alcohol is discussed in a separate entry in this volume. *n*-Propanol: Molecular weight = 60.11; Specific gravity (H_2O:1) = 0.81 at 25°C; Boiling point = 97°C; Freezing/Melting point = −127°C; Vapor pressure = 15 mmHg at 25°C; Flash point = 22.2°C; Autoignition temperature = 412°C. Explosive limits: LEL = 2.2%; UEL = 13.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description (*n*-): Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. *n*-Propyl alcohol is used as a solvent in lacquers, dopes; to make cosmetics, dental lotions, cleaners, polishes, and pharmaceuticals; as a surgical antiseptic. It is a solvent for vegetable oils, natural gums and resins; rosin, shellac, certain synthetic resins; ethyl cellulose and butyral; as a degreasing agent; as a chemical intermediate.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 200 ppm/492 mg/m^3 TWA; 400 ppm/984 mg/m^3 STEL, Not Classifiable as a Human Cardinogen; BEI issued.

TEEL-0: 0.25 ppm

PAC-1: 0.75 ppm

PAC-2: 5 ppm

PAC-3: 150 ppm

DFG MAK: 200 ppm/500 mg/m^3 [skin]; BAT: 50 mg [Acetone]/L in blood or urine/end-of-shift as isopropyl alcohol.

Australia: TWA 200 ppm (500 mg/m^3); 200 ppm (492 mg/m^3) STEL [skin], 1993; Austria: MAK 200 ppm (500 mg/m^3), 1999; Belgium: TWA 200 ppm (492 mg/m^3); STEL 250 ppm, [skin], 1993; Denmark: TWA 200 ppm (500 mg/m^3), [skin], 1999; Finland: TWA 200 ppm (500 mg/m^3); STEL 250 ppm, [skin], 1999; France: VME 200 ppm (500 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, 1993; Norway: TWA 100 ppm (245 mg/m^3), 1999; Poland: MAC (TWA) 200 mg/m^3; MAC (STEL) 600 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Sweden: NGV 150 ppm (350 mg/m^3), KTV 250 ppm (600 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (500 mg/m^3), [skin], 1999; Turkey: TWA 200 ppm (500 mg/m^3), 1993; United Kingdom: TWA 200 ppm (500 mg/m^3); STEL 250 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 250 ppm [skin]. Russia[35, 43] set a MAC value of 0.3 mg/m^3 for ambient air in residential areas[60] both on a momentary and a daily average basis. Several states have set guidelines or standards for propanol in ambient air[60] ranging from 0.67 mg/m^3 (Massachusetts) to 5.0−6.25 mg/m^3 (North Dakota) to 8.0 mg/m^3 (Virginia) to 10.0 mg/m^3 (Connecticut) to 11.905 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1401, alcohols.[18]

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 6900 μg/L based on health effects. Russia[35, 43] set a MAC of 0.25 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propyl alcohol can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Prolonged skin contact can cause a burning sensation and rash. Exposure to high concentrations can affect the central nervous system and cause headaches, drowsiness, dizziness, and confusion; may cause ataxia, gastrointestinal pain, abdominal cramps, nausea, vomiting, diarrhea. High levels can cause unconsciousness.

Long Term Exposure: Repeated skin exposure may cause drying and cracking of the skin. Propyl alcohol may cause mutations. Handle with extreme caution. This chemical is listed by the state of New Jersey as a Special Health Hazard and a data sheet (listed below) states that this chemical may be a carcinogen in humans: It has been shown to cause liver carcinomas and sarcoma, spleen sarcoma, and leukemia in animals. It should be treated with caution.

Points of Attack: Eyes, skin, respiratory system, gastrointestinal tract, central nervous system. May cause liver damage. It may cause brain or nerve damage.

Medical Surveillance: Liver function tests. Evaluate for brain and nerve effects including cerebellar, autonomic and peripheral nervous systems, changes in memory, concentration, sleeping pattern, mood, headaches, and fatigue. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, Teflon™, nitrile, and polyvinyl acetate are recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 800 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propyl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where propyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II or III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Propylamine P:1210

Molecular Formula: C_3H_9N

Common Formula: $CH_3CH_2CH_2NH_2$

Synonyms: 1-Aminopropane; 1-Iodopropane; Mono-*n*-propylamine; Monopropylamine; Propanamine; *n*-Propilamina (Spanish); Propylamine

CAS Registry Number: 107-10-8

RTECS® Number: UN9100000

UN/NA & ERG Number: UN1277/132

EC Number: 203-462-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U194.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: *n*-Propylamine is a water-white liquid with a strong irritating odor similar to that of ammonia. Molecular weight = 59.13; Specific gravity (H_2O:1) = 0.71 at 25°C; Boiling point = 49°C; Freezing/Melting point = −83°C; Flash point = < −37°C; Autoignition temperature = 318°C. Explosive limits: LEL = 2.0%; UEL = 10.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Propylamine is used to make textile resins, drugs, pesticides, and other chemicals.

Incompatibilities: Violent reaction with oxidizers and mercury, strong acids, organic anhydrides, isocyanates, aldehydes, nitroparaffins, halogenated hydrocarbons, alcohols, and many other compounds. Attacks many metals and alloys, especially copper. Aqueous solutions may attack glass.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 15 ppm

PAC-1: 50 ppm

PAC-2: 250 ppm

PAC-3: 250 ppm

Finland: STEL 5 ppm (12 mg/m^3), [skin], 1999; Russia[43] set a MAC of 5 mg/m^3 in work-place air. It should be recognized that propylamine can be absorbed through your skin, thereby increasing your exposure.

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.2$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Propylamine can affect you when breathed in and by passing through your skin. Corrosive to the eyes, skin, and respiratory tract. Propylamine can cause severe eye burns leading to permanent damage and blindness. Contact can cause severe skin burns. Breathing Propylamine can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. Overexposure may damage lungs, liver, kidneys, and heart muscle.

Long Term Exposure: Repeated lower exposure may damage the lungs, liver, kidneys, and/or heart muscle. Some amines cause skin or lung sensitization and allergy; however, it is not known if this chemical causes these allergies.

Points of Attack: Lungs, liver, kidneys, heart.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: tests for kidney and liver function. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including

resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and polyvinyl acetate are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to propylamine, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a MSHA/NOSH-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propylamine is incompatible with strong acids (such as hydrochloric, sulfuric, and nitric), acid anhydrides, acid chlorides, strong oxidizers (such as chlorine, bromine, and fluorine), carbon dioxide, and triethynyl aluminum. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where Propylamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propylamine. Wherever propylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be ineffective for fighting fires. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, T; Risk phrases: R11; R23; R34; Safety phrases: S1/2; S16; S26; S36; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propyl chloroformate is a colorless liquid. Molecular weight = 122.56; Boiling point = 114−116°C; Flash point = −50°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 2₩. Insoluble in water; slowly decomposes.

Potential Exposure: Propyl chloroformate is used in organic synthesis; as an intermediate for polymerization initiators; military poison gas.

Incompatibilities: Oxidizers, water, and alcohol

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*
TEEL-0: 0.75 ppm
PAC-1: 2 ppm
PAC-2: **3.7** ppm
PAC-3: **11** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator; vapors cause tearing. Corrosive to eyes, skin, and mucous membranes. May cause burns and permanent eye damage. Poisonous: may be fatal if inhaled, swallowed, or absorbed through skin.

Long Term Exposure: May cause lung damage.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISON, CORROSIVE," It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 0.8/1.3

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen chloride and chlorine, are produced in fire. *Small fires:* Dry chemical, carbon dioxide extinguishers. Move container from fire area if you can do so without risk. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Spray cooling water on containers that are exposed to flames until after fire is out. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1994; NCI: Carcinogenesis Studies (inhalation); no evidence: mouse, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Propylene is a colorless gas with a slight odor. The odor threshold is 23 ppm. Molecular weight = 42.09; Specific gravity (H_2O:1) = 0.51 at 25°C; Boiling point = −47°C; Freezing/Melting point = −185°C; Flash point = Flammable gas (−72°C); Autoignition temperature = 455°C. Explosive limits: LEL = 2.0%; UEL = 11.1%. Hazard Identification (based on NFPA-704

M Rating System): Health 1, Flammability 4, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen. Propylene is used in the production of fabricated polymers, fibers, polypropylene resins, solvents, isopropyl alcohol, propylene dimer and trimer as gasoline components and detergent raw materials, propylene oxide, cumene, synthetic glycerol, isoprene, and oxo-alcohols.

Incompatibilities: Violent reaction with oxidizers and many other compounds. Able to form unstable peroxides; can polymerize, especially in heat, direct sunlight, oxidizers and other chemicals.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 500 ppm/860 mg/m^3 TWA, not classifiable as a human carcinogen.

Protective Action Criteria (PAC)
TEEL-0: 500 ppm
PAC-1: 1500 ppm
PAC-2: 10,000 ppm
PAC-3: 20,000 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Russia: STEL 100 mg/m^3, 1993; Switzerland: MAK-W 10,000 ppm (17,500 mg/m^3), 1999; United Kingdom: asphyxiant, 2000; the Netherlands: MAC-TGG 900 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[43] set a MAC of 3.0 mg/m^3 in ambient air in residential areas both on a momentary and a daily average basis.

The oxygen content should be tested regularly to ensure that it is at least 19% by volume.

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.8$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propylene can affect you when breathed in. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels can cause you to pass out from lack of oxygen. Death can result. Contact with liquefied propylene can cause frostbite.

Long Term Exposure: Exposure may cause an irregular heartbeat. It may also damage the liver.

Points of Attack: Liver, heart, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Holter monitor (a special 24-h EKG to look for irregular heartbeat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to propylene is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propylene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or direct sunlight. Sources of ignition, such as smoking and open flames, are prohibited where propylene is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of propylene. Wherever propylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Procedures for the handling, use, and storage of propylene cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Put on protective clothing and equipment. Remove tank or cylinder to an open area. Allow to bleed off slowly into atmosphere. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or liquid. Poisonous gases, including carbon dioxide and carbon monoxide, are produced in fire. Stop flow of gas. Use carbon dioxide or dry chemical. Use water spray, fog, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers and protect firefighters. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration.

Regulatory Authority and Advisory Bodies

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propylene chlorohydrin is a colorless liquid. Molecular weight = 94.55; Boiling point = 133−134°C; Flash point = 52°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

78-89-7 & 204-819-6

ACGIH TLV®[1]: 1 ppm/4 mg/m^3 [skin], not classifiable as a human carcinogen.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Propylene chlorohydrin can affect you when breathed in and by passing through your skin. Contact can severely irritate and may burn the eyes. Breathing propylene chlorohydrin can irritate the nose and throat. Contact can irritate the skin. Overexposure may cause you to be lightheaded, unsteady, and drowsy.

Long Term Exposure: No chronic health effects are known at this time.

Points of Attack: Skin, eyes.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to propylene chlorohydrin, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where propylene chlorohydrin is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen chloride and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

PAC-3: 500 mg/m^3

United Kingdom: TWA 150 ppm, total vapor and particulates; STEL 10 mg/m^3, particulates, 2000.

Determination in Air: NIOSH Analytical Method #5523, Glycols.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.9$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Two fluid ounces (60 mL) has caused stupor which lasted for a few hours which was followed by complete recovery.

Long Term Exposure: A mild allergen. Repeated or prolonged contact may cause skin sensitization and allergy. Therapeutic doses given for over a year have been associated with seizures; no further seizures occurred upon withdrawal of medication.

Points of Attack: Skin.

Medical Surveillance: Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene, Nitrile + PVC, butyl rubber; polyvinyl chloride, Tychem® (from E.I. du Pont de Nemours & Company), Trellchem™, and Responder™ are among the recommended protective materials. Butyl rubber, Nitrile, Neoprene, and Neoprene + natural rubber are among the glove materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a well-ventilated area away from ignition sources. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations.

It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Propylene glycol dinitrate P:1260

Molecular Formula: $C_3H_6N_2O_6$

Common Formula: $CH_3CHONO_2CH_2ONO_2$

Synonyms: PGDN; Propylene glycol-1,2-dinitrate; 1,2-Propanediol, dinitrate; 1,2-Propylene glycol dinitrate

Note: Otto fuel is primarily propylene glycol dinitrate.

CAS Registry Number: 6423-43-4; 106602-80-6 (otto fuel)

RTECS® Number: TY6300000

UN/NA & ERG Number: FORBIDDEN to be transported

EC Number: 229-180-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Propylene glycol dinitrate is an explosive, colorless, high-boiling liquid (solid below −8°C) with a disagreeable odor. Molecular weight = 166.11; Specific gravity (H_2O:1) = 1.23 at 25°C; Boiling point = (decomposes) 207°C at 760 mmHg; Freezing/Melting point = −7.8°C; Vapor pressure = 0.07 mmHg at 22°C. Flash point = 99°C. Strong oxidizer. Slightly soluble in water; solubility = 0.1%.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Propylene glycol dinitrate has been used as a torpedo propellant. The explosion potential is similar to ethylene glycol dinitrate.

Incompatibilities: A strong oxidizer. Contact with ammonia compounds, amines, strong acids, reducing agents, combustible materials may result in fire and explosion. It is similar to ethylene glycol dinitrate in explosion potential. Propylene glycol dinitrate may explode if strongly shocked or heated.

Permissible Exposure Limits in Air

Conversion factor: 6.79 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.05 ppm/0.3 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.05 ppm/0.34 mg/m^3 TWA [skin]; BEI$_M$ issued for Methemoglobin inducers.

Protective Action Criteria (PAC)*

6423-43-4 (propylene glycol dinitrate) & 106602-80-6 (otto fuel which is primarily propylene glycol dinitrate)

TEEL-0: 0.05 ppm

PAC-1: **0.17** ppm

PAC-2: **1.0** ppm

PAC-3: **13** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.05 ppm/0.34 mg/m^3 TWA; Peak Limitation Category I(1) [skin].

Australia: TWA 0.05 ppm (0.3 mg/m^3), [skin], 1993; Austria: MAK 0.05 ppm (0.3 mg/m^3), [skin], 1999; Belgium: TWA 0.5 ppm (0.35 mg/m^3), [skin], 1993; Denmark: TWA 0.02 ppm (0.2 mg/m^3), [skin], 1999; Finland: TWA 0.02 ppm (0.2 mg/m^3); STEL 0.06 ppm, [skin], 1999; France: VME 0.05 ppm (0.3 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 0.3 mg/m^3, [skin], 2003; Sweden: NGV 0.1 ppm (0.7 mg/m^3), KTV 0.3 ppm (2 mg/m^3), [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.35 mg/m^3), [skin], 1999; United Kingdom: TWA 0.2 ppm (1.4 mg/m^3); STEL 0.2 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 ppm [skin]. Several states have set guidelines or standards for propylene glycol dinitrate in ambient air[60] ranging from 3 μg/m^3 (North Dakota) to 5 μg/m^3 (Virginia) to 6 μg/m^3 (Connecticut) to 7 μg/m^3 (Nevada).

Determination in Air: See OSHA Analytical Method 43.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Propylene glycol dinitrate can affect you when breathed in and by passing through your skin. Exposure can cause headaches, stuffy nose, eye irritation, a "drunken" feeling with impaired balance, visual disturbance. Higher exposures can interfere with the ability of the blood to carry oxygen (methemoglobinemia). This causes cyanosis, a bluish color to the skin and can lead to death. Propylene glycol dinitrate can cause the blood pressure to drop rapidly. Human volunteers at 0.2 ppm exposure exhibited headaches and disruption in visually evoked response. At 0.5 ppm, marked impairment in balance was noted. At 1.5 ppm eye irritation occurred, in addition.[53]

Long Term Exposure: May cause liver and kidney damage.

Points of Attack: Eyes, central nervous system, blood, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood tests for methemoglobin level. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.05* ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Explosive. Prior to working with this chemical you should be trained on its proper handling and storage. Propylene glycol dinitrate must be stored to avoid contact with ammonia compounds, amines, oxidizers, reducers, or combustible material since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and avoid shocking or jolting containers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Dinitropropylene glycol is FORBIDDEN.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Propylene glycol monomethyl ether P:1270

Molecular Formula: $C_4H_{10}O_2$

Common Formula: $CH_3OCH_2CHOHCH_3$

Synonyms: Dowtherm® 209; 1-Methoxy-2-hydroxypropane; 1-Methoxy-2-propanol; 2-Methoxy-1-methylethanol; PGME; Propylene glycol methyl ether

CAS Registry Number: 107-98-2

RTECS® Number: UB7700000

UN/NA & ERG Number: UN3092/129

EC Number: 203-539-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono- and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol $R\text{—}(OCH_2CH_2)_n\text{—}OR'$, where $n = 1$, 2, or 3; R = alkyl or aryl groups; $R' = R$, H, or groups which when removed, yield glycol ethers with the structure: $R\text{—}(OCH_2CH)_n\text{—}OH$. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. $R\text{—}(OCH_2CH_2)_n\text{—}OR'$; Where $n = 1$, 2, or 3; R = alkyl C7 or less; or R = phenyl or alkyl substituted phenyl; $R' + H$, or alkyl C7 or less; or OR' consisting of carboxylic ester, sulfate, phosphate, nitrate, or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: None assigned; Risk phrases: 10; Safety phrases: S2; S24 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Propylene glycol monomethyl ether is a colorless liquid with an ethereal odor. The odor threshold is 10 ppm. Molecular weight = 90.14; Specific gravity (H_2O:1) = 0.96 at 25°C; Boiling point = 120°C; Freezing/Melting point = (sets to glass) −96°C; Vapor pressure = 12 mmHg at 25°C; Flash point = 36.1°C; Autoignition temperature = 272°C. Explosive limits: LEL = 1.6%; UEL = 13.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Human Data; Primary Irritant. Propylene glycol monomethyl ether is used as a solvent for coatings; cellulose esters and acrylics; acrylics dyes; inks; and stains. It may also be used as a heat-transfer fluid.

Incompatibilities: Reacts with oxidizers, strong acids, acid chlorides, acid anhydrides, isocyanates, aluminum, and copper. Hygroscopic (i.e., absorbs moisture from the air). May slowly form reactive peroxides during prolonged storage.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.69 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 100 ppm/360 mg/m^3 TWA: 150 ppm/540 mg/m^3 STEL.

ACGIH TLV®[1]: 100 ppm TWA; 150 ppm STEL.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 150 ppm

PAC-2: 150 ppm

PAC-3: 1250 ppm

DFG MAK: 100 ppm/370 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Austria: MAK 100 ppm (375 mg/m^3), 1999; Belgium: TWA 100 ppm (369 mg/m^3); STEL 150 ppm (553 mg/m^3), 1993; Denmark: TWA 50 ppm (185 mg/m^3), 1999; Finland: TWA 100 ppm (360 mg/m^3); STEL 150 ppm, [skin], 1999; France: VME 100 ppm (360 mg/m^3), 1999; Norway: TWA 50 ppm (180 mg/m^3), 1999; the Netherlands: MAC-TGG 375 mg/m^3, 2003; Switzerland: MAK-W 100 ppm (360 mg/m^3), KZG-W 200 ppm (720 mg/m^3), 1999; United Kingdom: TWA 100 ppm (375 mg/m^3); STEL 300 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 150 ppm. Several states have set guidelines or standards for PGME in ambient air[60] ranging from 3.6—5.4 mg/m^3 (North Dakota) to 6.0 mg/m^3 (Virginia) to 7.2 mg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method #2554; OSHA Analytical Method 99.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Propylene glycol monomethyl ether can affect you when breathed in and by passing through your skin. Contact can irritate the eyes and skin. Exposure can irritate the nose and throat. Very high levels may cause lung, liver, and kidney damage. Very high levels of propylene glycol monomethyl ether may cause central nervous system depression, dizziness and lightheadedness, and unconsciousness.

Long Term Exposure: Causes skin dryness, dermatitis. May cause liver and kidney damage. Can irritate the lungs; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 100 ppm, use a NIOSH/MSHA- or European Standard EN 149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full-facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: 1-Methoxy-2-propanol requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3. Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for

firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

PAC-2: **12** ppm

PAC-3: **23** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 3B.

Australia: TWA 2 ppm (5 mg/m^3), [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Denmark: TWA 2 ppm (5 mg/m^3), [skin], 1999; Finland: STEL 2 ppm (5 mg/m^3), [skin], carcinogen, 1999; France: carcinogen, 1993; Japan: 2 ppm (4.7 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 0.6 μg/m^3, 2003; the Philippines: TWA 2 ppm (5 mg/m^3), [skin], 1993; Russia: TWA 2 ppm, 1993; Switzerland: MAK-W 2 ppm (5 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 2 ppm (5 mg/m^3), [skin], 1993; United

Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for propyleneimine in ambient air[60] ranging from zero (North Dakota) to 12 μg/m^3 (Pennsylvania) to 50 μg/m^3 (Connecticut and Virginia) to 119 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates the eyes, skin, and respiratory tract. Contact may cause skin burns and permanent eye damage. Symptoms of exposure include inflammation and blistering of the skin, eye, and upper respiratory tract; irritation, nausea, itching, and periodic vomiting. Headache, dizziness, and pain in the temple. Shortness of breath; and increased nasal and laryngeal secretion are seen. It is toxic after acute exposure. LD_{50} = (oral-rat) 19 mg/kg (highly toxic).

Long Term Exposure: Caused skin drying and dermatitis. A potential occupational carcinogen. May affect the kidneys.

Points of Attack: Eyes, skin. Cancer site in animals: nasal cavity, breast, brain, blood or bone marrow.

Medical Surveillance: NIOSH lists the following tests: complete blood count; granulocytic leukemia. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Propyleneimine must be stored to avoid contact with acids and strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where propyleneimine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of Propyleneimine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propyleneimine. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid breathing vapors; avoid bodily contact with the material. Toxic gases, including oxides of nitrogen and carbon monoxide, are released in a fire. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap with water. Use water spray to disperse vapors and dilute standing pools of liquid. Keep sparks and flames away. Attempt to stop leak if it can be done without hazard. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive

concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

European/International Regulations: Hazard Symbol: F+, T; R45; R46; R12; R20/21/22; R36/37/38; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Propylene oxide is a colorless liquid with an ether-like odor. Molecular weight = 58.09; Boiling point = 34.4°C; Specific gravity (H_2O:1) = 0.83 at 25°C; Freezing/Melting point = −112.2°C; Vapor pressure = 445 mmHg at 25°C; Flash point = −37.2°C; Autoignition temperature = 450°C. Explosive limits: LEL = 2.3%; UEL = 36−38.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 2. Soluble in water; solubility = 41%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector;

Human Data; Hormone, Primary Irritant. Propylene oxide is used as an intermediate in the production of polyether polyols and propylene glycol; as a fumigant; in the production of adducts as urethane foam ingredients; in detergent manufacture; as a component in brake fluids.

Incompatibilities: Reacts with strong oxidizers, anhydrous metal chlorides, chlorine, iron, strong acids, caustics and peroxides. Polymerization may occur due to high temperatures or contamination with alkalis, aqueous acids, amines, metal chlorides, and acidic alcohols. Attacks some plastics, coatings, and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.38 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/240 mg/m^3 TWA.

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 2 ppm/4.8 mg/m^3 TWA, sensitizer; confirmed animal carcinogen with unknown relevance to humans. (2000)

NIOSH IDLH: 400 ppm (potential occupational carcinogen).

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **73** ppm

PAC-2: **290** ppm

PAC-3: **870** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 20 ppm (50 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 20 ppm (48 mg/m^3), 1993; Denmark: TWA 5 ppm (12 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (12 mg/m^3), carcinogen, 1999; France: VME 20 ppm (50 mg/m^3), carcinogen, 1999; the Netherlands: MAC-TGG 6 mg/m^3, 2003; the Philippines: TWA 100 ppm (240 mg/m^3), 1993; Russia: STEL 1 mg/m^3, [skin], 1993; Sweden: NGV 5 ppm (12 mg/m^3), KTV 10 ppm (25 mg/m^3), 1999; Switzerland: MAK-W 2.5 ppm (6 mg/m^3), carcinogen, 1999; Turkey: TWA 100 ppm (240 mg/m^3), 1993; United Kingdom: TWA 5 ppm (12 mg/m^3), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia set a MAC of 0.08 mg/m^3 for ambient air in residential areas. Several states have set guidelines or standards for propylene oxide in ambient air[60] ranging from 0.0833 μg/m^3 (Kansas) to 1.0 μg/m^3 (Connecticut) to 15.0 μg/m^3 (Massachusetts) to 167.0 μg/m^3 (New York) to 250.0 μg/m^3 (South Carolina) to 500.0 μg/m^3 (North Dakota) to 625.0 μg/m^3 (Pennsylvania) to 850.0 μg/m^3 (Virginia) to 1190.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1612. Propylene oxide; OSHA Analytical Method 88.

Permissible Concentration in Water: Russia has set[35] a MAC value of 0.01 mg/L in water bodies used for domestic purposes and 0.005 mg/L in water bodies used for fishery purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = <0.02.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Propylene oxide may irritate or burn the skin, eyes, and respiratory tract. Contact with the liquid can cause blindness and death. This material is moderately toxic by inhalation and ingestion. It may cause irreversible and reversible changes. Skin contact with the material or solutions of the material cause irritation; diluted solutions are more irritating than undiluted materials. Dermatitis (red, inflamed skin) is common. Exposure may cause mild depression of the central nervous system, and eye, nasal, and lung irritation. Other signs and symptoms of acute exposure may include headache, nausea, vomiting, and unconsciousness. Victims may appear as if they are in a drunken stupor. Pulmonary edema may occur.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. This substance is possibly carcinogenic to humans. May decrease fertility in males and females. May cause lung damage; pneumonia may develop.

Points of Attack: Eyes, skin, respiratory system. Cancer site in animals: nasal cavity, stomach.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Examination of the eyes and vision.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and butyl rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Propylene oxide must be stored to avoid contact with anhydrous metal chlorides, iron, strong acids (such as hydrochloric, sulfuric, and nitric), strong bases and peroxides, copper or copper alloys since violent reactions occur. Propylene oxide will attack some forms of plastics, rubber, and coatings. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where propylene oxide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of propylene oxide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propylene oxide. Wherever propylene oxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Firefighting should be done from a safe distance or from a protected location. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Move container from area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.[22]

Propyl isocyanate P:1300

Molecular Formula: C_4H_7NO
Common Formula: C_3H_7NCO
Synonyms: 1-Isocyanatopropane; Isocyanic acid, propyl ester; *m*-Propyl isocyanate; 1-Propyl isocyanate
CAS Registry Number: 110-78-1
RTECS® Number: NR190000
UN/NA & ERG Number: UN2482/155
EC Number: 203-803-6
Regulatory Authority and Advisory Bodies
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Propyl isocyanate is a colorless to light yellow liquid with a sharp odor. Molecular weight = 85.12; Flash point = 23°C. Insoluble; reacts with water.

Potential Exposure: This material is used in making other chemicals and insecticides.

Incompatibilities: Violent reactions with strong oxidizers, water, amines, strong bases, and alcohols.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC) Isocyanate-bearing waste (as CNs, n.o.s.).
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. May be absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Propyl isocyanate can affect you when breathed in and possibly by passing through your skin. Irritates the eyes, skin, nose, throat, and lungs. Prolonged contact may cause severe irritation and permanent eye damage. Very high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Very irritating substances may affect the lungs. Many isocyanates cause an asthma-like lung allergy. It is not known for certain if propyl isocyanate does.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if the person is not having an attack at the time of the test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to propyl isocyanate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Propyl isocyanate must be stored to avoid contact with strong oxidizers, water, amines, strong bases (such as sodium hydroxide or potassium hydroxide) and alcohols since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, light, and moisture. Sources of ignition, such as smoking and open flames, are prohibited where propyl isocyanate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of propyl isocyanate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of propyl isocyanate.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 1.7/2.7

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 2500/800
Then: Protect persons downwind (miles/kilometers)
Day 6.0/9.6
Night 7.0+/11.0+ distance can be larger in certain atmospheric conditions

Fire Extinguishing: Propyl isocyanate is a flammable liquid. Poisonous gases are produced in fire, including hydrogen cyanide and oxides of nitrogen. Use dry chemical, CO_2, or foam extinguishers. *Do not use water*. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

n-Propyl nitrate P:1310

Molecular Formula: $C_3H_7NO_2$
Common Formula: $CH_3CH_2CH_2NO_2$
Synonyms: Nitrate de propyle *normal* (French); Nitric acid, propyl ester; Propyl nitrate; Nitric acid, *n*-propyl ester; Propyl ester of nitric acid
CAS Registry Number: 627-13-4
RTECS® Number: UK0350000
UN/NA & ERG Number: UN1865/131
EC Number: 210-985-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *n*-Propyl nitrate is a colorless to pale yellow liquid with an ether-like odor. Molecular weight = 105.11; Specific gravity (H_2O:1) = 1.07 at 25°C; Boiling point = 110.6°C; Freezing/Melting point = −100°C; Vapor pressure = 18 mmHg at 25°C; Flash point = 20°C. Explosive limits: LEL = 2%; UEL = 100%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 3 (Oxidizer). Slightly soluble in water.

Potential Exposure: Propyl nitrate has been used as an intermediate as a rocket propellant and as an ignition improver in diesel fuels.

Incompatibilities: Reacts with strong oxidizers, combustible materials. A shock-sensitive explosive. May explode on heating. Forms explosive mixtures with combustible materials.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.30 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/110 mg/m^3 TWA.

NIOSH REL: 25 ppm/105 mg/m^3 TWA; 40 ppm/170 mg/m^3 STEL.

ACGIH TLV®[1]: 25 ppm/107 mg/m^3 TWA; 40 ppm/172 mg/m^3 STEL; BEI$_M$ issued for methemoglobin inducers.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)

TEEL-0: 25 ppm

PAC-1: 40 ppm

PAC-2: 100 ppm

PAC-3: 500 ppm

DFG MAK: 25 ppm/110 mg/m^3 TWA; Peak Limitation Category II(2).

Australia: TWA 25 ppm (110 mg/m^3); STEL 40 ppm, 1993; Austria: MAK 25 ppm (110 mg/m^3), 1999; Belgium: TWA 25 ppm (107 mg/m^3); STEL 40 ppm (172 mg/m^3), 1993; Denmark: TWA 25 ppm (110 mg/m^3), 1999; Finland: TWA 25 ppm (105 mg/m^3), 1999; Norway: TWA 20 ppm (90 mg/m^3), 1999; the Philippines: TWA 25 ppm (110 mg/m^3), 1993; the Netherlands: MAC-TGG 110 mg/m^3, 2003; Switzerland: MAK-W 25 ppm (110 mg/m^3), 1999; Turkey: TWA 25 ppm (110 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 40 ppm. Several states have set guidelines or standards for propyl nitrate in ambient air[60] ranging from 1.05−1.70 mg/m^3 (North Dakota) to 1.75 mg/m^3 (Virginia) to 2.1 mg/m^3 (Connecticut) to 2.5 mg/m^3 (Nevada).

Determination in Air: Use NIOSH II(3), Method #S-227; OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: None listed for humans according to NIOSH[2] but other sources[24] state that vapor inhalation causes low blood pressure, hypotony, hemoglobin defect, anoxia, and cyanosis. In animals: irritation of the eyes, skin; methemoglobinemia, anoxia, cyanosis, dyspnea (breathing difficulty), weakness, dizziness, headache.

Points of Attack: May attack the blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin; Complete blood count; urinalysis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Consider treatment for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 250 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*End-of-service life indicator (ESLI) required.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Protect containers against physical damage. Outdoor or detached storage is preferred. Indoor storage should be in a flammable liquid storage room. Propyl nitrate should be isolated from combustible materials and oxidizing agents. Wear Neoprene™ gloves, plastic coverall, and self-contained breathing apparatus. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. After covering the spills with soda ash, mix and spray with water. Scoop into a bucket of water and let it stand for 2 h. Neutralize with 6M-HCl and pass into the drain with sufficient water. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. On fires in which containers are not exposed, use dry chemical, foam, or carbon dioxide. Water spray may be ineffective as an extinguishing agent. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Use water from unmanned monitors or householders to keep fire-exposed containers cool. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes.[22] An alternative route suggested involves pouring over soda ash, neutralizing with HCl, and flushing to the drain with water.

EC Number: 218-893-2 [*Annex I Index No.:* 015-032-00-0]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Malaysia) (UN).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R52/53; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Prothoate is an amber to yellow crystalline solid with a camphor-like odor. Molecular weight = 285.39; Boiling point = 135°C at 0.1 mm; Freezing/Melting point = 29°C. Hazard Identification (based on NFPA-704 M

Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of the systemic acaricide and insecticide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.35 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 1.7 mg/m^3

PAC-3: 7.5 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus pesticides.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This is a highly toxic material capable of causing death or permanent injury due to exposures during normal use. Small doses at frequent intervals are additive. Similar to parathion. Symptoms may include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, dizziness, weakness, muscle twitching, difficult breathing, blurring or dimness of vision, and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all the three.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. If material has been ingested, induce vomiting with ipecac.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including nitrogen oxides, sulfur oxides, phosphorus oxides, are produced in fire. This material may burn but does not readily ignite. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. In fighting fires, stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pyrene is a colorless crystalline solid when pure or pale yellow plates (impure). Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Solids and solutions have a blue fluorescence (Merck Index). Molecular weight = 202.26; Boiling point 404°C at 760 mmHg[2]; Freezing/Melting point = 151.2°C.[2] Flash point = 199°C. Explosive limits: LEL = 0.6%; UEL = 3.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Tumorigen, Mutagen. Primary Irritant. Pyrene is used as an industrial chemical and in biochemical research.

Permissible Exposure Limits in Air
NIOSH IDLH: 80 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.75 mg/m^3
PAC-1: 2.5 mg/m^3
PAC-2: 1.7 mg/m^3
PAC-3: 15 mg/m^3
DFG MAK: [skin].
Russia set a MAC of 0.3 mg/m^3 in work-place air.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: Zero is recommended for maximum protection of human health.[6] Kansas[61] has set a guideline for pyrene in drinking water of 0.029 μg/L. The World Health Organization (WHO) recommends a maximum of 2 μg/L for specific PAHs, but this list does not include pyrene.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.88-5.32$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Pyrene is a skin irritant, a suspected mutagen; and an equivocal tumor-causing agent. Workers exposed to 3−5 mg/m^3 of pyrene exhibited some teratogenic effects. Pyrene is a polycyclic aromatic hydrocarbon (PAH). The acute toxicity of pure PAHs appears low when administered orally or dermally to rats or mice. Human exposure to PACs or PAHs is almost exclusively via the gastrointestinal and respiratory tracts, and approximately 99% is ingested in the diet. Despite the high concentrations of pyrene to which humans may be exposed through food, there is currently little information available to implicate diet-derived PAHs as the cause of serious health effects.

Long Term Exposure: The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (category 1) in animal studies.

Points of Attack: Skin, respiratory system, bladder, liver, kidneys.

Medical Surveillance: Preplacement and regular physical examinations are indicated for workers having contact with acenaphthene in the workplace. NIOSH lists: complete blood count; chest X-ray; pulmonary function tests: Forced Vital Capacity; Forced Expiratory Volume (1 s); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria.[2]

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that this airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration over 0.1 mg/m^3:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place.

Shipping: Flammable solids, organic, n.o.s. require a shipping label of "FLAMMABLE MATERIALS." It falls in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Remove all sources of ignition and dampen spilled material with toluene to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent dampened with toluene to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Pyrethrins or pyrethrum P:1340

Molecular Formula: $C_{20-21}H_{28-30}O_{3-5}$; $C_{20}H_{28}O_3$/$C_{21}H_{28}O_5$/$C_{21}H_{30}O_3$/$C_{22}H_{30}O_5$/$C_{21}H_{28}O_3$/$C_{22}H_{28}O_5$

Synonyms: Buhach; Chrysanthemum cinerareaefolium; Cinerin I; Cinerin II; Dalmation insect flowers; Firmotox; Insect powder; Jasmolin I; Jasmolin II; Piretrina (Spanish); Pyrethrin I; Pyrethrin II; Pyrethrum; Pyrethrum insecticide; Trieste flowers

CAS Registry Number: 8003-34-7; 121-21-1 (I); 121-29-9 (II)

RTECS® Number: UR4200000

UN/NA & ERG Number: UN2902 (Pesticides, liquid, toxic, n.o.s.)/151

EC Number: 232-319-8; 204-455-8 [*Annex I Index No.:* 613-023-00-1] (I); 204-462-6 [*Annex I Index No.:* 613-024-00-7] (II)

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Type I:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

US EPA Hazardous Waste Number (RCRA No.): P008.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

Type II:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1 lb (0.454 kg).

European/International Regulations (*I &II*): Hazard Symbol: Xn, N; Risk phrases: R0/21/22; R50/53; Safety phrases: S2; S13; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: The pyrethrins are a variable mixture of compounds which are found in pyrethrum flowers: cinerin, jasmolin, and pyrethrin. Pyrethrins are a brown, viscous oil or solid. Molecular weight = 316−378; 372.45; Specific gravity (H_2O:1) = 1.0 (approx.) at 25°C; Boiling point = 170°C at 0.1 mm (decomposition); Flash point = 82−88°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector; Human Data; Natural Product. Pyrethrins are used as an ingredient of various contact insecticides. Those engaged in the isolation, formulation, or application of these materials.

Incompatibilities: Violent reaction with strong oxidizers, alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 5000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 100 mg/m^3

DFG MAK: 5 mg/m^3, inhalable fraction, danger of skin sensitization; Peak Limitation Category II(2).

Arab Republic of Egypt: TWA 5 mg/m^3, 1993; Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Norway: TWA 5 mg/m^3, 1999; Thailand: TWA 5 mg/m^3, 1993; Turkey: TWA 5 mg/m^3, 1993; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for pyrethrum in ambient air[60] ranging from 16.7 μg/m^3 (New York) to 50.0 μg/m^3 (Florida and South Carolina) to 50.0–100.0 μg/m^3 (North Dakota) to 80.0 μg/m^3 (Virginia) to 100.0 μg/m^3 (Connecticut) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5008, Pyrethrum; OSHA Analytical Method 7.[18]

Determination in Water: Fish Tox: 2.38748000 ppb (HIGH).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Pyrethrum can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness and rhinorrhea (discharge of thin nasal mucus).

Long Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing, and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain, breathing difficulty, and abnormal chest X-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Skin contact can cause rash with redness, blisters, and intense itching. A severe generalized allergy can occur with weakness and collapse. Human Tox = 68.09339 ppb. Chronic Human Carcinogen Level (CHCL) (LOW).

Points of Attack: Respiratory system, skin, central nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest X-ray if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 mg/m³:* CcrOv95 (APF = 10) [Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *125 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 mg/m³:* CcrFOv100 (APF = 50) [Any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *5000 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Pyrethrum must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and alkalines since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Pesticides, liquid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1. and Packing Group I to III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}): 100,000 (estimate).

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including acid fumes, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: F, Xn; Risk phrases: R11; R20/21/22; Safety phrases: S2; S26; S28 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Pyridine is a colorless liquid with a nauseating, fish-like odor. The odor threshold is 0.17 ppm. Molecular weight = 79.11; Specific gravity (H_2O:1) = 0.98 at 25°C; Boiling point = 115.6°C. Melting/Freezing point = −42.2°C; Vapor pressure = 16 mmHg at 25°C;

Flash point = 20°C; Autoignition temperature = 482°C. Explosive limits: LEL = 1.8%; UEL = 12.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Pyridine is used as a solvent in the chemical industry and as a denaturant for ethyl alcohol; as an intermediate in the production of pesticides; in pharmaceuticals; in the manufacture of paints, explosives, dyestuffs, rubber, vitamins, sulfa drugs, and disinfectants.

Incompatibilities: Violent reaction with strong oxidizers, strong acids, chlorosulfonic acid, maleic anhydride, oleum iodine.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.24 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 5 ppm/15 mg/m^3 TWA.
NIOSH REL: 5 ppm/15 mg/m^3 TWA.
ACGIH TLV®[1]: 1 ppm/3.1 mg/m^3 TWA.
NIOSH IDLH: 1000 ppm.
Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 3 ppm
PAC-2: 5 ppm
PAC-3: 1000 ppm
DFG MAK: [skin] 5 ppm/16 mg/m^3 TWA; Peak Limitation Category II(2).

Arab Republic of Egypt: TWA 5 ppm (15 mg/m^3), 1993; Australia: TWA 5 ppm (15 mg/m^3), 1993; Austria: MAK 5 ppm (15 mg/m^3), 1999; Belgium: TWA 5 ppm (16 mg/m^3), 1993; Denmark: TWA 5 ppm (15 mg/m^3), 1999; Finland: TWA 5 ppm (15 mg/m^3); STEL 10 ppm (30 mg/m^3), [skin], 1999; France: VME 5 ppm (15 mg/m^3), VLE 10 ppm, 1999; the Netherlands: MAC-TGG 0.9 mg/m^3, 2003; Norway: TWA 5 ppm (15 mg/m^3), 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 30 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Sweden: NGV 5 ppm (16 mg/m^3), KTV 10 ppm (35 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (15 mg/m^3), KZG-W 10 ppm (30 mg/m^3), 1999; Turkey: TWA 5 ppm (15 mg/m^3), 1993; United Kingdom: TWA 5 ppm (16 mg/m^3); STEL 10 ppm (33 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm. The Czech Republic: MAC 5.0 mg/m^3.[35] Russia[35, 43] has also set a MAC of 0.08 mg/m^3 for the ambient air in residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for pyridine in ambient air[60] ranging from 2.0 μg/m^3 (New York) to 150 μg/m^3 (Indiana) to 150.0−300.0 μg/m^3 (North Dakota) to 250.0 μg/m^3 (Virginia) to 300.0 μg/m^3 (Connecticut, Florida) to 357.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1613[18]; OSHA Analytical Method 7.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 207 μg/L. Russia[43] set a MAC of 200 μg/L in water bodies used for domestic purposes and 10 μg/L in water bodies used for fishery purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.65$.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquids, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the central nervous system; can cause stomach upset, headache, dizziness, lightheadedness, confusion, coma, and death. *Inhalation:* May cause nose and throat irritation at low levels. Above 5 ppm, the odor may no longer be detected but a characteristic taste may remain. Exposures of 6−12 ppm have caused headache, dizziness, nervousness, trouble sleeping, nausea, and vomiting. *Skin:* Contact with liquid may cause painful irritation and first-degree burns. Longer contact may cause second-degree burns. *Eyes:* Vapors may cause irritation. Contact with liquid can cause irritation, burns, and permanent eye damage. *Ingestion:* 2−3 mL (1/15−1/10 fl oz) may cause loss of appetite, nausea, fatigue, and depression. Swallowing ½ cup has resulted in vomiting, diarrhea, fever, abdominal pain, bluish tint to the skin, confusion, hallucinations, severe lung congestion, and death.

Long Term Exposure: Affects the central nervous system, brain, liver, and kidneys. Can cause skin allergy. Ingestion of about 2 mL (1/10 fl oz) three times/day for a prolonged period resulted in lever and kidney damage and death. Long-term inhalation of levels of 125 ppm in addition to the symptoms listed above may result in damage to the nervous system.

Points of Attack: Eyes, skin, central nervous system, liver, kidneys, gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: Expired Air; liver function tests; urinalysis. If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system; interview for brain effects, kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *250 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Pyridine must be stored to avoid contact with strong oxidizers (such as chloride, bromine, and fluorine), strong acids (such as hydrochloride, sulfuric, and nitric), chlorosulfonic acid, maleic anhydride, and oleum iodine because violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where pyridine is used, handles, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gallons or more of pyridine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of pyridine. Wherever pyridine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides and cyanides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby nitrogen oxides are removed from the effluent gas by scrubber, catalytic or thermal devices.[22]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pyriminil is a yellow crystalline solid resembling corn meal. Molecular weight = 272.29; Freezing/Melting point = 223°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: Those involved in the manufacture, formulation, or application of this single-dose, acute rodenticide. Not registered as a pesticide in the United States.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 3.5 mg/m^3

PAC-2: 6.2 mg/m^3

PAC-3: 20 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical may cause death by cardiovascular collapse and respiratory failure. Symptoms include nausea, vomiting, abdominal pain, chills, mental confusion, anorexia, aching, dilated pupils, dehydration, chest pain, urinary retention, irregular heartbeat, and muscular weakness. Exposure may also result in visual disturbances, central nervous system depression, and tremors.

Long Term Exposure: It may damage the pancreas, causing diabetes. Human survivors regularly develop an insulin-deficient, ketosis-prone form of diabetes mellitus. Also, it affects the central nervous system.

Points of Attack: Central nervous system.

Medical Surveillance: Blood sugar. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Phenylurea pesticide, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire, including nitrogen oxides. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Likely to produce cancer in humans; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: (*Quinoline and its strong acid salts*) Cancer 10/24/97.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R21/22; R36/38; R68; R51/53; Safety phrases: S1/2; S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Quinoline is a colorless liquid with a penetrating amine odor. Turns brown on exposure to light. Molecular weight = 129.17; Boiling point = 238°C; Freezing/Melting point = −15°C; Flash point = 101−107°C; Autoignition temperature = 480°C. Explosive limits: LEL = 1.2%; UEL = 7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in cold water; highly soluble in hot.

Potential Exposure: In manufacture of quinoline derivatives (dyes and pesticides); in synthetic fuel manufacture. Occurs in cigarette smoke.

Incompatibilities: Reacts, possibly violently, with strong oxidants, strong acids, perchromates, nitrogen tetroxide, and maleic anhydride. Keep away from moisture, steam, and light. Contact with hydrogen peroxide may cause explosion. Unpredictably violent, this substance has been the source of various plant accidents.

Permissible Exposure Limits in Air

AIHA WEEL: 0.001 ppm TWA [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.001 ppm

PAC-1: 0.6 ppm

PAC-2: 5 ppm

PAC-3: 25 ppm

The state of New York has set a guideline for quinoline in ambient air[60] of 0.03 μg/m^3.

Determination in Air: No methods available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin or eye contact can cause burns. Vapors can irritate the eyes and respiratory tract and may cause sore throat, nosebleeds, hoarseness, cough, phlegm, and/or tightness in the chest. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High exposure can cause nausea, vomiting, gastrointestinal cramping, fever, dizziness, fatigue, rapid and irregular pulse, troubled breathing, collapse, and even death from paralysis of muscles needed for breathing. Liver damage may also occur.

Long Term Exposure: May affect the liver and retina of the eyes. May cause liver damage. May lead to development of skin allergy with rash and itching. Very irritating substances may cause lung damage. This substance caused mutations and is possibly carcinogenic to humans.

Points of Attack: Nervous system, liver and kidneys, eyes.

Medical Surveillance: Eye examination. Liver and kidney function tests. Examination of the nervous system.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person’s airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor

Sitting’s Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00016-3

or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective butyl rubber gloves and protective clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a refrigerator under an inert atmosphere and protect from exposure to light, moisture, strong oxidants, strong acids, perchromates, nitrogen tetroxide, maleic anhydride. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Quinoline requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use absorbent substance to pick up spilled material. Follow by washing surface well first with alcohol, then with soap and water. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, carbon monoxide, and carbon dioxide, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Quinone is a yellow, crystalline material or large yellow, monoclinic prisms with a pungent, irritating odor. Molecular weight = 108.10; Specific gravity (H_2O:1) = 1.32 at 25°C; Boiling point = (sublimes) about 180°C; Freezing/Melting point = 115.6°C; 224°C (decomposes); Vapor pressure = 0.1 mmHg at 25°C; Flash point (depending on humidity) = 38−93°C; Autoignition temperature = 560°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. Due to this compound's ability to react with certain nitrogen compounds to form colored substances, quinone is widely used in the dye, textile, chemical, tanning, and cosmetic industries. It is used as an industrial chemical, laboratory reagent, and as an intermediate in chemical synthesis for hydroquinone and other chemicals.

Incompatibilities: Strong oxidizers, some combustible substances, reducing agents, and strong bases. Decomposes exothermically on warming above 60°C, when moist, producing carbon monoxide.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.42 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.4 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.4 mg/m^3 TWA.

Determination in Air: Use NIOSH II(4), Method #S-181, Quinone.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.21.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The vapor irritates the eyes, skin, and respiratory tract; can cause nosebleeds, hoarseness, cough, phlegm, and/or tightness in the chest. Skin contact can cause severe irritation. Solid quinone in contact with skin or the lining of the nose and throat may produce discoloration, severe irritation, swelling, and the formation of ulcers, papules, and vesicles. Prolonged contact with the skin may cause ulceration. Quinone vapor is highly irritating to the eyes. Following prolonged exposure to vapor, brownish conjunctival stains may appear. These may be followed by corneal opacities and structural changes in the cornea and loss of visual acuity. The early pigmentary stains are reversible, while the corneal dystrophy tends to be progressive. Further effects reported[52] include vomiting, collapse, and coma.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The substance may have effects on the skin and eyes, resulting in discoloration, inflammation and injury of the corneal epithelium, keratitis (inflammation of the cornea), reduced vision. Can cause lung irritation; bronchitis may develop. May cause kidney damage.

Points of Attack: Eyes, skin, lungs, kidneys.

Medical Surveillance: Ophthalmic examination. Careful examination of the eyes, including visual acuity and slit lamp examinations, should be done during placement and periodic examinations. Lung function tests. Kidney function tests. Also evaluate skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode). *Up to 20 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (982°C, 2.0 s minimum).

Determination in Water: Fish Tox = 64.49856000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause corneal damage and permanent injury. High levels can interfere with the blood's ability to carry oxygen causing methemoglobinemia; cyanosis, with blue color to the skin and lips. Higher levels can cause trouble breathing, collapse, and even death. A chloromononitrobenzene, this chemical may have similar toxic effects as nitrobenzene.

Long Term Exposure: May cause sensitization and skin allergy. May cause damage of the liver and kidneys. Human Tox = 2.10000 ppb (HIGH).

Points of Attack: Blood, skin, liver, kidneys.

Medical Surveillance: Blood methemoglobin levels. Evaluation by a qualified allergist. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical above 0.5 mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 5000 (estimate).

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal.

Quinuclidinyl benzilate (Agent BZ, WMD) Q:0120

Molecular Formula: $C_{21}H_{23}NO_3$

Synonyms: Agent 15; Agent-Buzz; 1-Azabicyclo(2,2,2) octan-3-ol, benzilate (ester); Benzeneacetic acid, α-hydroxy-α-phenyl-, 1-azabicyclo(2.2.2)oct-3-yl ester; Benzilic acid, 3-quinuclidinyl ester; BUZZ; BZ; 3-Chinuclidylbenzilate; 3-(2,2-Diphenyl-2-hydroxyethanoyloxy)-quinuclidine; Oksilidin; QNB; 3-Quinuclidinol benzilate; 3-Quinuclidinyl benzilate; Quinuclidinyl benzilate

Hydrochloride:

1-Azabicyclo(2.2.2)octan-3-ol, benzylate (ester), hydrochloride; Benzeneacetic acid, alpha-hydroxy-alpha-phenyl-, 1-azabicyclo(2.2.2)oct-3-yl ester, HCL; Benzilic acid, 3-quinuclidinyl ester, hydrochloride; CHEKB; HNB 3; 3-Quinuclidinyl benzilate hydrochloride; Quinuclidyl benzylate hydrochloride; Ro 2-3308

CAS Registry Number: 6581-06-2; 62869-69-6; 13004-56-3 (hydrochloride)
RTECS®Number: DD4639000; VD6300000 (hydrochloride)
UN/NA & ERG Number: UN 2810 (Toxic liquids, organic, n.o.s.)/153
EC Number: Not established
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).
Report any release of WMD to National Response Center 1-800-424-8802.
While not a mandated "Federally listed" waste, BZ is more toxic than most RCRA listed chemicals. However, BZ is a "listed" hazardous waste in some states where it may have been stockpiled by the military.
WGK (German Aquatic Class): No value assigned.
Description: Quinuclidinol benzilate (QNB) is a white crystalline solid. Odorless. Molecular weight = 337.41; Freezing/Melting point = 167.5°C; also 164−165°C; Boiling point = 320°C; Solid density = 0.51 g/cm^3 (bulk); 1.33 g/cm^3 (crystal); Vapor density = 11.6; Vapor pressure = negligible; about 0.5 mg/m^3 at 70°C; Flash point = 246°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3; Flammability 0; Reactivity 0. Slightly soluble in water.
History of the agent: QNB is an incapacitating agent and has been considered historically for use as a chemical warfare agent.[CDC] As a chemical weapon, QNB was mixed with a pyrotechnic mixture in small bombs designed for aerial delivery. Once exploded, the mixture produced a potentially dangerous aerosol of QNB. In the early 1960s at Pine Bluff Arsenal, Arkansas, the United States produced munitions containing QNB. Production ceased in the late 1960s and all stockpiles at every military installation were eventually destroyed by 1990. Iraq's "Agent 15" is believed to be identical to, or closely related to QNB. In general, the effectiveness of QNB as a WMD has proven both highly undependable and unpredictable.
Potential Exposure: Mutagen, drug; incapacitating agent. QNB is a glycolate anticholinergic compound that affects the central nervous system (CNS) and peripheral nervous system (PNS) and is related to the drugs atropine, scopolamine, and hyoscyamine. QNB is nonirritating; symptoms are delayed for several hours. QNB can be used to contaminate water, food, and agricultural products. A highly potent drug and central nervous system (CNS) depressant, QNB is a delayed-action incapacitating agent, usually dispersed as an aerosol, but it can also be used to penetrate skin when mixed with a solvent (such as DMSO), and to contaminate food and water. QNB appears to be widely used in pharmacologic research. The key to protection from QNB is prevention from entering the body with good quality aerosol filter and impermeable gloves and clothing. QMB is stable in most solvents, with a half-life of 3−4 weeks in moist air; it can be dispersed even with heat-producing munitions.
Incompatibilities: May form explosive mixture with air. Decomposes at about 170°C in air under prolonged heating. After 1 or 2 h at 200°C, it is completely decomposed. Rate of decomposition is both temperature and purity dependent. No effect on steel or stainless steel after 3 months at 71°C. Aluminum and anodized aluminum are mildly attacked after 3 months at 71°C. Contact with metals may evolve flammable and potentially explosive hydrogen gas.
Persistence of Chemical Agent: QNB is very persistent in soil and water and on surfaces.
Permissible Exposure Limits in Air:
Protective Action Criteria (PAC)*
6581-06-2
TEEL-0: 0.0075 mg/m^3
PAC-1: 0.02 mg/m^3
PAC-2: **0.037** mg/m^3
PAC-3: **0.69** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face.**
Determination in Air: No method is available for detecting QNB in environmental samples.[CDC]
Determination in Water: No method is available for detecting QNB in environmental samples.[CDC]
Routes of Entry: Respiratory system, ingestion, skin, or eye contact. Skin and eye absorption is possible, depending on liquid solvents that might be used to enhance absorption. Inhalation and ingestion of QNB are important routes of exposure for the solid.[CDC]
Harmful Effects and Symptoms
QNB is nonirritating stunning agent. The onset of incapacitation is dose dependent. Symptoms may occur as early as 1 h following exposure and continue for 48 h. The onset of incapacitation is dose dependent. It might occur as early as 1 h after exposure and continue from 48 h to 4 days depending on level of exposure. An untreated casualty may require from 3 to 4 days to achieve full recovery from the effects of QNB intoxication. QNB affects a victim's ability to remember, solve problems, make sound decisions and judgments, pay attention to assigned tasks, and understand instructions. High levels of exposure can completely destroy a victim's ability to perform any tasks, military and/or otherwise.
Short Term Exposure: A very potent drug, QNB, can cause confusion, dream-like state, hallucinations, and severe delirium; it also affects circulation, digestion, salivation, sweating, and vision. QNB causes dilation of the pupils, which is extremely uncomfortable to most people. QNB produces profound mental disturbances at a dose of 0.1−0.2 mg. Signs and symptoms of exposure include agitation, restlessness, dizziness, giddiness; failure to obey orders, confusion, erratic behavior; stumbling or staggering; vomiting; hallucinations; blurred vision; dry, flushed skin; urinary retention;

ileus; tachycardia; hypertension; and elevated temperature (>101°F/38°C). QNB may cause short-term memory loss, and variable levels of side effects are experienced in different people. Impairments caused by QNB are generally temporary and unlikely to be fatal; however, they can be severe with high exposures.[NIOSH] QNB is an anticholinergic. LCt_{50} = High; estimated to be 200,000 mg-min/m^3; ICt_{50} = 112 mg-min/m^3. LD50 = (iv-mouse) 18 mg/kg[US Army]; 25 mg/kg; TD_{Lo} (lowest published toxic dose) = (subcutaneous-human) 3 μg/kg.[NIOSH]

Delayed effects of exposure: Widespread formation of clots in the blood vessels (disseminated intravascular coagulation) is a potential complication in a victim with marked agitation and/or exceptionally high body temperature (hyperthermia).[NIOSH]

Long Term Exposure: Information is unavailable about the carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to QNB.

Points of Attack: CNS (central nervous system); PNS (peripheral nervous system).

Medical Surveillance: In a victim with marked agitation and/or exceptionally high body temperature (hyperthermia), clotting studies (e.g., prothrombin time, activated partial thromboplastin time, and international normalized ratio) are recommended. Urine tests.

Decontamination: Establish the decontamination corridor upwind and uphill of the hot zone. The warm zone should include two decontamination corridors. One decontamination corridor is used to enter the warm zone and the other for exiting the warm zone into the cold zone. The decontamination zone for exiting should be upwind and uphill from the zone used to enter. Decontamination area workers should wear appropriate PPE. A solution of detergent and water (which should have a pH value of at least 8 but should not exceed a pH value of 10.5) should be available for use in decontamination procedures. Soft brushes should be available to remove contamination from the PPE. Labeled, durable 6-mil polyethylene bags should be available for disposal of contaminated PPE.

INDIVIDUAL DECONTAMINATION: *Decontamination of First Responder:* Begin washing PPE of the first responder using soap and water solution and a soft brush. Always move in a downward motion (from head to toe). Make sure to get into all areas, especially folds in the clothing. Wash and rinse (using cold or warm water) until the contaminant is thoroughly removed. Remove PPE by rolling downward (from head to toe) and avoid pulling PPE off over the head. Remove the SCBA after other PPE has been removed. Place all PPE in labeled durable 6-mil polyethylene bags. *Decontamination of Patient/Victim:* Remove the patient/victim from the contaminated area and into the decontamination corridor. Remove all clothing (at least down to their undergarments) and place the clothing in a labeled durable 6-mil polyethylene bag. Thoroughly wash and rinse (using cold or warm water) the contaminated skin of the patient/victim using a soap and water solution. Be careful not to break the patient/victim's skin during the decontamination process, and cover all open wounds. Cover the patient/victim to prevent shock and loss of body heat. Move the patient/victim to an area where emergency medical treatment can be provided.

First Aid: *Eyes*: After removing patient/victim from the source of exposure, immediately wash eyes with large amounts of tepid water for at least 15 min. Do not allow the patient/victim to rub eyes. Monitor the patient/victim for signs of whole-body (systemic) effects; if signs appear, see the *Inhalation* section for treatment recommendations. Seek medical attention immediately.

Ingestion: After removing patient/victim from the source of exposure, immediately ensure that the patient/victim has an unobstructed airway. *Do not induce vomiting.* See the *Inhalation* section for first aid recommendations. Seek medical attention immediately.

Inhalation: After removing patient/victim from the source of exposure, immediately, evaluate respiratory function and pulse. Ensure that the patient/victim has an unobstructed airway. If shortness of breath occurs or breathing is difficult, administer oxygen. Assist ventilation as required. Always use a barrier or bag-valve-mask device. If breathing has ceased, provide artificial respiration. Monitor for exceptionally high body temperature. If body temperature is elevated above 102°F/39°C, initiate immediate and vigorous cooling (as for heatstroke), using 72° to 75°F/22° to 24°C water and air circulation (fanning), wet cloths and air circulation, or maximum exposure to air in a shaded area with maximum air circulation. Do not use ice for skin cooling. Give fluids sparingly. Manage dryness and coating of the mouth and lips using moist swabs and small amounts of petroleum jelly. Monitor for skin abrasions caused by repetitive movements. Remove potentially harmful items, including cigarettes, matches, medications, and small items that could be accidentally ingested, from the patient/victim's possession. Consider loose restraint of disoriented or agitated patient/victims. Consider separation of affected individuals into small groups to minimize potential crowd control problems. Seek medical attention immediately. *Skin:* After removing patient/victim from the source of exposure, immediately, see the *Decontamination* section (above). See the *Inhalation* section for first aid recommendations. Seek medical attention immediately.

Note to health professionals: Treatment of QNB intoxication largely consists of supportive care: use of intravenous fluids and appropriate cooling measures to address elevated core body temperature and judicious use of sedation using benzodiazepines. Severe toxicity may require the use of physostigmine in a hospital setting.*[CDC]

Antidote: *Some military references suggest the use of physostigmine to temporarily increase synaptic acetylcholine concentrations. Physostigmine poses its own risks of side effects and interactions with other drugs and should be used only by physician or other medical personnel familiar with its safe use. Suggested dosages for physostigmine in the treatment of QNB (BZ) poisoning follow: *Test dose:* If the diagnosis is in doubt, a dose of 1 mg might be given. If a slight improvement occurs, routine dosing should be given.

Routine dosing: Doses of about 45 mcg/kg for adults have been recommended. This might be modified by the response. A mental status examination should be done every hour and the dose and time interval of dosing should be modified according to whether the mental status is improved or not. As the patient improves, the dosage requirement will decrease.

Routes of administration: IM: 45 mcg/kg in adults (20 mg/kg in children); IV: 30 mcg/kg slowly (1 mg/min); PO: 60 mcg/kg if patient is cooperative (because of bitter taste, consider diluting in juice). For each route, titrate about every 60 min to mental status.[USAMRICD]

Personal Protective Methods: First Responders should use a NIOSH- or European Standard EN 149-certified Chemical, Biological, Radiological, Nuclear (CBRN) Self Contained Breathing Apparatus (SCBA) with a Level A protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level A protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience. *LEVEL A: (RED ZONE):* Used when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2 (not established). A Totally-Encapsulating Chemical Protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

Respirator Selection: Where there is potential for exposure to QNB, use a NIOSH- or European Standard EN 149-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle.

Storage: QNB is stable in most solvents, with a half-life of 3−4 weeks in moist air. Store at 2−8°C.

Shipping: Quinuclidinol benzilate (QNB) shipping name is "TOXIC, LIQUIDS, ORGANIC, N.O.S." Subsidiary Hazardous Class or Division Label "Poison (Toxic)." Hazardous Class or Division 6.1. Packing Group III.

Spill Handling: QNB aerosol is heavier than air. It will spread along the ground and collect and stay in poorly ventilated, low-lying, or confined areas (e.g., sewers, basements, and tanks). Hazardous concentrations may develop quickly in enclosed, poorly ventilated, or low-lying areas. Keep out of these areas. Stay upwind. *Environment/spillage disposal:* Do not touch or walk through the spilled agent if at all possible. However, if you must, personnel should wear the appropriate PPE during environmental decontamination. See the PPE section of this record for detailed information. Keep combustibles (e.g., wood, paper, and oil) away from the spilled agent. Use water spray to reduce aerosols or divert aerosol cloud drift. Avoid allowing water runoff to contact the spilled agent. Do not direct water at the spill or the source of the leak. Stop the leak if it is possible to do so without risk to personnel. Prevent entry into waterways, sewers, basements, or confined areas. Isolate the area until aerosol has dispersed. Ventilate the area.[NIOSH] Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Spills must be contained by covering with vermiculite, diatomaceous earth, clay, fine sand, sponges, and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous sodium hydroxide solution (a minimum 10 wt. %). Scoop up all material and place in a fully removable head drum with a high-density polyethylene liner. The decontamination solution must be treated with excess bleach to destroy the CN formed during hydrolysis. Cover the contents with additional bleach before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA, and DOT regulations. Dispose of the material per IAW waste disposal methods provided below. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 10 wt. % sodium hydroxide is not available, then the following decontaminants may be used instead and are listed in order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate, and Supertropical Bleach Slurry (STB). Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at

(800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

QNB, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Fire Extinguishing: QNB (BZ) is combustible; it may burn but does not ignite readily. QNB (BZ) might be transported in a molten form. QNB (BZ) may decompose upon heating producing corrosive and/or toxic gases. Containers may explode when heated. In case of fire, evacuate the area, including yourself. If there is some reason that you have to put out the fire—for example, there are things nearby that cannot be allowed to burn—use unattended equipment, then evacuate everyone immediately, including yourself. When heated, aerosols may form explosive mixtures with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. QNB (BZ) aerosol is heavier than air. It will spread along the ground and collect and stay in poorly ventilated, low-lying, or confined areas (e.g., sewers, basements, and tanks). Hazardous concentrations may develop quickly in enclosed, poorly ventilated, or low-lying areas. Keep out of these areas. Stay upwind. Fire may produce irritating, corrosive, and/or toxic gases.

If you must extinguish a QNB (BZ) fire—Small fires: Use dry chemical, carbon dioxide, or water spray. *Large fires*: Use dry chemical, carbon dioxide, alcohol-resistant foam, or water spray. Move containers from the fire area if it is possible to do so without risk to personnel. Dike fire control water for later disposal; do not scatter the material. For fire involving tanks or car/trailer loads, fight the fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after the fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tanks. Always stay away from tanks engulfed in fire. Run-off from fire control or dilution water may be corrosive and/or toxic, and it may cause pollution. If the situation allows, control and properly dispose of run-off (effluent).

Disposal Method Suggested:

See "Spill Handling," above.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Known carcinogen; EPA and the National Academy of Sciences, Committee on Biological Effects of Ionizing Radiation: Radium is a known human carcinogen. Radium-224; Radium-226; Radium-228; Radon-222 and their decay products Category 1.

Radionuclides and Reportable Quantities (RQ) listed under CERCLA (see 40CFR Part 302, Table 302.4, Appendix B, for more information): Radium-223 RQ = 1 curies; Radium-224 RQ = 10 curies; Radium-225 RQ = 1 curies; Radium-226 RQ = 0.1 curies; Radium-227 RQ = 1000 curies; Radium-228 RQ = 0.1 curies; Radon-220 RQ = 1 curies; Radon-222 RQ = 1 curies.

Listed in the TSCA inventory.

The Clean Air Act authorizes EPA to establish annual limits, known as National Emission Standards for Hazardous Air Pollutants (NESHAP) for the maximum amount of radium and other radionuclides that may be released to the air. Radium = 10 mRem.

The Safe Drinking Water Act authorizes EPA to limit the Maximum Contaminant Levels (MCL) of radium and other radionuclides in publicly supplied drinking water.

Description: Radium (Ra) is a radioactive element, found naturally in the environment. Ra is a silvery-white-metallic solid at 25°C; it tarnishes black when exposed to air. It is an alkaline earth metal; there are 33 isotopes, all of them are unstable. Radium is commonly available as radium bromide ($RaBr_2$) or radium chloride ($RaCl_2$). Atomic weight = 226.025; Density = 5.5 g/cm^3 at 28°C; Freezing/Melting point = 700°C; Boiling point = 1140°C; 1536°C; 1737°C [Merck]; Density = 5.3 g/cm^3 at 26.85°C; Vapor pressure = 327 Pa at 700°C. *Radium bromide* is a white to brownish crystalline solid. Radioactive. Molecular weight = 395.83; Density = 5.79 at 20°C; Specific gravity = (H_2O:1) 3.34; Freezing/Melting point = 728°C (decomposes); Boiling point = 900°C (sublimes). Soluble in cold water. *Radium chloride* is a yellowish-white or brownish crystalline solid. Radioactive. Molecular weight = 296.9 g/mol; Density = 4.91; Freezing/Melting point = 1000°C.

Potential Exposure: Radium is not available as a pure metal but is found in very small quantities in uranium and thorium ores. Uranium and thorium are found in small amounts in most rocks and soil; radium is formed when these elements break down in the environment. One ton of uranium ore yields only slightly more than 0.1 g of radium. Radium is formed from the radioactive decay; and as a by-product of refining these ores. Radium exists in several isotope forms. Two of the principal radium isotopes found in the environment are ^{226}Ra (radium-226) and ^{228}Ra (radium-228). Radium compounds, due to their geologically short half-life and intense radioactivity, are quite rare. A single gram of ^{226}Ra produces 10^{-4} mm of radon (Rn) a day. Radium-226, radium's most stable isotope has a half-life of about 1603−1620 years, and remains in the body for life. Radium, when used to produce radon gas, is used for treating various types of cancer; in radiography of metals; and combined with other metals, such as beryllium, as a neutron emitting source used in research and for calibrating radiation instruments. Until the 1960s, radium was a component in self-luminous paints used for watch, compass, and aircraft instrument dials and other aircraft and military instrumentation. A less dangerous radioactive source, ^{60}Co (cobalt-60), replaced radium in luminous paint. The greatest health risk from radium comes from exposure to its radioactive decay product, radon (Rn). Radon is common in many soils and can collect in buildings, including homes.

Incompatibilities: Metallic radium is highly chemically reactive. It forms compounds that are very similar to barium compounds, making separation of the two elements difficult.[EPA] On contact with water, radium forms flammable hydrogen gas. Radium bromate is a strong oxidizer; avoid contact with a combustible material (clothing, wood, paper, oil, etc.).

Permissible Exposure Limits:

Recommended Occupational Annual Dose Limits (NCRP and NRC):

Whole body: 5 Rem (0.05 Sv)/1 year.

Lens of eye: 15 Rem (0.15 Sv).

Skin: 50 Rem (0.5 Sv).

Hands or feet: 50 Rem (0.5 Sv).

Cumulative occupational limit: 1 Rem (0.01 Sv) × age.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00017-5

The limit for radiation exposure for a declared pregnant radiation worker is 500 mRem (0.005 Sv) for the entire gestation period. The separate limit for the fetus is 500 mRem (0.005 Sv) for the entire gestation; exposures to the fetus must be uniform and must be maintained at or below 50 mRem (0.0005 Sv)/mo.

Radiological Dispersal Device (RDD) Incidents

Particulate sampling can be performed to measure the radioactivity of dust in the air and to further characterize exposures. Based on the sampling data, the respirator protection factor needed to meet the relevant exposure limits can be determined (see Table below), and the specific type of respirator needed can be identified. According to the data, it may be possible to downgrade or remove requirements for respiratory protection. However, until exposures have been characterized, responders and support personnel should continue to utilize full-face air-purifying P100 respirators, or higher respiratory protection (e.g., SCBAs, PAPRs).

Guidance Matrix for Radiological Dispersal Device (RDD) Incidents

OSHA Occupational Exposure Limits for Ionizing Radiation 29 CFR 1910.1096	**Rem (Sv)/calendar qtr.**
Whole body, head, and trunk	—
Active blood-forming organs	—
Lens of eye, or Gonads	1.25 (0.0125 Sv)
Hands and forearms	—
Feet and ankles	18.75 (0.1875 Sv)
Skin of whole body	7.5 (0.075 Sv)
Minors (workers under age 18)	10% of above limits
Workers over age 18	3 Rem (0.3 Sv) may be permitted under conditions specified in 29CFR1910.1096(b)(2)

Note: The Department of Homeland Security is currently chairing an interagency workgroup which is in the process of assessing the protective action guidance for response to an RDD event.

EPA Limits and Advisory Levels: United States, annual radiation exposure limits are found in Title 10, Part 20 of the Code of Federal Regulations, and in equivalent state regulations.

Public dose limits due to licensed activities (NRC) 100 mRem (0.01 Sv)/year.

Air: Radium NESHAP = 10 mRem (0.1 Sv).*

Water: ^{226}Ra & ^{228}Ra (combined radium) MCL = 5 pCi/L; ^{224}Ra = 15 picocuries/liter (5 pCi/L).*

Indoor Air (advisory "action level"): 4 pCi/L radon (Rn).

*Both the air and water standards limit the increased lifetime cancer risk to about 2 in 10,000.

Permissible Concentration in Water: The US EPA has set an MCL of 5 pCi/L in drinking water for Radium-226 and Radium-228 (combined) and 15 pCi/L for Radium-224.

Permissible Concentration in Soil: The US EPA has set a soil concentration limit of 5 pCi/g for Radium-226 in uranium and thorium mill tailings in the first 15 cm of soil and 15 picocuries per gram (5 pCi/g) in deeper soil.

Routes of Entry: Inhalation, ingestion, external exposure to *alpha*-, *beta*-, and *gamma*-rays.

Harmful Effects and Symptoms

Radium is highly radioactive and its decay product, radon (Rn) gas, is also radioactive. Radium is over one million times more radioactive than the same mass of uranium. Since radium is chemically similar to calcium, it has the potential to cause great harm by replacing it in bones and teeth. The later effects include an increase in cavities and broken teeth.

Short Term Exposure: Inhalation, injection, ingestion or body exposure to radium can cause cancer and other disorders. Exposure to high levels can increase the risk of bone, liver, and breast cancer. Radium emits several kinds of radiations, in particular, *alpha* particles and *gamma* rays. *Alpha* particles are generally harmful only if emitted inside the body. However, both internal and external exposure to *gamma* radiation is harmful. *Gamma* rays can penetrate the body, so *gamma* emitters like radium can result in exposures even when the source is a distance away. *Radium bromate*: Highly hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation. Slightly hazardous in case of skin contact; prolonged contact may result in skin burns, inflammation (including reddening, itching, and scaling), blistering, and ulcerations. Inhalation overexposure may cause respiratory irritation. Inflammation of the eye is characterized by redness, watering, and itching. Exposure from *gamma* rays is measured in units of roentgens (Rads); 100 Rads = 1 Gray (Gy) = 1 J/kg. For example: Radiation sickness = total body exposure of 100 Rads (or 1 Gy). Radiation sickness and death in half the population = total body exposure of 400 Rads (or 4 Gy). Without medical treatment, nearly everyone who receives more than 400 Rads will die within 30 days. 100,000 Rads causes almost immediate unconsciousness and death within an hour.[NYT]

Long Term Exposure: Long-term exposure to radium increases the risk of developing several diseases. Inhaled or ingested radium increases the risk of developing lymphoma, bone cancer, and diseases that affect the formation of blood, such as leukemia and aplastic anemia. These effects usually take years to develop. External exposure to radium's gamma radiation increases the risk of cancer to varying degrees in all tissues and organs. Historically, Marie Curie's death due to aplastic anemia has been blamed on exposure and handling of radium. Patients who were injected with radium in Germany, from 1946 to 1950, for the treatment of certain diseases including tuberculosis were significantly shorter as adults than people who were not treated.[CDC]

Points of Attack: Liver, blood (anemia), eyes (cataracts) and other organs, bones and teeth.

Medical Surveillance: There are tests that are used to determine exposure to radium or other radioactive substances. For example, a whole body count can measure the total amount of radioactivity in the body, and urine and feces can be tested for the presence of radionuclides. There is no test that can detect external exposure to radium's gamma radiation, unless the doses were very high, and cellular damage is detectable. Another test measures radon (Rn) in exhaled air [radon (Rn) is a breakdown product of radium]. None of these tests are routinely performed in a doctor's office; they require specialized laboratory equipment. These tests are unable to quantify exposure, nor can they be used to predict whether a patient will develop long-term or harmful health effects.

First Aid: Unless you are dressed in appropriate protective gear to prevent self-contaminating, do not provide medical attention. Evacuate the victim from area of exposure to a safe area as soon as possible. To stop ongoing contamination, have the victim remove clothing, if possible, and place clothing in a sealed garbage bag or container. Check the victim's breathing and pulse; start CPR, if necessary.

Skin: If skin contamination has occurred, measure levels of contamination with a survey meter, record results, and begin decontamination by gentle washing with plenty of water (warm if possible) and nonabrasive and disinfecting soap, washing downwards towards extremities, not upwards. Dry body and cover the irritated skin with an emollient. If burns are obvious, do not use ointments. Wrap victim in a clean, soft blanket. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility.

Eyes: Check for and remove any contact lenses. Immediately flush eyes with cold water. Avoid the use of an eye ointment. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility. *Inhalation:* Allow the victim to rest in a well-ventilated area. If breathing is difficult, administer oxygen. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility.

Ingestion: Do not induce vomiting. Loosen tight clothing such as a collar, tie, belt. Seek immediate medical attention; evacuate the victim to nearest emergency medical facility.

Personal Protective Methods: *Radium bromate:* Engineering Controls: Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit. Emergency responders to an explosion or the resulting fires will generally not know they are being exposed to radiation unless they utilize a radiation-detecting device. There is no practical personal protective equipment (PPE) to protect First Responders against externally penetrating *gamma* radiation. Monitoring devices are the only means to ensure that responders do not enter an area where exposures to external *gamma* radiation is excessive. Personal protective equipment (PPE) to prevent skin contamination of particulates is very effective against particulate-borne radiation hazards (i.e., *alpha* and *beta* particles). Typical firefighter "turnout" gear, including a SCBA and radiation detection device or dosimeter, may be adequate for this purpose (depending on radiation level). The use of turnout gear or any disposable protective clothing suitable for particulate exposure should be followed by appropriate decontamination of personnel and equipment. *Personal Protection in Case of a Large Spill:* Splash goggles; full suit; dust respirator; boots; gloves. A self-contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling radioactive material.

Respirator Selection: Protection of internal organs from inhalation of radioactive particulates can be provided by wearing an appropriate particulate respirator. The SCBAs will provide the highest level of protection. Responders should utilize at least a full-face air-purifying respirator with a P-100 or HEPA filter, as appropriate. Respiratory protection specifically approved by NIOSH for CBRN exposures is desirable. However, where specific CBRN-approved respirators are not available, the incident commander may allow alternative NIOSH-approved respirators, such as SCBAs, or full-face powered or nonpowered air-purifying respirators with P-100 or HEPA filters, as appropriate. It should be noted that these recommendations for respiratory protection are designed ONLY for protection against inhalation of radioactive particulates, and do not consider protection that may be necessary for other contaminants, such as chemical or biological agents.

At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Store in a ventilated area to prevent accumulation of radon (Rn).

Shipping: Radioactive material, Type A package nonspecial form, nonfissile or fissile-excepted, requires a label of "RADIOACTIVE MATERIAL." It falls in Hazard Class 7.

A1 and A2 values for Radium-226 taken from §173.435 (see also Table A-1 in 10CFR71 (Appendix A): A1(Special Form) 0.3 TBq (8.11 Ci); A2 (Normal Form) 0.02TBq (0.541Ci))*

*Special form materials are limited to those materials which, if released from a package, would present a hazard only due to direct *external radiation*. Usually, due to the high physical integrity of a special form material, radioactive material contamination is not expected even under severe accident conditions. This high physical integrity is occasionally the result of *inherent natural* properties of the material, such as its being in nondispersible solid form. Most often, however, it is an *acquired characteristic*, resulting from being welded (encapsulated) into an extremely durable metal capsule.

The A1 and A2 quantities for each radionuclide are basically the maximum activity that can be transported in a Type A package. For many radionuclides, the regulations allow substantially larger quantities of special form material to be placed in a Type A packaging than when the material is in "normal form," i.e., "nonspecial form." Special form radioactive material is defined in 49 CFR 173.403. Special form sources must have at least one external physical dimension which exceeds 5 mm (0.197″). The minimum dimension requirement makes the capsule easier to see and recover in the event of its release from the package during an accident. *Special form encapsulations are required to be constructed in a manner that they can only be opened by destroying the capsule*. This requirement prevents the inadvertent loosening or opening of the capsule either during transport or following an accident. The testing requirements for determination of whether radioactive materials qualify as "special form" are found in 49CFR173.469, which describes tests for high temperature, impact, percussion, bending, and leakage.

Spill Handling: Notify authorities that spill has occurred. Do not touch spilled material. Cover with absorbent paper or dike with absorbent. Isolate the area to prevent unnecessary spread of the material and personnel exposures. Prevent entry into sewers, basements, or confined areas; dike if needed. Using appropriate monitoring equipment, survey the spill site; evaluate the presence of contamination on an individual's skin and clothing and on lab equipment. If skin or clothing contamination is present, assume a MAJOR spill has occurred. Do not attempt to clean it up. Confine all potentially contaminated individuals in order to prevent the further spread of contamination. If possible, shield the source, but only if it can be done without significantly increasing radiation exposure to yourself or other personnel. Leave the affected room and lock the doors in order to prevent entry. Do what you can to prevent further spreading of contamination to unrestricted areas. Contact local and state authorities and the Department of Energy (DOE) Radiological Response Team. Call for assistance on disposal.

Fire Extinguishing: If "Radioactive material, Type A package nonspecial form" is involved in a fire situation, first contact the Department of Energy (DOE) Radiological Response Team, as well as state and local authorities. Do not use water; use suitable dry powder, graphite, soda ash, powdered sodium chloride, or sand.

Disposal Method Suggested: Radioactive material considered waste and must be retained in containers for disposition by the authorizing institution. Drain disposal is prohibited. It is the responsibility of the operating institution to arrange for the proper disposal of all forms of any radioisotopes. The use, storage, transportation, labeling, and disposal of radioactive material are regulated through the Nuclear Regulatory Commission (NRC) using 10 CFR (Code of Federal Regulations) as the regulatory basis and 49 CFR (Transportation). (The CFRs are available at no cost on the internet at http://www.access.gpo.gov/nara/cfr/index.html)

CAS Registry Number: 50-55-5

RTECS® Number: ZG0350000

UN/NA & ERG Number: UN1544/151

EC Number: 200-047-9

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Limited Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1987; NTP: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis studies (feed); clear evidence: mouse, rat, 1980.

US EPA Hazardous Waste Number (RCRA No.): U200.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Reserpine is a white to pale buff to slightly yellow crystalline substance that darkens on exposure to light. Molecular weight = 608.75; Freezing/Melting point = 264−265°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. May be combustible.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Human Data; Natural Product. An alkaloid. Reserpine, a pharmaceutical, is a naturally occurring substance that is isolated from the roots of the plant *Rauwolfia serpentina*. Insoluble in water. Reserpine is used as a hypertensive for humans and animals, tranquilizer, and sedative. Permitted for use as an additive in food for human consumption, and the feed and drinking water of food-producing animals.

Incompatibilities: A weak acid; keep away from bases. Incompatible with strong oxidizers and strong reducing agents.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Massive overexposure may cause decreased blood pressure, convulsions, and coma. Reserpine is highly toxic to man. In humans, 0.014 mg/kg produces psychotropic effects. Symptoms include nausea, diarrhea, excessive salivation, nasal stuffiness, drowsiness, nightmares, emotional depression and other psychotropic effects, extra systoles, angina pain, edema and weight gain sometimes associated with frank congestive heart failure, thrombocytopenia, tremor, muscular stiffness, severe hypotension in conjunction with general anesthetic administration.

Long Term Exposure: May be a human carcinogen. There is limited evidence that this chemical causes breast cancer in humans, and breast and testes cancer in animals. Reproductive activity: may also be a mutagen and teratogen. Reserpine may damage the developing fetus. People taking reserpine daily for medical purposes have developed nightmares, severe depression, cramps, diarrhea, and weight gain. It is unknown if these symptoms occur from repeated occupational exposure.

Points of Attack: Nervous system. *Cancer site:* breast in humans; breast and testes in animals.

Medical Surveillance: There is no special test for this chemical. If overexposure or illness is suspected, medical attention is recommended.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than this body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required for drug manufacture by the Food and Drug Administration. Refer to 21CFR210, *FDA Regulation for Good Manufacturing Practices.*

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry place. Protect from exposure to light and acids. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Alkaloids, solid, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." Respirine falls in Hazard Class 3.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources:[52] Remove all sources of ignition and dampen spilled material with toluene to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent dampened with toluene to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R36/38; R50; Safety phrases: S2; S26; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Resorcinol is a white crystalline solid with a characteristic odor and a sweetish taste. Turns pink on exposure to air or light, or contact with iron. Molecular weight = 110.12; Boiling point = 277.2°C; Freezing/Melting point = 108.9°C; Vapor pressure = 0.0002 mmHg at 25°C; Flash point = 127.2°C (cc); Autoignition temperature = 607°C. Explosive limits: LEL = 1.4% at 200°C. UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Highly soluble in water; solubility = 110%.

Potential Exposure: Compound Description: Drug, Tumorigen, Mutagen, Human Data; Primary Irritant. Resorcinol is weakly antiseptic; resorcinol compounds are used in the production of resorcinol−formaldehyde adhesives; or as an intermediate; in pharmaceuticals and hair dyes for human use. Major industrial uses are as adhesives in rubber products and tires, wood adhesive resins, and as ultraviolet absorbers in polyolefin plastics. Resorcinol is also a by-product of coal conversion and is a component of cigarette smoke. Thus, substantial opportunity exists for human exposure.

Incompatibilities: Reacts with oxidizers, nitric acid, oil, ferric salts, methanol, acetanilide, albumin, antipyrene, alkalies, urethane, ammonia, amino compounds. Hygroscopic; absorbs moisture from the air.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.50 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 10 ppm/45 mg/m^3 TWA; 20 ppm/90 mg/m^3 STEL.

ACGIH TLV®[1]: 10 ppm/45 mg/m^3 TWA; 20 ppm/90 mg/m^3 STEL; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 20 ppm

PAC-2: 20 ppm

PAC-3: 20 ppm

DFG MAK: Danger of skin sensitization.

Australia: TWA 10 ppm (45 mg/m^3); STEL 20 ppm, 1993; Austria: MAK 10 ppm (45 mg/m^3), 1999; Belgium: TWA 10 ppm (45 mg/m^3); STEL 20 ppm, 1993; Denmark: TWA 10 ppm (45 mg/m^3), 1999; EU OEL: TWA 10 ppm, 45 mg/m^3; 2000; Finland: TWA 10 ppm (45 mg/m^3); STEL 20 ppm (90 mg/m^3), 1999; France: VME 10 ppm (45 mg/m^3), 1999; Hungary: TWA 45 mg/m^3; STEL 90 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 45 mg/m^3, 2003; Poland: MAC (TWA) 45 mg/m^3; MAC (STEL) 90 mg/m^3, 1999; Sweden: NGV 10 ppm (45 mg/m^3), [skin], 1999; Switzerland: MAK-W 10 ppm (45 mg/m^3), 1999; United Kingdom: TWA 10 ppm (46 mg/m^3); STEL 20 ppm (92 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 20 ppm. Several states have set guidelines or standards for resorcinol in ambient air[60] ranging from 3.1 μg/m^3 (Massachusetts) to 450.0−900.0 μg/m^3 (North Dakota) to 750.0 μg/m^3 (Virginia) to 900.0 μg/m^3 (Connecticut, Florida, New York) to 1071.0 μg/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-7; Methanol; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #5701; OSHA Analytical Method: PV-2053.

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes and 0.004 mg/L in water bodies used for fishery purposes. The state of Maine has set a guideline of 140 μg/L for drinking water.[61]

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.8−0.9.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact causes a severe rash and blistering. Eye contact can cause burns and permanent damage. May affect the blood, causing formation of methemoglobin, cyanosis, convulsions, restlessness, increased heart rate, dyspnea (breathing difficulty), dizziness, drowsiness, hypothermia, hemoglobinuria. High exposure can cause kidney and/or liver damage. *Inhalation:* Humans occupationally exposed to 10 ppm showed no effects. Experiments with animals showed no toxic effects after 8-h exposure to 625 ppm. *Skin:* Itching, irritation, redness, swelling, and chemical burns have been reported from contact with solutions of 3−25% strength. Skin absorption is significant and leads to loss of oxygen-carrying capacity of blood, convulsions, and death. *Eyes:* Animal tests suggest that 10% solution may cause irritation, pain, and corneal damage. Powdered resorcinol may cause chemical burns to the cornea resulting in blindness. *Ingestion:* May cause excessive sweating, low blood pressure, slowed breathing, tremors, breakdown of blood cells and death. One teaspoonful may cause death.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated exposure can cause lung damage. May cause kidney, liver, spleen damage.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, central nervous system, blood, spleen, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: urine test for resorcinol. Tests for kidney and liver function. Methemoglobin level. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine. Emergency treatment and management is similar to phenol.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, oil, ferric salts, methanol, acetanilide, albumin, antipyrine, and urethane. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Resorcinol requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Establish forced ventilation to keep levels below explosive limit. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Liquid solutions should be absorbed on sand or vermiculite and shoveled into suitable containers. Scrub spill area with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a combustible solvent and incinerate.

Rhodium R:0120

Molecular Formula: Rh; $O_3Rh_2 \cdot xH_2O$ [Rhodium(III) oxide, hydrate]

Synonyms: Elemental rhodium; Rhodium black; Rhodium-103

CAS Registry Number: 7440-16-6; 123542-79-0 [Rhodium (III) oxide, hydrate]; 12137-27-8 (Rhodium(IV) oxide); 12036-35-0 (Rhodium oxide, solids)

RTECS® Number: VI9069000 (metal)

UN/NA & ERG Number: UN3089 (metal powder, flammable, n.o.s.)/170

EC Number: 231-125-0; 234-846-9 [Rhodium(III) oxide, hydrate]

Regulatory Authority and Advisory Bodies

Listed on the TSCA inventory.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, elemental.

WGK (German Aquatic Hazard Class): Nonwater polluting agent (metal).

Description: Rhodium, together with platinum, palladium, iridium, ruthenium, and osmium, is one of the platinum-group metals in Group VIII of the Periodic Table. Rhodium metal is a white, hard, ductile, malleable solid with a bluish-gray luster. Molecular weight = 102.91; Specific gravity [metal] (H_2O:1) = 12.41 at 25°C; Boiling point = 3727°C; Freezing/Melting point = 1966°C. Insoluble in water.

Potential Exposure: Rhodium has few applications by itself, as in rhodium plating of white gold jewelry or plating of electrical parts, such as commutator slip rings, but, mainly, rhodium is used as a component of platinum alloys. Rhodium-containing catalysts have been proposed for use in automotive catalytic converters for exhaust gas cleanup.

Incompatibilities: Flammable as a dust or powder. Violent reaction with strong oxidizers, bromine pentafluoride, bromine trifluoride, chlorine trifluoride, oxygen difluoride.

Permissible Exposure Limits in Air

Metal fume and insoluble compounds

OSHA PEL: 0.1 mg[Rh]/m^3 TWA.

NIOSH REL: 0.1 mg[Rh]/m^3 TWA.

ACGIH TLV®[1] (*elemental*): 1 mg[Rh]/m^3; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

Metal

TEEL-0: 0.1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 100 mg/m^3

DFG MAK: Carcinogen Category 3B.

NIOSH IDLH: 100 mg[Rh]/m^3.

Australia: TWA 1 mg[Rh]/m^3, 1993; Belgium: TWA 1 mg [Rh]/m^3, 1993; Finland: TWA 0.1 mg[Rh]/m^3, 1999; France: VME 1 mg[Rh]/m^3, 1999; Norway: TWA 0.1 mg [Rh]/m^3, 1999; the Philippines: TWA 0.1 mg[Rh]/m^3, 1993; Switzerland: MAK-W 0.1 mg[Rh]/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg[Rh]/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Soluble compounds

OSHA PEL: 0.001 mg[Rh]/m^3 TWA.

NIOSH REL: 0.001 mg[Rh]/m^3 TWA.

ACGIH TLV®[1]: 0.01 mg[Rh]/m^3; not classifiable as a human carcinogen.

NIOSH IDLH: 2 mg[Rh]/m^3.

DFG MAK (*inorganic only*): Carcinogen Category 3B.

Several states have guidelines or standards for rhodium in ambient air[60] ranging from 0.16 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut), to 10.0 μg/m^3 (North Dakota) to 24.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II(3) Method #S-188.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: May cause metal fume fever. Rhodium(III) chloride and its hydrate are extremely toxic. May cause serious eye damage.

Long Term Exposure: Possible respiratory sensitization.

Points of Attack: Respiratory system. Ingestion [Rhodium (III) chloride].

Medical Surveillance: Examination by a qualified allergist. Lung function tests. Consider chest X-ray following acute overexposure to metal fume or dust.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If metal fume fever develops, it may last less than 36 h.

Note to physician: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 mg/m^3:* 95XQ

(APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red (*powder*): Flammability Hazard: Store in a flammable materials storage area. Prior to working with this material you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and sources of ignition. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Sipping: Flammable powder requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery in view of the high economic value. Recovery techniques for recycling of rhodium in plating wastes and spent catalysts have been described in the literature.

Rhodium trichloride R:0130

Molecular Formula: Cl_3Rh

Common Formula: $RhCl_3 \cdot xH_2O$ (trihydrate)

Synonyms: Hydrated rhodium trichloride; Rhodium chloride; Rhodium(III) chloride (1:3); Rhodium chloride, trihydrate

CAS Registry Number: 10049-07-7; 13569-65-8 (trihydrate)

RTECS® Number: VI9275000

UN/NA & ERG Number: UN3260 (Corrosive solid, acidic, inorganic, n.o.s.)/154

EC Number: 233-165-4 (trichloride)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: dropped from listing in 1988.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Rhodium trichloride is a red-brown or black, odorless solid or liquid. Molecular weight = 209.26; 263.32 (trihydrate); Boiling point = 775°C (sublimes); Freezing/Melting point = 400−500°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Insoluble in water.

Rhodium trichloride trihydrate, $RhCl_3 \cdot xH_2O$, is a deep-red crystalline solid. Soluble in water.
Potential Exposure: Compound Description: Mutagen. Rhodium trichloride is used in hydrosilylation, hydrogenation, carbonylation, oxidation, arylation. See also "Rhodium Metal." In plating operations and in catalyst preparation, the metal will be used as the trichloride.
Incompatibilities: Strong oxidizers.
Permissible Exposure Limits in Air
OSHA PEL: 0.001 mg[Rh]/m^3 TWA.
NIOSH REL: 0.001 mg[Rh]/m^3 TWA.
ACGIH TLV®[1]: 0.01 mg[Rh]/m^3; not classifiable as a human carcinogen.
No TEEL available.
DFG MAK: Carcinogen Category 3B.
NIOSH IDLH: 2 mg[Rh]/m^3.
Australia: TWA 1 mg[Rh]/m^3, 1993; Belgium: TWA 1 mg [Rh]/m^3, 1993; Denmark: TWA 0.001 mg[Rh]/m^3, 1999; Finland: TWA 0.001 mg[Rh]/m^3, [skin], 1999; France: VME 1 mg[Rh]/m^3, 1993; Norway: TWA 0.1 mg[Rh]/m^3, 1999; the Philippines: TWA 0.1 mg[Rh]/m^3, 1993; Switzerland: MAK-W 0.1 mg[Rh]/m^3, 1999; United Kingdom: TWA 0.001 mg[Rh]/m^3; STEL 0.003 mg[Rh]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Not classifiable as a human carcinogen. Several states have guidelines or standards for rhodium in ambient air[60] ranging from 0.16 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (North Dakota) to 24.0 μg/m^3 (Nevada).
Determination in Air: Use NIOSH II(3), Method #S-189.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: May cause eye irritation or serious damage. In animals: irritation of the eyes; central nervous system damage. LD_{50} = (oral-rat) 1302 mg/kg.
Long Term Exposure: May cause central nervous system damage. Tumorigenic and mutagenic effects have been reported in experimental lab animals.
Points of Attack: Eyes, central nervous system.
Medical Surveillance: Consider the point of attack in preplacement and periodic physical examinations.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Up to 0.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Rhodium trichloride is not specifically cited in DOT regulations. However it is covered under "CORROSIVE, ACIDIC, INORGANIC, N.O.S."[19] and labeled "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and reclaiming wherever possible in view of high economic value. See "Rhodium Metal."

RTECS Number: VJ2625000

UN/NA & ERG Number: UN3462 (Toxin, extracted from living sources, n.o.s.)/153

EC Number: None assigned.

Regulatory Authority and Advisory Bodies

Report any release of WMD to National Response Center 1-800-424-8802.

European/International Regulations: Hazard Symbol: T; Risk phrases: R26/27/28; R42/43; Safety phrases: S23; S28; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Class) No value assigned to these CAS numbers. *However, based on toxicity the following may apply*: 3—Severe hazard to waters.

Description: Ricin is a lethal, delayed-action cytotoxin; it is persistent in the environment. Ricin is a white powder. Molecular weight = (approx.) 64,000−66,000 Da; Volatility = negligible; Vapor pressure = negligible at 20°C; Boiling point = decomposes; Ricin is detoxified in 10 min at 80°C/176°F or in 1 h at 50°C/122°F at pH 7.8. Hazard Identification (based on NFPA-704 M Rating System): Health 4; Flammability 1; Reactivity 0.[CDC] Ricin is stable under ambient conditions and destroyed by heat and contact with solution household bleach. Michaelis constant (KM) = 0.1 imol/L for ribosomes; Enzymatic constant (K_{cat}) = 1500/min. The toxin is soluble in water.

Detection: Various tests for the detection of Ricin are available, including "Pro-Strips™" from Avant Technologies, the BIO-911™ test strip developed by Osborn Scientific Group, Lakeside, AZ. This one-step test is reported to detect, within minutes, the presence of minute quantities of the toxin (less than 50 ng); the freeze-dried assay kit to detect crude Ricin called Ruggedized Advanced Pathogen Identification Device (Rapid)™, Rapid LT™, and Razor™ instrument developed by Idaho Technologies, Inc. Ricin is detectable in urine, plasma, and environmental samples. *Instant Check Abrin/Ricin Detection Kit*, Catalog Number: IC-RA-003-10. Kit Contents: 10 test units each test contains 2 tests (1 Abrin and 1 Ricin) per unit, lyophilized reagent, reconstitution buffer, wash buffer, transfer pipettes, instruction booklet. EY Laboratories, Inc., 107 N. Amphlett Blvd, San Mateo, CA 94401, USA, Toll Free (North America) 1-800-821-0044; Telephone: 1-650-342-3296, Option 2 or 3 Fax: +1 (650) 342 2648. Also, in 2009, researchers at Yeshiva University's Albert Einstein College of Medicine have developed an accurate test. Polymerase Chain Reaction (PCR) can detect castor bean DNA in most Ricin preparations. See also "Water Detection," below.

History of the material: Ricin is a lectin—a plant glycoprotein that binds and agglutinates animal cells. Ricin comes from the seeds (or beans) of the castor bean plant, *Ricinus communis.* The beans are processed to form castor oil, formerly used as a laxative and now used in industry as a lubricant. Annual worldwide processing of castor beans is approximately 1 million tons to produce castor oil; waste mash from this production is 3−5% Ricin by weight. Large scale production and use of Ricin by an enemy is fairly difficult. It is estimated that a ton of Ricin would be required to produce a mass casualty biological weapon; therefore an enemy would have to produce a very large quantity in order to cover a large area of a battlefield. For centuries farmers have known the dangers to farm animals that have eaten castor beans. In fact, people found castor beans in 6000-year-old Egyptian tombs. Castor oil has been used for centuries as a medicine, and scientists have known about Ricin's effect on stopping the body from making proteins since 1800. During WWII the United States and Britain worked together on building bombs carrying Ricin, but the only reported military use was by Iraq in their war with Iran. The US Army discovered large stores of Ricin in Al Qaeda caves in Afghanistan. This relatively inexpensive, accessible, natural source allows easy preparation of large quantities of Ricin; therefore, there is little motivation to produce it synthetically. Large-scale production of Ricin by recombinant DNA techniques is probably possible. Certain governments have successfully used Ricin to murder political enemies. In 1978, Georgi Markov, a Bulgarian journalist living in London, was assassinated when a Ricin pellet was injected into his leg using a specialized gun disguised as an umbrella. In February 2004, Ricin was found in the Senate mail room on Capitol Hill in Washington, DC. No one became ill from that exposure. Since 1978, worldwide, there have been more than a dozen other known incidents involving Ricin. Although Ricin has the potential for use as a terrorist weapon, it is also being investigated as a treatment for cancer and AIDS.

Potential Exposure: Potentially Fatal. Mutagen, Teratogen. Ricin, a protein found in castor beans, is one of the most incredibly potent and lethal substances known to humankind—500 μg (an amount capable of fitting on the head of a pin)—is capable of killing an adult within a few days. The castor plant and castor beans are important industrial plants and vast amounts of castor plants and beans are grown commercially. The castor plant, originally native to Africa, is an attractive plant that can be found in people's yards as ornamentals. If the flowers are removed before they produce seeds, the risk of accidents can be averted. Ricin poisoning can occur following accidental ingestion of castor beans. In some countries castor beans are used as beads on necklaces; both children and adults have eaten just a few beans and died from the poison. This invasive 8−10 foot tall plant can be found in more than 25 US states and other places, including Australia. The plants die in freezing weather. The beans are turned into important and valuable industrial products. After the castor oil is squeezed from the castor beans, about 5% of what's left is Ricin. Although people have used weak castor oil as a laxative, purgative, and general folk-medicine "cure all," pure Ricin kills in a few days. Ricin get into the body's cells and inhibits protein synthesis. Once this essential mechanism is halted, within hours the body's system begin to shut down and the body begins to die. Ricin poisoning is not contagious and does not spread from person to person. Because Ricin is not a living thing but rather a chemical made by living things, it probably would NOT make as effective a military weapon as viruses or bacteria like the ebola virus or anthrax. Nevertheless, it would make an effective terrorist weapon because it is easy to make and easy to use. It is estimated that a ton of Ricin would be required to produce a mass casualty biological weapon. With no known antidote*, vaccine, or other effective therapy available for Ricin poisoning, the threat of this agent being released into the environment as an aerosol, or added to the food or water supply, could be catastrophic. Ricin is extremely hazardous when freeze-dried, forming a light, easily-dispersed powder. For this reason, research laboratory personnel are usually directed to avoid freeze-drying Ricin.

*Various public and private sector organizations are working on the development of antibody therapy that shows promise in neutralizing Ricin in animals. If successful, this therapy could result in a vaccine for humans and potentially reduce the threat of Ricin being used as a terrorist weapon.

Incompatibilities: Product is considered stable at ambient temperature. Ricin and other protein toxins can be destroyed by exposure to 0.1% sodium hypochlorite solution (household bleach) for 10 min. The toxic portion of Ricin is heat stable at ambient temperatures and begins to decompose at 60°C/140°F. At 80°C/176°F, most of the toxicity is lost in about 30 min. When heated to decomposition, Ricin emits toxic nitrogen oxides. Avoid contact with strong oxidizers.

Permissible Exposure Limits in Air:
Protective Action Criteria (PAC)[CDC]
TEEL-0: 0.025 mg/m^3
PAC-1: 0.075 mg/m^3
PAC-2: 0.5 mg/m^3
PAC-3: 1.5 mg/m^3
ChemWatch®: 0.00006 mg/m^3 Ceiling limit (sensitizer).[CDC]

Determination in Air: No NIOSH or OSHA methods available.

Permissible Concentration in Water: Unknown.

Determination in Water:

Detecting Ricin in Water; Summary of Results

Technology	*Contaminant Presence/ Absence*	*False Pos (+)/Neg(−) Responses*	*Consistency*	*Lowest Detectable Conc.*
BADD™ Test Strips	9/21	0/0	100%	20 mg/L
BioVerify Test Kits	15/22	0/3	97%	0.0005 mg/L
RAMP® Test	12/15	0/0	100%	5 mg/L
BioThreat Alert® Test Strips*	15/15	2/1	100%	0.035 mg/L
Enzyme Linked Immunosorbent Assay (ELISA)	12/15	0/0	100%	0.0075 mg/L
QTL Biosensor	12/15	2/2	90%	0.25 mg/L

*The most accurate results for Ricin using the Bio-Threat® Alert test strips.

Source: EPA/Homeland Security (2004−2006): see full report at http://www.epa.gov/nhsrc/tte_immtestkitpandb.html

(Tetracore, Inc.) detected 15/15 for Ricin (2004−2006).

Routes of Entry: Can be absorbed by all routes of exposure. Ricin normally enters the body by ingestion. Aerosolized Ricin would enter the body by inhalation. The toxin attaches to cell surfaces of a variety of tissues, particularly the stomach lining if ingested or the moist, upper respiratory tissues if inhaled.

Harmful Effects and Symptoms

The symptoms depend on purity of the Ricin, the level of exposure, and route of exposure (inhalation, ingestion, or injection), the dose received. The LD_{50} = (oral-ingestion) 1−20 mg/kg (the equivalent of 8 castor beans); (human-injection) 1−1.75 μg/kg; (human-inhalation) 21−42 μg/kg. As little as 500 μg of Ricin (about what might fit on the head of a pin; 1/228th of an aspirin tablet) may be enough to kill an adult. When Ricin toxins get inside the victim's body, they block protein synthesis (the body's ability to regenerate protein). Initial symptoms usually appear between 6−10 h and 3 days. Clinical signs may appear as early as 45 min after ingestion if the victim has an empty stomach. Death can occur within 36−72 h of exposure, depending on the route of exposure and upon the dose received. Death from Ricin poisoning could take place within 36−48 h of exposure, whether by injection, ingestion, or inhalation. Victims may linger for 10−12 days before death or recovery, also depending upon the level of exposure. However, if a person lives longer than 5 days after Ricin poisoning, without complications, they are less likely to die.

Short Term Exposure: The following lists do not convey prioritization or indicate specificity.

Inhalation: Within a few hours of inhaling significant amounts of Ricin, the likely symptoms would be respiratory distress, difficult or labored breathing, shortness of breath, chest tightness, hypoxemia, fever, cough, nausea, sweating, aching muscles. Heavy sweating may follow as noncardiogenic pulmonary edema develops.* This would make breathing even more difficult, and the skin might turn blue. Excess fluid in the lungs would be diagnosed by X-ray or by listening to the chest with a stethoscope. Finally, low blood pressure, blue skin, multisystem organ failure, respiratory failure may occur, and possible death.

Skin: It is uncertain if Ricin can be absorbed through the skin. It is generally believed that the risk of toxicity is low from contact with unbroken skin; however, Ricin may be absorbed through irritated, damaged, abraded, wounded, or injured skin; or through normal skin when Ricin is dissolved in a solvent carrier. If enough ricin gets through the skin, the symptoms will be similar to those described for ingestion. If Ricin is injected, the muscles and lymph nodes near the injection site would die. This could lead to liver and kidney failure and death. *Eyes:* Tearing, swelling of the eyelids, pain, redness, corneal injury. Urinary excretion of Ricin is probably slow and limited with the estimated half-life being about 8 days. LD_{50} = (humans) 1 mg/kg; a single seed can be fatal. LD_{50} = (oral-mice) about 3 μg/kg by injection or aerosol.

Ingestion: Generally within a few hours symptoms will appear, including nausea, vomiting, abdominal pain and cramping, diarrhea (possibly bloody), lowered blood pressure, hallucinations, and bloody urine, gastrointestinal bleeding, low or no urinary output, dilation of the pupils, fever, thirst, sore throat, headache, vascular collapse, and shock. Severe vomiting and diarrhea may result from severe dehydration and multisystem organ failure. In a few days, organs (liver, spleen, and kidneys) might stop working, and possible death.

*Ricin-induced pulmonary edema would be expected to occur much later (1−3 days postexposure) compared to other agents such as phosgene (about 6 h postexposure).

Late phase complications: Ricin has cell-killing (cytotoxic) effects on the liver, central nervous system, kidneys, and adrenal glands, typically 2−5 days after exposure. The patient may be asymptomatic (showing no symptoms of exposure) during the preceding 1−5 days.[CDC]

Pulmonary edema would be expected to occur much later (1−3 days postexposure) compared to that induced by other agents such as phosgene (about 6 h postexposure).

Long Term Exposure: Repeated exposures to Ricin may cause allergic/asthma-like symptoms with congestion of nose and throat; itchy, watery eyes; hives; tightness of the chest; and in acute cases, wheezing. May affect kidneys, liver, pancreas. Based on animal studies, Ricin may be capable of causing severe lung damage in humans. Information about carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to Ricin is unknown at this time.

Points of Attack: Lungs, eyes, skin (primarily through cuts and bruises). The risk of toxicity from unbroken skin exposure to Ricin is low but there is still a danger of allergic skin reactions.

Medical Surveillance: Unfortunately Ricin symptoms resemble those that are similar to other diseases, especially the common flu. Laboratory testing might include metabolic acidosis, increased liver function tests, increased renal function tests, hematuria, leukocytosis (2- to 5-fold higher than normal).

First Aid: No antidote exists for Ricin. Make all exposed people go to the nearest hospital emergency department. Make all potentially exposed people shower and change clothes. In case you have gotten Ricin on your skin or your clothing, immediately shower and change clothes. See a doctor as soon as possible: since it can take only a day and a half for symptoms to appear, all exposed persons should get to a doctor that same day. If exposure includes contact with Ricin, remove it *off or out* of the body as quickly as possible. Treatment needs to be provided in a hospital setting. Make the doctors and nurses aware of the potential for exposure so that they can protect themselves; and provide the most appropriate treatments and therapies. If you have to wait for medical assistance, make the victim comfortable. If Ricin has been ingested, the airway must be secured and stomach pumping (gastric lavage) may be considered. Vigorous gastric lavage is recommended only if it can be done shortly after ingestion (generally within 1 h). Risk of aggravating injury to the lining of the gastrointestinal (GI) tract must be considered.

To minimize the effects of the poisoning and to keep the patient stable, Ricin poisoning is treated through supportive therapy. The types of supportive medical care would depend on several factors, such as the route by which victim(s) were poisoned (i.e., whether poisoning was by inhalation, ingestion, eye, or skin exposure). Do not induce vomiting. Rinse mouth, flush stomach with activated charcoal* (if the Ricin has been very recently ingested), wash out the victim's eyes with water, especially if the eyes are red and irritated. Supportive care could include intravenous fluid input and support of circulation and respiration; giving medications to treat conditions such as seizure and low blood pressure. Fluid input is critical, as fluid losses of up to 2−1/2 L are probable. If individual is drowsy or unconscious, do not give anything by mouth. In the event of vomiting, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration. Fluid and electrolyte balance should be monitored and restored if abnormal. Early and aggressive IV fluid and electrolyte replacement. If the victim's lungs fill with fluid, you administer oxygen if his breathing is difficult or labored.

*Superactivated charcoal may be of little value for large molecules such as Ricin.[USAMRICD]

Decontamination: When Ricin symptoms appear and you know the location of the attack, the area should be decontaminated with responders wearing Level A (fully encapsulated suit with SCBA). Otherwise, stay away. Move as fast as possible; extra minutes before decontamination might make a big difference. If the Ricin attack was aerosolized (by small particles floating in the air), and you have the equipment (*this is very important*), then you have to decontaminate as soon as possible. If you do not have the equipment and training, do not enter the hot zone to rescue and decontaminate victims. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. If possible, place all clothing in a labeled durable 6-mil polyethylene bag. If the victim cannot move, decontaminate, if possible, without touching and without entering the hot zone. To prevent spreading the agent, be certain that victims are decontaminated as much as possible before allowing them to leave the area. During the decontamination process, be careful not to break the patient's/victim's skin, and take care to cover all open wounds. The CDC recommends a decontamination procedure solution of detergent and water (with a pH value in the alkaline range of more than 8 but less than 10.5). Soft brushes should be available to remove contamination from the personal protective equipment. Also, recommended for cleanup of people and surfaces is household bleach. Use a fresh (made daily) solution of 0.5% sodium hypochlorite [diluted household bleach (10%, or one part bleach to nine parts water)]. Contact time: 15 min. Do not get bleach solution in the victim's eyes, open wounds (especially of the abdomen, spinal cord, or brain), or mouth. Wash off the diluted bleach solution after 15 min. Labeled, durable 6-mil polyethylene bags should be available for disposal of clothing and contaminated personal protective equipment. In the absence of pH adjusted solutions, wash the victim with lots of warm water with soap. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing (at least down to undergarments), begin washing immediately. Immediate flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: the idea is to immediately wash with water, then have the victim (not the responder) remove all the victim's clothing, then wash again (with soap if available), and then move away from the hot zone in an upwind and uphill direction.

Personal Protective Methods: Level A (Fully encapsulated suit with SCBA) protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level A (Fully encapsulated suit with SCBA) protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. Recommended protective clothing and materials include Tychem® BR or Responder® CSM. *Note:* Safe use of protective clothing and equipment requires specific skills developed through training and experience.

Respirator Selection: Pressure demand, self-contained breathing apparatus [SCBA; Chemical, Biological, Radiological, Nuclear (CBRN), if available] is recommended in response to nonroutine emergency situations.

Storage: Color Code—Blue: Health Hazard/Poison (Toxic): Store in a secure, locked poison location. Store in a cool, dry, well-ventilated area and away from food stuff containers.

Shipping: Toxin, extracted from living sources, n.o.s. requires a label of "POISON (TOXIC)." This falls in Hazard Class: 6.1(a) Packing Group: III,[NIOSH] but you may want to treat it as Packing Group I.

Spill Handling: You must be careful! Avoid generating dust. Since a Ricin attack may be by small particles of Ricin floating in the air (aerosol), do not breathe it or get it on you. Remember that the victim's clothes or body may have Ricin; touch them and you can become a victim. If you think Ricin particles might be in the area, stay out until you are equipped with Level A (Fully encapsulated suit with SCBA), proper personal protective equipment (PPE), including protective clothing and respiratory protection. Shut off heating, ventilation, and air conditioning (HVAC) systems to prevent the tiny aerosolized (floating in the air) Ricin droplets from spreading throughout the building. Keep the public away. Immediately call for medical assistance. For those contaminated by Ricin, do not allow anyone to leave the hot zone. The Ricin chemical does not dissipate quickly, and "survives" in clothing and bedding for long periods of time. Consequently, people as well as "things" must be quarantined and decontaminated. Do not allow anyone to leave until medical people examine them. Do not breathe, touch, or eat anything that might be contaminated with Ricin. Notify the federal authorities, local health, and pollution/environmental agencies. See Decontamination.

Fire Extinguishing: Foam, dry chemical powder, BCF [bromochlorodifluoromethane (Halon 1211)] (where regulations permit), carbon dioxide, water spray or fog—large fires only. When heated to decomposition, Ricin emits toxic nitrogen oxides.

Disposal Method Suggested: Do not clean up or dispose of Ricin, except under supervision of a specialist.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: 21/22; R50/53; Safety phrases: S2; S25; S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ronnel is a white to light tan crystalline solid. Molecular weight = 321.54; Specific gravity (H_2O:1) = 1.48 at 25°C; Boiling point = (decomposes); Freezing/Melting point = 41°C. Practically insoluble in water; solubility = 0.004% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector. Those involved in manufacture, formulation, and application of this insecticide for farm (livestock) and household uses.

Incompatibilities: Strong oxidizers. Store at temperatures not exceeding 25−30°C.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA.

NIOSH REL: 10 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA measured as inhalable fraction and vapor; not classifiable as a human carcinogen; BEI$_A$ issued for Acetylcholinesterase-inhibiting pesticides.

NIOSH IDLH: 300 mg/m^3.
No TEEL available.
Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 10 mg/m^3, 1993; Russia: STEL 0.3 mg/m^3, 1993; the Netherlands: MAC-TGG 10 mg/m^3, 2003; United Kingdom: TWA 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for ronnel in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides; OSHA Analytical Method PV-2054.

Permissible Concentration in Water: Mexico[35] has set maximum permissible concentration of 50 μg/L in estuaries and 5 μg/L in coastal waters.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.9$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. There is limited evidence that ronnel may damage the developing fetus. May cause personality changes, such as depression, anxiety, irritability. High or repeated exposure may cause nerve damage causing weakness, a feeling of "pins and needles" in the arms and legs; and poor coordination.

Points of Attack: Skin, central nervous system, blood plasma.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 100 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 250 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 300 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, solid, toxic, require a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including oxides of phosphorus, sulfur dioxide, dimethyl sulfide, and trichlorophenol. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added flammable solvent in furnace equipped with afterburner and alkali scrubber.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 201-501-9 [*Annex I Index No.:* 650-005-00-2]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (feed); equivocal evidence: rat; no evidence: mouse.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R25; R36/37/38; R50/53; Safety phrases: S1/2; S22; S24/25; S36; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Rotenone is a colorless to red odorless crystalline solid. Molecular weight = 394.45; Boiling point =

(decomposes below BP); 210−220°C at 0.5 mm; Freezing/Melting point = 165.6°C; Vapor pressure = 1×10^{-6} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Natural Product; Primary Irritant. Those involved in extraction from derris root, formulation, or application of this insecticide. Rotenone is used as a pharmaceutical and veterinary drug.

Incompatibilities: Strong oxidizers, alkalies.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.
NIOSH REL: 5 mg/m^3 TWA.
ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.
NIOSH IDLH: 2500 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 125 mg/m^3
DFG MAK: [skin].

Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3, 1993; the Philippines: TWA 5 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Turkey: TWA 5 mg/m^3, 1993; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for rotenone in ambient air[60] ranging from 1.67 μg/m^3 (New York) to 50.0 μg/m^3 (Florida and South Carolina) to 50.0−100.0 μg/m^3 (North Dakota) to 80.0 μg/m^3 (Virginia) to 100.0 μg/m^3 (Connecticut) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5007, Rotenone.

Permissible Concentration in Water: The state of Maine has set a guideline of 4.0 μg/L for rotenone in drinking water.[61]

Determination in Water: Fish Tox = 1.49403000 ppb (HIGH); Octanol−water coefficient: Log $K_{ow} = 4.1$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause severe irritation and permanent damage. Exposure can cause numbness of the mucous membrane, nausea, vomiting, abdominal pain, muscular tremors, incoherence, colonic convulsions, stupor. May cause a severe drop in blood sugar. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May affect the liver and kidneys. There is limited evidence that rotenone causes cancer of the liver and breast in animals, and damage to the developing fetus. There is limited evidence that this chemical is stored in breast milk and passed on to nursing infants. Repeated skin contact can cause severe rash. Human Tox = 28.00000 ppb (INTERMEDIATE).

Points of Attack: Central nervous system, eyes, respiratory system, liver, and kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Blood sugar. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 50 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter]. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 250 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from prolonged exposure to light. Keep away from oxidizers and alkalis. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: Rotenone requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 10,000 (estimate).

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Rotenone is decomposed by light and alkali to less insecticidal products. It is readily detoxified by the action of light and air. It is also detoxified by heating; 2 h at 100°C results in 76% decomposition. Oxidation products are probably nontoxic. Incineration has been recommended as a disposal procedure. Burial with lime would also present minimal danger to the environment.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

CAS Registry Number: 81-07-2
RTECS® Number: DE4200000
EC Number: 201-321-0 [1,2-benzisothiazol-3(2H)-one 1,1-dioxide]
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3.
US EPA Hazardous Waste Number (RCRA No.): U202.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Reportable Quantity (RQ): 100 lb (45.4 kg).
California Proposition 65 Chemical: Delisted 4/6/01.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Saccharin is a crystalline solid with a sweet taste (500 times sweeter than sugar). Molecular weight = 183.19; Freezing/Melting point = 229°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.
Potential Exposure: The information provided has to do, primarily, with the manufacturing of saccharin. Saccharin has been used as a nonnutritive sweetening agent. At one point the US consumption pattern for all forms of saccharin has been estimated as 45% in soft drinks; 18% in tabletop sweeteners; 14% in fruits, juices, sweets, chewing gum, and jellies; 10% in cosmetics and oral hygiene products; 7% in drugs, such as coating on pills; 2% in tobacco; 2% in electroplating; and 2% for miscellaneous uses. Human exposure to saccharin occurs primarily through ingestion because of its use in many dietetic foods and drinks and some personal hygiene products, including toothpastes and mouthwashes. The general public is exposed to saccharin, especially by persons required to reduce sugar intake.
Incompatibilities: Keep away from strong oxidizers.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: May cause skin irritation. Exposure to very high levels can cause loss of appetite, nausea, vomiting, and diarrhea.
Long Term Exposure: Saccharin in very high doses has been shown to cause bladder cancer in male rats. Other animal species have not shown this effect. High exposures in certain susceptible individuals may cause skin allergy.
Points of Attack: Bladder, skin.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Urine cytology (a special test for abnormal cells in the urine). Evaluation by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: At any exposure level, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00018-7

breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use extinguishers suitable for surrounding fires. Poisonous gases are produced in fire, including oxides of nitrogen and sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R22; R68; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Safrole is a colorless to yellow liquid with an odor of camphor or sassafras. Molecular weight = 162.20; Boiling point = 232−234°C; Freezing/Melting point = 11°C; Flash point = 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: This compound has been used to flavor beverages and foods. It is also reported to be used in soap manufacture, perfumery, sleep aids, sedatives, and pesticides. The FDA estimated exposure to safrole of the general public through food consumption was extremely low since the Agency prohibited its use in food. Derived from oil of sassafras or camphor. Minimal exposure may occur through the use of edible spices, including nutmeg and mace, which contain low levels of naturally occurring safrole.

Incompatibilities: Oxidizing agents.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 100 mg/m^3
PAC-3: 500 mg/m^3

Permissible Concentration in Water: The compound does not pose a hazard to the general population through consumption of drinking water because safrole is insoluble in water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact can cause severe skin and eye irritation. Ingestion may cause abdominal burning, nausea, and vomiting; diarrhea, dysuria, hematuria, unconsciousness, shallow respiration, and convulsions. Inhalation may cause dizziness, rapid and shallow breathing, tachycardia, bronchial irritation, and unconsciousness or convulsions. Other effects may include cyanosis, delirium, and circulatory collapse.

Long Term Exposure: May be a carcinogen in humans.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Environmentally hazardous substances, solid, n.o.s. require a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources[52]: Remove all sources of ignition, ventilate the spill area, and use absorbent to pick up spilled material. Follow by washing surfaces well, first with 60−70% ethanol and water, then with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Salicylic acid S:0120

Molecular Formula: $C_7H_6O_3$
Common Formula: $C_6H_4(OH)COOH$
Synonyms: *o*-Hydroxybenzoic acid; 2-Hydroxybenzoic acid; Keralyt; Orthohydroxybenzoic acid; Retarder W; SA; SAx
CAS Registry Number: 69-72-7
RTECS® Number: VO0525000
UN/NA & ERG Number: Not regulated.
EC Number: 200-712-3
Regulatory Authority and Advisory Bodies
US EPA Gene-Tox Program, Positive: *S. cerevisiae*—reversion; Negative: Histidine reversion—Ames test.
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
FDA—over-the-counter drug.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Salicylic acid is a white crystalline solid. Molecular weight = 138.13; Boiling point = 76°C (sublimes); Freezing/Melting point = 157°C; Flash point = 157°C; Autoignition temperature = 540°C. Explosive limits: LEL = 1.1% at 200°C; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Insoluble in water.
Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Used as a topical keratolytic agent; in the manufacture of aspirin, salicylates, resins, as a dyestuff intermediate; prevulcanization inhibitor; analytical reagent; fungicide, antiseptic, and food preservative.
Incompatibilities: Iron salts; lead acetate; iodine. Forms an explosive mixture in air.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.3 mg/m^3
PAC-1: 0.75 mg/m^3
PAC-2: 6 mg/m^3
PAC-3: 400 mg/m^3

Routes of Entry: Ingestion, inhalation, eyes and/or skin contact. Absorbed through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Overexposure may affect the central nervous system and the body's acid−base balance, causing delirium and tremors. *Inhalation:* May cause ringing in the ears, confusion, rapid pulse and breathing; headache, dizziness, nausea, and vomiting. *Skin:* May be very irritating and cause skin sores. May act as a systemic poison if applied to large areas of the skin. *Eyes:* Causes irritation; may be severe. *Ingestion:* 10 g may cause headache, dizziness, nausea, and vomiting. Ingestion of about 1 oz may be fatal.
Long Term Exposure: Repeated large doses may cause, in addition to the symptoms listed above, abdominal pain; loss of appetite; heartburn, poor digestion; stomach ulcers; bleeding of the stomach; iron-deficiency anemia; restlessness, incoherent speech; tremor, kidney damage; coma, convulsions, and death. Repeated or prolonged contact with skin may cause acne-like skin sores.
Points of Attack: Skin, blood, kidneys.
Medical Surveillance: Complete blood count (CBC). Kidney function tests. Evaluation by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately.
Skin contact: remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Note to physician: Induced emesis—gastric lavage, activated charcoal, or a combination of these—may be necessary to clear the gastrointestinal tract. Sodium bicarbonate (IV) with added potassium may be necessary for blood acidosis.
Personal Protective Methods: Wear protective gloves and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a

full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained in its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from light. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Sarin (Agent GB, WMD) S:0130

Molecular Formula: $C_4H_{10}FO_2P$
Common Formula: $(CH_3)_2CHOP(CH_3)OF$

Synonyms: Fluoroisopropoxymethyl oxide; GB (military designation); IMPF; Isopropoxymethylphoryl, fluoride; Isopropyhyl methylphosphonofluoridate; Isopropyl methylfluorophosphate; *O*-Isopropyl methylphosphonofluoridate; Isopropyl methylphosphonofluoridate; Isopropyl-methylphosphoryl fluoride; Methylfluorophosphoric acid isopropyl ester; Methylfluorphosphorsaeureisopropylester (German); Methylphosphonofluoridic acid isopropyl ester; Methylphosphonofluoridic acid 1-methylethyl ester; MFI; Sarina (Spanish); Sarin II; T-144; T-2106; Tl 1618; Trilone 46

CAS Registry Number: 107-44-8; 50642-23-4

RTECS® Number: TA84000000

UN/NA & ERG Number: UN2810/153

EC Number: None assigned.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g (*107-44-8; 1445-76-7 Chlorosarin, a precursor*).

Carcinogenicity: GB is not listed by the International Agency for Research on Cancer (IARC); American Conference of Governmental Industrial Hygienists (ACGIH); Occupational Safety and Health Administration (OSHA); or National Toxicology Program (NTP) as a carcinogen.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical.

Note: Army Regulation, AR 50-6, deals specifically with the shipment of chemical agents; must be escorted in accordance with Army Regulation, AR 740-32.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sarin (GB), a nerve agent, is one of the most toxic of the known chemical warfare agents. Exposure to sarin can cause death in minutes. A fraction of an ounce (1−10 mL) of GB on the skin can be fatal. GB is an odorless, colorless, tasteless, nonflammable liquid at 15°C and 1 atm. *GB has no warning properties, especially when pure, and it can take away your sense of smell.* Molecular weight = 140.09; Specific gravity (H_2O:1) = 1.080 at 25°C; Boiling point = 147°C; Freezing/Melting point = −57°C; Vapor pressure = 2.9 mmHg at 25°C; 2.1 mmHg at 20°C; Liquid density = 1.10 g/mL at 20°C; Relative vapor density (air = 1) = 4.86; Vapor density = 4.9; Volatility = 22,000 mg/m^3 at 25°C. Flash point = >280°C; 78°C (cc).[NIOSH] Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Sinks in water; soluble in water and hydrolyzes. The hydrolysis products are considerably less toxic than the material itself. *Note:* If it is used as a weapon, notify US Department of Defense: Army. If a means of detection is available, use M-8 paper (detection: yellow) or M256-A1 Detector Kit (detection limit: 0.005 mg/m^3). *Warning: A single drop on* *the skin can be fatal*. Damage and/or death may occur before chemical detection can take place.

Potential Exposure: GB is used as a quick-acting chemical warfare nerve agent; nerve gas. Both the liquid and the vapor can kill you. Very small amounts can hurt you in 1 min or less, and can quickly lead to death. A single drop, if vaporized, can kill everyone in a room![USCG] Sarin is 26 times more deadly than cyanide gas and 20 times more deadly than potassium cyanide.

Persistence of Chemical Agent: Sarin (GB): Summer: 10 min to 24 h; Winter: 2 h to 3 days.

Incompatibilities: Attacks tin, magnesium, cadmium-plated steel, and some aluminums. GB decomposes tin, magnesium, cadmium-plated steel, and aluminum. Slightly corrosive to brass, copper, and lead. No attack on 1020 steel, Inconel®, and K-Monel®. Hydrolyzed by water. In acid conditions, GB hydrolyzes, forming hydrofluoric acid (HF). Rapidly hydrolyzed by dilute aqueous sodium hydroxide, or sodium carbonate, forming relatively nontoxic products of polymers and isopropyl alcohol. Contact with metals may evolve flammable hydrogen gas.

STEL: 0.0001 mg/m^3

IDLH: 0.1 mg/m^3

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) GB*

TEEL-0: 0.00015 ppm

PAC-1: **0.00048** ppm

PAC-2: **0.006** ppm

PAC-3: **0.022** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

WPL (Worker population limit): 0.00003 mg/m^3.

The suggested permissible airborne exposure concentration of sarin (GB) for an 8-h workday or a 40-h workweek is an 8-h time-weighted average (TWA) of 0.00003 mg/m^3 (2×10^{-5} ppm). This value is based on the TWA of GB as proposed in the USAEHA Technical Guide No. 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents GA, GB, GD, and VX.*

GPL (General population limit): 0.000001 mg/m^3.

Also, the general population limits (as recommended by the Surgeon General's Working Group, US Department of Health): 0.000003 mg/m^3. *Human Toxicity:* The human lethal dose (man) is approximately 0.01 mg/kg. LCt_{50} = 100 mg-min/m^3. LD_{50} [skin] = 1.7 g/70 kg [man] (*Medical Aspects of Chemical and Biological Warfare, Part I*, Walter Reed Medical Center, 1997).

Determination in Air: Available monitoring equipment for agent GB is the M8/M9 detector paper, detector ticket, blue band tube, M256/M256A1 kits, bubbler, Depot Area Air Monitoring System (DAAMS); Automatic Continuous Air Monitoring System (ACAMS); Real Time Monitoring (RTM); Demilitarization Chemical Agent Concentrator (DCAC); M8/M43, M8A1/M43A2, Hydrogen Flame Photometric Emission Detector (HYPED); CAM-M1, Miniature Chemical Agent Monitor (MINICAM); and the Real Time Analytical Platform (RTAP). Real-time, low-level monitors (with alarm) are required for GB operations. In their absence, an IDLH atmosphere must be presumed. Laboratory operations conducted in appropriately maintained and alarmed engineering controls require only periodic low-level monitoring.

Determination in Water: Use M-272 Chemical Agent Water Testing Kit. Detection limit for nerve agents is 0.02 mg/L. Also, for cyanides, distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). *Food chain concentration potential:* sarin is soluble in water; bioconcentration in aquatic organisms is not expected to be an important fate process [US Army Corps of Engineers. Special Report 86−38, Britton, K. B., *Low Temperature Effects on Sorption, Hydrolysis, and Photolysis of Organophosphates: A Literature Review, p. 23.* Washington DC, 1986]. Octanol−water coefficient: Log K_{ow} = (estimated) −1.4.

Water pollution: If used as a weapon, utilize an M272 Water Detection Kit (Detection limit: 0.02 mg/L). Dangerous to aquatic life in high concentrations. May be dangerous if it enters water intakes. Notify local health and pollution control officials. Notify operators of nearby water intakes. This material will be broken down in water quickly, but small amounts may evaporate. This material will be broken down in moist soil quickly. Small amounts may evaporate into the air or travel below the soil surface and contaminated groundwater.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Extremely toxic; vapor LCt_{50} = 100 mg-min/m^3. Extremely active cholinesterase inhibitor. The toxic effects of this chemical are similar to parathion, but more severe and dangerous. Liquid, LD_{50} (skin) = 1.7 g/70 kg man; sarin: (mice) (200 μg/kg). A single drop on the skin can cause death. Death may occur within 15 min after fatal dose is absorbed. Symptoms of overexposure may occur within minutes or hours—depending upon dose. They include miosis (constriction of pupils) and visual effects; headache and pressure sensation; runny nose and nasal congestion; salivation, tightness in the chest; nausea, vomiting, giddiness, anxiety, difficulty in thinking; difficulty sleeping, nightmares, muscle twitches, tremors, weakness, abdominal cramps; diarrhea, involuntary urination, and defecation.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions and respiratory failure. Limited data suggest that chronic or repeated exposure to GB may result in a delayed postural sway and/or impaired psychomotor performance (neuropathy).

Points of Attack: Respiratory system; central nervous system; skin, eyes, plasma and red blood cell cholinesterase. Liver and kidney damage.

Medical Surveillance: Patients/victims who have severe exposure should be evaluated for persistent central nervous system (CNS) effects. Consider the points of attack in preplacement and periodic physical examinations. Complete blood count (CBC). Evaluation of thyroid function. Lung function tests. Central nervous system tests. Liver and kidney function tests.

First Aid: Administration of antidotes is a critical step in managing a patient/victim. However, this may be difficult to achieve in the Red Zone, because the antidotes may not be readily available, and procedures or policies for their administration in the Red Zone may be lacking. Do not administer antidotes preventatively; there is no benefit to doing so. Diazepam (or other benzodiazepines) should be administered when there is evidence of seizures, usually seen in cases of moderate to severe exposure to a nerve agent. Remember, physical findings of localized exposure often precede systemic exposure and physical findings.[NIOSH]

Inhalation: Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil constriction, a lack of coordination, etc.), immediately administer, in rapid succession, all three Nerve Agent Antidote Kit(s), Mark I injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated at 5−20 min intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. *Seek medical attention immediately*.

Eye contact: Immediately flush eyes with water for 10−15 min, then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken *immediately* to the medical treatment facility for observation.

Skin contact: Don respiratory protective mask and remove contaminated clothing. Immediately wash contaminated skin with copious amounts of soap and water, 10% sodium carbonate solution, or 5% liquid household bleach. Rinse well with water to remove decontaminant. Administer an intramuscular injection with the *Mark I* Kit injectors only if local sweating and muscular twitching symptoms are observed. *Seek medical attention immediately*.

Ingestion: Do not induce vomiting. First symptoms are likely to be gastrointestinal. Immediately administer an intramuscular injection of the *Mark I* kit autoinjectors.

Medical Treatment: Electrocardiogram (ECG), and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5−10 mg in adults and 0.2−0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6−12 h to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.[NIOSH]

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Nerve gases stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Do not wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate upwind and uphill: Patients exposed to nerve agent by vapor only should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; Patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Remember that the water you use to decontaminate the victims is dangerous. Be sure you have decontaminated the victims as much as you can before they are released from the area, so they do not spread the nerve gas. Rinse the eyes, mucous membranes, or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

*The following can be used in addition to household bleach: (1) solids, powders, and solutions containing various types of bleach ($NaOCl$ or $Ca(OCl)_2$); (2) DS2 (2% $NaOH$, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide (NaOH) dissolved in water, phenol, ethanol, and ammonia.

Note: Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods: Wear protective "A-Level" PPE: rubber gloves, protective clothing; goggles, respirators, butyl rubber gloves M3 and M4, Norton chemical protective glove set; and Tyvek® "F" decontamination suit provides barrier protection against chemical warfare agents. Airtight, impermeable clothing was developed for personnel who must enter heavily contaminated areas. This clothing is made of butyl rubber or a coated fabric, such as Tyvek "F," and provides barrier protection against liquid chemical warfare agents. Although resistant to liquid chemical agents, impermeable protective clothing may be penetrated after a few hours of exposure to heavy concentration of agent. Consequently, liquid contamination on the clothing must be neutralized or removed as soon as possible. If the proper equipment is not available, or if the rescuers have not been trained in its use, call for assistance from the US Soldier and Biological Chemical Command—Edgewood Research Development and Engineering Center (from 0700-1630 EST call 410-671-4411, and from 1630-0700 EST call 410-278-5201; ask for the Staff Duty Officer). All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Swatch Test Results for Level A Suits and Chemical Protective Gloves for GB (Sarin)

Item	**Breakthrough**
25-mil Chemical protective gloves	>480 min
Kappler Suit Model 42483	350 min
TYCHEM 10,000 Pkg Style No. 12645	>480 min

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOvHie [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister having a high-efficiency particulate filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus). The US Army standard M40 Series (which replaced the M17A1 protective mask) provides complete respiratory protection against all known military toxic chemical agents, but it cannot be used in an oxygen-deficient environment and it does not afford protection against industrial toxics, such as ammonia and carbon monoxide. *It is not approved for civilian use.*

The following is taken from the Riegle Report:

Less than 0.0001 mg/m^3: A full face-piece, chemical canister, air-purifying protective mask will be on hand for escape. (The M9- or M40-series masks are acceptable for this purpose). *0.0001–0.2 mg/m^3:* A NIOSH/MSHA- or European Standard EN149-approved pressure demand full face-piece SCBA or supplied-air respirator with escape air cylinder may be used. Alternatively, a full face-piece, chemical canister air-purifying protective mask is acceptable for this purpose (for example, M9-, M17-, or M40-series mask or other mask certified as equivalent) is acceptable. *Greater than 0.2 mg/m^3 or unknown concentration:* NIOSH/MSHA- or European Standard EN 149-approved pressure demand full face-piece SCBA suitable for use in high agent concentrations with protective ensemble.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone A] requires a shipping label of "POISONOUS/TOXIC MATERIALS." Inhalation Hazard. It falls in Hazard Class 6.1 and Packing Group III.[NIOSH]

Storage: In handling, the buddy system will be incorporated. No smoking, eating, and drinking in areas containing agent is permitted. Containers should be periodically inspected for leaks (either visually or by a detector kit). Stringent control over all personnel practices must be exercised. Decontamination equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. Chemical showers, eyewash stations, and personal cleanliness facilities must be provided. Wash hands before meals and each worker will shower thoroughly with special attention given to hair, face, neck, and hands, using plenty of soap before leaving at the end of the workday.

Spill Handling: Spills must be contained by covering with vermiculite, diatomaceous earth, clay, fine sand, sponges, and paper or cloth towels. Decontaminate with copious amounts of aqueous sodium hydroxide solution (a minimum 10 wt. %). Scoop up all material and place in a fully removable head drum with a high-density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Dispose of material used to decontaminate exterior of drum. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

If 10 wt. % aqueous sodium hydroxide solution is not available, then the following decontaminants may be used instead and are listed in the order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate, and Super-tropical Bleach Slurry (STB).

GB when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.8/1.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 2500/800
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Fire: If tank, rail car, or tank truck is involved in fire, isolate for at least 800 m (½ mile) in all directions; also, consider initial evacuation for 800 m (½ mile) in all directions. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Rapidly hydrolyzed by dilute aqueous sodium hydroxide or sodium carbonate forming relatively nontoxic products. Water alone removes the fluorine atom producing a nontoxic acid. Decontaminants include bleach slurry, dilute alkali, hot soapy water, steam, and ammonia. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. See also above "Determination in Water." Soil: 2−24 h at 5°−25°C.

Fire Extinguishing: Highly volatile poison! (organophosphate). Breathing the vapor, skin [a single drop on the skin can be fatal] or eye contact, or swallowing the material can kill you; symptoms may be delayed for several hours. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Storage containers and parts of containers may rocket great distances, in many directions. Vapors are heavier than air and will collect and stay in low areas. *Combustion products are less deadly than the material itself.* Toxic products of combustion may include carbon monoxide, fluorine, and phosphorus oxide. GB will react with steam or water to produce toxic and corrosive vapors. All persons not engaged in extinguishing the fire should be evacuated. Fires involving GB should be contained to prevent contamination to uncontrolled areas. When responding to a fire alarm in buildings or areas containing agents, firefighting personnel clothing (without TAP clothing) during chemical agent firefighting and fire rescue operations. Respiratory protection is required. Positive pressure, full face-piece, NIOSH-approved self-contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes, they will wear appropriate levels of protective clothing. Complete protection required; have available decontaminants (bleach, alkali) and atropine. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Open pit burning or burying of GB or items containing or contaminated with GB in any quantity is prohibited. The detoxified GB using procedures above can be thermally destroyed by incineration in an EPA-approved incinerator in accordance with appropriate provisions of federal, state, and local RCRA regulations.

A minimum of 56 g of decon solution is required for each gram of GB. Decontaminant/agent solution is allowed to agitate for a minimum of 1 h. Agitation is not necessary following the first hour. At the end of 1 h, the resulting solution should be adjusted to a pH greater than 11.5. If the pH is below 11.5, sodium hydroxide (NaOH) should be added until a pH above 11.5 can be maintained for 60 min. An alternate solution for the decontamination of GB is 10 wt. % sodium carbonate in place of the 10% sodium hydroxide solution above. Continue with 56 g of decon to 1 g of agent. Agitate for 1 h but allow 3 h for the reaction. The final pH should be adjusted to above 10. It is also permitted to substitute 5.25% sodium hypochlorite or 25 wt. % monoethylamine (MEA) for the 10% sodium hydroxide solution above. MEA must be completely dissolved in water prior to addition of the agent. Continue with 56 g of decon for each gram of GB and provide agitation for 1 h. Continue with same ratios and time stipulations. Scoop up all material and place in a fully removable head drum with a high-density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled per IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA, and DOT regulations. Dispose of the material per IAW waste disposal methods provided below. Dispose of material used to decontaminate exterior of drum in accordance with IAW, federal, state, and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Selenium exists in three forms: a red amorphous powder, a gray form, and red crystals. Occurs as an impurity in most sulfide ores. Selenium, along with tellurium, is found in the sludges and sediments from electrolytic copper refining. It may also be recovered in flue dust from burning pyrites in sulfuric acid manufacture. Molecular weight = 78.96; Specific gravity (H_2O:1) = 4.28 at 25°C; Boiling point = 685°C; Freezing/Melting point = 144°C (red crystalline form); 217°C (gray crystalline form). Hazard Identification (based on NFPA-704 M Rating System): (powder) Health 3, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Human Data. Most of the selenium produced is used in the manufacture of selenium rectifiers. It is also utilized as a pigment for ruby glass, paints, and dyes; as a vulcanizing agent for rubber; a decolorizing agent for green glass; a chemical catalyst in the Kjeldahl test; as an insecticide; in the manufacture of electrodes, selenium photocells, selenium cells, and semiconductor fusion mixtures; in photographic toning bathes; and for dehydrogenation of organic compounds. It is also used in veterinary medicine and in antidandruff shampoos. Se is used in radioactive scanning for the pancreas and for photostatic and X-ray xerography. It may be alloyed with stainless steel, copper, and cast steel. Selenium is a contaminant in most sulfide ores of copper, gold, nickel, and silver; and exposure may occur while removing selenium from these ores.

Incompatibilities: Reacts violently with strong acids and strong oxidizers, chromium trioxide, potassium bromate, cadmium. Reacts with incandescence on gentle heating with phosphorous and metals, such as nickel, zinc, sodium, potassium, platinum. Reacts with water at 50°C forming flammable hydrogen and selenious acids.

Permissible Exposure Limits in Air

The PEL and REL also apply to other selenium compounds (as Se) except selenium hexafluoride; the MAK applies to Se and its inorganic compounds.

OSHA PEL: 0.2 mg[Se]/m^3 TWA.

NIOSH REL (*except selenium hexafluoride*): 0.2 mg[Se]/m^3 TWA.

ACGIH TLV®[1]: 0.2 mg[Se]/m^3 TWA.

NIOSH IDLH: 1 mg[Se]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

DFG MAK (*metal and inorganic compounds*): 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II (4); Carcinogen Category 3B; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Austria: MAK 0.1 mg/m^3, 1999; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, 1999; Finland: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, 1999; Hungary: STEL 0.1 mg/m^3, 1993; the Netherlands: MAC-TGG 0.1 mg[Se]/m^3, 2003; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) 0.1 mg/m^3; MAC (STEL) 0.3 mg/m^3, 1999; Sweden: NGV 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, 1999; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg [Se]/m^3. Russia[43] set a MAC of 2.0 mg/m^3 in work-place air. Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μg/m^3 (Montana) to 0.27 μg/m^3 (Massachusetts) to 0.66 μg/m^3 (New York) to 2.0 μg/m^3 (Florida and North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 35 μg/L as a 24-h average, never to exceed 260 μg/L for recoverable inorganic selenite. *To protect saltwater aquatic life:* 54 μg/L as a 24-h average, never to exceed 410 μg/L. To protect human health: 10 μg/L.[6] There are a variety of foreign standards for selenium in water.[35] The Czech Republic has set 0.1 mg/L in surface water, 0.05 mg/L in drinking water reserve, and 0.01 mg/L in drinking water. Germany[35] has set 0.008 mg/L as a maximum permissible concentration in drinking water. The EEC has set 0.01 mg/L as a MAC for drinking water. Mexico has set 0.01 mg/L for receiving waters used for drinking purposes. Russia has set 0.001 mg/L as a MAC for drinking water. WHO has set 0.01 mg/L as a limit for drinking water. Maine has set[61] a guideline of 0.01 mg/L and Minnesota 0.045 mg/L for drinking water. EPA[62] has proposed 0.05 mg/L as a limit for drinking water.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μm filtration prior to the above analysis.

Routes of Entry: Inhalation of dust or vapor, percutaneous absorption of liquid, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

The normal dietary intake of selenium, about 50−150 μg/day, is sufficient to meet the daily nutritional requirement for this essential nutrient. Selenium compounds can be toxic. However, at levels of daily intake that are only moderately higher than the nutritional requirement. The severity of the toxic effects of selenium would depend upon how much selenium was eaten and how often. Swallowing a quantity of concentrated sodium selenate or sodium selenite (for example, part of a bottle of sodium selenate designed to be administered to a flock of sheep, or large numbers of selenium supplement pills) would be life threatening without immediate treatment. If amounts of selenium that were moderately higher than the daily nutritional requirement were eaten over long periods of time, several health effects could occur, including brittle hair, deformed nails; and in extreme cases, numbness and a lack of coordination in arms and legs. These health effects have been observed in people living in several villages in the People's Republic of China who were exposed to foods that were high in selenium for months to years. There have been no reports of populations in the United States exhibiting these symptoms of extreme chronic selenium poisoning.

Short Term Exposure: Selenium can affect you when breathed in. Fumes can irritate the eyes and the respiratory tract. Contact can burn the eyes and skin. Inhalation of fume may cause symptoms of asphyxiation, chills and fever, and bronchitis. High levels can cause troubled breathing, lung irritation (pneumonitis), and headaches. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms of exposure can cause visual disturbance, headache, chills, fever, dyspnea (breathing difficulty), bronchitis, metallic taste, garlic breath, gastrointestinal disturbance.

Long Term Exposure: Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the central nervous system, blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic breath.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, blood, spleen. In animals: anemia, liver necrosis, cirrhosis, kidney, spleen damage.

Medical Surveillance: NIOSH lists the following tests: Body Hair/Nail; whole blood (chemical/metabolite); blood plasma; blood serum; liver function tests; urine (chemical/metabolite); urine (chemical/metabolite), 24-h collection; urinalysis; white blood cell count/differential. Urine test for selenium (normal is less than 100 μg/L of urine). If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator) or 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PAPRDM if not present as a fume (any powered, air-purifying respirator with a dust and mist filter) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Selenium must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water.

Shipping: Selenium requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including selenium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Powdered selenium: dispose in a chemical waste landfill. When possible, recover selenium and return to suppliers.[22]

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Selenium dioxide is a white to slightly reddish crystalline solid or yellow liquid which forms a yellow-green vapor that has a sour and pungent odor. Odor threshold in air = 0.0002 mg/m^3. Molecular weight = 110.96; Sublimation point = 315°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water; solubility = 40%.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector. Selenium dioxide is used in the manufacture of selenium compounds, a reagent for alkaloids; an oxidizing agent; in paint and ink pigments; in metal "blueing" and etching; as a chemical catalyst; in photographic toners; in electric and photoelectric components; and others.

Incompatibilities: Strong acids may cause release of toxic hydrogen selenide gas. Water solution is a medium strong acid (selenious acid). Reacts with many substances producing toxic selenium vapors. Attacks many metals in the presence of water.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg[Se]/m^3 TWA.

Russia[43] set a MAC of 0.1 μg/m^3 in ambient air in residential areas on a momentary basis and 0.05 μg/m^3 on a daily average basis.

Determination in Air: Use NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 35 μg/L as a 24-h average, never to exceed 260 μg/L for recoverable inorganic selenite. *To protect saltwater aquatic life:* 54 μg/L as a 24-h average, never to exceed 410 μg/L. To protect human health: 10 μg/L.[6] There are a variety of foreign standards for selenium in water.[35] The Czech Republic has set 0.1 mg/L in surface water, 0.05 mg/L in drinking water reserve, and 0.01 mg/L in drinking water. Germany[35] has set 0.008 mg/L as a maximum permissible concentration in drinking water. The EEC has set 0.01 mg/L as a MAC for drinking water. Mexico has set 0.01 mg/L for receiving waters used for drinking purposes. Russia has set 0.001 mg/L as a MAC for drinking water. WHO has set 0.01 mg/L as a limit for drinking water. Maine has set[61] a guideline of 0.01 mg/L and Minnesota 0.045 mg/L for drinking water. EPA[62] has proposed 0.05 mg/L as a limit for drinking water.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μm filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion, skin, and/or eyes. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. *Inhalation:* Low-level exposures may cause garlic breath and metallic taste in the mouth. Tiredness, pallor, and indigestion have been reported. Unknown high levels have caused intense irritation of nose, throat, and lungs, with coughing, sneezing, congestion, dizziness, and headache. Inhalation may cause chemical pneumonitis. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* May cause dermatitis with itchy red bumps forming. Chemical burns may also occur. Intense pain will occur if selenium oxide penetrates under the fingernail. *Eyes:* May cause pain and irritation. Eyelids may become puffy, an allergic reaction known as “rose eye.” *Ingestion:* No information specific to selenium oxide. Based on other selenium compounds, may cause nausea, vomiting, abdominal pain, diarrhea, metallic taste, and garlic odor on breath. Animal studies suggest that the lethal dose for an adult may be as low as 1/200 oz.

Long Term Exposure: Allergic sensitization may occur resulting in onset of skin rash and rose eye at very low levels. Discoloration of hair and nails may also affect many organ systems. Animal feeding studies suggest that liver, spleen, and kidney damage is possible. Nasopharyngeal irritation, gastrointestinal distress, and persistent garlic breath may also occur. Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the central nervous system, blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic breath.

Points of Attack: Skin, eyes, liver, kidneys, spleen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Note to physician: 10% sodium thiosulfate solutions, creams, and eye ointments will rapidly convert selenium oxide to less harmful red selenium. Urinary selenium may be useful indicator of degree of exposure. Liver function tests are suggested.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator) or 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PAPRDM if not present as a fume (any powered, air-purifying respirator with a dust and mist filter) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store away from acids and water. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. For liquids, absorb on sand or vermiculite and shovel slurry into sealed container. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including selenium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 15 (≥1.67% concentration).

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 1000 lb (450 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Selenium hexafluoride is a nonflammable, colorless gas. Repulsive odor. Molecular weight = 192.96; Boiling point = −34.4°C (Sublimation point = −46°C); Freezing/Melting point = −50.6°C (also −39°C); Relative vapor density (air = 1) = 6.66. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Insoluble in water; slow reaction.

Potential Exposure: Selenium hexafluoride, a gas, is utilized as a gaseous electric insulator.

Incompatibilities: Hydrolyzes very slowly in cold water. Decomposes on heating, producing hydrogen fluoride, fluoride, and selenium. Contact with metal or acid will produce toxic gaseous hydrogen selenide.

Permissible Exposure Limits in Air

OSHA PEL: 0.05 ppm/0.4 mg[Se]/m^3 TWA.

NIOSH REL: 0.05 ppm TWA.

ACGIH TLV®[1]: 0.05 ppm/0.4 mg[Se]/m^3 TWA.

NIOSH IDLH: 2 ppm.

PAC-2: **0.087** ppm

PAC-3: **0.26** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 0.05 ppm (0.2 mg/m^3), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; MAK 0.1 mg[Se]/m^3, 1999; Belgium: TWA 0.05 ppm (0.16 mg/m^3), 1993; Denmark: TWA 0.05 ppm (0.4 mg/m^3), 1999; Finland: TWA 0.05 ppm (0.4 mg/m^3); STEL 0.15 ppm (1.2 mg/m^3), 1999; France: VME 0.05 ppm (0.2 mg/m^3), 1999; Japan 0.1 mg [Se]/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg[Se]/m^3, 2003; Norway: TWA 0.05 ppm (0.4 mg/m^3), 1999; the Philippines: TWA 0.05 ppm (0.4 mg/m^3), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3, 1999; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 0.05 ppm (0.4 mg/m^3), 1999; United Kingdom: TWA 0.1 mg[Se]/m^3, 2000; TWA 2.5 mg[F]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 ppm. Several states have set guidelines or standards for SeF_6 in ambient air[60] ranging from 2 μg/m^3 (North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: Collection by impinger or fritted bubbler, analysis by atomic absorption spectrometry.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Contact with the liquid can cause frostbite.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. May affect the central nervous system, liver, and kidneys.

Points of Attack: Respiratory system, liver, kidneys, skin. In animals: pulmonary irritation, edema.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine). Lung function tests. Consider chest X-ray following acute overexposure. Liver and kidney function tests. Examination by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 2 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Selenium hexafluoride requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.2/1.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 1.8/2.9
Night 4.0/6.5

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire. The material itself does not burn or burns with difficulty. Poisonous gases are produced in fire, including hydrogen fluoride, fluoride, and selenium. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: If possible, convert selenium compounds to an insoluble form with SO_2 before landfill or solidification.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as selenium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as selenium compounds, n.o.s., waste number not listed.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Selenium oxychloride is a colorless to yellowish liquid. Fumes in air. Molecular weight = 165.86; Boiling point = 176.3°C; Specific gravity (H_2O:1) = 2.42 at 25°C; Freezing/Melting point = 8.5−11°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1₩. Reacts with water.

Potential Exposure: Compound Description: Human Data. This material is used as a solvent for many substances, including metals and as a chlorinating agent; and resin plasticizer; as an ionizing solvent; for monochlorination of ketones.

Incompatibilities: Water and air reactive. The aqueous solution is a strong acid and oxidizer. Reacts violently with bases, reducing agents, powdered antimony, red and white phosphorus, disilver oxide, lead oxide, and potassium.

Note: Never pour water into this substance; when dissolving or diluting always add it slowly to the water.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg[Se]/m^3 TWA.
NIOSH REL: 0.2 mg[Se]/m^3 TWA.
ACGIH TLV®[1]: 0.2 mg[Se]/m^3 TWA.
NIOSH IDLH: 1 mg [Se]/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.42 mg/m^3
PAC-1: 1.26 mg/m^3
PAC-2: 10 mg/m^3
PAC-3: 10 mg/m^3

DFG MAK: 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C. Arab Republic of Egypt: TWA 0.2 mg[Se]/m^3, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Belgium: TWA 0.2 mg[Se]/m^3, 1993; Denmark: TWA 0.1 mg[Se]/m^3, 1999; Finland: TWA 0.1 mg[Se]/m^3; STEL 0.3 mg[Se]/m^3, 1999; Hungary: STEL 0.1 mg[Se]/m^3, 1993; Norway: TWA 0.1 mg[Se]/m^3, 1999; the Philippines: TWA 0.2 mg[Se]/m^3, 1993; Poland: MAC (TWA) 0.1 mg[Se]/m^3, 1993; Sweden: NGV 0.1 mg[Se]/m^3, 1999; Switzerland: MAK-W 0.1 mg [Se]/m^3, 1999; Turkey: TWA 0.2 mg[Se]/m^3, 1993; United Kingdom: TWA 0.1 mg[Se]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg[Se]/m^3. Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μg/m^3 (Montana) to 0.27 μg/m^3 (Massachusetts) to 0.66 μg/m^3 (New York) to 2.0 μg/m^3 (Florida and North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 35 μg/L as a 24-h average, never to exceed 260 μg/L for recoverable inorganic selenite. *To protect saltwater aquatic life:* 54 μg/L as a 24-h average, never to exceed 410 μg/L. To protect human health: 10 μg/L.[6] There are a variety of foreign standards for selenium in water.[35] The Czech Republic has set 0.1 mg/L in surface water, 0.05 mg/L in drinking water reserve, and 0.01 mg/L in drinking water. Germany[35] has set 0.008 mg/L as a maximum permissible concentration in drinking water. The EEC has set 0.01 mg/L as a MAC for drinking water. Mexico has set 0.01 mg/L for receiving waters used for drinking purposes. Russia has set 0.001 mg/L as a MAC for drinking water. WHO has set 0.01 mg/L as a limit for drinking water. Maine has set[61] a guideline of 0.01 mg/L and Minnesota 0.045 mg/L for drinking water. EPA[62] has proposed 0.05 mg/L as a limit for drinking water.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μm filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is very toxic and may cause death or permanent injury after very short exposures to small quantities. Inhalation of small quantities may be corrosive and irritating to the respiratory tract. It can burn and severely irritate the skin and eyes and cause burns to the mouth, esophagus, and stomach when ingested. Inhalation of this material may cause garlic breath, odor, nausea, vomiting, indigestion, fever, headache, lassitude, irritability, and unstable blood pressure.

Long Term Exposure: Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the central nervous system, blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic breath.

Points of Attack: Skin, lungs, liver.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 mg/m³:* DM if not present as a fume (any dust and mist respirator) or any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PAPRDM if not present as a fume (any powered, air-purifying respirator with a dust and mist filter) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Selenium oxychloride requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including selenium and chloride, are produced in fire. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as selenium and compounds.

US EPA Hazardous Waste Number (RCRA No.): U205.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 10/1/89.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (SeS_2).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: There are various selenium sulfides: Selenium monosulfide, SeS, is orange-yellow powder or tablets, Molecular weight = 111.02; Boiling point = (decomposes) 118−119°C; Freezing/Melting point = 111°C. Selenium disulfide, SeS_2 which is a bright red to yellow material; Freezing/Melting point ≤100°C. Se_2S_6 which is a light orange crystalline solid. Freezing/Melting point = 121.5°C. Se_4S_4 is a red crystalline solid. Molecular weight = 143.08; Freezing/Melting point = 113°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Selenium sulfide is used for the treatment of seborrhea, especially in shampoos. The chemical is available over the counter as Selsun®, a stabilized buffered suspension. FDA reports that selenium sulfide is an active ingredient in some drug products used for the treatment of dandruff and certain types of dermatitis. A dandruff shampoo containing 1% selenium sulfide is available without a prescription and is recommended for use once or twice a week. By prescription, selenium sulfide is available in a 2.5% shampoo or lotion, with the recommended application limited to 10 min for 7 days to avoid the possibility of acute toxic effects. Selenium sulfide is also used topically in veterinary medicine for eczemas and dermatomycoses.

Incompatibilities: Oxidizers, strong acids. Violent reaction with silver oxide.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg[Se]/m^3 TWA.

NIOSH REL: 0.2 mg[Se]/m^3 TWA.

ACGIH TLV®[1]: 0.2 mg[Se]/m^3 TWA.

Protective Action Criteria (PAC)

NIOSH IDLH: 1 mg [Se]/m^3.

Monosulfide

TEEL-0: 0.281 mg/m^3

PAC-1: 0.844 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 15 mg/m^3

Disulfide

TEEL-0: 0.362 mg/m^3

PAC-1: 1.09 mg/m^3

PAC-2: 1.81 mg/m^3

PAC-3: 60 mg/m^3

DFG MAK: 0.05 mg[Se]/m^3, inhalable fraction TWA; Peak Limitation Category II(4); Carcinogen Category 3B; Pregnancy Risk Group C.

Several states have set guidelines or standards for selenium compounds as selenium in ambient air[60] ranging from 0.26−1.57 μg/m^3 (Montana) to 0.27 μg/m^3 (Massachusetts) to 0.66 μg/m^3 (New York) to 2.0 μg/m^3 (Florida and North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 35 μg/L as a 24-h average, never to exceed 260 μg/L for recoverable inorganic selenite. *To protect saltwater aquatic life:* 54 μg/L as a 24-h average, never to exceed 410 μg/L. To protect human health: 10 μg/L.[6] There are a variety of foreign standards for selenium in water.[35] The Czech Republic has set 0.1 mg/L in surface water, 0.05 mg/L in drinking water reserve, and 0.01 mg/L in drinking water. Germany[35] has set 0.008 mg/L as a maximum permissible concentration in drinking water. The EEC has set 0.01 mg/L as a MAC for drinking water. Mexico has set 0.01 mg/L for receiving waters used for drinking purposes. Russia has set 0.001 mg/L as a MAC for drinking water. WHO has set 0.01 mg/L as a limit for drinking water. Maine has set[61] a guideline of 0.01 mg/L and Minnesota 0.045 mg/L for drinking water. EPA[62] has proposed 0.05 mg/L as a limit for drinking water.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μm filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. The dust irritates the respiratory tract. Higher exposure can cause headaches, troubled breathing, and pneumonitis. Symptoms of exposure include irritation of the skin (dermatitis), eyes, and mucous membranes; eye injury; hair loss; discoloration of hair; garlic odor of the breath; depression, languor, giddiness, emotional instability; excess dental caries; pallor, nervousness; digestive disturbances; and nausea.[52]

Long Term Exposure: A probable carcinogen in humans, it has been shown to cause liver and lung cancer in animals. Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the central nervous system, blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic breath.

Points of Attack: Liver.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine).

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool dry place. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Selenium disulfide requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides and selenium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Determination in Air: NIOSH(IV) Methods #7300, Elements; #7301; #7303; #9102; NIOSH II(7), Method #S190; OSHA Analytical Method ID-121 and ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 35 μg/L as a 24-h average, never to exceed 260 μg/L for recoverable inorganic selenite. *To protect saltwater aquatic life:* 54 μg/L as a 24-h average, never to exceed 410 μg/L. To protect human health: 10 μg/L.[6] There are a variety of foreign standards for selenium in water.[35] The Czech Republic has set 0.1 mg/L in surface water, 0.05 mg/L in drinking water reserve, and 0.01 mg/L in drinking water. Germany[35] has set 0.008 mg/L as a maximum permissible concentration in drinking water. The EEC has set 0.01 mg/L as a MAC for drinking water. Mexico has set 0.01 mg/L for receiving waters used for drinking purposes. Russia has set 0.001 mg/L as a MAC for drinking water. WHO has set 0.01 mg/L as a limit for drinking water. Maine has set[61] a guideline of 0.01 mg/L and Minnesota 0.045 mg/L for drinking water. EPA[62] has proposed 0.05 mg/L as a limit for drinking water.

Determination in Water: Digestion followed by atomic absorption gives total selenium. Dissolved selenium is determined by 0.45 μm filtration prior to the above analysis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Selenous acid and its salts are capable of penetrating the skin and can produce acute poisonings. Corrosive to the eyes, skin, and respiratory tract. May affect the eyes, resulting in "rose-eye," an allergic-type reaction of the eyelids. It is highly toxic orally. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inorganic selenium compounds may cause dermatitis. Toxic effects are similar to those of selenium and other selenium compounds. Garlic odor of breath is a common symptom. Pallor, nervousness, depression, and digestive disturbances have been reported in cases of chronic exposure. The most common industrial injuries are irritations and burns of the skin.

Long Term Exposure: Repeated or prolonged contact may cause skin dermatitis. May affect the central nervous system, blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic breath.

Points of Attack: Skin, eyes, liver, kidneys, nervous system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; urinalysis (routine); white blood cell count/differential. Urine test for selenium (should not exceed 100 μg/L of urine). Examination of the nervous system. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained in its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from reducing agents, acids, combustibles. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Liquid containing selenium inorganic compounds should be absorbed in vermiculite, dry sand, earth, or similar material. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including selenium oxides and selenium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Semicarbazide hydrochloride is a white crystalline solid. Molecular weight = 111.55; Freezing/Melting point = 172−175°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as a reagent for ketones and aldehydes with which it affords crystalline compounds having characteristic freezing/melting points. Also used in isolation of hormones and certain fractions from essential oils.

Incompatibilities: Oxidizers. May ignite combustible materials (wood, oil, paper).

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 20 mg/m^3

PAC-1: 60 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 100 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Toxic by ingestion. Symptoms of exposure include convulsions; irritation of skin, eyes, and mucous membranes; gastroenteric disturbances; and anemia. High level of exposure may affect the nervous system.

Long Term Exposure: There is limited evidence that this chemical causes lung cancer in animals. High or repeated exposure may cause nerve damage with weakness, a feeling of “pins and needles,” and loss of coordination in the limbs.

Points of Attack: Nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained in its proper handling and storage. Store in a refrigerator and protect from oxidizers, combustible materials, moisture. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam. For large fires, use water spray, fog, or foam. Poisonous gases are produced in fire, including nitrogen oxides and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 232-263-4

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Silane is a colorless, pyrophoric gas with a repulsive odor. Molecular weight = 32.13; Boiling point = −169°C; Specific gravity (H_2O:1) = 1.31 at 25°C; Specific gravity (H_2O:1) = 1.31 at 25°C; Freezing/Melting point = −111.7°C; Flash point = −236°C. Relative vapor density (air = 1) = 1.11. Explosive limits: LEL = 1.37%; UEL = 100%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 3₩. Slight solubility in water; slowly decomposes.

Potential Exposure: Compound Description: Mutagen. Silane is used as a doping agent for solid-state devices, as a source of silicon for semiconductors, and in the production of amorphous silicon.

Incompatibilities: An extremely flammable gas; may spontaneously ignite in air. A strong reducing agent. Reacts slowly with water. Reacts with oxidizing agents, halogens [bromine, chlorine, carbonyl chloride, antimony pentachloride, tin(IV) chloride], potassium hydroxide solution. Explodes in oxygen. Decomposes on heating or on burning producing silicon and hydrogen.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 ppm/7 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/6.6 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 5 ppm

PAC-1: **100** ppm

PAC-2: **130** ppm

PAC-3: **270** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 5 ppm (7 mg/m^3), 1993; Belgium: TWA 5 ppm (6.6 mg/m^3), 1993; Denmark: TWA 0.5 ppm (0.7 mg/m^3), 1999; Finland: TWA 0.5 ppm (0.7 mg/m^3); STEL 1.5 ppm (2.0 mg/m^3), 1999; France: VME 5 ppm (7 mg/m^3), 1999; Japan: 100 ppm (130 mg/m^3), 1999; Norway: TWA 0.5 ppm (0.7 mg/m^3), 1999; the Netherlands: MAC-TGG 0.7 mg/m^3, 2003; United Kingdom: TWA 0.5 ppm (0.67 mg/m^3); STEL 1 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm. Several states have set guidelines or standards for silane in ambient air[60] ranging from 70 μg/m^3 (North Dakota) to 140 μg/m^3 (Connecticut) to 167 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Silicon tetrahydride can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Skin or eye contact with the liquid may cause frostbite. Not much is known about the effects of exposure to high levels, but somewhat similar chemicals cause severe irritation of the eyes, skin, and lungs.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Silicon tetrahydride must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Silicon tetrahydride should be stored and used under a blanket of inert gas as it explodes on contact with air. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where silicon tetrahydride is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of silicon tetrahydride.

Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Silane, compressed, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. For small fires, use dry chemical or CO_2 extinguishers. Avoid halons. Dolomite powder or graphite are recommended dry chemical agents.[24] Poisonous gases are produced in fire, including silicon and explosive hydrogen. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dispose by controlled burning or seal cylinders and return to suppliers.[24]

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1997; NIOSH (*Silica, amorphous silica, fused*): Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex I (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Amorphous silica, the noncrystalline form of SiO_2, is a transparent to gray, odorless, amorphous powder. Molecular weight = 60.09; Specific gravity (H_2O:1) = 2.20 at 25°C; Boiling point = 2230°C; Freezing/Melting point = 1710°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Amorphous fumed silica is used as a mineral, natural or synthetic fiber. Those involved in the production and handling of fumed silica for paint pigments or catalysts. Diatomaceous earth is used in clarifying liquids, in manufacture of fire brick and heat insulators; used as a filtering agent; as a filler in construction materials; pesticides, paints, and varnishes. Those involved in mining of diatomaceous earth or fabrication of products therefrom.

Incompatibilities: Fluorine, oxygen difluoride, chlorine trifluoride.

Permissible Exposure Limits in Air

Silica, amorphous silica, fused

OSHA PEL: 30 mg/m^3 total dust/divided by the value "%$SiO_2 + 2$" TWA; *either one* of the following methods: 250 mppcf respirable dust/divided by the value "%$SiO_2 + 5$" *or* 10 mg/m^3 respirable dust/divided by the value "%$SiO_2 + 2$."

NIOSH REL: 0.05 mg/m^3, respirable dust TWA; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: withdrawn.

DFG MAK (*CAS: 60676-86-0 & 7699-41-4*): 0.3 mg/m^3 respirable fraction; Pregnancy Risk Group C.

Silica, amorphous precipitated and gel and diatomaceous earth, uncalcined

OSHA PEL: *either one of the methods:* 20 mppcf [millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques] *or* 80 mg/m^3 divided by the value "%SiO_2," TWA.

NIOSH REL: 6 mg/m^3 TWA.

ACGIH TLV®[1]: withdrawn for the following: silica amorphous, precipitated and gel; silica fume; silica fused; diatomaceous earth, calcined.

NIOSH IDLH: 3000 mg/m^3.

Protective Action Criteria (PAC)

Amorphous hydrated

TEEL-0: 6 mg/m^3
PAC-1: 18 mg/m^3
PAC-2: 100 mg/m^3
PAC-3: 500 mg/m^3

Amorphous fumed

TEEL-0: 6 mg/m^3
PAC-1: 18 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 500 mg/m^3

DFG MAK (*diatomaceous earth, uncalcined)*: 4 mg/m^3, inhalable fraction; Pregnancy Risk Group C.

Austria: MAK 4 mg/m^3, 1999; Norway: TWA 1.5 mg/m^3 (respirable dust), 1999; Switzerland: MAK-W 4 mg/m^3, 1999; Thailand: TWA 80 mg/m^3, 1993; United Kingdom: TWA 6 mg/m^3, total dust, 2000; United Kingdom: TWA 1.2 mg/m^3 (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 3 mg/m^3 (respirable fraction, for particulate matter containing no asbestos and <1% crystalline silica). Russia[43] set a MAC of 2 mg/m^3 in work-place air.

Determination in Air: Use NIOSH(IV) Method #7501 (any form); OSHA Analytical method ID-125G (fumed).

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Amorphous fused silica can affect you when breathed in. Exposure can cause a very serious lung disease called silicosis, with cough and shortness of breath. Very high exposures can cause this problem to develop in a few weeks, or with lower exposures it may occur over many years. Silicosis can cause death. If silicosis develops, chances of getting tuberculosis are increased. The disease may progress, with or without continued exposure. If it does, this can be crippling or even fatal.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Chest X-ray every 1−3 years. If abnormal chest X-ray develops, the following should be done periodically: skin test for TB.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility.

Personal Protective Methods: All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 30 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 60 mg/m^3:* 95XQ (APF = 10) [Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 150 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 300 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 3000 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Amorphous fused silica must be stored to avoid contact with powerful oxidizers including fluorine, oxygen difluoride, chrome trifluoride, and manganese trioxide, since violent reactions occur.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Amorphous fused silica itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer [Silica, crystalline (airborne particles of respirable size)] 10/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, all forms.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Crystalline silica is a component of many mineral dusts and materials which melts to a glass at very high temperature. Molecular weight = 60.09; Specific gravity (H_2O:1) = 2.66 at 25°C; Boiling point (quartz) = 2230°C; Freezing/Melting point (quartz) = 1610°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description (cristobalite): Tumorigen, Human Data; (quartz): Tumorigen, Mutagen, Organometallic, Human Data; (tridymite): Tumorigen, Mutagen; Human Data. Cristobalite is used in the manufacture of water glass, refractories, abrasives, ceramics, and enamels. Quartz is used as a mineral, natural or synthetic fiber. Tridymite is used as a filtering and insulating media and as a refractory material for furnace linings. Workers are potentially exposed to crystalline silica in industries such as granite quarrying and cutting, foundry operations; metal, coal, dentistry, painting, and nonmetallic mining; and manufacture of clay and glass products.

Incompatibilities: Violent reactions with powerful oxidizers: fluorine, chlorine trifluoride; manganese trioxide; oxygen difluoride, hydrogen peroxide, etc.; acetylene; ammonia.

Permissible Exposure Limits in Air

OSHA PEL: (*silica, crystalline α-quartz, CAS: 14808-60-7 & Silica, crystalline tripoli CAS: 1317-95-9*): 30 mg/m^3 total dust/divided by the value "%$SiO_2 + 2$" TWA; *either one* of the following methods: 250 mppcf respirable dust/divided by the value "%$SiO_2 + 5$" *or* 10 mg/m^3 respirable dust/divided by the value "%$SiO_2 + 2$"; For Silica crystalline, tridymite, CAS: 15468-32-3 and Silica, crystalline cristobalite, CAS 14464-46-1 use ½ the values calculated above using the count or mass formula for quartz. See also Table Z-3 of 29 CFR 1910.1000.

NIOSH REL (*silica, crystalline, all forms*): 0.05 mg/m^3, respirable dust TWA; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1] (*Silica, crystalline α-quartz, CAS: 14808-60-7 & Crystalline cristobalite, CAS 14464-46-1*): 0.025 mg/m^3 TWA, Respirable fraction of dust; Suspected Human Carcinogen.

NIOSH IDLH: (*cristobalite and tridymite*) 25 mg/m^3; (*quartz and tripoli*) 50 mg/m^3.

PAC-3: 50 mg/m^3

14464-46-1 (cristobalite)

TEEL-0: 0.025 mg/m^3

PAC-1: 0.075 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 25 mg/m^3

DFG MAK (s*ilica, crystalline, all forms*): respirable; Carcinogen Category 1.

Austria: MAK 0.15 mg/m^3, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Finland: TWA 0.1 mg/m^3, 1999; France: VME 10/(2X + 2), 1999; Norway: TWA 0.05 mg/m^3 (respirable dust), 1999; Russia: STEL 1 mg/m^3 (total dust), 1993; the Netherlands: MAC-TGG 0.075 mg/m^3, 2003; Switzerland: MAK-W 0.15 mg/m^3, 1999; Thailand: TWA 10 mg/m^3, 1993; United Kingdom: TWA0.3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 mg/m^3 (respirable dust).

Determination in Air: Use: Use NIOSH Analytical Method (cristobalite), #7500, Silica, crystalline, by XRD; #7601, by VIS; #7602, by IR; #7603, Silica, crystalline in coal mine dust, by IR; OSHA Analytical Method ID-142; 125-G.

Routes of Entry: Inhalation of dust, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. Inhalation can cause cough, dyspnea (breathing difficulty), wheezing.

Long Term Exposure: Can cause decreased pulmonary function, progressive respiratory symptoms, fibrosis (silicosis). A potential occupational carcinogen. Silicosis is a very serious lung disease that can cause cough and shortness of breath. Silicosis can develop in a few weeks at very high exposures, or it may occur over many years with lower exposures. Silicosis can cause death. If silicosis develops, risk of developing tuberculosis is increased. The disease may progress with or without continued exposure. If it does, this can be crippling or even fatal. Very fine silica or "silica flour" is even more hazardous.

Points of Attack: Eyes, respiratory system. Cancer site in animals: lungs.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Chest X-ray every 1−3 years. Chest X-rays should be read by a "B-reader," a doctor with special training for reading X-rays of the lungs. If abnormal chest X-ray develops, the following should be done periodically, skin test for tuberculosis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in the NIOSH document CT-112-23b, *Control Technology for Bag Filling Operations at Manville Products Corporation, Lompoc, CA.* NIOSH recommends that *silica sand* or materials containing *more than 1% free silica* be prohibited as abrasive substances in abrasive blasting and cleaning operations. The New Jersey Department of Health and Senior Services document *Stop Silicosis in Sandblasters; Use Silica Substitutes* recommends the substitution of less toxic *alumina* in pottery, and *quartz free grit* in abrasive blasting for silica, cristobalite. Follow OSHA regulations (OSHA Standard 1910.94) for abrasive blasting operations.

Respirator Selection: NIOSH: *Up to 0.5 mg/m^3:* 95XQ (APF = 10) (any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100). *Up to 1.25 mg/m³:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 2.5 mg/m³:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter). *Up to 25 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Silica must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Silica itself does not burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill.

Silicon S:0240

Molecular Formula: Si

Synonyms: Defoamer S-10; Elemental silicon; Silicon, amorphous powder

CAS Registry Number: 7440-21-3

RTECS® Number: VW0400000

UN/NA & ERG Number: UN1346 (powder, amorphous)/170

EC Number: 231-130-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Silicon is a nonmetallic element which is known as silicon metal. Does not occur free in nature, but is found in silicon dioxide (silica) and in various silicates.[NIOSH] It is a steel-gray crystalline solid or a black-brown amorphous material. Molecular weight = 28.09; Specific gravity (H_2O:1) = 2.33 at 25°C; Boiling point = 2345°C; Freezing/Melting point = 1410°C. Minimum Explosive Concentration = 160 g/m³. Ignition temperature of dust cloud = Unknown; Minimum Explosive concentration = 0.11 oz/ft³.[USBM] Relative explosion hazard of dust: Strong. Hazard Identification (based on NFPA-704 M Rating System): [powder] Health 1, Flammability 2, Reactivity 1. Nearly insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. Silicon may be used in the manufacture of silanes, silicon tetrachloride, ferrosilicon, silicones. It is used in purified elemental form in transistors and photovoltaic cells.

Incompatibilities: The powder is highly flammable. Keep this material away from calcium, carbonates, chlorine, fluorine, oxidizers, cesium carbide, alkaline carbonates.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m³ TWA, total dust; 5 mg/m³ TWA, respirable fraction.

NIOSH REL: 10 mg/m³ TWA, total dust; 5 mg/m³ TWA, respirable fraction.

ACGIH TLV®[1]: withdrawn.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m³

PAC-1: 45 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 500 mg/m^3
Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 10 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 10 mg/m^3, 1999; Switzerland: MAK-W 4 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^2, total inhalable dust, 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3.

Determination in Air: Filter; none; Gravimetric; NIOSH IV, Particulates NOR: Method #0500, total dust; Method #0600 (respirable dust).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Causes irritation of the eyes, skin, and upper respiratory system; cough. Silicon dust does not produce significant organic disease or toxic effect when exposures are kept under reasonable control. Unpleasant deposits may be caused in eyes, ears, and nasal passages, and injury to the skin and mucous membranes may be caused by the dust itself or by cleansing procedures used for its removal.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function test. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard (*amorphous powder*): Store in a flammable materials storage area. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and other incompatible materials.

Shipping: Silicon powder, amorphous requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Silicon carbide S:0250

Molecular Formula: CSi

Common Formula: SiC

Synonyms: Carbon silicide; Carborundum®, Crystolon®, Carbonite®, Electrolon®; Silicon monocarbide

CAS Registry Number: 409-21-2; *(alt.)* 12504-67-5; *(alt.)* 66039-27-8

RTECS® Number: VW0450000

EC Number: 206-991-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Silicon carbide is a yellow to green to bluish-black, iridescent crystalline substance. Colorless when pure. Molecular weight = 40.10; Specific gravity (H_2O:1) = 3.23 at 25°C; Boiling point = (sublimes); Freezing/Melting point = (sublimes with decomposition) 2700°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen. Those involved in the manufacture of silicon carbide abrasives, refractories, and semiconductors. Silicon carbide fibers are also produced in fibrous form as reinforcing fibers for composite materials.

Incompatibilities: None listed. Sublimes with decomposition at 2700°C.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 10 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.

ACGIH TLV®[1]: *Nonfibrous:* 10 mg/m^3 TWA, inhalable fraction; particulate matter containing no asbestos and $<1\%$ crystalline silica; 3 mg/m^3 TWA, respirable fraction, for particulate matter containing no asbestos and $<1\%$ crystalline silica; *fibrous (including whiskers):* 0.1 f/cc, TWA, respirable fibers; length >5 μm; aspect ratio $\geq 3:1$, as determined by the membrane filter method at 400−450× magnification (4-mm objective), using phase-contrast illumination; Suspected Human Carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 45 mg/m^3

PAC-2: 250 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1.5 mg/m^3, respirable fraction (previously "fine dust"); 4 mg/m^3, inhalable fraction; Pregnancy Risk Group C.

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 4 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; France: VME 10 mg/m^3, 1999; Switzerland: MAK-W 4 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; United Kingdom: TWA 4 mg/m^3 (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen.

Determination in Air: Use NIOSH IV Method #0500, total dust, Method #0600 (respirable dust), Particulates NOR.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, upper respiratory system; cough.

Long Term Exposure: Silicon carbide can alter the course of inhalation tuberculosis leading to extensive fibrosis and progressive disease.

Points of Attack: Respiratory system.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*metal*); 3—Highly water polluting (*colloidal*).

Description: Silver is a white lustrous metal that is extremely ductile and malleable. Molecular weight = 107.87; Specific gravity (H_2O:1) = 10.49 at 25°C (metal); Boiling point = 2212°C; Freezing/Melting point = 961°C. Hazard Identification (based on NFPA-704 M Rating System) (*powder*): Health 0, Flammability 0, Reactivity 1. Insoluble in water but soluble in hot sulfuric and nitric acids. Perhaps the most common soluble silver compounds are silver nitrate ($AgNO_3$) and silver cyanide (AgCN).

Potential Exposure: Silver may be alloyed with copper, aluminum, cadmium, lead, or antimony. The alloys are used in the manufacture of silverware, jewelry, coins, ornaments, plates, commutators, scientific instruments, automobile bearing, and grids in storage batteries. Silver is used in chrome-nickel steels, in solders and brazing alloys; in the application of metallic films on glass and ceramics, to increase corrosion resistance to sulfuric acid, in photographic films, plates, and paper; as an electroplated undercoating for nickel and chrome; as a bactericide for sterilizing water; fruit juices; vinegar, etc.; in bus bars and windings in electrical plants; in dental amalgams; and as a chemical catalyst in the synthesis of aldehydes. Because of its resistance to acetic and other food acids, it is utilized in the manufacture of pipes, valves, vats, pasteurizing coils and nozzles for the milk, vinegar, cider, brewing, and acetate rayon silk industries.

Incompatibilities: Acetylene, ammonia, hydrogen peroxide, bromoazide, chlorine trifluoride, ethyleneimine, oxalic acid, tartaric acid.

Permissible Exposure Limits in Air

NIOSH IDLH: 10 mg[Ag]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.01 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 0.5 mg/m^3

PAC-3: 10 mg/m^3

DFG MAK: *silver metal dust and fume*: 0.1 mg[Ag]/m^3, inhalable fraction TWA; Peak Limitation Category II(8); Pregnancy Risk Group D. *Silver salts:* 0.01 mg[Ag]/m^3, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Australia: TWA 0.1 mg/m^3, 1993; Austria: MAK 0.01 mg/m^3, 1999; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.1 mg/m^3, 1999; France: VME 0.1 mg/m^3, 1999; Japan: 0.01 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Norway: TWA 0.01 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: NGV 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.01 mg/m^3, 1999; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3 *silver metal dust*. Several states have set guidelines or standards for silver in ambient air[60] ranging from 0.01−0.08 $\mu g/m^3$ (Montana) to 0.2 $\mu g/m^3$ (Connecticut and Nevada) to 1.0 $\mu g/m^3$ (North Dakota) to 16,000 $\mu g/m^3$ (Virginia).

As silver soluble compounds
OSHA PEL: 0.01 mg/m^3 TWA.
NIOSH REL: 0.01 mg/m^3 TWA.
ACGIH TLV®[1]: 0.01 mg/m^3 TWA.

Determination in Air: NIOSH Analytical Method #7300 Elements by ICP; #8005, Elements in blood or tissue, #8310 Metals in urine; OSHA Analytical Method ID-121.

Permissible Concentration in Water: *To protect freshwater aquatic life:* should not exceed e[1.72 in(hardness)—6.52] μg/L at any time. *To protect saltwater aquatic life:* never to exceed 2.3 μg/L. To protect human health: 50 μg/L.[6] The state of Maine recommends that silver in drinking water should not exceed 50 μg/L.[61]

Determination in Water: Digestion followed by atomic absorption or colorimetric determination (with Dithizone) or by inductively coupled plasma (ICP) optical emission spectrometry. This gives total silver. Dissolved silver may be determined by these same methods preceded by 0.45 μm filtration.

Routes of Entry: Inhalation of fumes or dust, ingestion of solutions or dust, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Causes irritation of the eyes, skin, and respiratory tract. Ingestion of dust can cause gastrointestinal disturbance.

Long Term Exposure: Silver can affect you when breathed in. Repeated exposure to fine silver dust or fumes can cause blue-gray staining of the eyes, mouth, throat, internal organs, and skin. This occurs slowly and may take years to develop. Once present, it does not go away. It can be very disfiguring. Skin contact can cause silver to become imbedded in small cuts in the skin, forming a permanent tattoo. Can cause sores on the inner lining of the nose and may cause perforation of the nasal septum.

Points of Attack: Nasal septum, skin, eyes.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood serum; biologic tissue/biopsy; Pigmentation Evidence; urine (chemical/metabolite). Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: Slit lamp examination by an eye doctor. Examination of the skin, nose, and throat. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Silver must be stored to avoid contact with acetylene, ammonia, hydrogen peroxide, or ethyleneimine, since violent reactions occur.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical

as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid, but flammable in the form of dust or powder. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery, wherever possible, in view of economic value of silver. Techniques for silver recovery from photoprocessing and electroplating wastewaters have been developed and patented.

Silver cyanide S:0270

Molecular Formula: CAgN

Synonyms: Cianuro de plata (Spanish); Cyanure d'argent (French)

CAS Registry Number: 506-64-9

RTECS® Number: VW3850000

UN/NA & ERG Number: UN1684/151

EC Number: 208-048-6

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as silver and compounds.

US EPA Hazardous Waste Number (RCRA No.): P104.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as cyanides.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Silver cyanide is a white or grayish odorless powder which darkens when exposed to light. Molecular weight = 133.89; Freezing/Melting point = 320°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: It is primarily used in silver plating.

Incompatibilities: Acetylene, ammonia, and hydrogen peroxide (H_2O_2). Acid and acid fumes produce hydrogen cyanide. Contact with fluorine is violently explosive at normal temperatures. Incompatible with phosphorus cyanide.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min, Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

Protective Action Criteria (PAC)

TEEL-0: 0.0124 mg/m^3

PAC-1: 0.35 mg/m^3

PAC-2: 2.5 mg/m^3

PAC-3: 12.4 mg/m^3

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

NIOSH IDLH: 25 mg[CN]/m^3.

Silver salts: 0.01 mg[Ag]/m^3, respirable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

NIOSH IDLH: 10 mg[Ag]/m^3

Determination in Air: Use NIOSH Analytical Method #7904, Cyanides. See also entry for Silver.

Permissible Concentration in Water: Again, both silver and cyanide can be considered. The EPA limit for silver in drinking water is 50 μg/L and that for cyanides is 154 μg/L.[61]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Silver cyanide can affect you when breathed in and by passing through your skin. Heating releases deadly cyanide gas. Skin or eye contact can cause irritation. A deadly poison if ingested.

Long Term Exposure: Repeated exposure can slowly cause the eyes, inner nose, throat, skin, and body organs to turn a blue-gray color. This may take years to develop but is permanent. High or repeated exposure may cause kidney damage.

Points of Attack: Kidneys, skin.

Medical Surveillance: To detect early changes in body color, careful periodic examinations of the eyes, inner nose, throat, and skin are useful. Persons with high or frequent exposure should consider periodic tests for kidney function. If cyanide exposure is suspected, immediate medical attention is recommended. Consider urine test for thiocyanates to detect cyanide exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acetylene, ammonia, and hydrogen peroxide. Protect from light. Silver cyanide and fluorine are violently explosive at normal temperatures.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including cyanide and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: O, C, N; Risk phrases: R8; R34; R50/53; Safety phrases: S1/2; S26; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Silver nitrate is a colorless to dark gray, odorless, crystalline solid. Molecular weight = 169.88; Boiling point = 444°C (decomposes); Freezing/Melting point = 212°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3 (Oxidizer). Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Silver nitrate is used in photography, silver plating; as an antiseptic; in chemical reactions; and mirror manufacturing; as starting material in production of other silver compounds.

Incompatibilities: A strong oxidizer. Reacts violently with combustible and reducing materials. Reacts with acetylene forming a shock-sensitive explosive. Reacts with alkalis, antimony salts, ammonia, arsenites, bromides, carbonates, chlorides, iodides, hydrogen peroxide, thiocyanates, ferrous salts, oils, hypophosphites, morphine salts, creosote, phosphates, tannic acid, tartarates, halides, vegetable extracts, and others. Attacks some forms of plastics, rubber, and coatings.

Determination in Air: See entry for Silver.

Permissible Concentration in Water: EPA[6] and the state of Maine[61] have set guidelines of 50 μg/L for silver in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. May affect the blood, causing formation of methemoglobin. *Inhalation:* May cause irritation of the nose, throat, and lungs. *Skin:* May cause irritation. Concentrated solutions may cause burns, sores, and discoloration of skin. Solid materials will cause chemical burns especially if skin is wet. *Eyes:* May cause irritation which can be severe. Solid material may cause chemical burns and permanent damage.

Ingestion: May cause burns to mouth and throat, abdominal pain, diarrhea, and dizziness. Shock and convulsions may develop. Estimated lethal dose is 2 g or 1/14 oz for a 150-lb adult.

Long Term Exposure: All forms of silver accumulate and are excreted very slowly. Blue-gray discoloration (argyreia) of eyes, nose, throat, and skin may occur. This discoloration is likely to be permanent. May affect the blood causing formation of methemoglobin. Very irritating substances can cause lung effects. High or repeated exposure may cause kidney damage.

Points of Attack: Skin, kidneys, blood.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Examination of the eyes, nose, throat, and skin for changes in color. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Test for blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Note to physician: If swallowed, perform gastric lavage, using 1−2% sodium chloride water every 15 min, followed by saline catharsis. Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with solutions containing silver nitrate. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Silver nitrate must be stored to avoid contact with oils and fuels, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and alkalis. Silver nitrate should not be stored in plastic containers. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Solid material: evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable but is a strong oxidizer capable of increasing the intensity of an existing fire and the flammability of combustible, organic, or other oxidizable materials. Use type of extinguisher appropriate to other burning materials. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Silver compounds

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as silver and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as silver compounds, n.o.s., waste number not listed. Land Ban chemical.

EPCRA Section 313: Includes any unique chemical substance that contains silver as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as silver, soluble compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Silver picrate is a yellow powder or crystalline material which turns brown when heated or exposed to light. Molecular weight = 335.98. Soluble in water.

Potential Exposure: Used in antibacterial medicines.

Incompatibilities: Organics or other oxidizable materials. Dried out material is unstable and a severe explosion risk; protect from shock, light, and vibration.

Permissible Exposure Limits in Air

As silver soluble compounds

OSHA PEL: 0.01 mg/m^3 TWA.

NIOSH REL: 0.01 mg/m^3 TWA.

ACGIH TLV®[1]: 0.01 mg/m^3 TWA.

No TEEL available.

DFG MAK: *silver salts:* 0.01 mg[Ag]/m^3, respirable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

NIOSH IDLH: 10 mg[Ag]/m^3.

Determination in Air: See entry for Silver.

Permissible Concentration in Water: The EPA[6] and the state of Maine[61] have set limits of 50 μg/L for silver in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Silver picrate can affect you when breathed in and by passing through your skin. Eye contact can cause burns with possible damage. Skin contact can cause severe irritation or burns.

Long Term Exposure: Repeated exposure can slowly cause the eyes, inner nose, throat, skin, and body organs to turn a blue-gray color. This usually takes years to develop but is permanent. High or repeated exposure can cause kidney damage.

Points of Attack: Skin, eyes, kidneys.

Medical Surveillance: To detect early changes in body color, careful periodic examinations of the eyes, inner nose, throat, and skin are useful. Persons with high or frequent exposure should consider periodic tests for kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *0.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Treat as an explosive material. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from organics or other readily oxidizable materials. Protect from shock, light, and vibration. Sources of ignition, such as smoking and open flames, are prohibited where silver picrate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever silver picrate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Silver picrate (dry) is FORBIDDEN. Silver picrate, wetted with not $<$30% water, by mass, requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep silver picrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Silver picrate is a flammable material which may be ignited by heat, sparks, or flames. Containers may explode if exposed to heat, flame, or shock. Cover with sand, earth, or water spray, and keep it wet. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Silvex S:0300

Molecular Formula: $C_9H_7Cl_3O_3$

Common Formula: $Cl_3C_6H_2OCH(CH_3)COOH$

Synonyms: Acide, 2-(2,4,5-trichloro-phenoxy) propionique (French); Amchen 2,4,5-TP; Aqua-Vex; Color-set; Dedweed; Double strength; Fenomore; Fenoprop; Fruitone T; Fruit-O-Net; Kuran; Kuron; Kurosal; Kurosalg; Miller NU set; Propon; Silvex herbicide; Silvi-RHAP; STA-fast; 2,4,5-TC; 2,4,5-TCPPA; 2,4,5-TP; 2,4,5-Trichlorophenoxy-α-; α-(2,4,5-Trichlorophenoxy)propanoic acid; 2-(2,4,5-Trichlorophenoxy)propanoic acid; 2-(2,4,5-Trichlorphenoxy)propionsaeure (German)

CAS Registry Number: 93-72-1

RTECS® Number: UF8225000

UN/NA & ERG Number: UN2765 (Phenoxy pesticides, solid, toxic)/152

EC Number: 202-271-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity.

Banned or Severely Restricted (several countries) (UN).[13]

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below) as 2,4,5-tp acid.

US EPA Hazardous Waste Number (RCRA No.): U233.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8150 (2).

Safe Drinking Water Act: MCL, 0.05 mg/L; MCLG, 0.05 mg/L; Regulated chemical (47 FR 9352) as 2,4,5-TP.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.72; Nonwastewater (mg/kg), 7.9.

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Silvex is a colorless powder; Freezing/Melting point = 179−181°C; Vapor pressure = 1×10^{-7} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly water soluble.

Potential Exposure: Those engaged in the manufacture, formulation, and application of this herbicide.

Incompatibilities: None listed.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 35 mg/m^3

PAC-3: 250 mg/m^3

Permissible Concentration in Water: Surface water levels should never exceed 2.5 ppb silvex (butoxyethyl ester); 2.0 ppb (propyleneglycolbutylether ester) (EPA).

Determination in Water: Fish Tox = 1515.29908000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin and eye irritation. Poisonous by ingestion. Approximate lethal dose = 2.4 tablespoonful/150 lb man.

Long Term Exposure: Silvex has caused liver and kidney damage in experimental animals. Human Tox = 56.00000 ppb (LOW).

Points of Attack: Liver, kidneys, skin, eyes.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Phenoxy pesticides, solid, toxic and "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 300.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.[1] Mix with excess sodium carbonate, add water and let stand for 24 h before flushing down the drain with excess water; or[2] pour onto vermiculite and incinerate with wood, paper, and waste alcohol. EPA compared disposal procedures. They concluded that incineration was difficult and unreasonably expensive. They concluded that land-spreading permitted exposure to silvex and the contaminant TCDD. The preferred method was disposal in a secure hazardous waste landfill.

Simazine S:0310

Molecular Formula: $C_7H_{12}ClN_5$

Synonyms: A 2079; AI3-51142; Aktinit S; Aquazine; Batazina; 2,4-Bis(aethylamino)-6-chlor-1,3,5-triazin (German); 2,4-Bis(ethylamino)-6-chloro-*s*-triazine; Bitemol; Bitemol S-50; Cat (Japan); CDT; Cekusan; Cekuzina-S; Cet; 1-Chloro-3,5-bis(ethylamino)-2,4,6-triazine; 2-Chloro-4,6-bis (ethylamino)-*s*-triazine; 2-Chloro-4,6-bis(ethylamino)-1,3,5-triazine; 6-Chloro-*N*,*N*′-diethyl-1,3,5-triazine-2,4-diamine; 6-Chloro-N^2,N^4-diethyl-1,3,5-triazine-2,4-diamine; 6-Chloro-*N*, *N*′-diethyl-1,3,5-triazine-2,4-diyldiamine; Framed; G 27692; Geigy 27692; Gesaran; Gesatop; Gesatop-50; H 1803; Herbazin 50; Herbex; Herboxy; Hungazin DT; NSC 25999; Premazine; Primatel S; Primatol S; Princep 80W; Simadex; Simanex; Simazina (Spanish); Simazine 80W; Tafazine; Tafazine 50-W; Taphazine; Triazine A 384; *s*-Triazine, 2-chloro-4,6-bis(ethylamino)-; 1,3,5-Triazine-2,4-diamine, 6-chloro-*N*,*N*′-diethyl-; W 6658; Weedex; Zeapur

CAS Registry Number: 122-34-9

RTECS® Number: XY5250000

UN/NA & ERG Number: UN2753/151

EC Number: 204-535-2 [*Annex I Index No.*: 612-088-00-3]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act: MCL, 0.004 mg/L; MCLG, 0.004 mg/L; Regulated chemical (47 FR 9352).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R40; R50/53; Safety phrases: S2; S36/37; S46; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Simazine is a combustible, white crystalline solid with little or no odor; Freezing/Melting point = (decomposes) 225°C; Vapor pressure = 2.2×10^{-8} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this preemergence herbicide.

Incompatibilities: Powder forms explosive mixture with air. Incompatible with strong oxidizers.

Permissible Exposure Limits in Air: Russia set a MAC of 2.0 mg/m^3 for simazine in work-place air[35] and a MAC of 0.02 mg/m^3 for ambient air in residential areas both on a momentary and a daily average basis.

Permissible Concentration in Water: Russia set a MAC of 2.4 μg/L in water bodies used for fishery purposes and a limit of zero in water bodies used for domestic purposes. A lifetime health advisory of 35 μg/L has been developed by EPA (see "References" below). Various states have developed guidelines for simazine in drinking water[61] ranging from 150 μg/L (California) to 430 μg/L (Maine) to 2150 μg/L (Wisconsin).

Determination in Water: Analysis of simazine is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen−phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen−phosphorus detector. The method detection limit has not been determined for this compound but it is estimated that the detection limits for the method analytes are in the range of 0.1−2 μg/L. Fish Tox = 1732.04831000 ppb (VERY LOW). Octanol−water coefficient: Log K_{ow} = 2.08.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin or eye irritation. Moderately poisonous if ingested. Approximate lethal dose = 1.5 cupful/150 lb man. No case of poisoning in humans from simazine has been reported, although exposure to simazine has caused acute and subacute dermatitis in Russia, characterized by erythema, slight edema, moderate pruritus, and burning lasting 4−5 days.

Long Term Exposure: Repeated exposure may cause weight loss and reduced red blood cell count. *Chronic*

Toxicity—simazine fed to rats for 2 years at 1.0, 10, and 100 ppm produced no difference between treated and control animals in gross appearance or behavior. The rats fed 100 ppm had approximately twice as many thyroid and mammary tumors as the control animals, but it was stated that these were not attributable to simazine. A 2-year chronic-feeding study of simazine in dogs with simazine 80W fed at 15, 150, and 1500 ppm showed only a slight thyroid hyperplasia at 1500 ppm and slight increases in serum alkaline phosphatase and serum glutamic oxaloacetic transaminase in several of the dogs fed 1500 ppm. Human Tox = 4.00000 ppb (HIGH).

Points of Attack: Blood.

Medical Surveillance: Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Triazine pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group I to III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 130.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Strong acid or alkaline hydrolysis leads to complete degradation of simazine. However, large quantities of simazine should be incinerated in a unit operating at 850°C equipped with off-gas scrubbing equipment.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Soapstone S:0320

Molecular Formula: $H_2Mg_3O_{12}Si_4$

Common Formula: $3MgO \cdot 4SiO_2 \cdot H_2O$

Synonyms: Massive talc; Silicate soapstone; Soapstone silicate; Steatite; Talc

CAS Registry Number: None listed.

RTECS® Number: VV8780000

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence (talc not containing asbestiform fibers); Sufficient (for talc containing asbestiform fibers).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Description: Soapstone is an odorless gray-white crystalline solid. Molecular weight = 351.31; Specific gravity (H_2O:1) = 2.7−2.8 at 25°C; Freezing/Melting point = 900−1000°C. Negligible solubility in water.

Potential Exposure: Soapstone is used as a pigment in paints, varnishes, rubber, and soap. It is used in lubricating molds and machinery. In massive form, it is used as a heat insulator.

Incompatibilities: Silicates can react violently with lithium.

Permissible Exposure Limits in Air

OSHA PEL: 20 mppcf TWA.

NIOSH REL: 6 mg/m^3, total dust TWA; 3 mg/m^3 (respirable dust) TWA.

ACGIH TLV®[1]: 6 mg/m^3 (for particulate matter containing no asbestos and <1% crystalline silica) TWA; 3 mg/m^3 (respirable fraction, for particulate matter containing no asbestos and <1% crystalline silica) TWA.

NIOSH IDLH: 3000 mg/m^3.

Protective Action Criteria (PAC)

Talc

TEEL-0: 2 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: *for talcum* suspended 2004; Carcinogen Category 3B.

The Netherlands: MAC-TGG 5 mg/m^3 (total dust); 2.5 mg/m^3 (respirable dust), 2003.

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract causing coughing, wheezing.

Long Term Exposure: Pneumoconiosis: cough, dyspnea (breathing difficulty); digital clubbing; cyanosis, basal crackles; or pulmonale.

Points of Attack: Respiratory system, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). Consider the points of attack in preplacement and periodic physical examinations. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 30 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 60 mg/m^3*: 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 150 mg/m^3:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 300 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50)* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 3000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid airborne dust, then transfer material to a suitable container for disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill.

Sodium S:0330

Molecular Formula: Na

Synonyms: Elemental sodium; Natrium; Sodio (Spanish); Sodium element; Sodium, metal liquid alloy; Sodium metal

CAS Registry Number: 7440-23-5

RTECS® Number: VY0686000

UN/NA & ERG Number: UN1428/138

EC Number: 231-132-9 [*Annex I Index No.:* 011-001-00-0]

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R14/15; R34; Safety phrases: S1/2; S5 (If appropriate); S8; S43; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium is a soft silvery white metallic element. Pyrophoric solid or molten liquid. Odorless. Molecular weight = 22.99; Boiling point = 881.4°C; Freezing/Melting point = 98°C; Autoignition temperature ≥115°C (in dry air). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 3₩. Violent reaction with water.

Potential Exposure: Those involved in tetra-alkyl lead manufacture using lead-sodium alloy as a reactant; those using sodium as a liquid metal coolant, as a catalyst, or in the manufacture of sodium hydride, borohydride, or peroxide.

Incompatibilities: A strong reducing agent. A dangerous fire hazard when exposed to heat and moisture. Violent reaction with water, forming sodium hydroxide. Violent reaction with oxidizers, acids, halogenated hydrocarbons, phosphorus and phosphorus compounds, sulfur and sulfur compounds, and many other chemicals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

PAC-1: 2 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 500 mg/m^3

Permissible Concentration in Water: The metal reacts with water. Sodium ion limit is 10 mg/L as desirable in drinking water; 200 mg/L may be injurious to humans. Russia[43] set a MAC of 120 mg/L in water bodies used for domestic purposes. Several states have set guidelines for sodium in drinking water[61] ranging from 20 mg/L (Massachusetts) to 100 mg/L (Kansas).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Contact with water, including perspiration, causes the formation of sodium hydroxide fumes which are highly irritating to skin, eyes, nose, and throat. May cause sneezing and coughing. Very severe exposures may result in difficult breathing, coughing, and chemical bronchitis. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Contact may cause itching, tingling, thermal and caustic burns, and may cause permanent damage. *Eyes:* May cause tearing, very painful irritation, and burns. Contact with eyes may result in permanent damage and loss of sight. *Ingestion:* Causes immediate intense burning sensation in mouth, throat, and stomach, followed by salivation, vomiting, rapid breathing, symptoms of shock, diarrhea, loss of consciousness, and death.

Long Term Exposure: Very irritating substances may affect the lungs. It is not known, however, if sodium causes lung damage.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure to sodium metal, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. Wipe the chemical off the skin with a dry cloth. Then quickly remove contaminated clothing. Immediately wash area with large amounts of water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to sodium, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red Stripe (*lump*): Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium must be stored to avoid contact with water, halogenated hydrocarbons, phosphorus and phosphorus compounds, and sulfur and sulfur compounds, since violent reactions occur. Protect storage containers from physical damage. Keep in an inert atmosphere or under oil. Requires special precautions to avoid contact with moisture, including condensation from other objects and perspiration. Store in a dry, fire resistive room exclusively for sodium storage. Sprinkler systems should not be used, so keep combustibles away. Remove only the amount of sodium needed for immediate use and place dry in a friction top metal can under a layer of oil. Transport in a special container with a tight-fitting cover. Where sodium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Sodium metal requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group I. *Note:* Finely divided sodium is pyrophoric.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Put on proper protective equipment. Blanket with appropriate inert material. Scoop up and place in a suitable, sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. A severe fire risk on contact with water or moisture. Blanket with dry soda ash, graphite, salt, dry limestone, or other approved dry powder. *Do not use water*, carbon dioxide, or halogenated extinguishers. Poisonous gases are produced in fire, including sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with absorption of oxide fumes.

Sodium aluminate S:0340

Molecular Formula: $AlNaO_2$
Common Formula: $NaAlO_2$ ($Na_2O \cdot Al_2O_3$)
Synonyms: β-Alumina; *beta*-Alumina; Aluminum sodium oxide; J 242; Maxifloc 8010; Monofrax H; Nalco 680; Sodium aluminum oxide; Sodium polyaluminate; VSA 45
CAS Registry Number: 11138-49-1
RTECS® Number: BD1600000
EC Number: 234-391-6
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
UN/NA & ERG Number: UN2812 (solid)/154; UN1819 (solution)/154.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Sodium aluminate is a white crystalline solid or solution. Molecular weight = 82.12; Freezing/Melting point = 1650°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.
Potential Exposure: Used in water and waste treatment; papermaking industry; in printing on fabrics; in the manufacture of pigments, milk glass, and soap; hardening building stone; sizing paper; as a water softener.
Incompatibilities: The aqueous solution is a strong base. Reacts violently with acid. Incompatible with organic anhydrides, isocyanates, alkylene oxides, epichlorohydrin, aldehydes, alcohols, glycols, caprolactum, chlorocarbons. Attacks copper, tin, aluminum, and zinc.
Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 2 mg[Al]/m^3 TWA.
ACGIH TLV®[1]: 2 mg[Al]/m^3 TWA as soluble salts and alkyls, n.o.s.
Protective Action Criteria (PAC)
TEEL-0: 6.08 mg/m^3
PAC-1: 18.2 mg/m^3
PAC-2: 30.4 mg/m^3
PAC-3: 150 mg/m^3
Australia: TWA 2 mg[Al]/m^3, 1993; Belgium: TWA 2 mg [Al]/m^3, 1993; Denmark: TWA 2 mg[Al]/m^3, 1999; France: VME 2 mg[Al]/m^3, 1999; Norway: TWA 2 mg[Al]/m^3, 1999; Russia: TWA 2 mg[Al]/m^3, 1993; Sweden: NGV 2 mg[Al]/m^3, 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: TWA 10 mg/m^3, total dust inhalable dust; TWA 4 mg/m^3, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg[Al]/m^3.
Determination in Air: Use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Sodium aluminate can affect you when breathed in. Sodium aluminate solution is a corrosive chemical. Skin or eye contact can cause severe irritation or burns, with possible damage. Breathing sodium aluminate dust can irritate the air passages. This may cause cough with phlegm and/or shortness of breath. Inhalation of dust may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Corrosive on ingestion.
Long Term Exposure: Irritating substances may affect the lungs. It is not known whether sodium aluminate causes lung damage.
Points of Attack: Lungs.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Consider chest X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Respirator Selection: Where there is potential for exposure to solid sodium aluminate, use a NIOSH/MSHA- or

European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for high exposures or liquid sodium aluminate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Sodium aluminate, solid, requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III. Sodium aluminate, solution, requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is nonflammable. Use agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 239-148-8 [*Annex I Index No.:* 009-016-00-2]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol (*natural and synthetic*): T, N; Risk phrases: R20/22; R48/23/25; R51/53; Safety phrases: S1/2; S22; S37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sodium aluminum fluoride is a colorless to dark red or black, crystalline solid. Odorless. Loses color on heating. Molecular weight = 209.95; Boiling point = (decomposes); Freezing/Melting point = 1000°C. Very slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Sodium aluminum fluoride is used in making pesticides, ceramics, glass, and polishes; in refining reduction of aluminum, flux, glass, and enamel.

Incompatibilities: Strong acids, strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL

0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

As aluminum, soluble salts

OSHA PEL: None.

NIOSH REL: 2 mg[Al]/m^3 TWA.

No TEEL available.

Australia: TWA 2 mg[Al]/m^3, 1993; Belgium: TWA 2 mg [Al]/m^3, 1993; Denmark: TWA 2 mg[Al]/m^3, 1999; France: VME 2 mg[Al]/m^3, 1993; Russia: TWA 2 mg[Al]/m^3, 1993; Sweden: NGV 2 mg[Al]/m^3, 1999; Switzerland: MAK-W 2 mg[Al]/m^3, 1999; United Kingdom: LTEL 2 mg [Al]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg[Al]/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) #7902, Fluoride; for aluminum, soluble salts, use NIOSH #7013 Aluminum; #7300, Elements; #7303; OSHA Analytical Method ID-121.

Permissible Concentration in Water: Drinking water, *aluminum* guidelines[61] are 1.43 mg/L in Massachusetts and 5.0 mg/L in Kansas. *Fluoride* guidelines are 1.8 mg/L in Arizona, 2.4 mg/L in Maine, and 4.0 mg/L according to EPA. Toxic to aquatic organisms.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sodium aluminum fluoride can affect you when breathed in. Eye contact can cause severe irritation, burns with possible loss of vision. Skin contact can cause irritation and even burns, especially if prolonged. Breathing can irritate the nose, throat, and air passages. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause nausea, abdominal pain, diarrhea, salivation, thirst, sweating.

Long Term Exposure: Repeated exposure can cause stiff spine; calcification of ligaments of ribs, pelvis. Repeated or high exposures may cause permanent lung damage.

Points of Attack: Eyes, skin, lungs, skeletal system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. Urine fluoride test (levels above 3−4 mg/L at the end of exposure represent increased exposure).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-103: *Inorganic fluorides*.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium aluminum fluoride must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Environmentally hazardous substances, solid, n.o.s. require a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Use dry chemicals appropriate for metal fires. Poisonous gases are produced in fire, including sodium oxides and fluorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Sodium aluminum hydride S:0360

Molecular Formula: AlH_4Na

Common Formula: $NaAlH_4$

Synonyms: Aluminate(1-), tetrahydro-, sodium, (*t*-4)-; Aluminum sodium hydride; Sah 22; Sodium aluminum tetrahydride; Sodium tetrahydroaluminate(1-)

CAS Registry Number: 13770-96-2

RTECS® Number: BD01800000

UN/NA & ERG Number: UN2835/138

EC Number: 237-400-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium aluminum hydride is a white crystalline solid. Molecular weight = 54.01; Freezing/Melting point = 183°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity ₩. Reaction with water may be dangerous.

Potential Exposure: Used in chemical synthesis.

Incompatibilities: A strong reducing agent. Violent reaction with water, air, oxidizers, acids, alcohols, and ethers. Reaction with water may cause fire or explosion. May ignite spontaneously in moist air.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 300 mg/m^3

The limits for "aluminum pyro powders" may be applicable (NJ).

OSHA PEL: None.

NIOSH REL: 5 mg[Al]/m^3 TWA.

ACGIH TLV®[1]: 5 mg[Al]/m^3 TWA.

The limits for aluminum soluble salts, for reference

OSHA PEL: None.

NIOSH REL: 2 mg[Al]/m^3 TWA.

ACGIH TLV®[1]: 2 mg[Al]/m^3 TWA as soluble salts and alkyls, n.o.s.

Determination in Air: Use NIOSH #7300; #7301; #7303.

Permissible Concentration in Water: This material reacts vigorously with water so this category is not pertinent.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sodium aluminum hydride can affect you when breathed in. Exposure can irritate the eyes, skin, and respiratory tract. If wet, sodium aluminum hydride may cause burns and permanent damage.

Long Term Exposure: May cause lung injury, pulmonary fibrosis.

Points of Attack: Skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Dangerous if any form of moisture is present. Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium aluminum hydride must be stored to avoid contact with water, air, oxidizers, acids, alcohols, and ethers, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where sodium aluminum hydride is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of sodium aluminum hydride. Wherever sodium aluminum hydride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium aluminum hydride is a flammable solid. It can ignite spontaneously in moist air. The flame may be invisible. *Do not use water*. Use dry chemical, soda ash, or lime extinguishers. Fires may restart after it has been extinguished. Poisonous and explosive gases are produced in fire, including sodium oxides and hydrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Sodium arsenate S:0370

Molecular Formula: $AsH_3Na_xO_4$; $AsHNa_2O_4$
Common Formula: $Na_xH_3AsO_4$; HNa_2AsO_4
Synonyms: Arsenite de sodium (French); Arsenito sodico (Spanish); Arsenous acid, sodium salt; Atlas A; Chem Pels C; Chem-Sen 56; Disodium arsenate heptahydrate; Kill-All; Penite; Prodalumnol; Sodanit; Sodium metaarsenite
Dibasic: Arsenic acid disodium salt; Disodium arsenate; Disodium hydrogen arsenate; Sodium arsenate, dibasic
Heptahydrate: Dibasic sodium arsenate heptahydrate; Disodium arsenate, heptahydrate; Sodium acid arsenate, heptahydrate; Sodium arsenate, dibasic, heptahydrate; Sodium arsenate heptahydrate; Sodium arseniate heptahydrate
CAS Registry Number: 7631-89-2; 7778-43-0 (dibasic; disodium hydrogenarsenate); *(alt.)* 55957-14-7; 10048-95-0 (heptahydrate)
RTECS® Number: CG1225000; CG0875000 (dibasic); CG0900000 (heptahydrate)
UN/NA & ERG Number: UN1685/151
EC Number: 231-547-5; 231-902-4 [*Annex I Index No.:* 033-005-00-1] (*dibasic; disodium hydrogenarsenate*)
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 15,000 (≥1.00% concentration).
Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1987.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).
Reportable Quantity (RQ): 1 lb (0.454 kg).
California Proposition 65 Chemical: Cancer 2/27/87.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; 1% [disodium hydrogen arsenate (dibasic)].
Canada: Priority Substance List & Restricted Substances/Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) arsenic compounds.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/25; R53; Safety phrases: S1/2; S20/21; S28; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Sodium arsenate and sodium arsenate, dibasic are both white crystalline, odorless solids. Molecular weight = 202.94; 185.91 (dibasic); 427.00 (heptahydrate); Boiling point = 180°C (decomposition); Freezing/Melting point = 85°C; 57°C (dibasic). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description (dibasic): Mutagen, (heptahydrate) Tumorigen, Mutagen; Reproductive Effector. Sodium arsenate is used in dyeing and printing; making other arsenates; as a germicide; in dyeing with turkey-red oil.
Incompatibilities: Acids, chemically active metals. Arsine, a very deadly gas, can be released in the presence of acid, acid mists, or hydrogen gas. Attacks many metals (such as aluminum, iron, and zinc) in the presence of moisture producing arsenic and arsine fumes.
Permissible Exposure Limits in Air
Inorganic arsenic compounds
OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled. See [1910.1018].
NIOSH REL: 0.002 mg[As]/m^3 15 min Ceiling Concentration. A potential occupational carcinogen. Limit exposure to lowest feasible concentration; See Appendix A.
ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 0.0271 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 13.5 mg/m^3
PAC-3: 13.5 mg/m^3
DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/end-of-shift; Carcinogen Category 1.
NIOSH IDLH: potential occupational carcinogen 5 mg[As]/m^3.
Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).
Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of

Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: EPA[61] has set 50 μg/L of arsenic as a standard for drinking water. This standard has been in effect for 50 years. The Clinton administration reduced this level to 10 μg/L, and the G.W. Bush administration rescinded this change in 2001.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the central nervous system, digestive tract, circulatory system, causing loss of fluids and electrolytes, collapse, shock, and death. Exposure at low level may result in death. Death can occur due to a severe decrease in blood pressure. Thickening of skin on palms and soles following chronic low-level exposures. Symptoms of exposure include a feeling of constriction of throat, difficulty in swallowing; abdominal discomfort with pain, vomiting, watery diarrhea; sweetish metallic taste; garlicky odor of breath and stools; and dizziness with frontal headaches. Symptoms usually appear one-half to 1 h after ingestion but may be delayed many hours.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and dermatitis. May affect the peripheral nervous system, skin, mucous membranes, causing neuropathy, skin thickening and pigmentation disorders, ulcers and perforation of nasal septum, and liver cirrhosis. Nerve damage may include "pins and needles," burning, numbness, and later weakness in the limbs. This substance is carcinogenic to humans. A probable teratogen in humans.

Points of Attack: Skin, nervous system, liver.

Medical Surveillance: Before first exposure and every 6−12 months thereafter, a medical history and examination are recommended, including: examination of the nose, skin eyes, nails, and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). At NIOSH recommended exposure levels, urine arsenic should not be greater than 100 μg/g creatinine in the urine. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures: For severe poisoning BAL have been used. For milder poisoning, penicillamine (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, *Inorganic Arsenic.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium arsenate must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Sodium arsenate must be stored to avoid contact with acids. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Sodium arsenate itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in minimum quantity of concentrated, reagent hydrochloric acid. Filter if necessary. Dilute with water until white precipitate forms. Add just enough 6 M HCl to redissolve. Saturate with hydrogen sulfide. Filter, wash the precipitate; dry, package, and ship to the supplier. (Sax, DPIMR see below).

Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301, #7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: The EPA[61] has set a limit of 0.05 μg/L in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Sodium arsenite may irritate or burn the skin, eyes, and mucous membranes. Skin contact can cause burning sensation, itching, and rash. Extremely toxic: probable oral lethal dose (human) 5−50 mg/kg, between 7 drops and one teaspoon for a 70-kg person (150 lb). Poisonous if swallowed or inhaled. Signs and symptoms of acute exposure to sodium arsenite may be severe and include headache, vomiting, stomach pain, vomiting, cough, dyspnea (shortness of breath), hypotension (low blood pressure), and chest pain. Gastrointestinal effects include difficulty in swallowing, intense thirst, generalized abdominal pain, vomiting, and painful diarrhea; blood may be noted in the vomitus and feces. A weak pulse, cyanosis (blue tint to the skin and mucous membranes), and cold extremities may also be observed. Neurological effects include giddiness, delirium, mania, stupor, weakness, headache, dizziness, and fainting. Convulsions, paralysis, and coma may occur.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and dermatitis. May affect the peripheral nervous system, skin, mucous membranes, causing neuropathy, skin thickening and pigmentation disorders, ulcers and perforation of nasal septum, and liver cirrhosis. Nerve damage may include "pins and needles," burning, numbness, and later weakness in the limbs. This substance is carcinogenic to humans. A probable teratogen in humans.

Points of Attack: Liver, kidneys, skin, lungs, lymphatic system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nose, skin, eyes, nails, and nervous system. Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a workday). At NIOSH recommended exposure levels, urine arsenic should not be greater than 100 μg/g creatinine in the urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures: For severe poisoning BAL has been used. For milder poisoning penicillamine (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, *Inorganic Arsenic.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium arsenite must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Sodium arsenite, solid, or sodium arsenite, aqueous solutions, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II. Aqueous solutions fall in DOT Hazard Class 6.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Sodium arsenite itself does not burn. Poisonous gases are produced in fire, including arsenic and sodium monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: The arsenic may be precipitated as calcium arsenite. It should be stored until recycled.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Sodium azide is a colorless to white, odorless, crystalline solid. Combustible solid above 300°C. Molecular weight = 65.02; Specific gravity (H_2O:1) = 1.85 at 25°C; Boiling point = (decomposes); Freezing/Melting point = (the solid crystals decompose with the evolution of nitrogen gas, leaving a residue of sodium oxide) 275°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2. Soluble in water; reaction; solubility = 42% at 17°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Human Data. Sodium azide is used as preservative and diluent. It has been used for a wide variety of military, laboratory, medicine and commercial purposes. It is used extensively as an intermediate in the production of lead azide, commonly used in detonators and other explosives. Reported to be used in automobile air-bag inflation. One of the largest potential exposures is that to automotive workers, repairmen, and wreckers, if sodium azide is used as the inflation chemical. Commercial applications include use as a fungicide, nematocide, and soil sterilizing agent and as a preservative for seeds and wine. The lumber industry has used sodium azide to limit the growth of enzymes responsible for formation of brown stain on sugar pine, while the Japanese beer industry used it to prevent the growth of a fungus which darkens its product. The chemical industry has used sodium azide as a retarder in the manufacture of sponge rubber, to prevent coagulation of styrene and butadiene latexes stored in contact with metals; and to decompose nitrites in the presence of nitrates.

Incompatibilities: Reacts explosively and/or forms explosive and/or shock-sensitive compounds with acids and many metals. Contact with water forms hydrazoic acid. Combustible solid (if heated above 300°C). May explode when heated above its melting point, especially if heating is rapid. Reacts with acids, producing toxic, shock-sensitive, and explosive hydrogen azide. It forms explosive compounds with phosgene, brass, zinc, trifluoroacrylol fluoride, and nitrogen-diluted bromine vapor. Reacts with benzoyl chloride and potassium hydroxide, bromine, carbon disulfide, copper, lead, nitric acid, barium carbonate, sulfuric acid, chromium(II) hypochlorite, dimethyl sulfate, dibromomalononitrile, silver, mercury. Over a period of time, sodium azide may react with copper, lead, brass, or solder in plumbing systems to form an accumulation of the *highly explosive* and shock-sensitive compounds of lead azide and copper azide.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 ppm (as HN_3) [skin] Ceiling Concentration; 0.3 mg/m^3 (as NaN_3) [skin] Ceiling Concentration.

ACGIH TLV®[1]: 0.11 ppm (as HN_3) [skin] Ceiling Concentration; 0.29 mg/m^3 (as NaN_3) [skin] Ceiling Concentration; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 25 mg/m^3

DFG MAK: 0.2 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Australia: TWA 0.1 ppm (0.3 mg/m^3), 1993; Austria: MAK 0.07 ppm (0.2 mg/m^3), 1999; Belgium: STEL 0.11 ppm (0.3 mg/m^3), 1993; Denmark: TWA 0.3 mg/m^3, 1999; Finland: TWA 0.1 ppm (0.3 mg/m^3); STEL 0.3 ppm (0.9 mg/m^3), 1999; France: VLE 0.1 ppm (0.3 mg/m^3), 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Switzerland: MAK-W 0.07 ppm (0.2 mg/m^3), 1999; United Kingdom: STEL 0.3 mg[NaN_3], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.29 mg/m^3. Several states have set guidelines or standards for sodium azide in ambient air[60] ranging from 0.7 μg/m^3 (Nevada) to 2.5 μg/m^3 (Virginia) to 3.0 μg/m^3 (North Dakota).

Determination in Air: Use OSHA Analytical Method ID-121.

Permissible Concentration in Water: No criteria set. (Sodium azide reacts with water to produce hydrazoic acid).

Routes of Entry: Inhalation, ingestion, skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates the eyes, skin, and respiratory tract. Contact of skin causes redness and pain. Contact with eyes causes redness, pain, and blurred vision; may cause loss of vision. Inhalation or ingestion causes dizziness, weakness, blurred vision, slight shortness of breath, hypotension, slow heart rate, abdominal pain, and spasms. Serious cases of exposure may result in convulsions, unconsciousness, and death. Exposure slightly above the exposure limits in air can cause death by affecting the central nervous system. Azides can cause blood pressure to drop and thus have action similar to cyanides and nitrites. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Sodium azide is a broad-spectrum metabolic poison that interferes with oxidation enzymes and inhibits nuclear phosphorylation. Although the effects in these systems are complex, there is general agreement that azide causes a dissociation of phosphorylation and cellular respiration. For this reason parallels have been drawn to other metabolic inhibitors, such as cyanide, malonitrile, and fluoride.

Long Term Exposure: May cause kidney damage. Sodium azide is a potent mutagen in barley, peas, rice, and soybeans. It is also a very effective mutagen in bacteria. Its potency as a mutagen is comparable to the nitrosamines as a class. For these reasons sodium azide has been suspected of being a carcinogen. However, several studies have been performed to determine whether it is a carcinogen. In each instance the results were negative.

Points of Attack: Eyes, skin, central nervous system, cardiovascular system, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system and vision (including visual fields). Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Where sodium azide may be present in solution, wear splash-proof chemical goggles and face shield, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 0.1 ppm as a dust, fume, or mist, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, or for exposures to hydrazoic acid vapor, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium azide must be stored to avoid contact with benzoyl chloride, potassium hydroxide, bromine, copper, and lead, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, heat, and acids. On contact with water it forms hydrazoic acid which is explosive. Danger of explosion exists from friction, heat, or contamination. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Rapid heating above 275°C can cause rapid decomposition and explosion. If material is on fire or involved in fire, use water in flooding quantities as fog. Use foam, carbon dioxide, or dry chemical. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Disposal may be accomplished by reaction with sulfuric acid solution and sodium nitrate in a hard rubber vessel. Nitrogen dioxide is generated by this reaction and the gas is run through a scrubber before it is released to the atmosphere. Controlled incineration is also acceptable (after mixing with other combustible wastes) with adequate scrubbing and ash disposal facilities.

Sodium benzoate S:0400

Molecular Formula: $C_7H_5NaO_2$

Common Formula: C_6H_5COONa

Synonyms: Antimol; Benzoate of soda; Benzoate sodium; Benzoesaeure (Na-salz) (German); Benzoic acid, sodium salt; Sobenate; Sodium benzoic acid

CAS Registry Number: 532-32-1

RTECS® Number: DH6650000

UN/NA & ERG Number: Not regulated.

EC Number: 208-534-8

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: TRP reversion.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium benzoate is a white crystalline solid. It is odorless and nonflammable. Molecular weight = 144.11; Decomposes at 120°C; Melting point = >300°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Sodium benzoate is used as a food and feed additive, flavor, packaging material; pharmaceutical; preservative for food products and tobacco; antifungal agent; antiseptic, rust and mildew inhibitor; intermediate in the manufacture of dyes. Used as a human hygiene biocidal product.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 400 mg/m^3

Sodium salt

TEEL-0: 100 mg/m^3

PAC-1: 350 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: An eye and skin irritant. The accumulation of dust in the eyes, ears, nose, throat, and lungs may be sufficiently unpleasant and distracting to make work near machinery hazardous. Irritation may result from abrasion or chemical action. Sodium benzoate can cause allergic reactions. Sodium benzoate has been given GRAS (Generally Recognized As Safe) status by the Food and Drug Administration at the levels currently being used as a food preservative. Ingestion of 8−10 g (1/3 oz) may cause nausea and vomiting. Twelve grams has caused gastric pain and loss of appetite. These symptoms disappear when exposure stops. LD_{50} = (oral-rat) 27 mg/kg.

Long Term Exposure: Sodium benzoate may produce an allergic reaction and, in addition, may intensify the symptoms of allergies to other substances.

Points of Attack: Skin, lungs.

Medical Surveillance: Examination by a qualified allergist. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Avoid prolonged skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium benzoate is combustible. It may emit acrid fumes when heated to decomposition (at 120°C/248°F). Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R31; Safety phrases: S2; S25; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium bisulfite is a white crystalline solid with a slight odor of sulfur dioxide and a disagreeable taste. Slowly oxidized to the sulfate on exposure to air. Molecular weight = 104.06; Specific gravity (H_2O:1) = 1.48 at 25°C; Boiling point = (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. Sodium bisulfite is used in the digestion of wood pulp; in the tanning of leather; in the dyeing of textiles; as a photographic reducing agent; as a food preservative; as an additive in electroplating; as disinfectant, bleach, antioxidant; and as inhibitor of yeast and bacteria in winemaking.

Incompatibilities: Aqueous solution is a weak acid. Incompatible with strong acids, such as hydrochloric and nitric, and oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates. Reacts with bases forming sulfate. Slowly oxidizes to sulfate in air. Heat causes decomposition. Slowly oxidized to the sulfate on exposure to air. Contact with oxidizers or acids forms sulfur dioxide gas. Attacks some metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: Sensitizing substances as sulfites.

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for sodium bisulfite in ambient air[60] ranging from 5.0 μg/m^3 (North Dakota) to 80.0 μg/m^3 (Virginia) to 100.0 μg/m^3 (Connecticut) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Permissible Concentration in Water: Maryland[61] has set a guideline of 70.0 μg/L for sodium bisulfite in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive and can cause severe skin and eye irritation and burns. Irritates the respiratory tract, causing cough, wheezing, and shortness of breath. Ingestion may cause irritation to mouth, throat, and stomach. Allergic response may occur. This could include itching of ears and legs, nausea, cough, tightening of throat, and reddening of the skin.

Long Term Exposure: An asthma-like allergy may develop after repeated exposure. Skin allergy may develop. May irritate the lungs, causing bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Note to physician: Converted to sulfuric acid in stomach. Acute obstruction of alimentary canal may occur up to 3 weeks following ingestion.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area away from strong acids, such as hydrochloric and nitric, and oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates.

Shipping: Bisulfites, inorganic, aqueous solutions, n.o.s. require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Cover spilled liquid with soda ash, absorb on vermiculite or other inert material. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is noncombustible. Extinguish fire using an agent suitable for type of surrounding fire. Sodium bisulfite itself does not burn. Poisonous gases are produced in fire, including sulfur oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dump into water, add soda ash, then neutralize with HCl; flush to sewer with large volumes of water.

UN/NA & ERG Number: UN1688/152

EC Number: 204-708-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1987.

Banned or Severely Restricted (Portugal) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

As arsenic compounds

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds.

Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: organics 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sodium Cacodylate is a white crystalline solid which occurs as the trihydrate. It liquefies in the water of hydration at 60°C and becomes anhydrous at 120°C. Molecular weight = 159.99. Hazard Identification (based on

NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: This material has been used as a nonselective herbicide and for general weed control.

Incompatibilities: Incompatible with oxidizers, strong bases, acids, active metals (iron, aluminum, zinc). Contact with acids forms highly toxic dimethylarsine gas. Attacks some metals.

Permissible Exposure Limits in Air

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA.

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

Protective Action Criteria (PAC)

TEEL-0: 1.07 mg/m^3

PAC-1: 3.2 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) #5022, arsenic, Organo-.

Permissible Concentration in Water: The EPA[61] has set a limit of 0.05 μg/L in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sodium cacodylate is corrosive to the skin, eyes, and mucous membranes. Moderately toxic; probable oral lethal dose in humans is 0.5−5 g/kg or between 1 oz and 1 pint (or 1 lb) for a 70-kg (150-lb) person. It may cause disturbances of the blood, kidneys, and nervous system. Acute exposure to sodium cacodylate may be fatal. Headache, red-stained eye, and a garlicky odor of the breath may be the first effects noticed. Other signs and symptoms include generalized weakness, intense thirst, muscle cramping, seizures, toxic delirium, and shock. Nausea, vomiting, anorexia, abdominal pain, and diarrhea may occur. Hypotension (low blood pressure), tachycardia (rapid heart rate), pulmonary edema, ventricular fibrillation, and other cardiac abnormalities are usually found following severe exposure.

Long Term Exposure: Repeated exposure may cause ulcers and hole in the nasal septum. Hoarseness and sore eyes also occur. Repeated contact may cause thickened skin, pigmentation changes. May cause liver damage and nerve damage, causing sensation of "pins and needles," weakness, and loss of coordination in the limbs. May cause gastrointestinal tract and reproductive effects. Repeated exposures can cause metallic taste; poor appetite; nausea, vomiting, diarrhea, and stomach pain; seizures and death.

Points of Attack: Skin, respiratory system, kidneys, central nervous system, liver, gastrointestinal tract, reproductive system.

Medical Surveillance: Examination of the nose, skin, eyes, and nails. Examination of the nervous system. Liver function tests. Test for urine arsenic. NIOSH recommended that exposure levels should not exceed 100 μg/L of creatinine in the urine. Results may be accurate within 2 days of eating shellfish or fish (which may increase arsenic levels); they are most accurate at the end of a workday.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-plate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Sodium cacodylate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium cacodylate itself does not burn. Use any agent suitable for surrounding fire. Stay upwind; keep out of low areas. Wear self-contained breathing apparatus and full protective clothing. Move container from fire area, if you can do so without risk. Poisonous gases are produced in fire, including arsenic oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For cacodylic acid, precipitate as calcium arsenate and calcium arsenite by treatment with excess lime water. Recycle if possible. If not, put in secure storage for possible disposal in leach-proof dumps.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (Commercial grade).

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Highly Reactive Substance and Explosive (World Bank).[15]

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Sodium chlorate is a white crystalline solid. Molecular weight = 106.44; Decomposes below boiling point at ca. 300°C; Freezing/Melting point = 248°C (also listed at 255°C and 264°C). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 2 (Oxidizer). Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen, Human Data; Primary Irritant. Sodium chlorate is used to manufacture dyes, explosives, in paper pulp processing and as a weed killer; used as a constituent of atratol and pramitol.

Incompatibilities: A strong oxidizer. Reacts violently with combustibles, sulfuric acid, and reducing materials. Reacts with strong acids giving off carbon dioxide. Explosions may be caused by contact with ammonia salts, ammonium thiosulfate, antimony sulfide, arsenic, carbon, charcoal, organic matter, organic acids, thiocyanates, chemically active metals, oils, metal sulfides, nitrobenzene, powdered metals, sugar. Reacts with some organic contaminants forming shock-sensitive mixtures. Decomposes on heating above 300°C or on burning, producing oxygen and toxic chlorine fumes. Attacks zinc, magnesium, and steel.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.15 mg/m^3
PAC-1: 0.4 mg/m^3
PAC-2: 3 mg/m^3
PAC-3: 75 mg/m^3

Permissible Concentration in Water: Russia[43] set a MAC of 20 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sodium chlorate can affect you when breathed in. Eye or skin contact can cause severe irritation and even burns. Breathing sodium chlorate, especially dust or mist, can irritate the nose and throat. It can also cause cyanosis, causing the skin to turn blue (methemoglobinemia), because it interferes with the blood's ability to carry oxygen. Damage to red blood cells (hemolytic anemia) can also occur. If severe or repeated, this can cause kidney damage. Ingestion can cause kidney damage. The effects may be delayed.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Kidney damage can occur from severe or repeated damage to red blood cells resulting from exposure. Very irritating substances may cause lung damage.

Points of Attack: Kidneys, lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: complete blood count (CBC). Test for methemoglobin if skin is blue.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim under medical observation.

Antidotes and Special Procedures: Do not use methylene blue to treat methemoglobinemia from sodium chlorate as it can cause increased toxicity.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to sodium chlorate, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium chlorate must be stored to avoid contact with ammonium thiosulfate, antimony sulfide, arsenic, carbon, charcoal, organic matter, organic acids, sulfuric acid, thiocyanates, and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Protect storage containers against physical damage. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep sodium chlorate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or

federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium chlorate may burn, but does not readily ignite. Heat above 300°C produces oxygen which can increase the intensity of fire and may ignite other combustible materials. Flood areas with water unless that is incompatible with other materials in the fire area. Poisonous gases are produced in fire, including chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Sodium chloroplatinate S:0440

Molecular Formula: $Cl_6Pt \cdot 2Na \cdot 4H_2O$

Synonyms: Platinate(2-), hexachlorodisodium, tetrahydrate; Platinic sodium chloride; Sodium hexachloroplatinate(IV); Sodium platinic chloride; Sodium platinic chloride

CAS Registry Number: 1307-82-0

EC Number: None assigned

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% as platinum, water-soluble salts.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sodium chloroplatinate is a yellow-orange or red-brown crystalline solid. Odorless. Molecular weight = 561.9; Melting point = loses water at 100°C; Vapor pressure = essentially zero. Soluble in water; solubility = 50 g/100 g at 20°C.

Potential Exposure: Used as a catalyst.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.002 mg[Pt]/m^3 TWA.

NIOSH REL: 0.002 mg[Pt]/m^3 TWA.

ACGIH TLV®[1]: 1 0.002 mg[Pt]/m^3 TWA.

No TEEL available.

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.

NIOSH IDLH: 4 mg [Pt]/m^3.

Several states have set limits on platinum in ambient air[60] as well. See the entry on platinum for details.

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Chloroplatinates can affect you when breathed in. Severe allergy can develop to potassium chloroplatinates. Symptoms include asthma (with cough, wheezing, and/or shortness of breath), runny nose, and/or skin rash, sometimes with hives. If allergy develops, even small future exposure can trigger significant symptoms. Some persons exposed to this type of chemical have developed lung scarring. Family members can develop allergy to dust carried home on work clothing. It may irritate the eyes, nose, and throat. High exposure may cause irritability and even seizures.

Long Term Exposure: May cause skin sensitization and dermatitis and/or asthma-like allergy. Repeated exposures can cause sores or ulcers in the lining of the nose. Tetrachloroplatinates are mutagens.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray every 3 years should be considered if above tests are not normal. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (for soluble Pt salts): *Up to 0.05 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.1 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 4 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance cause eye irritation and damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chlorides and sodium oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sodium chromate, including the hexahydrate, is a yellow crystalline solid that can also be used in solution. Molecular weight = 161.98; Freezing/Melting point = 760−792°C. Soluble in water. The dichromate is a red or red-orange crystalline solid. Molecular weight = 161.98; Freezing/Melting point = 357°C (decomposes at 400°C). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Used to make dyes, inks, pigments, and other chromates; in leather tanning, a corrosion inhibitor in circulating water systems; metal treatment; a drilling mud additive; chemical intermediate for chromium catalysts; colorimetry, oxidizing agent; bleaching agent; an algicide, fungicide, insecticide; in wood preservation.

Incompatibilities: Aqueous solution in a base. A strong oxidizer. Violent reaction with reducing agents, combustibles, strong acids, organic materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Disodium chromate

TEEL-0: 0.0156 mg/m^3

PAC-1: 1.25 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 46.7 mg/m^3

Dichromate

TEEL-0: 0.0126 mg/m^3

PAC-1: 20 mg/m^3

PAC-2: 37.8 mg/m^3

PAC-3: 37.8 mg/m^3

Decahydrate

TEEL-0: 0.0329 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 98.7 mg/m^3

Tetrahydrate

TEEL-0: 0.0291 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 87.4 mg/m^3

As chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.

DFG MAK: Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

United Kingdom: carcinogen, 2000. The former USSR-UNEP/IRPTC joint project[43] set a MAC of 0.01 mg/m^3 in work-place air. Connecticut[60] has set a guideline of 0.25 μg/m^3 for chromium trioxide in ambient air.

Determination in Air: Use NIOSH Analytical Methods #7600, #7604, #7605, #7703, #9101; OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: The EPA[6] has designated chromium as a priority toxic pollutant. To protect human health, the limits are trivalent chromium (in chromates): 170 μg/L and hexavalent chromium (in dichromates) 50 μg/L.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption or by colorimetry (diphenylcarbazide) or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μm filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sodium chromate can affect you when breathed in. It can also pass into inner layers of the skin. A corrosive. Eye contact can cause severe damage with possible loss of vision. Irritation of nose, throat, and bronchial tubes can occur, with cough and/or wheezing. Skin contact can cause severe irritation, deep ulcers, or an allergic skin rash.

Long Term Exposure: Sodium chromate is a human carcinogen. Sodium chromates can cause a sore or perforated nasal septum, with bleeding, discharge, or crusting. May cause skin allergy with eczema-like rash. Can cause lung irritation or allergy; bronchitis may develop. May cause kidney damage.

Points of Attack: Skin, lungs, kidneys. *Cancer site:* throat and lungs.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Examination of the nose and skin. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Also check your skin daily for little bumps or blisters, the first sign of "chrome ulcers." If not treated early, these can last for years after exposure. Urine test for chromates. This test is most accurate shortly after exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. (As chromic acid and chromates) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH criteria document #76-129 [Chromium(VI)].

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustibles, organics, or other easily oxidized materials. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chromium oxide and sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sodium cyanide is found as white granules, flakes, or lumps. Sodium cyanide is shipped as pellets or briquettes. Odorless when dry. It absorbs water from air (is hygroscopic or deliquescent). Hydrogen cyanide gas released by sodium cyanide has a distinctive mild, bitter almond odor, but a large proportion of people cannot detect it; the odor does not provide adequate warning of hazardous concentrations. Molecular weight = 49.01; Boiling point = 1496°C; Freezing/Melting point = 564°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water (reactive).

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Sodium cyanide is used as a solid or in solution to extract metal ores, in electroplating and metal cleaning baths; in metal hardening; in treatment of rabbit and rat burrows and holes and termite nests; in insecticides.

Incompatibilities: Strong oxidizers, such as acids, acid salts, chlorates, and nitrates. Sodium cyanide decomposes on contact with acids, acid salts, water, moisture, and carbon dioxide, releasing highly toxic and flammable hydrogen cyanide gas. Aqueous solution is a strong base; it reacts violently with acid and is corrosive. Reacts violently with acid, strong oxidizers, such as nitrates and chlorates. Decomposes in the presence of air, moisture, or carbon dioxide producing highly toxic and flammable hydrogen cyanide gas. Absorbs moisture from the air forming a corrosive syrup. Corrosive to active metals, such as aluminum, copper, and zinc.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[CN]/m^3 TWA.

NIOSH REL: 4.7 ppm/5 mg[CN]/m^3 [10 min] Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

NIOSH IDLH: 25 mg[CN]/m^3.
Protective Action Criteria (PAC)*
TEEL-0: **4** mg/m^3
PAC-1: **4.0** mg/m^3
PAC-2: **14** mg/m^3
PAC-3: **30** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 3.8 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C. Skin contact may contribute significantly in overall exposure.

Australia: TWA 5 mg/m^3, [skin], 1993; Austria: MAK 5 mg [CN]/m^3, [skin], 1999; Denmark: TWA 5 mg/m^3, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, KZG-W 10 mg/m^3, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 mg/m^3 [skin]. Russia[43] has set a MAC value of 0.009 mg/m^3 for ambient air in residential areas on a momentary basis and 0.004 mg/m^3 on an average daily basis. Several states have set guidelines or standards for cyanides in ambient air[60] ranging from 16.7 μg/m^3 (New York) to 50.0 μg/m^3 (Florida and North Dakota) to 80.0 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut and South Dakota) to 125 μg/m^3 (South Carolina) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen cyanide.[18]

Permissible Concentration in Water: In 1976 the EPA criterion was 5.0 μg/L for freshwater and marine aquatic life and wildlife. As of 1980, the criteria are: *To protect freshwater aquatic life:* 3.5 μg/L as a 24-h average, never to exceed 52.0 μg/L. *To protect saltwater aquatic life:* 30.0 μg/L on an acute toxicity basis; 2.0 μg/L on a chronic toxicity basis. *To protect human health:* 200 μg/L. The allowable daily intake for man is 8.4 mg/day.[6]

On the international scene, the South African Bureau of Standards has set 10 μg/L, the World Health Organization (WHO) 10 μg/L, and Germany 50 μg/L as drinking water standards.

Other international limits[35] include an EEC limit of 50 μg/L; Mexican limits of 200 μg/L in drinking water and 1.0 μg/L in coastal waters and a Swedish limit of 100 μg/L. Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes and 50 μg/L in water for fishery purposes.

The US EPA[49] has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 μg/L. States which have set guidelines for cyanides in drinking water[61] include Arizona at 160 μg/L and Kansas at 220 μg/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). Octanol−water coefficient: Log K_{ow} (estimated) = −1.69.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Sodium cyanide releases hydrogen cyanide gas, a highly toxic chemical asphyxiant that interferes with the body's ability to use oxygen. Exposure to sodium cyanide can be rapidly fatal. It has whole-body (systemic) effects, particularly affecting those organ systems most sensitive to low oxygen levels: the central nervous system (brain), the cardiovascular system (heart and blood vessels), and the pulmonary system (lungs).[NIOSH]

Short Term Exposure: Sodium cyanide can be absorbed through the skin, thereby increasing exposure. Sodium cyanide is corrosive to the eyes, skin, and respiratory tract. Contact can cause skin and eye burns, and possible permanent eye damage. Inhalation can cause lung irritation with coughing, sneezing, and difficult breathing; slow gasping respiration. Corrosive if swallowed. These substances may affect the central nervous system. Symptoms include headaches, confusion, nausea, pounding heart, weakness, and unconsciousness.

Long Term Exposure: Repeated or prolonged contact with sodium cyanide may cause thyroid gland enlargement and interfere with thyroid function. May cause nosebleed and sores in the nose; changes in blood cell count. May cause central nervous system damage with headache, dizziness, confusion, nausea, vomiting, pounding heart, weakness in the arms and legs, unconsciousness, and death. May affect liver and kidney function. Repeated lower exposures can cause sores in the nose with nosebleeds.

Points of Attack: Liver, kidneys, skin, cardiovascular system, central nervous system, thyroid gland.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Blood cyanide levels. Complete blood count (CBC). Evaluation of thyroid function. Liver function tests. Kidney function tests. Central nervous system tests. EKG. Smokers may have somewhat higher blood cyanide and urine thiocyanate levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. *Polyethylene (for sodium cyanide, less than 30%, only) is among the recommended protective materials.* All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, acid salts, oxidizers, light, and moisture. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Sodium cyanide requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and in Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Keep water away from release. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN 1689 (Sodium cyanide) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: Material does not burn; fight surrounding fire with an agent appropriate for the burning material. NaCN decomposes in the presence of moisture, damp air, or carbon dioxide, producing highly toxic and flammable hydrogen cyanide gas and oxides of nitrogen. *NO* acidic dry chemical extinguishers; *NO* hydrous agents; *NO* water; *NO* carbon dioxide directly on material. Vapors are heavier than air and may collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not allow water to enter open containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Add strong alkaline hypochlorite and allow to react for 24 h. Then flush to sewer with large volumes of water.[22]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R31; R36/37; R50/53; Safety phrases: S2; S8; S26; S41; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dichloroisocyanuric acid, sodium salt, is a white crystalline powder having a chlorine odor. Thermally unstable. Molecular weight = 220.96; Specific gravity (H_2O:1) = 1.10 at 25°C; Freezing/Melting point = (decomposes) 230°C. NFPA 704 M Hazard Identification (anhydrous): Health 2, Flammability 0, Reactivity 2 (Oxidizer). Soluble in water; solubility = 25%.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector; Human Data; Primary Irritant. It is used in cleaning; making dry bleaches, detergents, sanitizers, and disinfectants; in swimming pool and sewage treatment.

Incompatibilities: Contact with water, acids, or acid fumes releases toxic chlorine gas. A powerful oxidizer. Violent reaction with reducing agents, organic matter, easily chlorinated or oxidized materials. Incompatible with ammonium salts; amines forming nitrogen trichloride.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause severe eye and permanent damage. Skin contact can cause severe irritation especially if skin is moist or material is in solution. Inhalation can cause irritation of the respiratory tract. The dry material is less irritating to the skin. A strong poison and corrosive if ingested; may cause liver damage.

Long Term Exposure: Highly irritating substances may affect the lungs.

Points of Attack: Lungs, eyes, skin, liver.

Medical Surveillance: Lung function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from ammonium compounds, hydrated salts, moisture, and combustible materials. Where possible, automatically transfer material from drums or other storage containers to process containers. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Dichloroisocyanuric acid salts require a shipping label of "OXIDIZER." They fall in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Keep water away from release. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid but it is a powerful oxidizer and may increase the activity of an existing fire. May burn rapidly. Use flooding quantities of water, from a distance. Do *NOT* use extinguishers containing ammonia. Poisonous gases are produced in fire, including sodium oxide, chlorine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

FDA—over-the-counter drug.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: Hazard Symbol: T; Risk phrases: R25; R32; R36/38; Safety phrases: S1/2; S22; S36; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium fluoride is a white powder or colorless crystals. Often used in a solution. Odorless. Pesticide grade is often dyed blue. Molecular weight = 41.99; Specific gravity (H_2O:1) = 2.78 at 25°C; Boiling point = 1703.9°C; Freezing/Melting point = 992.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 4%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Widely used in the chemical industry; in water treatment and fluoridation of drinking water; as an insecticide, fungicide, and rodenticide; chemical cleaning; electroplating, glass manufacture; vitreous enamels; preservative for adhesives; toothpastes, disinfectant, dental prophylaxis; also used orally in the treatment of various bone diseases to increase bone density and to relieve bone pain.

Incompatibilities: Strong oxidizers, acids.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min Ceiling Concentration.

ACGIH TLV$^{®}$[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC)

TEEL-0: 5.53 mg/m^3

PAC-1: 5.53 mg/m^3

PAC-2: 5.53 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV$^{®}$: not classifiable as a human carcinogen. Several states have set limits for fluoride in ambient air[60] ranging from as low as 2.85 μg/m^3 (Iowa) to as high as 60,000 μg/m^3 (Kentucky).

Determination in Air: Use NIOSH Analytical Method (IV) #7902, Fluorides; #7906; OSHA Analytical Method ID-110.

Permissible Concentration in Water: As with air, the applicable regulations are those for the fluoride ion. The values which have been set for drinking water[61] are a standard of 4.0 mg/L set by EPA and a guideline of 2.4 mg/L set by the state of Maine.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Liquid can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Sodium fluoride can affect you when breathed in. Inhalation of dust or mist can cause severe irritation and burns of the eyes and skin. Irritates the eyes and respiratory system. May cause permanent eye damage. Exposure can cause nausea, abdominal pain, diarrhea, salivation, thirst, sweating.

Long Term Exposure: Repeated or prolonged industrial contact can cause dermatitis. Repeated exposure can cause fluoride to build up in the body. Can irritate the lungs; bronchitis may develop. Repeated exposure can cause fluoride to build up in the body causing stiffness, brittle bones; stiff spine; calcification of ligaments of ribs, pelvis; and crippling. Repeated exposures can cause weakness and muscle twitching; tremors, convulsions, coma, and even death. May cause kidney damage. Prolonged contact can cause sores in the nose and perforated septum. High concentrations can damage the developing fetus. These effects *DO NOT* occur when sodium fluoride is used in drinking water for dental cavity prevention.

Points of Attack: Eyes, skin, respiratory system, central nervous system, skeleton, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Sodium fluoride requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including fluorine and oxides of sodium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Determination in Air: Use NIOSH II(5) Method #S-301.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: May affect the cardiovascular system and central nervous system, causing cardiac disorders and respiratory failure. Exposure may result in death. This material is super toxic. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The probable oral lethal dose in humans is less than 5 mg/kg, or a taste (less than 7 drops) for a 150-lb person. Symptoms include nausea, vomiting, apprehension, auditory hallucinations, facial paresthesia, twitching face muscle, pulsus altenans, ectopic heartbeat, ventricular fibrillation. Symptoms are usually seen within one-half hour of exposure, but severe effects may be delayed as long as 20 h. A rebuttable presumption against registration of sodium fluoroacetate for pesticidal uses was issued on December 1, 1976 by the US EPA on the basis of reductions in nontarget and endangered species and because there is no human antidote.

Long Term Exposure: May cause liver and kidney damage. Affects the central nervous system, causing epileptiform convulsive seizures that may be followed by severe depression.

Points of Attack: Cardiovascular system, lungs, kidneys, liver, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Up to 0.25 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 0.5 mg/m^3:* 95QX [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to*

2.5 mg/m³: 100SaT (100F) (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Sodium fluorosilicate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including fluorine and sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. This compound is unstable at temperatures above 110°C and decomposes at 200°C. Thus, careful incineration has been suggested as a disposal procedure. According to their procedure, the product should be mixed with large amounts of vermiculite, sodium bicarbonate, and sand-soda ash. Slaked lime should also be added to the mixture. Two incineration procedures for this mixture are suggested. The better of these procedures is to burn the mixture in a closed incinerator equipped with an afterburner and an alkali scrubber. The other procedure suggests that the mixture be covered with scrap wood and paper in an open incinerator. (The incinerator should be lighted by means of an excelsior train).[22]

EC Number: 240-934-8 [*Annex I Index No.:* 009-012-00-0]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Banned or Severely Restricted (in UK) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Sodium hexafluorosilicate is a white crystalline solid. Molecular weight = 188.06. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Primary Irritant. This material is used as an intermediate in the production of synthetic cyrolite; as a drinking-water additive; as an insecticide in delousing and in mothproofing of woolens.

Incompatibilities: Reacts with acids to produce hydrogen fluoride, which is a highly corrosive and poisonous gas.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC)

TEEL-0: 4.12 mg/m^3

PAC-1: 4.12 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 412 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use NIOSH Analytical Method (IV) #7902, Fluorides; #7906.

Permissible Concentration in Water: As with air, the applicable regulations are those for the fluoride ion. The values which have been set for drinking water[61] are a standard of 4.0 mg/L set by EPA and a guideline of 2.4 mg/L set by the state of Maine.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause difficult breathing and burning of the mouth, throat, and nose which may result in bleeding. These may be felt at 7.5 mg/m^3. Nausea, vomiting, profuse sweating, and excess thirst may occur at higher levels. *Skin:* May cause rash, itching, and burning of skin. Solutions of 1% strength may cause sores if not removed promptly. *Eyes:* May cause severe irritation. *Ingestion:* Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. Five to forty milligrams may cause diarrhea and vomiting. More severe symptoms of burning and painful abdomen; sores in mouth, throat, and digestive tract; tremors, convulsions, and shock will occur around a dose of 1 g. Death may result by ingestion of 2−5 g.

Long Term Exposure: Fluoride may increase bone density, stimulate new bone growth, or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 mg/m^3 or higher. May cause mottling of the bones or teeth at this level, resulting in fluorosis. May cause lung damage.

Points of Attack: Bones, lungs.

Medical Surveillance: Lung function tests. DEXA bone densitometry scan.

First Aid: *Inhalation:* Move person to fresh air. Give artificial respiration, if necessary. If the nose is bleeding put absorbent material (like cotton) into the nasal openings. Do not pack the nostrils. Change the material often. Seek medical attention. *Skin:* Remove soiled clothing. Wash skin with soap and water for at least 5 min. Seek medical attention, if necessary. *Eyes:* Wash eyes with slow, steady stream of water for at least 15 min. Seek medical attention immediately. *Ingestion:* Seek medical attention. Give aluminum hydroxide gel, if conscious.

Note to physician: Inject intravenously 10 mL of 10% calcium gluconate solution. Gastric lavage with lime water of 1% calcium chloride.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry area that is well ventilated. Protect from damage and acids.

Shipping: Sodium fluorosilicate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Enter spill area only with protective clothing and devices. Treat with soda ash or slaked lime. Use an industrial vacuum cleaner to remove the spill. Clean up with soap and water is allowed only if exposure and contamination are not increased to above the recommended levels. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is nonflammable. Use agents suitable to surrounding fire. Poisonous gases are produced in fire, including fluorine and sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: Cell transform.—SA7/SHE.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium hydroxide is a white, odorless, deliquescent material sold as pellets, flakes, lumps, or sticks. Aqueous solutions are known as soda lye. Molecular weight = 40.00; Specific gravity (H_2O:1) = 2.13 at 25°C; Boiling point = 1390°C; Freezing/Melting point = 318.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Highly soluble in water; solubility = 111%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Human Data; Primary Irritant. Sodium hydroxide is utilized to neutralize acids and make sodium salts in petroleum refining, viscose rayon, cellophane, plastic production; and in the reclamation of solutions of their salts. It is used in the manufacture of mercerized cotton, paper, explosives, and dyestuffs in metal cleaning; electrolytic extraction of zinc; tin plating; oxide coating; laundering, bleaching, dishwashing; and it is used in the chemical industries.

Incompatibilities: A strong base and a strong oxidizer. Violent reaction with acid. Incompatible with water, flammable liquids, organic halogens, nitromethane, nitrocompounds, and combustibles. Rapidly absorbs carbon dioxide and water from air. Contact with moisture or water may generate heat. Corrosive to metals. Contact with zinc, aluminum, tin, and lead in the presence of moisture, forming explosive hydrogen gas. Attacks some forms of plastics, rubber, or coatings.

Permissible Exposure Limits in Air

OSHA PEL: 2 mg/m^3.

NIOSH REL: 2 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 2 mg/m^3 Ceiling Concentration.

Protective Action Criteria (PAC)*

TEEL-0: 0.5 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: **5** mg/m^3

PAC-3: **50** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: No numerical value established.

NIOSH IDLH: 10 mg/m^3.

Australia: TWA 2 mg/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: STEL 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3, 1999; France: VME 2 mg/m^3, 1999; Japan: 2 mg/m^3, 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Norway: TWA 2 mg/m^3, 1999; the Philippines: TWA 2 mg/m^3, 1993; Poland: MAC (TWA) 0.5 mg/m^3; MAC (STEL) 1 mg/m^3, 1999; Sweden: TGV 2 mg/m^3, 1999; Switzerland: MAK-W 2 mg/m^3, KZG-W 4 mg/m^3, 1999; Thailand: TWA 2 mg/m^3, 1993; Turkey: TWA 2 mg/m^3, 1993; United Kingdom: STEL 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 2 mg/m^3. Russia has set 10 μg/m^3 as a MAC for ambient air in residential areas on a once-daily basis. Several states have set guidelines or standards for sodium hydroxide in ambient air[60] ranging from 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (North Dakota and South Carolina) to 40.0 μg/m^3 (Connecticut and South Dakota) to 48.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7401, alkaline Dusts; OSHA Analytical Method ID-121.

Permissible Concentration in Water: There are no criteria for NaOH as such. The EPA has, however, recommended criteria for pH as follows: to protect freshwater aquatic life: pH 6.5−9.0; to protect saltwater aquatic life: pH 6.5−8.5; and to protect humans' drinking water: pH 5−9.

Routes of Entry: Inhalation of dust or mist, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Highly corrosive to the eyes, skin, and the respiratory tract. *Inhalation:* Can cause severe irritation of the nose and throat and inflammation of the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Can cause severe irritation and deep burns. *Eyes:* Can cause severe irritation, corneal burns, and blindness. *Ingestion:* Can cause burning of the mouth and throat, nausea, vomiting, abdominal pains, and diarrhea (occasionally with blood). Can also cause swelling of the larynx and subsequent suffocation, holes in stomach and intestines, heart failure, coma. Death has resulted from swallowing less than 1/3 oz of the solid.

Long Term Exposure: Skin irritation may develop from repeated exposure to the solid or low concentrations of the liquid. Irritation to the lungs, nose, throat, and mouth may occur if exposed to low levels for long periods of time. May cause temporary loss of hair.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with large amounts of water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation.

For 30–70% solution: Sealed chemical materials with good to excellent resistance: butyl rubber; natural rubber; Neoprene™, nitrile rubber; polyethylene, PVC, Teflon™, Viton™, Viton™/chlorobutyl rubber; Saranex™, Silvershield™, Sol-vex® nitrile.

For less than 30% solution: Viton + chlorobutyl rubber, Silvershield™, polyvinyl chloride; polyethylene, Nitrile + polyvinyl chloride; and chlorinated polyethylene are among the recommended protective materials. Neoprene™ + Natural rubber and polyethylene.

All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—White Stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical you should be trained on its proper handling and storage. Sodium hydroxide must be stored to avoid contact with water, acids, flammable liquids, organic halogen compounds, metals, or nitro compounds, because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Sodium hydroxide, solid, or sodium hydroxide solution requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II. The solution falls in Hazard Class 8 and Packing Groups II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Wear protective clothing. For the solid, sweep into large vessel containing a large amount of water. Neutralize with weak hydrochloric acid. For solution, neutralize with weak hydrochloric acid. Pick up with mop or water vacuum. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Sodium hydroxide itself does not burn, but it is a strong oxidizer and may ignite combustibles, such as wood, paper, oil, etc. Poisonous gases are produced in fire, including sodium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Discharge into tank containing water, neutralize, then flush to sewer with water.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1992.

US EPA Gene-Tox Program, Negative: TRP reversion.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R31; R41; Safety phrases: S2; S26; S39; 46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium metabisulfite is a white crystalline powder with a sulfur dioxide odor. It may be considered the anhydride of 2 molecules of sodium disulfite. Molecular weight = 190.10; Specific gravity (H_2O:1) = 1.40 at 25°C; Boiling point = (decomposes); Freezing/Melting point = (decomposes) $\geq$ 150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 54%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Sodium metabisulfite is used as an antioxidant in pharmaceutical preparations and as a preservative in foods. People with asthma have a greater chance of having an allergic reaction with this chemical. Individuals allergic to *sodium bisulfite* (a food preservative found in some wine, fresh shrimp, packaged foods, and restaurant salads and potatoes) may have a severe reaction when exposed to sodium metabisulfite.

Incompatibilities: A strong reducing agent. Mixtures with water form a strong corrosive. Incompatible with reducing agents and combustibles. Heat causes decomposition. Slowly oxidized to the sulfate on exposure to air and moisture. Attacks metals.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: Sensitizing substances as sulfites.

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for sodium metabisulfite in ambient air[60] ranging from 50.0 μg/m^3 (North Dakota) to 80.0 μg/m^3 (Virginia) to 100.0 μg/m^3 (Connecticut) to 119.0 μg/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, skin and/or eye contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Sodium metabisulfite can affect you when breathed in. Exposure can irritate the nose, throat, and sinuses. It can also irritate the lungs, causing coughing, wheezing, and shortness of breath. Very severe general (anaphylactic) reactions can also occur in those allergic to sodium metabisulfite that can be fatal. Contact can irritate the skin.

Long Term Exposure: Sodium metabisulfite may cause an asthma-like allergy. Future exposures can cause asthma attacks with cough, shortness of breath, wheezing, and/or chest tightness. Can cause lung irritation; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5* mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials, such as wood and paper. DOT requires sodium metabisulfite to be packed in earthenware, glass, metal, or plastic during transport.

Shipping: Bisulfites, inorganic, aqueous solutions, n.o.s. require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sodium metabisulfite may burn, but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Sodium metabisulfite may ignite nearby combustible materials. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sodium pentachlorophenate is a crystalline solid with a phenolic odor. Molecular weight = 288.30. Soluble in water; solubility = 33% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector. Uses include: wood preservative; as a fungicide in water-based latex paints; preservation of cellulose products, textiles, adhesives, leather, pulp, paper and industrial waste systems; a contact and preemergence herbicide; general disinfectant and control of the intermediate snail host of schistosomiasis. The technical grade of sodium pentachlorophenate usually contain toxic microcontaminants including polychlorinated dibenzodioxins and dibenzofurans (132-64-9 and others).

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3.5 mg/m^3

PAC-2: 24 mg/m^3

PAC-3: 75 mg/m^3

Russia[43] set a MAC of 0.1 mg/m^3 in work-place air and MAC values for ambient air in residential areas as follows: 0.005 mg/m^3 on a momentary basis and 0.001 mg/m^3 on a daily average basis.

Determination in Air: No method available.

Permissible Concentration in Water: Russia[43] set a MAC of 5 mg/m^3 in water bodies used for domestic purposes and 0.0005 mg/L in water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure to fine dusts or sprays cause burning in eyes and painful irritation in upper respiratory tract. If inhaled, it will induce violent coughing and sneezing. Skin irritation results from brief exposures, causing a burning sensation or rash. Symptoms of severe systemic intoxication include loss of appetite, respiratory difficulties, anesthesia, fever, sweating, difficulty in breathing, and rapidly progressive coma. Severe intoxications, including fatalities, have been reported from uncontrolled use. This compound causes inflamed gastric mucosa, congestion of the lungs, edema in the brain, cardiac dilatation, degeneration of the liver and kidneys. Individuals suffering from kidney and liver diseases have a lowered resistance and should not be exposed.

Long Term Exposure: May cause skin allergy. May cause anemia. May damage the liver and kidneys. Repeated exposure can cause headache, weakness, sweating, fever, muscle twitching, dizziness, confusion, and death.

Points of Attack: Skin, blood, liver, kidneys.

Medical Surveillance: Complete blood count (CBC). Liver and kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Sodium pentachlorophenate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill. Collect spilled material in most convenient manner and deposit in sealed containers for later disposal. Liquids should be absorbed in vermiculite, dry sand, earth, or similar material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. It is noncombustible. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Wear self-contained (positive pressure) breathing apparatus and full protective clothing. Move container from fire area if possible. Runoff from fire control or dilution water may cause pollution. Poisonous gases are produced in fire, including hydrogen chloride, chlorides, and sodium oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Sodium selenite is a white crystalline substance. Molecular weight = 172.94; Freezing/Melting point = (decomposes) 320°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Highly soluble in water; solubility = >80% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Sodium selenite is used in glass manufacturing and as an alkaloidal reagent; for removing green color from glass during its manufacture; alkaloidal reagent; reagent in bacteriology; testing germination of seeds; decorating porcelain; as a livestock feed additive.

Incompatibilities: The aqueous solution is a medium strong base. Reacts with water, strong acids, hot surfaces, causing decomposition and a toxic hazard.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg[Se]/m^3 TWA.

NIOSH REL: 0.2 mg[Se]/m^3 TWA.

ACGIH TLV®[1]: 0.2 mg[Se]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.438 mg/m^3

PAC-1: 1.31 mg/m^3

PAC-2: 2.19 mg/m^3

PAC-3: 2.19 mg/m^3

DFG MAK: 0.05 mg[Se]/m^3 inhalable fraction; Carcinogen Category 3; Pregnancy Risk Group C.

NIOSH IDLH: 1 mg [Se]/m^3.

Arab Republic of Egypt: TWA 0.2 mg[Se]/m^3, 1993; Australia: TWA 0.2 mg[Se]/m^3, 1993; Austria: MAK 0.1 mg[Se]/m^3, 1999; Belgium: TWA 0.2 mg[Se]/m^3, 1993; Denmark: TWA 0.1 mg[Se]/m^3, 1999; Finland: TWA 0.1 mg[Se]/m^3; STEL 0.3 mg[Se]/m^3, 1999; Hungary: STEL 0.1 mg[Se]/m^3, 1993; Norway: TWA 0.1 mg[Se]/m^3, 1999; the Philippines: TWA 0.2 mg[Se]/m^3, 1993; Poland: MAC (TWA) 0.1 mg[Se]/m^3, 1993; Sweden: NGV 0.1 mg [Se]/m^3, 1999; Switzerland: MAK-W 0.1 mg[Se]/m^3, 1999; Turkey: TWA 0.2 mg[Se]/m^3, 1993; United Kingdom: TWA 0.1 mg[Se]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg[Se]/m^3. Russia[43] set a MAC of 0.1 μg/m^3 in ambient air in residential areas on a momentary basis and 0.05 μg/m^3 on a daily average basis.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 35 μg/L as a 24-h average, never to exceed 260 μg/L for recoverable inorganic selenite. *To protect saltwater aquatic life:* 54 μg/L as a 24-h average, never to exceed 410 μg/L. To protect human health: 10 μg/L.[6] There are a variety of foreign standards for selenium in water.[35] The Czech Republic has set 0.1 mg/L in surface water, 0.05 mg/L in drinking water reserve, and 0.01 mg/L in drinking water. Germany[35] has set 0.008 mg/L as a maximum permissible concentration in drinking water. The EEC has set 0.01 mg/L as a MAC for drinking water. Mexico has set 0.01 mg/L for receiving waters used for drinking purposes. Russia has set 0.001 mg/L as a MAC for drinking water. WHO has set 0.01 mg/L as a limit for drinking water. Maine has set[61] a guideline of 0.01 mg/L and Minnesota 0.045 mg/L for drinking water. EPA[62] has proposed 0.05 mg/L as a limit for drinking water.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation of the dust can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the liver, kidneys, heart, nervous system, and gastrointestinal tract. *Inhalation:* Dust or fumes can cause irritation of the nose, throat, and lungs; nausea, vomiting, intestinal disturbance; garlic odor on breath; headache, fatigue, and irritability. *Skin:* Can cause irritation, burning, and red or yellow discoloration. *Eyes:* Can cause irritation and injury. *Ingestion:* Can cause nausea, vomiting, abdominal pain, diarrhea, metallic taste, and garlic odor on breath. Elemental selenium has low acute systemic toxicity, but dust or fumes can cause serious irritation of the respiratory tract. In humans, a concentration of 5 ppm in food or 0.5 ppm in milk or water has been estimated to be dangerous (selenium compounds). Animal studies suggest that the lethal dose for an adult may be as low as 1/200 oz.

Long Term Exposure: Long-term exposure to selenium compounds may be a cause of amyotrophic lateral sclerosis in humans. Repeated or prolonged contact may cause skin dermatitis. May affect the central nervous system, blood, teeth, and bones. May cause nervousness, depression, pallor, digestive disturbances. Kidney and liver damage may occur. Daily ingestion of 25 mg of sodium selenite, containing 4−5 selenium, after 11 days showed signs of hair and fingernail loss, fatigue, nausea, vomiting, and garlic breath.

Points of Attack: Liver, kidneys, heart, nervous system, gastrointestinal tract.

Medical Surveillance: Urine test for selenium (should be less than 100 μg/L of urine). Liver and kidney function tests. Examination of the nervous system. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Wear protective gloves when inducing vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from selenium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Change gloves frequently. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For levels up to 2 mg/m^3 use a respirator with full face-piece and dust and mist filters. For levels up to 7.5 mg/m^3 use a powered air-purifying respirator with dust and mist filters or supplied-air respirator operated in continuous-flow mode. For levels up to 10 mg/m^3 use a high-efficiency particulate filter respirator with a full face-piece. For levels up to 100 mg/m^3 use a Type C supplied-air respirator with a full face-piece operated in a positive-pressure mode. For levels above 100 mg/m^3 or use in areas of unknown concentrations use a self-contained Type C supplied-air respirator with an auxiliary self-contained breathing apparatus, both with full face-piece and operated in a positive-pressure mode. For firefighting use a self-contained breathing apparatus with a full face-piece operated in a positive-pressure mode. For escape from a contaminated area use a high-efficiency particulate filter respirator with a full face-piece or an escape self-contained breathing apparatus with a full face-piece.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store at room temperature in watertight containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but will not ignite readily. When heated to decomposition, may emit toxic fumes of selenium and sodium oxide. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Poisonous gases are produced in fire, including selenium and sodium oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Liquid or solid: make a strongly acidic solution using hydrochloric acid. Slowly add sodium sulfite to the cold solution. Stir mixture producing sulfur dioxide. Heat, forming dark-gray selenium and black tellurium. Let stand overnight. Filter and dry. Ship to supplier.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: Cell transform.—SA7/SHE

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sodium sulfate is a white crystalline solid. It is frequently found as the decahydrate. Molecular weight = 142.04; Specific gravity (H_2O:1) = 2.71 at 25°C; Freezing/Melting point = 888°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Sodium sulfate is used in the manufacture of glass; as a precipitating agent in the manufacture of silver emulsions; as an analytical reagent; in making ultramarine and paper pulp; in ceramic glazes and pharmaceuticals; as a food additive; and as a filler in synthetic detergents.

Incompatibilities: Violent reaction with aluminum, magnesium. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 75 mg/m^3

PAC-1: 200 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Permissible Concentration in Water: Maryland[61] has set a guideline of 210 μg/L for sodium sulfate in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation of nose and throat at high dust levels. *Skin:* No information found. *Eyes:* May cause irritation of nose and throat at high dust levels. *Ingestion:* Irritation of the digestive tract, vomiting, and diarrhea may result from ingestion of 1/2 oz.

Long Term Exposure: No information found.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wear a dust mask if necessary.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Keep tightly closed in a cool place.

Shipping: Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge waste sodium sulfate directly into sewers or surface waters. Recovered sodium sulfate may be disposed of by burial in a landfill.

EC Number: 231-821-4
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence Group 3, 1992.
US EPA Gene-Tox Program, Positive: *S. cerevisiae*—reversion.
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Sodium sulfite is a white crystalline solid. Molecular weight = 126.04; Specific gravity (H_2O:1) = 2.63 at 25°C; Freezing/Melting point = (decomposes) 538°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen. Sodium sulfite is used as a reducing agent; in boiler water treatment; food applications; in photographic developers and fixers; in bleaching of wool, paper, textiles, straw, and silk; manufacture of dyes; dechlorination; preservation of meat, fruit, and egg products; silvering of glass.
Incompatibilities: A strong reducing agent. Incompatible with strong oxidizers, combustibles, organic materials. Reacts with strong acids, producing toxic sulfur dioxide.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 100 mg/m^3
Permissible Concentration in Water: Maryland[61] has set a guideline of 100 μg/L for sodium sulfite in drinking water.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: *Inhalation:* May cause asthmatic reactions. Animal studies indicate that levels of 1 mg/m^3 may cause slight swelling of lung tissue and irritation. *Skin:* Corrosive. Causes irritation and burns. *Eyes:* Corrosive. Causes severe irritation and burns. *Ingestion:* Solutions cause gastric irritation by the liberation of sulfurous acid. Because of rapid oxidation to sulfate, sulfites are well tolerated until large doses are reached; then violent colic and diarrhea, circulatory disturbances; central nervous depression; and death can occur. Increased dosage will result in sudden, violent colic and diarrhea, circulatory disturbances; slowed breathing; fainting, rapid pulse; and death. The lethal dose may be about 10 g (about 1/3 oz).
Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Repeated or prolonged inhalation exposure may cause asthma.
Points of Attack: Skin, lungs.
Medical Surveillance: Examination by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials.

Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry location in closed containers.

Shipping: Corrosive solid, acidic, inorganic, n.o.s. requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable. Use agents suitable for surrounding fire. Decomposes above 538°C; Toxic sulfur dioxide gases formed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Sodium tellurite S:0560

Molecular Formula: Na_2O_3Te

Common Formula: Na_2TeO_3

Synonyms: Sodium tellurate(IV); Telluric acid, disodium salt; Tellurous acid, disodium salt; Telurito sodico (Spanish)

CAS Registry Number: 10102-20-2

RTECS® Number: WY24500000

UN/NA & ERG Number: UN3284 (tellurium compound, n.o.s.)/151

EC Number: 233-268-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sodium tellurite is a white crystalline solid. Molecular weight = 221.58; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used in bacteriology and medicine. Formerly used as pesticide.

Incompatibilities: Cadmium, nitric acid, halogens, oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Te]/m^3 TWA.

NIOSH REL: 0.1 mg[Te]/m^3 TWA.

ACGIH TLV®[1]: 0.1 mg[Te]/m^3 TWA.

NIOSH IDLH: 25 mg[Te]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.174 mg/m^3

PAC-1: 0.521 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 43.4 mg/m^3

DFG MAK: 0.1 mg[Te]/m^3, inhalable fraction.

Australia: TWA 0.1 mg/m^3, 1993; Austria: MAK 0.1 mg/m^3, 1999; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, 1999; Finland: TWA 0.1 mg/m^3, STEL 0.3 mg/m^3, 1999; France: VME 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg[Te]/m^3, 2003; the Philippines: TWA 0.1 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3; MAC (STEL) 0.03 mg/m^3, 1999; Sweden: NGV 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.5 mg/m^3, 1999; Turkey: TWA 0.1 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg[Te]/m^3. Several states have set guidelines or standards for tellurium in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7900. See also #7300, Elements; #7301; #7303; #9102; OSHA Analytical Method ID-121.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[43] set a MAC of 0.01 mg/L for tellurium in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin and eyes. Irritates the respiratory tract, causing cough and wheezing. The material is both an oral and dermal toxic hazard. The material is toxic by ingestion. Oral ingestion of tellurium compounds is generally regarded as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 70-kg (150 lb) person. Tellurium compounds are regarded as super toxic for skin exposures. Symptoms of exposure are as follows: sleepiness, fatigue, stupor; loss of appetite; nausea, vomiting, stomach pain; metallic taste; garlic odor of the breath and sweat; dryness of the mouth or excessive salivation; renal pain; bronchitis, irregular breathing; cyanosis, fatty degeneration of the liver; and unconsciousness.

Long Term Exposure: Repeated or prolonged exposure to tellurium compounds may cause reproductive damage, liver and kidney damage, lung irritation. Bronchitis may develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Liver, kidneys, lungs.

Medical Surveillance: Lung function tests, liver and kidney function tests.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. If medical advice is not readily available, consider inducing vomiting of this toxic material. Transport at once to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1 mg/m^3:* 95QX [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full-face-piece). *Up to 25 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Shipping: Tellurium compound, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group I to III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Do not use halogens. Poisonous gases are produced in fire, including tellurium and sodium oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Soman (Agent GD, WMD) S:0565

Molecular Formula: $C_7H_{16}FO_2P$

Common Formula: $CH_3P(O)(F)OCH(CH_3)C(CH_3)3$

Synonyms: EA 1210; Fluoromethylpinacolyloxyphosphine Oxide; GD (military designation); Methyl-fluoropinacolyl-phosphonate; Methyl-pinacolyloxyfluorophosphine oxide; Methyl-pinacolyloxyphosphonyl flouride; PFMP; Phosphonofluoridic acid, methyl-, 1, 2, 2-trimethylpropyl ester; Pinacolyl methylphosphonofluoridate; Pinacolyl methanefluorophosphonate; Pinacolyl methylfluorophosphonate; Pinacolyloxymethylphosphonyl flouride; Somain; Thickened GD; TGD; 1,2,2-Trimethylpropylmethylphosphonofluoridate; 1,2,2,-Trimethylpropoxyfluoromethylphosphine oxide; Zoman

Chlorosoman

O-Pinacolyl methylphosphonochloridate; méthylphosphonochloridate de O-pinacolyle (French)

CAS Registry Number: 96-64-0; 50642-24-5; 7040-57-5 (Chlorosoman)

RTECS® Number: None found

UN/NA & ERG Number: UN2810/153

EC Number: Not assigned

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g (*96-64-0; 7040-57-5 chlorosoman*).

Carcinogenicity: GD is not listed by the International Agency for Research on Cancer (IARC), American Conference of Governmental Industrial Hygienists (ACGIH), Occupational Safety and Health Administration (OSHA), or National Toxicology Program (NTP) as a carcinogen.

US DOT 49CFR172.101, Inhalation Hazard Chemical.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Soman (GD) is a fluorinated organophosphorus compound. Exposure to soman can cause death in minutes. A fraction of an ounce (1−10 mL) of soman on the skin can be fatal.[NIOSH] When pure, GD is a colorless liquid with fruity odor. With impurities, or upon aging, GD is an amber to dark-brown oily liquid with an odor of rotten fruit or camphor (like Vicks® Vapo-Rub). Do not rely on odor for detection; not everyone can smell low concentrations of this chemical. Molecular weight = 182.17; Boiling point = 198°C; 167−200°C; Specific gravity ($H_2O = 1$) = 1.022 at 25°C; Melting point: −42°C; Vapor pressure = 0.40 mmHg at 25°C; Vapor density (air = 1) = 6.3; Volatility = 3900 mg/m^3 at 25°C; Flash point = 121°C (oc). Flammability limits: Unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1. Slightly soluble in water. Thickened agent GD [TGD] is essentially the same as GD except for viscosity. Viscosity = (approx.) 1180 centistokes uses "K125" (acryloid copolymer, 5%) to create TGD. K125 is not known to be a hazardous material except in a finely divided, powder form.[CDC]

Potential Exposure: Agent GD is a quick-acting chemical warfare nerve agent (nerve gas). Medical treatment of soman is difficult because it permanently binds to receptors in the body in minutes. Large amounts of the vapor or liquid can hurt you in minutes, and can quickly lead to death.

Persistence of Chemical Agent: Soman (GD): Summer: 10 min to 24 h; Winter: 2 h to 3 days.

Incompatibilities: Stable after storage in steel for 3 months at 65°C. GD corrodes steel at the rate of 1×10^{-5} inch/month. Raising the pH increases the rate of decomposition significantly. GD decomposes slowly in water; will hydrolyze to form $HF{-}H{-}H{-}O{-}CH_3$ and $(CH_3)_3{-}C{-}C{-}O{-}P{-}OH$. GD reacts readily with bases and weak acids. Under acid conditions, GD hydrolyzes, forming hydrofluoric acid (HF). Flammable hydrogen gas produced by the corrosive vapors reacting with metals, concrete, etc. may be present.

Permissible Exposure Limits in Air

IDLH: 0.05 mg/m^3.[US Army]

Acute Exposure Guideline Levels (AEGLs)

Level 1—potential minor discomfort or noticeable effects; reversible

10 min—0.00049 ppm; 30 min—0.00028 ppm; 1 h—0.0002 ppm; 4 h—0.0001 ppm; 8 h—0.00050 ppm

Level 2—potentially impacting functional abilities or ability to escape; potential delayed recovery

10 min—0.0062 ppm; 30 min—0.0035 ppm; 1 h—0.0024 ppm; 4 h—0.0013 ppm; 8 h—0.00091 ppm

Level 3—Life threatening; level of potential initial fatalities 10 min—0.053 ppm; 30 min—0.027 ppm; 1 h—0.018 ppm; 4 h—0.0098 ppm; 8 h—0.0071 ppm

Protective Action Criteria (PAC) GD*
TEEL-0: 0.00003 ppm
PAC-1: **0.00018** ppm
PAC-2: **0.0022** ppm
PAC-3: **0.017** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

The suggested permissible airborne exposure concentration of soman (GD) for an 8-h workday or a 40-hour workweek is an 8-h time-weighted average (TWA) of 0.00003 mg/m^3 (2×10^{-5} ppm). This value is based on the TWA of GB as proposed in the USAEHA Technical Guide No. 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents GA, GB, GD, and VX*. Also, the general population limits (as recommended by the Surgeon General's Working Group, US Department of Health): 0.000003 mg/m^3.

Determination in Air: Available monitoring equipment for soman (GD) is the Automatic Chemical Agent Detector Alarm (ACADA), bubblers (GC method), and Chemical Agent Monitor (CAM).

Determination in Water: Log K_{ow} (estimated) = 1.02:Log $K_{\text{benzene-water}}$ = 1.61. Soman dissolves in water and remains very dangerous. To prevent anyone from drinking water mixed with soman, notify local health and pollution control officials. Also, notify operators of nearby water intakes and advise shutting water intakes. Hydrolysis by acidic, neutral, and basic mechanisms, giving fluoride and pinacolyl methylphosphonate. Rapidly hydrolyzed in basic solutions (e.g., Na_2CO_3, NaOH, or KOH) with a half-life of approximately 1 min at pH 11 at 25°C. Soman and its hydrolysis products exhibit no significant phototransformations in sunlight. Soman and its hydrolysis products are thermally stable at temperatures less than 49°C. Use M272 Chemical Agent Water Testing Kit. Detection limit for nerve agents is 0.02 mg/L. Bleaching powder (chlorinated lime) destroys soman but gives rise to cyanogen chloride (CAS: 506-77-4). See table of contents or name index for location of entry for: Cyanogen chloride.

Routes of Entry: Skin absorption, absorption through eyes, and inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Soman (GD) is a lethal anticholinesterase agent with the median lethal dose in humans being: LCt_{50} (inhalation) = 70 mg-min/m^3 (t = 10 min); LD_{50} (PC, bare skin) = 0.35 g/man (70 kg). *One to several minutes following overexposure to airborne soman (GD)*, the following acute symptoms appear: *Local effects* (lasting 1−15 days, increase with dose): *Eyes:* Miosis (constriction of pupils); redness, pressure sensation on eyes. *Inhalation:* Rhinorrhea (runny nose), nasal congestion, tightness in chest, wheezing, salivation, nausea, vomiting. *Systemic effects* (increases with dose): When inhaled soman (GD) will cause excessive secretion causing coughing/breathing difficulty; salivation and sweating; vomiting, diarrhea, stomach cramps; involuntary urination/defecation; generalized muscle twitching/muscle cramps; CNS depression including anxiety, restlessness, giddiness, insomnia, excessive dreaming, and nightmares. With more severe exposure, also headache, tremor, drowsiness, concentration difficulty; memory impairment; confusion, unsteadiness on standing or walking; and progressing to death. After exposure to liquid soman (GD), the following acute symptoms appear: *Local effects*: *Eyes:* Miosis (constriction of pupils); redness, pressure sensation on eyes. *Ingestion:* salivation, anorexia, nausea, vomiting, abdominal cramps, diarrhea, involuntary defecation, heartburn. *Skin:* Sweating, muscle twitching. If recovery from nerve agent poisoning occurs, it will be complete unless anoxia or convulsions have gone unchecked so long that irreversible central nervous system changes due to anoxemia have occurred.

Long Term Exposure: Limited data suggest delayed neuropathy (postural sway, psychomotor performance). Miosis has been noted up to 62 days.[CDC] Chronic exposure to soman (GD) causes forgetfulness, thinking difficulty, vision disturbances, muscular aches/pains. Mild or moderately exposed people usually recover completely. Severely exposed people are not likely to survive. Unlike some organophosphate pesticides, nerve agents have not been associated with neurological problems lasting more than 1−2 weeks after the exposure. Although certain organophosphate pesticides have been shown to be teratogenic in animals, these effects have not been documented in carefully controlled toxicological evaluations for soman (GD). The inhibition of cholinesterase enzymes throughout the body by nerve agents is more or less irreversible so that their effects are prolonged. Until the tissue cholinesterase enzymes are restored to normal activity, probably by very slow regeneration over a period of weeks or 2−3 months if damage is severe, there is a period of increased susceptibility to the effects of another exposure to any nerve agent. During this period the effects of repeated exposures are cumulative; after a single exposure, daily exposure to concentrations of a nerve agent insufficient to produce symptoms may result in the onset of symptoms after several days. Continued daily exposure may be followed by increasingly severe effects. After symptoms subside, increased susceptibility persists for one to several days. The degree of exposure required to produce recurrence of symptoms, and the severity of these symptoms, depend on duration of exposure and time intervals between exposures. Increased susceptibility is not limited to the particular nerve agent initially absorbed. Agent GD is not listed by the International Agency for Research on Cancer (IARC); American Conference of Governmental Industrial Hygienists (ACGIH); Occupational Safety and Health Administration (OSHA); or National Toxicology Program (NTP) as a carcinogen.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase, liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Complete blood count (CBC). Evaluation of thyroid function. Liver function tests. Kidney function tests. Central nervous system tests. EKG.

First Aid: *Inhalation:* Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil constriction, a lack of coordination, etc.), immediately administer, in rapid succession, all three Nerve Agent Antidote Kit(s); Mark I injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated at 5−20 min intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag of oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. Seek medical attention *immediately*.

Eye contact: Immediately flush eyes with water for 10−15 min, then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken *immediately* to the medical treatment facility for observation.

Skin contact: Don respiratory protective mask and remove contaminated clothing. Immediately wash contaminated skin with copious amounts of soap and water, 10% sodium carbonate solution, or 5% liquid household bleach. Rinse well with water to remove decontaminant. Administer nerve agent antidote kit, Mark I, only if local sweating and muscular twitching symptoms are present. Seek medical attention *immediately*.

Ingestion: Do not induce vomiting. First symptoms are likely to be gastrointestinal. *Immediately* administer Nerve Agent Antidote kit, Mark I. Seek medical attention immediately. If there is no apparent breathing, artificial resuscitation will be started immediately, but *do not* use mouth-to-mouth resuscitation when facial contamination exists; in this case, use mechanical resuscitator. The situation will dictate method of choice. When appropriate and trained personnel are available, cardiopulmonary resuscitation (CPR) may be necessary.

Notes for physician and qualified medical personnel: An individual who has received a known agent exposure or who exhibits definite signs or symptoms of agent exposure shall be given an intramuscular injection immediately with the MARK I kit autoinjectors. Some of the early symptoms of a *vapor exposure* may be rhinorrhea (runny nose) and/or tightness in the chest with shortness of breath (bronchial constriction). Some of the early symptoms of a *percutaneous exposure* may be local muscular twitching or sweating at the area of exposure followed by nausea or vomiting. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection shall not be administered when myosis is the only sign present. Instead, the individual shall be taken immediately to the medical facility for observation. Injections using the MARK I kit injectors (or atropine only if directed by the local physician) may be repeated at 5−20 min intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. Administer, in rapid succession, all three MARK I kit injectors (or atropine if directed by the local physician) in the case of SEVERE signs of agent exposure. If indicated, CPR should be started immediately. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. *CAUTION:* atropine does not act as a prophylactic and shall not be administered until an agent exposure has been ascertained.

Medical Treatment: Electrocardiogram (ECG), and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5−10 mg in adults and 0.2−0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6−12 h to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Nerve gases stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Do not wait for soap or for the victim to remove clothing; begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate upwind and uphill: Patients exposed to nerve agent by vapor only should be decontaminated by removing all clothing in a clean-air environment; and shampooing or rinsing the hair to prevent vapor-off gassing; patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Remember that the water you use to decontaminate the victims is dangerous. Be sure you have decontaminated the victims as much as you can before they are released from the area, so they do not spread the nerve gas. Rinse the eyes, mucous membranes, or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

*The following can be used in addition to household bleach: (1) solids, powders, and solutions containing various types of bleach ($NaOCl$ or $Ca(OCl)_2$); (2) DS2 (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide (NaOH) dissolved in water, phenol, ethanol, and ammonia.

Note: Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods: *Protective gloves*: Butyl Glove M3 and M4; Norton chemical protective glove set. *Eye protection*: chemical goggles. For splash hazards use goggles and face shield. *Other protective equipment*: Full protective clothing will consist of M9 mask and hood; butyl rubber suit (M3), M2A1 butyl boots; M3 and M4 gloves; unimpregnated underwear; or demilitarization protective ensemble (DPE). For laboratory operations, wear lab coats and have a protective mask readily available.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Positive pressure, full face-piece, NIOSH/MSHA- or European Standard EN 149-approved self contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes, they will wear appropriate levels of protective clothing.

From the Riegle Report

Less than 0.00003 mg/m^3: M9, M17, or M40 series mask shall be available for escape as necessary. *0.00003 mg/m^3* to *0.06 mg/m^3:* M9 or M40 series mask with Level A or Level B ensemble. *Greater than 0.06 mg/m^3:* or DPE or TAPES used with prior approval from AMC Field Safety Activity.

Note: When DPE or TAPES is not available, the M9 or M40 series mask with Level A protective ensemble can be used. However, use time shall be restricted to the extent operationally feasible, and may not exceed 1 h. As an additional precaution, the cuffs of the sleeves and the legs of the M3 suit shall be taped to the gloves and boots respectively to reduce aspiration.

Local Exhaust: Mandatory. Must be filtered or scrubbed to limit exit concentration to <0.00001 mg/m^3 (averaged over 8 h/day, indefinitely).

Special: Chemical laboratory hoods shall have an average inward face velocity of 100 linear feet per minute (lfpm) + 10% with the velocity at any point not deviating from the average face velocity by more than 20%. Laboratory hoods shall be located such that cross-drafts do not exceed 20% of the inward face velocity. A visual performance test utilizing smoke-producing devices shall be performed in assessing the ability of the hood to contain agent GD. Emergency back-up power necessary: Hoods should be tested semiannually or after modification or maintenance operations. Operations should be performed 20 cm inside hood face.

Other: Recirculation of exhaust air from agent areas is prohibited. No connection between agent areas and other areas through ventilation system is permitted.

Storage: In handling soman (GD), the buddy system will be incorporated. No smoking, eating, or drinking is permitted in areas containing agent GD. Containers should be periodically inspected for leaks (either visually or by a detector kit) and prior to transferring the containers from storage to work areas. Stringent control over all personnel practices must be exercised. Decontamination equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. Chemical showers, eyewash stations, and personal cleanliness facilities shall be provided. Wash hands before meals and each worker will shower thoroughly with special attention given to hair, face, neck, and hands, using plenty of soap before leaving at the end of the workday. *Other precautions:* Agent GD must be double-contained in liquid and vapor-tight containers when in storage or when outside of the ventilation hood.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone B] requires a shipping label of "POISONOUS/TOXIC MATERIALS." (Pinacolyl methyl phosphonofluoridate), Inhalation Hazard. It falls in Hazard Class 6.1 and Packing Group I, Hazard Zone B.

Spill Handling: Warn pollution control authorities and advise shutting water intakes. Spills must be contained by covering with vermiculite, diatomaceous earth, clay, fine sand, sponges, and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous sodium hydroxide solution (a minimum of 10%). Scoop up all material and place in a fully removable head drum with a high-density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, state, and DOT regulations. Dispose of material used to decontaminate exterior of drum in accordance with IAW, federal, state, and local regulations. Contaminated clothing will be placed in a fully removable head drum with a high-density polyethylene liner and the contents shall be covered with decontaminating solution as above before affixing the drum head. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the exposure limits (see Section 8). If 10 wt. % aqueous sodium hydroxide solution is not available, then the following decontaminants may be used instead and are listed in the order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate, and Supertropical Tropical Bleach Slurry (STB).

GD, when used as a weapon

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 1.5/2.4

Fire Extinguishing: When heated, vapors may form explosive mixtures with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Fires involving soman (GD) should be contained to prevent contamination of uncontrolled areas. All persons not engaged in extinguishing the fire should be evacuated immediately. Contact with soman (GD) or its vapors can be fatal. When responding to a fire alarm in buildings or areas containing nerve agents, firefighting personnel should wear full firefighter protective clothing (without TAP clothing) during chemical agent firefighting and fire rescue operations. Respiratory protection is required. Positive pressure, full face-piece, NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes, they will wear appropriate levels of protective clothing.

Disposal Method Suggested: A minimum of 55 g of decon solution is required per gram of soman (GD). Decontaminant/agent solution is allowed to agitate for a minimum of 1 h. Agitation is not necessary following the first hour provided a single phase is obtained. At the end of the first hour the pH should be checked and adjusted up to 11.5 with additional sodium hydroxide as required. An alternate solution for the decontamination of soman (GD) is 10% sodium carbonate in place of the 10% sodium hydroxide solution above. Continue with 55 g of decon per gram of GD. Agitate for 1 h and allow to react for 3 h. At the end of the third hour, adjust the pH to above 10. It is also permitted to substitute 5.25% sodium hypochlorite for the 10% sodium hydroxide solution above. Continue with 55 g of decon per gram of GD. Agitate for 1 h and allow to react for 3 h, then adjust the pH to above 10. Scoop up all material and place in a fully removable head and a high-density polyethylene liner. Cover the contents with additional decontaminating solution before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All contaminated clothing will be placed in a fully removable head drum with a high-density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled per IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the exposure limits. *Waste disposal method*: Open pit burning or burying of GD or items containing or contaminated with GD in any quantity is prohibited. The detoxified GD (using procedures above) can be thermally destroyed by incineration in an EPA approved incinerator in accordance with appropriate provisions of federal, state, and local RCRA regulations. *NOTE:* Several states define decontaminated surety material as a RCRA Hazardous Waste.

Stannic chloride, hydrated S:0570

Molecular Formula: $Cl_4H_{10}O_5Sn$
Common Formula: $SnCl_4 \cdot 5H_2O$
Synonyms: Stannic chloride pentahydrate; Tetrachlorostannane pentahydrate
CAS Registry Number: 10026-06-9 (hydrated)
RTECS® Number: XP8870000
UN/NA & ERG Number: UN2440/154
EC Number: 050-001-00-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Stannic chloride is a white to yellow powder with a faint odor of HCl. Molecular weight = 350.59; Boiling point = 114°C; Freezing/Melting point = −33°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: Hydrated stannic chloride is used for fixing certain textile dyes, and for treating silk to give weight to the fabric.

Incompatibilities: Reacts violently with water, forming corrosive hydrochloric acid and tin oxide fumes. Reacts with turpentine, alcohols, and amines, causing fire and explosion hazard. Attacks many metals; some forms of plastics, rubber, and coatings. Reacts with moist air to form hydrochloric acid.

Permissible Exposure Limits in Air

OSHA PEL: 2 mg[Sn]/m^3 TWA.

NIOSH REL: 2 mg[Sn]/m^3 TWA.

ACGIH TLV®[1]: 2 mg[Sn]/m^3 TWA.

No TEEL available.

DFG MAK: *tin, inorganic compounds:* No numerical value established. Data may be available.

NIOSH IDLH: 100 mg[Sn]/m^3.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Hydrated stannic chloride can affect you when breathed in. Corrosive to the eyes, skin, and respiratory tract. Eye damage may be permanent. Breathing hydrated stannic chloride can irritate the throat and bronchial tubes, causing cough and/or difficulty in breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Changes may occur on chest X-ray with repeated exposure, resulting in impaired lung functions. Tin may interfere with the body's ability to absorb iron from the diet or from vitamins, contributing to iron deficiency anemia.

Points of Attack: Lungs, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. Complete blood count (CBC). Hemoglobin or hematocrit. If acute breathing exposure to heated hydrated stannic chloride with chlorine gas is suspected, also consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA: *Up to 10 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 20 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 mg/m³:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 mg/m³:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Hydrated stannic chloride must be stored to avoid contact with water, moisture, chlorine, turpentine, ethylene oxide, and alkyl nitrates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Keep hydrated stannic chloride dry and out of direct sunlight. Hydrated stannic chloride can attack some plastics, rubbers, and coatings.

Shipping: Stannic chloride, pentahydrate, requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Hydrated stannic chloride itself does not burn. Poisonous gases are produced in fire, including hydrogen chloride, chlorine, and tin. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: NCI: Carcinogenesis Studies (feed); equivocal evidence: rat; no evidence: mouse.

US EPA Gene-Tox Program, Negative: *B. subtilis* rec assay; TRP reversion; Negative/limited: Carcinogenicity—mouse/rat.

Air Pollutant Standard Set: ACGIH[1]; DFG[3]; OSHA.[58]

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Stannous chloride is a white crystalline solid. Molecular weight = 189.59; 225.63 (dihydrate); Boiling point = (decomposes) 652°C; Freezing/Melting point = 246°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 90% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; (dihydrate) Mutagen; Reproductive Effector. Stannous chloride is used as a dye, pigment, and printing ink; in making chemicals; chemical preservatives; food additives; polymers, textiles, glass, silvering mirrors.

Incompatibilities: A strong reducing agent. Reacts violently with oxidants. Reacts violently with bromine trifluoride, potassium, hydrazine hydrate, sodium, sodium peroxide, ethylene oxide, and nitrates. Keep away from moisture, sources of oxygen, and combustible materials.

Permissible Exposure Limits in Air

Includes dihydrate

OSHA PEL: 2 mg[Sn]/m^3 TWA.

NIOSH REL: 2 mg[Sn]/m^3 TWA.

Australia: TWA 2 mg[Sn]/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 2 mg[Sn]/m^3, 1993; Denmark: TWA 2 mg[Sn]/m^3, 1999; Finland: TWA 2 mg [Sn]/m^3, 1999; Hungary: TWA 1 mg[Sn]/m^3; STEL 2 mg [Sn]/m^3, [skin], 1993; Norway: TWA 2 mg[Sn]/m^3, 1999; the Philippines: TWA 2 mg[Sn]/m^3, 1993; Poland: TWA 2 mg[Sn]/m^3, 1999; Switzerland: MAK-W 2 mg[Sn]/m^3, KZG-W 4 mg[Sn]/m^3, 1999; Thailand: TWA 2 mg[Sn]/m^3, 1993; United Kingdom: TWA 2 mg[Sn]/m^3; STEL 4 mg [Sn]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg[Sn]/m^3.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Stannous chloride can affect you when breathed in. Contact can cause skin and eye burns. Breathing stannous chloride dust or mist can irritate the throat and bronchial tubes, causing cough and/or difficulty in breathing. May affect the central nervous system and blood when ingested.

Long Term Exposure: Effects on the liver following ingestion. Changes may also occur on chest X-ray with repeated exposures; reduced lung function has been reported. Tin may interfere with the body's ability to absorb iron from the diet or from vitamins, contributing to iron deficiency anemia.

Points of Attack: Lungs, blood, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Complete blood count (CBC); hemoglobin or hematocrit. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™ and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA: *Up to 10 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 20 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Stannous chloride must be stored to avoid contact with bromine trifluoride, nitrates, potassium hydrazine hydrate, sodium peroxide, ethylene oxide, and hydrogen peroxide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture, sources of oxygen, and combustible materials. Sources of ignition, such as smoking and open flames, are prohibited where stannous chloride is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Corrosive solid, acidic, inorganic, n.o.s. requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Stannous chloride itself does not burn. Stannous chloride may ignite combustible materials. Poisonous gases are produced in fire, including chlorine and stannous sulfate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Stannous fluoride S:0590

Molecular Formula: F_2Sn

Common Formula: SnF_2

Synonyms: Fluoristan®; Stannous fluoride; Tin bifluoride; Tin difluoride

CAS Registry Number: 7783-47-3

RTECS® Number: XQ3450000

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

EC Number: 231-999-3

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA Gene-Tox Program, Negative: *N. crassa—aneuploidy.*

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Stannous fluoride is a white crystalline solid with a bitter, salty taste. Molecular weight = 156.69; Boiling point = 849°C; Freezing/Melting point = 213°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; 30% at 20°C.

Potential Exposure: Compound Description: Drug, Tumorigen, Mutagen. Stannous fluoride is used in caries prophylactic; as an ingredient of cavity-preventing toothpastes.

Incompatibilities: Reacts with acids, forming hydrogen fluoride fumes. Reacts violently with chlorine.

Permissible Exposure Limits in Air

No TEEL available.

As tin, inorganic compounds

OSHA PEL: 2 mg[Sn]/m^3 TWA.

NIOSH REL: 2 mg[Sn]/m^3 TWA.

ACGIH TLV®[1]: 2 mg[Sn]/m^3 TWA.

DFG MAK: *tin, inorganic compounds:* No numerical value established. Data may be available.

NIOSH IDLH: 100 mg[Sn]/m^3.

As fluorides

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2 mg[Sn]/m^3, 1993; Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 2 mg[Sn]/m^3, 1993; Belgium: TWA 2.5 mg[F]/m^3, 1993; Denmark: TWA 2.5 mg[F]/m^3, 1999; Denmark: TWA 2 mg[Sn]/m^3, 1999; Finland: TWA 2 mg[Sn]/m^3, 1999; Finland: TWA

Determination in Air: Filter; Acid; Hydride generation atomic absorption spectrometry; NIOSH Analytical Method (IV) #7900. See also #7300, Elements.

Permissible Concentration in Water: The EPA has set 4 mg/L as a standard for fluoride[61] but has no level set for tin.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Stannous fluoride can affect you when breathed in. Corrosive to the eyes. Irritates the skin and respiratory tract. Prolonged skin contact can cause burns. Breathing stannous fluoride can irritate the throat and bronchial tubes, causing cough and/or difficulty in breathing. Changes may also occur on chest X-ray with repeated exposures. When heated, toxic fluorine gas can be released, causing pulmonary edema (fluid in the lungs), a medical emergency that can be delayed for several hours. This can cause death. If swallowed, may affect the gastrointestinal tract, causing shock.

Long Term Exposure: May affect the teeth and bones. Repeated exposure, usually after years, may cause changes in the chest X-ray; reduced lung function has been reported. Tin released by stannous fluoride may interfere with the body's ability to absorb iron, contributing to iron deficiency anemia.

Points of Attack: Lungs, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: lung function tests. For persons exposed to levels half the TLV or greater, the following is recommended: hemoglobin or hematocrits. If acute breathing overexposure to heated stannous fluoride with fluorine gas is suspected, also consider chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. For heated stannous fluoride exposure, medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If swallowed, watch for symptoms of shock.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA: *Up to 10 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 20 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) * (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 100 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter. Click here for information on selection of N, R, or P filters) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Stannous fluoride must be stored to avoid contact with chlorine and turpentine, since violent reactions occur.

Shipping: Toxic solid, inorganic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical or CO_2 extinguishers. Poisonous fluorine gas is produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Stibine is a colorless gas with a characteristic disagreeable odor. It is produced by dissolving zinc/antimony or magnesium-antimony in hydrochloride acid. Molecular weight = 124.78; Boiling point = −18.3°C; Freezing/Melting point = −87.8°C; Flash point = Flammable gas; Relative vapor density (air = 1) = 4.31; Vapor pressure = >1 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2. Poor solubility in water.

Potential Exposure: Stibine is used as a fumigating agent. Exposure to stibine usually occurs when stibine is released from antimony-containing alloys during the charging of storage batteries, when certain antimonial drosses are treated with water or acid, or when antimony-containing metals come in contact with acid. Operations generally involved are metallurgy, welding, or cutting with blow torches; soldering, filling of hydrogen balloons; etching of zinc; and chemical processes.

Incompatibilities: A flammable gas. Incompatible with acids, halogenated hydrocarbons, oxidizers, moisture, chlorine, ammonia. Reacts violently with chlorine, concentrated nitric acid, and ozone. Decomposes in air. Thermally unstable: quick decomposition at 200°C producing metallic antimony and explosive hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 ppm/0.5 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.5 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 ppm/0.5 mg/m^3 TWA.

NIOSH IDLH: 5 ppm

Protective Action Criteria (PAC)

TEEL-0: 0.1 ppm

PAC-1: 0.2 ppm

PAC-2: 1.5 ppm

PAC-3: 9.6 ppm

Austria: MAK 0.1 ppm (0.5 mg/m^3), 1999; Denmark: TWA 0.05 ppm (0.25 mg/m^3), 1999; France: VME 0.1 ppm (0.5 mg/m^3), 1999; Norway: TWA 0.05 ppm (0.25 mg/m^3), 1999; Poland: MAC (TWA) 0.2 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Sweden: TWA 0.05 ppm (0.3 mg/m^3), 1999; United Kingdom: TWA 0.1 ppm (0.52 mg/m^3); STEL 0.3 ppm, 2000; the Netherlands: MAC-TGG 0.5 mg[Sb]/m^3. Several states have set guidelines or standards for stibine in ambient air[60] ranging from 5.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6008, Stibine.

Permissible Concentration in Water: See regulatory section.

Routes of Entry: Inhalation of gas.

Harmful Effects and Symptoms

Short Term Exposure: Stibine can affect you when breathed in. May be fatal if absorbed through the skin or inhaled. A strong sensitizer. May cause severe allergic respiratory reaction. Exposure can cause rapid, fatal poisoning, with symptoms of headaches, nausea, dark or bloody urine, pain in the back and abdomen, slowed breathing, and death. Exposure can also irritate the lungs and may lead to a buildup of fluid (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death. Stibine destroys red blood cells and can also cause liver and kidney damage.

Long Term Exposure: Stibine destroys red blood cells (hemolysis). May affect the kidneys, liver; hemoglobinuria, hematuria (blood in the urine), hemolytic anemia; jaundice. May affect the central nervous system.

Points of Attack: Blood, liver, kidneys, respiratory system, CNS.

Medical Surveillance: NIOSH lists the following tests: liver function tests; red blood cells/count, RBC hemolysis; urine (chemical/metabolite), hemoglobin; urinalysis (routine); white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Examination of the central nervous system. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Stibine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric), and halogenated hydrocarbons, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, and flames.

Shipping: Stibine requires a shipping label of "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 1.7/2.8
Night 4.5/7.2

Fire Extinguishing: This chemical is a flammable gas. Evolves hydrogen and poisonous gases, including antimony, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Use flooding quantities of water. Do not use halogenated extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in hydrochloric acid; add water to produce precipitate; add acid to dissolve again; precipitate with H_2S; filter and dry precipitate and return to suppliers.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R46; R65; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Stoddard solvent is a refined petroleum solvent containing $>65\%$ C_{10} or higher hydrocarbons. Stoddard solvent is a colorless liquid with a kerosene-like odor. Odor threshold = 1 ppm$^{(NY)}$−30 ppm. Molecular weight can vary = 140−160; Specific gravity (H_2O:1) = 0.765−0.795 at 25°C; Boiling point = 154−202°C[1]; 130−230°C; Flash point = 39−60°C; but, may vary from 21°C to 60°C based on composition; Autoignition temperature = 229−240°C; but may vary based on composition. Explosive limits: LEL = 0.6%; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 20, Flammability 2, Reactivity 0. Insoluble in water. See also "Naphthas" for related materials.

Potential Exposure: Compound Description: Primary Irritant. Stoddard solvent is used as a diluent in paints, coatings, and waxes; as a paint thinner; as a dry-cleaning agent; as a degreaser for metal parts; as an herbicide.

Incompatibilities: Forms explosive mixture with air. Keep away from strong oxidizers. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 500 ppm/2900 mg/m^3 TWA.

NIOSH REL: 350 mg/m^3 TWA; 1800 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 100 ppm/525 mg/m^3 TWA.

NIOSH IDLH: 20,000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 100 ppm

PAC-2: 350 ppm

PAC-3: 3850 ppm

Australia: TWA 790 mg/m^3, 1993; Belgium: TWA 100 ppm (525 mg/m^3), 1993; Denmark: TWA 25 ppm (140 mg/m^3), 1999; the Philippines: TWA 200 ppm (1150 mg/m^3), 1993; the Netherlands: MAC-TGG 575 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 100 ppm. Several states have set guidelines or standards for Stoddard solvent in ambient air[60] ranging from 5.25−10.50 mg/m^3 (North Dakota) to 7.0 mg/m^3 (Connecticut) to 12.5 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 1550, Naphthas; OSHA Analytical Method 48.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.2−7.1.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Causes irritation of the eyes and respiratory tract. Exposure to levels above 2400 mg/m^3 may cause headache, dizziness, nose and throat irritation. More severe exposures may cause nausea and vomiting, a feeling of intoxication, weakness, muscle twitches; and in extreme cases, convulsions, unconsciousness, and death. *Skin:* Contact with liquid may cause irritation and drying of skin. This can result in dermatitis. *Eyes:* Contact with liquid or vapor levels of 900−2400 mg/m^3 may cause irritation and tearing. *Ingestion:* Small amounts may cause headache, dizziness, nausea, vomiting, intoxication, weakness, muscle twitches, convulsions, and unconsciousness. May cause aspiration into the lungs and chemical pneumonia. As little as 3 oz may be fatal. If liquid is breathed into the lungs, as little as 1 oz may cause death due to respiratory failure.

Long Term Exposure: Prolonged or repeated contact with liquid may cause defatting of the skin with drying, irritation, and skin ulcers. Exposure to vapor may cause eye, nose and throat irritation, fatigue, headaches, anemia, jaundice, and damage to the liver and bone marrow. In animals: kidney damage. Repeated exposure may cause a rare reaction in some people that destroys blood cells (aplastic anemia). This can be fatal. Many petroleum-based solvents have been shown to cause brain and/or nerve damage. Effects may include reduced memory and concentration, personality changes, fatigue, sleep disturbances, reduced coordination, effects on the autonomic nerves and/or nerves to the limbs.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: complete blood count. Evaluation for brain effects. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do *NOT* induce vomiting.

Note to physician: Treat symptomatically for central nervous system depression. Supportive treatment for pulmonary edema using oxygen may be needed when aspiration of liquids or massive exposure to vapors has occurred.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Some of these manufacturers recommend *nitrile* or *polyvinyl alcohol* as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For engineering controls see *Criteria for a Recommended Standard: Occupational Exposure to Refined Petroleum*, NIOSH Doc. No. 77-192.

Respirator Selection: NIOSH: *Up to 3500 mg/m^3:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa* (APF = 10) (any supplied-air respirator). *Up to 8750 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 17,500 mg/m^3:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 20,000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Stoddard solvent must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Stoddard solvent is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Petroleum distillates, n.o.s. require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 242-646-8

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human No Adequate Data, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1978, 1999; NTP: Reasonably anticipated to be a human carcinogen.

US EPA Hazardous Waste Number (RCRA No.): U206.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer 1/1/88; Developmental/Reproductive toxin (male, female) 8/20/99.

Hazard Symbols: T; Risk phrases: R45; Safety phrases: S45; S53.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Streptozotocin is a crystalline substance. Molecular weight = 265.6; Freezing/Melting point = 115°C. Soluble in water.

Potential Exposure: Used as a medicine to treat cancer. Steptozotocin (STR), a water-soluble antibiotic, has been of interest as a potential antineoplastic agent. STR is used in research for studies on diabetes because of its specific toxic action on B-cells of the pancreas, including hyperglycemia. STR is produced by the soil microorganism *Streptomyces achromogenes*. It has also been synthesized by laboratory procedures. Occupational exposure to STR is believed to be limited to pharmaceutical and research workers.

Incompatibilities: Alkalis.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Can damage the kidneys and pancreas; may damage the nervous system. These effects may be permanent. High exposure can damage the bone marrow causing anemia, reduced white blood cells, and reduced platelets, causing a tendency to bleeding. Symptoms of exposure include abdominal pain; nausea, vomiting; central nervous system depression; renal or hepatic toxicity; proximal tubular damage; hematological toxicity, consisting of anemia, leukopenia, or thrombocytopenia; diabetes mellitus with severe toxic peripheral neuropathy.

Long Term Exposure: This chemical is a probable human carcinogen. There is evidence of liver, kidney, and pancreatic cancer in humans. There is evidence that it is a teratogen in animals. Exposure can cause kidney damage and pancreas damage causing diabetes. May damage the nervous system. This chemical is closely related to pyriminyl, a rat poison.

Points of Attack: Nervous system, kidneys, pancreas, liver.

Medical Surveillance: Liver and kidney function tests. Test for blood sugar. Complete examination of the nervous system, including the autonomic nervous system.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Groups II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R50/53; Safety phrases: S53; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Strontium chromate is a light yellow crystalline solid or powder. Molecular weight = 203.62. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Strontium chromate is used as a metal protective coating to prevent corrosion, in wash primers; and aluminum flake coatings; colorant in polyvinyl chloride resins and pyrotechnics.

Incompatibilities: Violent reaction with strong oxidizers, hydrazine. Incompatible with combustible, organic, or other readily oxidizable materials, such as paper, wood, sulfur, aluminum powder. Attacks plastics and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 0.005 mg[Cr]/m^3 TWA.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.0005 mg[Cr]/m^3 TWA, Suspected Human Carcinogen.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

No TEEL available.

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Arab Republic of Egypt: TWA 0.5 mg/m^3, 1993; Australia: TWA 0.5 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.001 mg [Cr]/m^3, 1999; Finland: TWA 0.5 mg/m^3; carcinogen, 1999; France: VME 0.05 mg[Cr]/m^3, 1999; [skin], 1993; India: TWA 0.5 mg/m^3, 1993; Japan: 0.01 mg[Cr]/m^3, 1999; Norway: TWA 0.02 mg[CrO_3]/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: TWA 0.5 mg/m^3, 1999; Sweden: NGV 0.02 mg/m^3, carcinogen, 1999; Switzerland: MAK-W 0.05 mg[Cr]/m^3, 1999; Thailand: TWA 1 mg/m^3, 1993; United Kingdom: TWA 0.05 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.0005 mg[Cr]/m^3. The former USSR-UNEP/IRPTC joint project[43] set a MAC of 0.01 mg/m^3 in work-place air. Connecticut[60] has set a guideline for chromium trioxide in ambient air of 0.25 μg/m^3.

Determination in Air: Use NIOSH Analytical Methods #7600,#7604, #7605, #7703, #9101; OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: For the protection of freshwater aquatic life: *hexavalent chromium:* 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: *hexavalent chromium:* 18 μg/L as a 24-h average, never to exceed 1260 μg/L. To protect human health: *hexavalent chromium*; 50 μg/L according to EPA.[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62]

Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines of 50 μg/L and 120 μg/L, respectively, for chromium in drinking water.[61]

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption or by colorimetry (diphenylcarbazide) or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μm filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Strontium chromate can affect you when breathed in. Strontium chromate is a carcinogen; handle with extreme caution. Contact may burn the skin and eyes. The vapor or dust may irritate the mouth, nose, and air passages.

Long Term Exposure: Repeated or prolonged exposure (at 20 mg/m^3) may damage the lungs, heart, liver, kidneys, and affect the nervous system. May affect the blood and brain, resulting in changes in white and red blood cells and neurovegetative disorders. Strontium chromate accumulates in the body with repeated exposure and effects can persist after exposure. Repeated or prolonged contact with skin may cause skin sensitization, dermatitis, or ulcers. Lungs may be affected or asthma may develop from repeated or prolonged exposure; and with some chromate exposures, nasal septim perforation has occurred. This substance is possibly carcinogenic to humans.

Points of Attack: Kidneys, liver, nervous system, heart, lungs.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis, complete blood count; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: tests for kidney and liver function. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and demulcents and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Strontium chromate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, oxidizing, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS, OXIDIZER." Strontium chloride falls in Hazard Class 6.1 and Packing Group I or II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete.

It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. Inhaling the hot fumes may cause cyanosis. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

As nitrate compounds (water dissociable)

EPCRA Section 313: Reportable only when in aqueous solution. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), as nitrates, inorganic, n.o.s.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Strontium nitrate is a white crystalline solid. Molecular weight = 211.64; Boiling point = 645°C; Freezing/Melting point = 570°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2 (Oxidizer). Soluble in water.

Potential Exposure: Strontium nitrate is used in matches, pyrotechnics, marine signals, and railroad flares.

Incompatibilities: A strong oxidizer. Violent reaction with reducing agents, combustibles, organics, or other readily oxidizable materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3.5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 500 mg/m^3

Russia[43] set a MAC of 1.0 mg/m^3 in work-place air.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Strontium nitrate can affect you when breathed in. Contact may burn the skin and eyes. The vapor or dust can irritate eyes, mouth, nose, and air passages. Higher levels may cause a chemical pneumonia.

Long Term Exposure: Repeated exposure (at 50 mg/m^3) has caused damage to the lungs, heart muscle, liver, kidneys, and blood forming organs; and affects the nervous system in animals. Strontium nitrate accumulates in the body with repeated exposure and effects can persist after exposure stops.

Points of Attack: Liver, kidneys, nervous system, blood.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: tests for kidney and liver function. Examination of the nervous system. Complete blood count (CBC). If respiratory symptoms are present, lung function tests are recommended. Persons on low calcium diets may be at greater risk of absorbing more strontium nitrate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 h in case chemical pneumonia or other respiratory symptoms are present.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits,

gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to strontium nitrate, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Strontium nitrate must be stored to avoid contact with combustible, organic, or other readily oxidizable materials, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Strontium nitrate requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep strontium nitrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Strychnine S:0650

Molecular Formula: $C_{21}H_{22}N_2O_2$; $C_{21}H_{22}N_2O_2 \cdot \frac{1}{2}H_2O_4S$ (sulfate)

Synonyms: Boomer-Rid; Certox; Dolco mouse cereal; Estricnina (Spanish); Gopher bait; Gopher-gitter; Hare-rid; Kwik-kil; Mole death; Mouse-nots; Mouse-rid; Mouse-tox; Nux vomica; Pied piper mouse seed; Ro-Dex; Sanaseed; Strychnidin-10-one; Strychnin (German); Strychnos

Strychnine, sulfate(2:1): Antivampire; Strychinium sulfate; Strychnidin-10-one, sulfate (2:1); Strychnine hemisulfate; Strychnine sulfate; Vampirol

CAS Registry Number: 57-24-9; 60-41-3 (sulfate)

RTECS® Number: WL2275000; WL2550000 (sulfate)

UN/NA & ERG Number: UN1692/151

EC Number: 200-319-7 [*Annex I Index No.:* 614-003-00-5]; 200-477-7 (strychnine sulfate)

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

US EPA, FIFRA 1998 Status of Pesticides: Canceled (sulfate).

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

US EPA Hazardous Waste Number (RCRA No.): P108.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0% *(Strychnine and salts).*

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations *(Strychnine and salts)*: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Strychnine is a colorless crystalline prisms or white powder. It is odorless; with a bitter taste. Molecular weight = 333.45; 383.49 (sulfate); Specific gravity (H_2O:1) = 1.36 at 25°C; Boiling point = (decomposes) 270°C at 5 mmHg; Freezing/Melting point = 267.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.02%.

Potential Exposure: Compound Description: Agricultural Chemical; Drug; Reproductive Effector; Human Data; Natural Product; (sulfate). Agricultural Chemical; Drug; Human Data. Strychnine is an alkaloid compound that has been widely used as a rodenticide/bait to kill rodents; a medicine, respiratory stimulant. Those involved in the extraction of the seeds of *Strychnos nux-vomica*, *Strychnos ignatii* (S. sancta Ingnatius), and *Strychnos tiente* (Upas tree); formulation or application of this rodent poison. The sulfate is used to kill gophers and moles. A common adulterant in illicit street drugs. Listed as a potential WMD biotoxin.[NIOSH]

Incompatibilities: Strong oxidizers. Dangerous when heated; forms toxic fumes, including nitrogen oxides. In the body, caffeine may increase the strychnine effect.

Permissible Exposure Limits in Air

OSHA PEL: 0.15 mg/m^3 TWA.

NIOSH REL: 0.15 mg/m^3 TWA.

ACGIH TLV®[1]: 0.15 mg/m^3 TWA.

NIOSH IDLH: 3 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.15 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 3 mg/m^3

PAC-3: 3 mg/m^3

Australia: TWA 0.15 mg/m^3, 1993; Austria: MAK 0.15 mg/m^3, 1999; Belgium: TWA 0.15 mg/m^3, 1993; Belgium: TWA 0.15 mg/m^3, 1999; Finland: TWA 0.15 mg/m^3; STEL 0.45 mg/m^3, 1999; France: VME 0.15 mg/m^3, 1999; the Netherlands: MAC-TGG 0.15 mg/m^3, 2003; the Philippines: TWA 0.15 mg/m^3, 1993; Poland: MAC (TWA) 0.15 mg/m^3, 1999; Switzerland: MAK-W 0.15 mg/m^3, KZG-W 0.3 mg/m^3, 1999; Turkey: TWA 0.15 mg/m^3, 1993; United Kingdom: TWA 0.15 mg/m^3; STEL 0.45 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.15 mg/m^3. Several states have set guidelines or standards for strychnine in ambient air[60] ranging from 1.5 μg/m^3 (North Dakota) to 2.5 μg/m^3 (Virginia) to 3.0 μg/m^3 (Connecticut) to 4.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5016.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.68.

Routes of Entry: Inhalation of dust, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Affects the central nervous system, causing convulsions, muscle contractions, and respiratory failure. Super toxic; probable oral lethal dose in humans is less than 5 mg/kg, a taste (less than 7 drops) for a 70-kg (150 lb) person. It causes violent generalized convulsions. Death results from respiratory arrest as the respiratory muscles are in sustained spasm. The lowest lethal oral dose reported for humans if 30 mg/kg. Respiratory paralysis and arrest are likely to occur following severe exposure to strychnine. Signs and symptoms of acute exposure generally involve excitation of all portions of the central nervous system. Convulsions, bilateral horizontal nystagmus (rapid, synchronous, horizontal, oscillations of the eyeballs), agitation, restlessness, apprehension, and abrupt jerking movements of the extremities may occur. Victims may also experience stiffness, painful muscle cramping (especially in the legs), and opisthotonos (spasm in which the spine and extremities are bent with convexity forward, the body resting on the head and heels). Vomiting and renal failure, as well as cyanosis (blue tint to skin and mucous membranes) and rhabdomyolysis (destruction of skeletal muscle), may be found.

Long Term Exposure: Chronic allergen if inhaled or ingested.

Points of Attack: Central nervous system.

Medical Surveillance: Be aware of possible convulsions. Consider the points of attack in preplacement and periodic physical examinations. Examination by a qualified allergist.

First Aid: Remove victims from exposure. Emergency personnel should avoid self-exposure to strychnine. Warning—Any unnecessary sensory input may induce seizures. Isolate the victims from any avoidable distractions. Rush to a healthcare facility! Evaluate vital signs including pulse and respiratory rate, and note any trauma. If no pulse is detected, provide CPR. If not breathing, provide artificial respiration. If breathing is labored, administer oxygen or other respiratory support. Remove contaminated clothing as soon as possible. If eye exposure has occurred, remove any contact lenses at once; eyes must be flushed with lukewarm water for at least 15 min. Wash exposed skin areas thoroughly with soap and water. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.75 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1.5 mg/m^3:* 95 XQ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 3 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a dust and mist filter) or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and heat. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Strychnine or strychnine salts requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Avoid breathing dusts, and fumes from burning materials. Keep upwind. Avoid bodily contact with the material. *Do Not* handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire; material itself does not burn or burns with difficulty. Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide, or dry chemical. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Careful incineration has been recommended for disposal. Two procedures are suggested.[1] Pour or sift onto a thick layer of sand and soda ash mixture (90:10). Mix and shovel into a heavy paper box with much paper packing. Burn in incinerator. Fire may be augmented by adding excelsior and scrap wood. Stay on the upwind side.[2] Waste may be dissolved in flammable solvent (alcohols, benzene, etc.) and sprayed into fire box of an incinerator with afterburner and scrubber.[22]

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Styrene is a colorless to yellowish, very refractive, oily liquid with a penetrating odor. The odor threshold = 0.02−0.47 ppm. Molecular weight = 104.16; Specific gravity (H_2O:1) = 0.91 at 25°C; Boiling point = 145°C; Freezing/Melting point = −30.6°C; Vapor pressure = 5 mmHg; Flash point = 31°C; Autoignition temperature = 490°C. Explosive limits: LEL = 0.9%; UEL = 6.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Practically insoluble in water; solubility = 0.03%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Styrene is used in the production of plastics and polystyrene resins. It is also used in combination with 1,3-butadiene or acrylonitrile to form copolymer elastomers, butadiene-styrene rubber, and acrylonitrile-butadiene-styrene (ABS). It is also used in the manufacture of protective coatings; resins, polyesters; in making insulators and in drug manufacture.

Incompatibilities: Styrene forms explosive mixture with air. A storage hazard above 31°C. Upon heating to 200°C, styrene polymerizes to form polystyrene, a plastic. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a cool, dry area away from oxidizers, catalysts for vinyl polymers, peroxides, strong acids, aluminum chloride. May polymerize if contaminated, subjected to heat; under the influence of light; and on contact with many compounds, such as oxygen, oxidizing agents, peroxides, and strong acids. Usually contains an inhibitor, such as *tert*-butylcatechol. Corrodes copper and copper alloys. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.26 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm TWA; 200 ppm Ceiling Concentration; 600 ppm [5 min max peak in any 3 h].

NIOSH REL: 50 ppm/215 mg/m^3 TWA; 100 ppm/425 mg/m^3 STEL.

ACGIH TLV®[1]: 20 ppm/85 mg/m^3 TWA; 40 ppm/170 mg/m^3 STEL, not classifiable as a human carcinogen. BEI: 800 mg[mendelic acid]/g creatinine in urine/end-of-shift; 300 mg[mendelic acid]/g creatinine in urine, prior to next shift; 240 mg[phenylglyoxylic acid]/g creatinine in urine/end-of-shift; 100 mg[phenylglyoxylic acid]/g creatinine in urine, prior to next shift; 0.55 mg[styrene]/L in blood/end-of-shift; 0.02 mg[styrene]/L in blood, prior to next shift.

Protective Action Criteria (PAC)*
TEEL-0: 20 ppm
PAC-1: **20** ppm
PAC-2: **130** ppm
PAC-3: **1100** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 20 ppm/86 mg/m^3 TWA; Peak Limitation Category II(2); Carcinogen Category 5; Pregnancy Risk Category C; BAT: 600 mg[mendelic acid plus phenylglyoxylic acid]/g creatinine in urine/end-of-shift; for long term exposures: after several shifts.

NIOSH IDLH: 700 ppm.

Australia: TWA 50 ppm (215 mg/m^3); STEL 100 ppm, 1993; Austria: MAK 20 ppm (85 mg/m^3), 1999; Denmark: TWA 25 ppm (105 mg/m^3), [skin], 1999; Finland: TWA 20 ppm (85 mg/m^3); STEL 100 ppm (420 mg/m^3), 1999; France: VME 50 ppm (215 mg/m^3), 1999; Hungary: STEL 50 mg/m^3, carcinogen, 1993; Japan: 50 ppm (210 mg/m^3), 2B carcinogen, 1999; the Netherlands: MAC-TGG 107 mg/m^3, 2003; Norway: TWA 25 ppm (105 mg/m^3), 1999; the Philippines: TWA 100 ppm (420 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3; MAC (STEL) 200 mg/m^3, 1999; Sweden: NGV 20 ppm (90 mg/m^3), KTV 50 ppm (200 mg/m^3), [skin], 1999; Switzerland: MAK-W 50 ppm (215 mg/m^3), KZG-W 100 ppm (430 mg/m^3), 1999; Thailand: TWA 100 ppm; STEL 200 ppm, 1993; Turkey: TWA 100 ppm (420 mg/m^3), 1993; United Kingdom: TWA 100 ppm (430 mg/m^3); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 40 ppm. Also, values for styrene in ambient air in residential areas vary. The Czech Republic[35] has set 0.015 mg/m^3, both on a momentary and a daily average basis. Russia has set 0.003 mg/m^3 both on a daily average and momentary basis[43] but values are also given[35] as 0.04 mg/m^3 on a once-daily basis and 0.002 mg/m^3 on a daily average basis. Several states have set guidelines or standards for styrene in ambient air[60] ranging from zero (North Carolina) to 3.45 μg/m^3 (Indiana) to 30.0 μg/m^3 (Rhode Island) to 34.48 μg/m^3 (Kansas) to 39.0 μg/m^3 (Massachusetts) to 716.0 μg/m^3 (New York) to 2150.0−4250.0 μg/m^3 (North Dakota) to 3600.0 μg/m^3 (Virginia) to 4300.0 μg/m^3 (Connecticut) to 5119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1501, Aromatic hydrocarbons; #3800. OSHA Analytical Method 9 or 89.

Permissible Concentration in Water: A lifetime health advisory of 140 μg/L has been determined by EPA.[48] Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes. This same limit applies to water bodies used for fishery purposes. Several states have set guidelines for styrene in drinking water[61] ranging from 10.0 μg/L (Wisconsin) to 140 μg/L (Arizona and Minnesota) to 270 μg/L Maine.

Determination in Water: Styrene may be determined by a purge-and-trap gas chromatographic procedure.[48] Octanol−water coefficient: Log $K_{\mathrm{ow}} = 3.2$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Irritates the eyes, skin, and respiratory tract. *Inhalation:* At or above 100 ppm, styrene causes immediate eye and nose irritation; persistent metallic taste; headache, fatigue, slight muscular weakness; loss of appetite; drowsiness, feelings of drunkenness, decreased coordination; depression, unconsciousness; inflammation of the lung, kidney and liver damage, and death. *Skin:* Can cause drying, cracking, itching, burning, and sores. Absorption is moderate and can cause symptoms described above. *Eyes:* Can cause severe itching, tearing, and injury to the surface of the eye. *Ingestion:* Symptoms are same as inhalation. Additional symptoms may include severe irritation of the mouth, throat, and stomach. Swallowing the liquid may cause chemical pneumonitis.

Long Term Exposure: Repeated exposure to low levels can cause concentration problems, memory problems, learning disability, slowed reflexes; reduced coordination and manual dexterity; and trouble with balance; nausea, headache, fatigue, and a feeling of drunkenness. Continued exposures to levels near 400 ppm can cause eye and throat irritation, and slight impairment of coordination and balance. At higher air concentrations, nasal, eye, throat, and skin irritation becomes pronounced. Prolonged inhalation of vapors may cause respiratory tract obstruction. Very high levels may affect brain function and cause liver damage and death. Cases of liver damage have been found in workers employed for over 5 years in polystyrene plants and exposed to a concentration of 20−150 ppm. Styrene has been found to produce lung tumors in mice and cause changes in the genetic material of laboratory organisms. Whether it does so in humans is not known.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, reproductive system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-workweek; whole blood (chemical/metabolite), prior to next shift; whole blood (chemical/metabolite), Prior to Shift, expired air, Expired Air, During Exposure. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: EEG (brain wave study).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Safety equipment manufacturers and styrene manufacturers recommend Teflon™, Viton™/chlorobutyl rubber, chlorinated polyethylene, and polyvinyl alcohol as the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Before entering a confined space where styrene monomer is present, check the oxygen level (at least 19% must be present) and that explosive concentration does not exist.

Respirator Selection: NIOSH: *500 ppm:* CcrOv* [any chemical cartridge respirator with organic vapor cartridge(s)] or SA* (any supplied-air respirator). *700 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. A storage hazard above 31°C. Before entering a confined space where styrene monomer is present, check the oxygen level (at least 19% must be present) and that explosive concentration does not exist. Styrene monomer must be stored to avoid contact with oxidizing agents; and catalysts for vinyl polymerization, such as peroxides, strong acids (such as hydrochloric, sulfuric, and nitric); and aluminum chlorides, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where styrene monomer is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of styrene monomer should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of styrene monomer. Wherever styrene monomer is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Styrene monomer will corrode copper and copper alloys and dissolve rubber. Styrene monomer must be stored with an inhibitor to prevent explosive reactions. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Styrene monomer, inhibited, requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including styrene oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In some cases, recovery and recycle of styrene monomer is economic and the technology is available.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R21; R36; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Styrene oxide is a colorless to pale straw-colored liquid with a pleasant, sweet odor. Molecular weight = 120.16; Specific gravity (H_2O:1) = 1.02 at 25°C; Boiling point = 194°C; Freezing/Melting point = −36.6°C; Flash point = 76°C; Autoignition temperature = 498°C. Explosive limits: LEL = 1%; UEL = 22%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Styrene oxide is used as a reactive intermediate, especially to produce styrene glycol and its derivatives. Substantial amounts are also used in the epoxy resin industry as a diluent. It may also have applications in the preparation of agricultural and biological chemicals, cosmetics, and surface coatings and in the treatment of textiles and fibers. Styrene oxide is made in quantities in excess of a million pounds per year, and further, is a presumed metabolite of styrene which is produced in much greater quantities.

Incompatibilities: Forms an explosive mixture with air. May polymerize on heating above 200°C, under the influence of strong acids, strong bases, oxidizers, metal salts, such as aluminum chloride, catalysts for vinyl polymers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 4 ppm

PAC-1: 12.5 ppm

PAC-2: 50 ppm

PAC-3: 50 ppm

Austria: carcinogen, 1999; France: carcinogen, 1993.

Determination in Air: NIOSH Analytical Method (IV) #1501, aromatic Hydrocarbons.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Toxic by ingestion, inhalation, and skin absorption. May be corrosive. Irritates the skin, eyes, and mucous membranes. If inhaled, causes irritation to mucosal surfaces; may cause headache, fatigue, weakness, nausea, vomiting, diarrhea, central nervous system depression; unsteadiness or feeling of drunkenness; peripheral and hepatic neuropathies. May cause you to pass out.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and skin allergy, with drying and cracking. May cause liver damage. Probable carcinogen in humans; has been shown to cause stomach and liver cancer in animals. May cause decreased fertility in females.

Points of Attack: Skin, liver.

Medical Surveillance: Liver function tests. Evaluation by a qualified allergist. Drinking alcohol may increase the liver damage caused by styrene oxide.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is recommended by some safety equipment manufacturers. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH as styrene monomer: *500 ppm:* CcrOv* [any chemical cartridge respirator with organic vapor cartridge(s)] or SA* (any supplied-air respirator). *700 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a cool, dry place. A fireproof area separated from strong acids is recommended.[57] Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well, first with 60−70% ethanol, then with soap and with 60−70% ethanol. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including styrene oxide, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (BPN).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R37/38; R41; R42; Safety phrases: S2; S22; S24; S26; S36/37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: These are proteolytic enzymes which take the form of light-colored, free-flowing powders. A protein containing numerous amino acids. Molecular weight = 28,000 (approx.).

Potential Exposure: Compound Description (BPN): Drug, Natural Product; Primary Irritant; (Carlsburg). Primary Irritant. These commercial proteolytic enzymes are used in laundry detergent formulations.

Incompatibilities: None reported.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.00006 mg/m^3 [60-min] STEL.

ACGIH TLV®[1] (*as crystalline active enzyme*): 0.00006 mg/m^3 Ceiling Concentration.

No TEEL available.

DFG MAK: Danger of airway sensitization.

(*BPN*) Australia: TWA 0.00006 mg/m^3, 1993; Denmark: TWA 0.00006 mg/m^3, 1999; Norway: TWA 0.00006 mg/m^3, 1999; Switzerland: MAK-W 0.00006 mg/m^3, 1999; United Kingdom: LTEL 0.00006 mg/m^3; STEL 0.00006 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.00006 mg/m^3.

(*Carlsburg*) Sweden: TWA 1 glycine unit/m^3, ceiling 3 glycine units/m^3, 1999; United Kingdom: LTEL 0.00006 mg/m^3; STEL 0.00006 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.00006 mg/m^3. Several states have set guidelines or standards for subtilisins in ambient air[60] ranging from zero (North Dakota) to 0.1 μg/m^3 (Nevada) to 1000.0 μg/m^3 (Virginia).

Determination in Air: No method available.

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Short Term Exposure: Subtilisins can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure can cause runny nose, congestion, sore throat, sweating, headache, chest pain, flu-like symptoms, cough, breathlessness, wheezing. Prolonged exposure may lead to chronic lung damage.

Long Term Exposure: Subtilisins may cause respiratory sensitization and enzyme asthma. Future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness. Contact can irritate the skin, especially in sweaty areas. Prolonged exposure may lead to chronic lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.00006 mg/m³*, use a NIOSH/MSHA- or European Standard EN149-approved respirator with a high-efficiency particulate filter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 200-334-9

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Inconclusive: Mammalian micronucleus.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sucrose is a white crystalline solid; Molecular weight = 342.34; Specific gravity (H_2O:1) = 1.59 at 25°C; Boiling point = (decomposes); Freezing/Melting point = (decomposition) 160−186°C. Maximum Explosive concentration (MEC) = 45 g/m³. Hazard Identification (based on

NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Highly soluble in water; solubility = 200%.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data. Widely used as a sweetener for foods in households and industry; in pharmacy as a preservative; in the manufacture of ink.

Incompatibilities: Oxidizers, sulfuric acid, nitric acid. A noncombustible solid, but fine airborne dust may explode.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA total dust; 5 mg/m^3 respirable fraction TWA.

NIOSH REL: 10 mg/m^3 TWA, total dust; 5 mg/m^3 TWA respirable fraction.

ACGIH TLV®[1]: 10 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; France: VME 10 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The state of Virginia has set 80.0 $\mu g/m^3$ as a guideline for sucrose in ambient air.

Determination in Air: Filter; none; Gravimetric; NIOSH IV, Particulates NOR: Method #0500, total dust, Method #0600 (respirable).

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Acute doses may cause irritation of the eyes, skin, and upper respiratory system; cough may develop.

Long Term Exposure: Chronic doses may cause obesity, peripheral vascular disease, possible exacerbation of diabetes mellitus, hypoinsulinemia, hyperlipemia, and dental cavities.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: Blood sugar.

First Aid: *Skin Contact:* Use soap and water to clean.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline. Seek medical attention if irritation or other symptoms develop.

Inhalation: Inhalation of powdered sucrose can cause coughing and irritation of the lungs. Leave the contaminated area and breathe fresh air. If persistent coughing or other symptoms develop, seek medical attention.

Ingestion: Ingestion of sucrose in moderate amounts poses no acute toxic problems unless the person is a diabetic.

Personal Protective Methods: Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Dust mask.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, potassium hydroxide.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water, then transfer material to a suitable container. Wash surfaces with soap and water. Use absorbent dampened with water to pick up remaining material. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid, but airborne particles may explode. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS® Number: EZ5075000

UN/NA & ERG Number: UN2992 (Carbamate pesticides, liquid, toxic)/151

EC Number: 202-388-9 [*Annex I Index No.:* 006-038-00-4]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1983; NTP: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis Studies (feed); clear evidence: rat, mouse, 1978; NTP: Report on Carcinogens, 2004.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R50/53; Safety phrases: S53; S45; S60; S61.

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sulfallate is an amber liquid. Molecular weight = 223.80; Boiling point = 128−130°C under 1.0 mm pressure; Flash point = 88°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: The major use for sulfallate in the United States is as a preemergent selective herbicide to control certain annual grasses and broadleaf weeds around vegetable and fruit crops. Sulfallate has also been used for weed control among shrubbery and ornamental plants. Some dithiocarbamates have been used as rubber components.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

DFG MAK: Danger of skin sensitization (dithiocarbamates used as rubber components).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. May be absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. High exposure may cause fatigue, sleepiness, headache, dizziness, upset stomach; severe rash and personality changes, muscle weakness, and collapse may result. LD_{50} = (oral-rat) 850 mg/kg (slightly toxic).

Long Term Exposure: Repeated or prolonged skin contact may cause rash from irritation. A probable carcinogen in humans. Repeated exposure may cause kidney damage. Sulfallate, a chlorinated dithiocarbamate, administered in the feed, was carcinogenic to Osborne-Mendel rats and to B6C3F1 mice, inducing mammary gland tumors in females of both species, tumors of the fore stomach in male rats, and lung tumors in male mice. May be a cholinesterase inhibitor.

Points of Attack: Skin, eyes, kidneys, plasma and red blood cell cholinesterase. Cancer site in animals: stomach, lungs.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry regulated area. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Carbamate pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." Sulfallate falls in Hazard Class 6.1 and Packing Group II or III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, sulfur oxides, and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be decomposed by strong oxidizing agent. Large amounts should be incinerated in a unit with effluent gas scrubbing.[22]

Sulfolane S:0710

Molecular Formula: $C_4H_8O_2S$

Common Formula: $C_4H_8SO_2$

Synonyms: Bondelane A; Bondolane A; Cyclic tetramethylene sulfone; Cyclotetramethylene; Dihydrobutadiene sulphone; 1,1-Dioxidetetrahydrothiofuran; 1,1-Dioxidetetrahydrothiophene; Dioxothiolan; 1,1-Dioxothiolan; Sulfalone; Sulfolan; Sulpholane; Sulphoxaline; Tetrahydrothiofen-1,1-dioxid; Tetrahydrothiophene dioxide; Tetrahydrothiophene 1,1-dioxide; 2,3,4,5-Tetrahydrothiophene-1,1-dioxide; Tetramethylene sulfone; Thiacyclopentane dioxide; Thiocyclopentane-1,1-dioxide; Thiolane-1,1-dioxide; Thiophane dioxide; Thiophan sulfone

CAS Registry Number: 126-33-0

RTECS® Number: XN0700000

EC Number: 204-783-1 [*Annex I Index No.:* 016-031-00-8]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; Safety phrases: S2; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sulfolane is a colorless oily liquid. Molecular weight = 120.18; Boiling point = 285°C; Freezing/Melting point = 27°C; Flash point = 176°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Sulfolane is used primarily as a process solvent for extraction of aromatics and for purification of acid gases. Used as a curing agent for epoxy resins; in medicine as an antibacterial; in fractionation of wood tars, tall oil, and other fatty acids; a component of hydraulic fluid; in textile finishing.

Incompatibilities: Strong oxidizers. Contact with nitronium tetrafluoroborate(1-) is potentially explosive.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 125 mg/m^3

PAC-1: 200 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 200 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to the eyes. Lethality data indicate that sulfolane is not highly acutely toxic. Oral LD_{50} values in the rat range from 1846 to 2500 mg/kg. Symptoms of neurotoxicity have been observed in rats, dogs, and monkeys; after ingestion, injection, inhalation, or dermal application of sulfolane. These effects include convulsions, hyperactivity, tremors, and ataxia. Other effects of acute exposure to sulfolane include alterations in stomach, intestines, lungs, and liver following ingestion; and lung and liver inflammation following inhalation.

Long Term Exposure: Sulfolane is neither a dermal sensitizer nor an irritant in the guinea pig, but it does cause eye injuries in rabbits. Subchronic inhalation exposure to sulfolane has resulted in leukopenia in rats and monkeys. No information was found on the carcinogenicity or teratogenicity of sulfolane. The compound was not mutagenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Banned or Severely Restricted (former USSR) (UN).[13]

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): P109.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S23; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sulfotep is a yellow mobile liquid with a garlic-like odor. Molecular weight = 322.34; Specific gravity (H_2O:1) = 1.20 at 25°C; Boiling point = (decomposes) 131−135°C at 2 mmHg; Vapor pressure = 0.0002 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1. Practically insoluble in water; solubility = 0.0007%. A pesticide that may be absorbed on a solid carrier or mixed in a more flammable liquid which will change the physical properties listed here.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Sulfotep is used in greenhouse fumigant formulations for control of aphids, spider mites, thrips, whiteflies, etc.

Incompatibilities: Strong oxidizers. Hydrolyzes very slowly in aqueous solution. Attacks some forms of plastic, rubber, and coatings. Corrosive to iron.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 13.18 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.2 mg/m^3 TWA [skin].

NIOSH REL: 0.2 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.2 mg/m^3, measured as inhalable fraction and vapor TWA [skin] not classifiable as a human carcinogen.

NIOSH IDLH: 10 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 10 mg/m^3

DFG MAK: 0.0075 ppm/0.1 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C.

EEC OEL: 0.1 mg/m^3 [skin].

Australia: TWA 0.2 mg/m^3, [skin], 1993; Austria: MAK 0.015 ppm (0.2 mg/m^3), [skin], 1999; Belgium: TWA 0.2 mg/m^3, [skin], 1993; Denmark: TWA 0.015 ppm (0.2 mg/m^3), [skin], 1999; France: VME 0.2 mg/m^3, [skin], 1999; Norway: TWA 0.015 ppm (0.2 mg/m^3), 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Switzerland: MAK-W 0.015 ppm (0.2 mg/m^3), [skin], 1999; Turkey: TWA 0.2 mg/m^3, [skin], 1993; United Kingdom: TWA 0.2 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Several states have set guidelines or standards for sulfotep in ambient air ranging from 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada) to 20.0 μg/m^3 (North Dakota).

Determination in Air: No test available.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.99.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. Can cause rapid, fatal poisoning. Contact may cause eye pain, blurred vision. May affect the nervous system. Symptoms of exposure include lacrimation (discharge of tears); rhinorrhea (discharge of thin nasal mucous); headache, cyanosis, anorexia, nausea, vomiting, diarrhea, localized sweating; weakness, twitching, paralysis, Cheyne-Stokes respiration; convulsions, low blood pressure; cardiac irregular/irregularities; respiratory failure and death. Super toxic; probable oral lethal dose in humans is less than 5 mg/kg, or a taste (less than 7 drops) for a 70-kg (150-lb) person. It is a cholinesterase inhibitor. Material is similar to parathion in symptomatology, including nausea followed by vomiting; abdominal cramps; diarrhea, excessive salivation; headache, giddiness, dizziness, weakness, tightness in chest; blurring of vision; tearing, slurring of speech; confusion, troubled breathing; convulsions, coma, and even death.

Long Term Exposure: A cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: NIOSH lists the following tests: Blood serum; cholinesterase, red blood cells/count. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above test as soon as possible and get an examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep under medical observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *Up to 5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 10 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and moisture. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Tetraethyl dithiopyrophosphate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sulfotep may burn, but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including oxides of phosphorus and sulfur and phosphoric acid mist, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Incineration with added flammable solvent in furnace equipped with afterburner and alkaline scrubber.[22]

Regulatory Authority and Advisory Bodies

FDA—over-the-counter and proprietary drug.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R38; Safety phrases: S2; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent (*metal*); 1—Slightly water polluting (*colloidal*).

Description: Sulfur is a yellow crystalline solid or powder. Often transported in the molten state. Molecular weight = 32.06; 256.5 (S_8); Boiling point = 445°C; Freezing/Melting point = 113−120°C (amorphous); 115°C (β-sulfur); 107°C (r-sulfur); Flash point = 207°C; 160°C (cc); Autoignition temperature = 232°C. Explosive limits: LEL = 35% (1400 g/m^3). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Human Data; Primary Irritant. Widely used in the manufacture of sulfuric acid, carbon bisulfide, drugs, fungicides, gunpowder, wood pulp, rubber, and other products.

Incompatibilities: Combustible solid. Liquid forms sulfur dioxide with air. Violent reaction with strong oxidizers, halogen compounds, phosphorus, sodium, tin, uranium, metal carbides, and other compounds. Forms explosive, shock-sensitive, or pyrophoric mixtures with ammonia, ammonium nitrate, bromates, calcium carbide, charcoal, chlorates, hydrocarbons, iodates, iron. Attacks steel when moist.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.25 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 150 mg/m^3

Russia set a MAC of 6.0 mg/m^3 for work-place air of elemental sulfur.

Determination in Air: Filter; Acid; Inductively coupled plasma; NIOSH Analytical Method (IV) #7300, Elements.

Permissible Concentration in Water: Mexico[35] set a MAC of 0.5 mg/L of sulfides in estuaries.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sulfur can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure can cause inflammation of the nose and irritate the lungs.

Long Term Exposure: Repeated exposures may cause chronic bronchitis to develop with cough, phlegm, and/or shortness of breath. Contact can irritate the skin and may cause skin allergy. Repeated exposure to sulfur dust may cause permanent eye damage (clouding of the eye lens and chronic irritation).

Points of Attack: Skin, respiratory tract.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. Eye examination. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to sulfur, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store solid sulfur in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); chemically active metals (such as potassium, sodium, lithium, and zinc); charcoal, phosphorus, metal nitrates (such as potassium nitrate), and metal halogenates (such as zinc bromate). Molten sulfur must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), chemically active metals (such as potassium, sodium, lithium, and zinc), and metal carbides (such as calcium carbide), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where sulfur is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Sulfur requires a shipping label of "CLASS 9" (Domestic) or "FLAMMABLE SOLID" (International). It falls in Hazard Class 9 (Domestic) or 4.1 (International) and Packing Group III. Sulfur, molten, requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sulfur is a combustible solid. Use dry chemical, water spray, or foam extinguishers. Fire may restart after it has been extinguished. Dust or vapor (from molten sulfur) forms explosive mixtures with air. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Salvage for reprocessing or dump to landfill.

EC Number: 233-036-2 [*Annex I Index No.:* 016-012-00-4]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R14; R20; R25; R29; R35; R50; Safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sulfur chloride is a fuming, oily liquid with a yellowish-red to amber color and a suffocating odor. It has an added hazard since it oxidizes and hydrolyzes to sulfur dioxide and hydrogen chloride. Molecular weight = 135.02; Specific gravity (H_2O:1) = 1.68 at 25°C; Boiling point = 137.8°C; Freezing/Melting point = −77.2°C; Flash point = 118°C (cc).[17] Autoignition temperature = 234°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1₩. Reacts with water (decomposes).

Potential Exposure: Compound Description: Human Data. Sulfur chloride finds use as a chlorinating agent, catalyst, and as an intermediate in the manufacture of organic chemicals, carbon tetrachloride, sulfur dyes, insecticides, synthetic rubber, and pharmaceuticals. Exposure may also occur during the extraction of gold, purification of sugar juice, finishing and dyeing textiles, processing vegetable oils, hardening wood, and vulcanization of rubber. Sulfur chloride has been used as a military poison.

Incompatibilities: Decomposes violently in water, forming hydrochloric acid, sulfur dioxide, sulfur, sulfite, thiosulfate, and hydrogen sulfide. Reacts with oxidizers, strong bases, peroxides, phosphorus oxides, organics, antimony, antimony sulfide, arsenic sulfide, mercury oxide, tin, alkenes, terpenes, unsaturated glycerides, chromyl chloride, methyl sulfoxide, dimethylformamide, acetone, and other compounds, causing fire and explosion hazard. Corrosive to many metals in the presence of water. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor 1 ppm = 5.52 mg/m^3.

OSHA PEL: 1 ppm/6 mg/m^3 TWA.

NIOSH REL: 1 ppm/6 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 1 ppm/5.5 mg/m^3 Ceiling Concentration.

NIOSH IDLH: 5 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.53 ppm

PAC-1: **0.53** ppm

PAC-2: **6.4** ppm

PAC-3: **15** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 1 ppm (6 mg/m^3), 1993; Austria: MAK 1 ppm (6 mg/m^3), 1999; Belgium: STEL 1 ppm (5.5 mg/m^3), 1993; Denmark: TWA 1 ppm (6 mg/m^3), 1999; Finland: TWA 1 ppm (6 mg/m^3); STEL 2 ppm (12 mg/m^3), [skin], 1999; Hungary: STEL 5 mg/m^3, 1993; Japan: 1 ppm (5.5 mg/m^3), 1999; the Netherlands: MAC 6 mg/m^3, 2003; Norway: TWA 1 ppm (6 mg/m^3), 1999; the Philippines: TWA 6 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 15 mg/m^3, 1999; Russia: STEL 1 ppm (0.3 mg/m^3), [skin], 1993; Switzerland: MAK-W 1 ppm (6 mg/m^3), KZG-W 2 ppm (12 mg/m^3), 1999; United Kingdom: STEL 1 ppm (5.6 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 1 ppm.

Several states have set guidelines or standards for sulfur monochloride in ambient air[60] ranging from 50.0 μg/m^3 (Virginia) to 60.0 μg/m^3 (North Dakota) to 120.0 μg/m^3 (Connecticut) to 143.0 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Violent reaction.

Routes of Entry: Inhalation of vapor, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator and corrosive. Fumes can cause severe irritation to eyes, skin, and mucous membranes of the upper respiratory tract. Contact can cause severe irritation, burns, and permanent eye damage. Corrosive on ingestion. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, nausea, and dizziness. Although this compound is capable of producing severe pulmonary irritation, few serious cases of industrial exposure have been reported. This may be due to the pronounced irritant effects of sulfur chloride which serve as an immediate warning signal when concentration of the gas approaches a hazardous level.

Long Term Exposure: May cause lung damage; bronchitis may develop. Repeated exposure can cause drying and cracking of the skin.

Points of Attack: Respiratory system, skin, eyes, lungs.

Medical Surveillance: Preemployment and periodic examinations should give special emphasis to the skin, eyes, and respiratory system. Pulmonary function tests may be useful. Lung function tests. Consider chest X-ray following acute overexposure. Exposures may also include sulfur dioxide and hydrochloric acid. See also these compounds.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Keep containers well closed and upright, away from heat. Do not allow water to get into container as this material reacts violently with water when in a closed vessel. Provisions should be made for washing down spills with large quantities of water. Vapor-tight electrical equipment is recommended to reduce corrosion. Separate from oxidizing materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Sulfur chloride requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Avoid contact with liquid and vapor. Keep people away. Wear goggles, self-contained breathing apparatus, and rubber over clothing (including gloves). Stop discharge if possible to do so without harm. Call fire department. Isolate and remove discharged material. Notify local health and pollution control agencies. Remove all ignition sources. Ventilate area of spill or leak. The aqueous solution is a strong acid that can be neutralized with lime or soda ash. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.1/0.2

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 0.8/1.3

When spilled in Water
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.8/1.3

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen chloride, hydrogen sulfide, sulfur oxides, are produced in fire. *Do not use water*. Use chemical extinguishers. Decomposes on contact with water to produce heat and toxic and corrosive fumes. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Wearing protective equipment, spray carefully onto sodium ash/slaked lime mixture. Then spray with water, dilute, neutralize, and flush to drain.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23; R34; Safety phrases: S1/2; S9; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sulfur dioxide is a noncombustible colorless gas at ambient temperatures with a characteristic strong suffocating odor. The odor threshold is 1.1 ppm. Shipped as a liquefied compressed gas. Molecular weight = 64.06; Boiling point = −10°C; Freezing/Melting point = −75.6°C; Relative vapor density (air = 1) = 2.26. Vapor pressure = 3.2 atm. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 10%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Sulfur dioxide is used in the manufacture of sodium sulfite, sulfuric acid, sulfuryl chloride, thionyl chloride, organic sulfonates, disinfectants, fumigants, glass, wine, ice, industrial and edible protein, and vapor pressure thermometers. It is also used in the bleaching of beet sugar, flour, fruit, gelatin, glue, grain, oil, straw, textiles, wicker ware; wood pulp; wool; in the tanning of leather; in brewing and preserving; and in the refrigeration industry. Exposure may also occur in various other industrial processes as it is a by-product of ore smelting, coal and fuel oil combustion, paper manufacturing, and petroleum refining.

Incompatibilities: Reacts with water to form sulfurous acid, a medium strong acid. Reacts violently with ammonia, acrolein, acetylene, alkali metals, such as sodium, potassium, magnesium, and zinc, chlorine, ethylene oxide, amines, butadiene. Attacks many metals including aluminum, iron, steel, brass, copper, nickel, especially in the presence of water or steam. Incompatible with halogens. Attacks plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.62 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/13 mg/m^3.

NIOSH REL: 2 ppm/5 mg/m^3 TWA; 5 ppm/13 mg/m^3 STEL.

ACGIH TLV®[1]: 0.25 ppm/0.65 mg/m^3 STEL; not classifiable as a human carcinogen.

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.2 ppm

PAC-1: 0.2 ppm

PAC-2: 0.75 ppm

PAC-3: 30 ppm

DFG MAK: 0.5 ppm/1.3 mg/m^3 TWA; Peak Limitation Category I(1); a momentary Ceiling Concentration value of 1 mL/m^3/2.7 mg/m^3 should not be exceeded; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 5 ppm (13 mg/m^3), 1993; Australia: TWA 2 ppm (5 mg/m^3); STEL 5 ppm, 1993; Austria: MAK 2 ppm (5 mg/m^3), 1999; Belgium: TWA 2 ppm (5.2 mg/m^3); STEL 5 ppm (13 mg/m^3), 1993; Denmark: TWA 2 ppm (5 mg/m^3), 1999; Finland: TWA 2 ppm (5 mg/m^3); STEL 5 ppm (13 mg/m^3), 1999; France: VME 2 ppm (5 mg/m^3), VLE 5 ppm (10 mg/m^3), 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Japan: 1999; Norway: TWA 2 ppm (5 mg/m^3), 1999; the Philippines: TWA 5 ppm (13 mg/m^3), 1993; Poland: MAC (TWA) 2 mg/m^3; MAC (STEL) 5 mg/m^3, 1999; Russia: STEL 10 mg/m^3, [skin], 1993; Sweden: NGV 2 ppm (5 mg/m^3), TKV 5 ppm (13 mg/m^3), 1999; Switzerland: MAK-W 2 ppm (5 mg/m^3), KZG-W 4 ppm (10 mg/m^3), 1999; Thailand: TWA 5 ppm (13 mg/m^3), 1993; Turkey: TWA 5 ppm (13 mg/m^3), 1993; United Kingdom: TWA 2 ppm (5.3 mg/m^3); STEL 5 ppm (13 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV®: STEL 5 ppm. Russia[43] set a MAC of 0.5 mg/m^3 for ambient air in residential areas on a momentary basis and 0.05 mg/m^3 on a daily average basis. Several states have set guidelines or standards for sulfur dioxide in ambient air[60] ranging from 1.2 μg/m^3 (Tennessee) to 80.0−1300.0 μg/m^3 (Arizona) to 119.0 μg/m^3 (Nevada) to 1300.0 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #6004, Sulfur dioxide; OSHA Analytical Methods ID-200, ID-104 (for impinger).

Routes of Entry: Inhalation of gas, direct contact of gas or liquid phase on skin and mucous membranes.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Causes irritation of the eyes, nose, throat. Nose and throat irritation may occur at 6−12 ppm. Between 10 and 50 ppm for 5−15 min, runny nose (rhinorrhea), difficult breathing, coughing and choking, reflex bronchoconstriction may occur. Levels of 50−100 ppm may only be tolerated for 30−60 min, and 400 ppm and above may immediately cause swelling and accumulation of fluid in throat and lungs (pulmonary edema), breathing stoppage, pneumonia, and death. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Levels of 1% (10,000 ppm) may be irritating to moist skin. Liquid may cause frostbite and chemical burns. *Eyes:* Irritation may occur at 20 ppm and above. Liquid may cause frostbite, and permanent damage leading to blindness. *Ingestion:* Liquid may cause frostbite and chemical burns to mouth.

Long Term Exposure: Repeated or prolonged inhalation exposure may cause asthma. May cause chronic irritation of the eyes and respiratory tract; loss of the sense of smell; burning and dryness. Stomach problems may also occur. May cause permanent lung damage. Repeated exposure to 10 ppm may cause irritation to throat and lungs and an increased occurrence of nosebleeds. There is limited animal evidence that sulfur dioxide causes lung cancer in animals. There is limited evidence that sulfur dioxide may damage the developing fetus.

Note: Persons with asthma, subnormal pulmonary function, or cardiovascular disease are at greater risk. Sulfur dioxide may irritate the eyes and respiratory tract. Signs and symptoms of acute exposure to sulfur dioxide may be severe and include coughing, choking, dyspnea (shortness of breath), sneezing, wheezing, and chest discomfort. Upper airway edema (swelling) or obstruction, bronchoconstriction, pneumonia, pulmonary edema, and respiratory paralysis may occur. Fatigue may be noted. Gastrointestinal effects may include nausea, vomiting, and abdominal pain. Cyanosis (blue tint to skin and mucous membranes) may be noted following exposure to sulfur dioxide. It may cause death or permanent injury after very short exposure to small quantities. 1000 ppm causes death from 10 min to several hours by respiratory depression.

Points of Attack: Respiratory system, skin, eyes.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential. Preplacement and periodic medical examinations should be concerned especially with the skin, eyes, and respiratory tract. Lung function tests. Examination of the eyes, nose, and throat. Consider chest X-ray following acute overexposure. Pulmonary function should be evaluated, as well as smoking habits, and exposure to other pulmonary irritants.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *100 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Keep below 130°F/54°C, protect containers from damage. Outdoor, ventilated, fireproof storage preferred. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: Sulfur dioxide requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3. Sulfurous acid (liquid SO_2) requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with

time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60

Then: Protect persons downwind (miles/kilometers)

Day 0.2/0.3

Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400

Then: Protect persons downwind (miles/kilometers)

Day 1.3/2.0

Night 3.6/5.7

Fire Extinguishing: Not flammable. Extinguish fires with dry chemical, carbon dioxide, water spry, fog, or foam. Wear self-contained breathing apparatus and full protective clothing. Move container from fire area. Stay away from ends of tanks. Cool containers that are exposed to flames with water from the side until well after the fire is out. Isolate area until gas has dispersed. Keep unnecessary people away. Containers may explode in heat of fire, or they may rupture and release irritating toxic sulfur dioxide. Sulfur dioxide has explosive properties when it comes in contact with sodium hydride; potassium chlorate at elevated temperatures; ethanol; ether; at very cool temperatures (−15°C); fluorine; chlorine trifluoride; and chlorates. It will react with water or steam to produce toxic and corrosive fumes. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pass into soda ash solution, then add calcium hypochlorite, neutralize, and flush to sewer with water (A-38).

Sulfur hexafluoride S:0760

Molecular Formula: F_6S

Common Formula: SF_6

Synonyms: Hexafluorure de soufre (French); Sulfur fluoride

CAS Registry Number: 2551-62-4

RTECS® Number: WS4900000

UN/NA & ERG Number: UN1080/126

EC Number: Not assigned

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Sulfur hexafluoride is a colorless, odorless gas. Molecular weight = 146.06; Boiling point = (sublimes) − 64°C; Freezing/Melting point = (sublimes) − 51°C; Relative vapor density (air = 1): 5.11; Vapor pressure = 21.5 atm. Shipped as a liquefied compressed gas. Condenses directly to a solid upon cooling. Practically insoluble in water; solubility = 0.003% at 25°C.

Potential Exposure: May contain highly toxic sulfur pentafluoride as an impurity. SF_6 is used in various electric power applications as a gaseous dielectric or insulator. The most extensive use is in high-voltage transformers. SF_6 is also used in waveguides, linear particle accelerators, Van de Graaff generators, chemically pumped continuous-wave lasers, transmission lines, and power distribution substations.

Nonelectrical applications include use as a protective atmosphere for casting of magnesium alloys and use as a leak detector or in tracing moving air masses. Several sources note that vitreous substitution of SF_6 in owl monkeys results in a greater ocular vascular permeability than that caused by saline. This implies that SF_6 could have an important use in retinal surgery.

Incompatibilities: May contain impurities that cause it to hydrolyze on contact with water, forming corrosive and toxic hydrogen fluoride. Vigorous reaction with disilane.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.98 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/6000 mg/m^3 TWA.

NIOSH REL: 1000 ppm/6000 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/5970 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 3000 ppm

PAC-2: 5000 ppm

PAC-3: 5000 ppm

DFG MAK: 1000 ppm/6100 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group D.

Australia: TWA 1000 ppm (6000 mg/m^3), 1993; Austria: MAK 1000 ppm (6000 mg/m^3), 1999; Belgium: TWA 1000 ppm (5970 mg/m^3), 1993; Denmark: TWA 1000 ppm (6000 mg/m^3), 1999; Finland: TWA 1000 ppm (6000 mg/m^3); STEL 1250 ppm (7500 mg/m^3), 1999; France: VME 1000 ppm (6000 mg/m^3), 1999; the Netherlands: MAC-TGG 6000 mg/m^3, 2003; the Philippines: TWA 1000 ppm (6000 mg/m^3), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 5000 mg/m^3, 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1000 ppm (6000 mg/m^3), 1999; Turkey: TWA 1000 ppm (6000 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (6070 mg/m^3); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1000 ppm. Several states have set guidelines or standards for sulfur hexafluoride in ambient air[60] ranging from 60.0 mg/m^3 (North Dakota) to 100.0 mg/m^3 (Virginia) to 120.0 mg/m^3 (Connecticut) to 142.857 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6602.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.68.

Routes of Entry: Inhalation, skin absorption, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Contact with the liquid may cause frostbite. Symptoms of exposure include asphyxia, increase (d) breathing rate, pulse rate, slight muscle incoordination, emotional upset, fatigue, nausea, vomiting. SF_6 is considered to be physiologically inert in the pure state. In high concentrations, however, pure SF_6 can act as a simple asphyxiant by displacing the necessary oxygen. Ordinarily, however, SF_6 does not exist in the pure state. It contains variable quantities of sulfur fluorides. In the presence of water, these sulfur fluorides can hydrolyze to yield hydrogen fluoride (HF) and oxyfluoride compounds, such as sulfuryl fluoride (SO_2F_2) and thionyl fluoride (SOF_2). These compounds have much more toxic health effects. Sulfur hexafluoride may also be contaminated with more toxic sulfur compounds, such as S_2F_{10}.

Long Term Exposure: Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite, diarrhea, or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Respiratory system, skeleton.

Medical Surveillance: Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *(fluorides) 12.5 mg/m³:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m³:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators.] The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m³:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PAPRDM*† *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 mg/m³:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Sulfur hexafluoride requires a shipping label of "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas. Poisonous gases are produced in fire, including sulfur oxides and fluorine compounds. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Seal unused cylinders and return to suppliers.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sulfuric acid is a colorless to dark-brown, odorless, oily liquid which is commercially sold at 93−98% H_2SO_4, the remainder being water. Molecular weight = 98.08; Specific gravity (H_2O:1) = 1.8 at 25°C; Boiling point = (decomposes) 340°C; Freezing/Melting point = 10.6°C; Vapor pressure = 0.001 mmHg. Fuming sulfuric acid (oleum) gives off free SO_2. Soluble in water; violent reaction.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Used as a chemical feedstock in the manufacture of acetic acid, hydrochloric acid, citric acid, phosphoric acid, aluminum sulfate, ammonium sulfate, barium sulfate, copper sulfate, phenol, superphosphates, titanium dioxide, as well as synthetic fertilizers, nitrate explosives, artificial fibers, dyes, pharmaceuticals, detergents, glue, paint, and paper. It finds use as a dehydrating agent for esters and ethers due to its high affinity for water; as an electrolyte in storage batteries; for the hydrolysis of cellulose to obtain glucose; in the refining of mineral and vegetable oil; and in the leather industry. Other uses include fur and food processing; carbonization of wool fabrics; gas drying; uranium extraction from pitchblende; and laboratory analysis. Sulfuric acid is among the highest volume produced chemical in the United States.

Incompatibilities: A strong acid and oxidizer. Reacts violently with water with dangerous spattering and evolution of heat. Reacts violently with combustible and reducing materials, bases, organic materials, chlorates, carbides, picrates, fulminates, water, powdered metals. Corrosive to most common metals, forming explosive hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA.

NIOSH REL: 1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.2 mg/m^3 (measured as thoracic fraction of the aerosol) TWA; Suspected Human Carcinogen; H_2SO_4 contained in strong inorganic acid mists.

NIOSH IDLH: 15 mg/m^3.

Protective Action Criteria (PAC)*

Includes oleum

TEEL-0: 0.2 mg/m^3

PAC-1: **0.20** mg/m^3

PAC-2: **8.7** mg/m^3

PAC-3: **160** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.1 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(1), a momentary Ceiling value of 0.2 mg/m^3 should not be exceeded; Carcinogen Category 4; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 1 mg/m^3, 1993; Australia: TWA 1 mg/m^3, 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 1 mg/m^3; STEL 3 mg/m^3, 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: TWA 1 mg/m^3; STEL 3 mg/m^3, [skin], 1999; France: VME 1 mg/m^3, VLE 3 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Japan: 1 mg/m^3, 1999; Norway: TWA 1 mg/m^3, 1999; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 3 mg/m^3, 1999; Russia: STEL 1 mg/m^3, [skin], 1993; Sweden: NGV 1 mg/m^3, TKV 3 mg/m^3, 1999; Switzerland: MAK-W 1 mg/m^3, KZG-W 2 mg/m^3, 1999; Thailand: TWA 1 mg/m^3, 1993; Turkey: TWA 1 mg/m^3, 1993; United Kingdom: TWA 1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 mg/m^3. Several states have set guidelines or standards for sulfuric acid in ambient air[60] ranging from 2.381 μg/m^3 (Kansas) to 10.0 μg/m^3 (South Carolina) to 14.0 μg/m^3 (Massachusetts) to 16.0 μg/m^3 (Virginia) to 12.0−100.0 μg/m^3 (North Carolina) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7903, Inorganic Acids; OSHA Analytical Method ID-113.

Permissible Concentration in Water: A guideline of 250 μg/L of sulfate has been recommended for drinking water by the EEC[35] and the state of Kansas.[61]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation of nose and throat at levels of 5 mg/m^3. Swelling of the throat and lungs and inflammation of the bronchial membranes may occur at levels of 12−35 mg/m^3. A few drops in the lung air passages may be fatal. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* May cause severe irritation, burns, and ulceration. *Eyes:* May cause severe irritation, damage to the cornea, and blindness. *Ingestion:* May cause damage to teeth; burning of the mouth, throat, and stomach; nausea, vomiting of blood and eroded tissue; holes in the stomach and intestines; shock; and kidney damage. Death may occur from as little as 1 oz. Signs and symptoms of acute ingestion of sulfuric acid may be severe and include salivation, intense thirst, difficulty in swallowing, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of sulfuric acid. Acute inhalation exposure may result in sneezing, hoarseness, choking, laryngitis, dyspnea (shortness of breath), respiratory tract irritation, and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa, pulmonary edema, chronic bronchitis, and pneumonia may also occur. If the eyes have come in contact with sulfuric acid, irritation, pain, swelling, corneal erosion, and blindness may result. Dermal exposure may result in severe burns, pain, and dermatitis (red, inflamed skin).

Long Term Exposure: Can cause chronic runny nose, tearing of the eyes, nose bleeding, and stomach upset. Risk of tooth erosion and pitting from repeated or prolonged exposure to the aerosol. Lungs may be affected by repeated or prolonged exposure to the aerosol; bronchitis may develop. Exposure to amounts greater than 3.0 mg/m^3 may cause all of the above symptoms in greater severity.

Points of Attack: Eyes, skin, respiratory system, teeth.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Examination of the teeth. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene, Teflon™, Saranex®, Neoprene™/natural rubber, Viton are among the recommended protective materials for *sulfuric acid solution of more than 70%*. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For engineering controls see NIOSH Criteria Document #74-128, *Exposure to Sulfuric Acid.*

Respirator Selection*: Up to 15 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprAgHie (APF = 25) (APF = 25)* (any powered, air-purifying respirator with acid gas cartridge(s) in combination with a high-efficiency particulate filter) or CcrFAg100 (APF = 50) [any chemical cartridge respirator with a full face-piece and acid gas cartridge(s) in combination with an N100, R100, or P100 filter] or GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF; Pd,Pp (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Sulfuric acid must be stored to avoid contact with water, chlorates, chromates, carbides, fulminates, nitrates, picrates, and powdered metals, since violent reactions occur. Store in tightly closed containers in a cool, dry well-ventilated area away from sunlight and in an area with an acid-resistant cement floor. Sources of ignition, such as smoking and open flames, are prohibited where sulfuric acid is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Always add acid to water, never the reverse. Sulfuric acid is extremely corrosive; handle with care and use proper equipment and practices. Wherever sulfuric acid is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Contact of sulfuric acid with metal drums may cause the release of flammable, explosive hydrogen gas; therefore, storage drums should be coated with acid-resistant material.

Shipping: Sulfuric acid with >51% acid or sulfuric acid with not >51% acid requires a shipping label of "CORROSIVE." They fall in Hazard Class 8 and Packing Group II.

Sulfuric acid, fuming, with 30% or more free sulfur trioxide requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I.

Sulfuric acid, fuming, with <30% free sulfur trioxide, requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group I.

Sulfuric acid, spent, requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Extremely hazardous to health; areas may be entered with extreme care. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. No skin surface should be exposed. Keep all sources of ignition away from containers because explosive mixtures of hydrogen may be produced during storage. Ventilate area of spill or leak. *Small spills:* cover area with sodium bicarbonate or soda ash/slaked lime. Shovel neutralized residues into containers for disposal, or (if not available) cover area with sand or earth and shovel into disposal containers. Other neutralizing agents are calcinated dolomite, calcium oxide and hydroxide, sodium carbonate. Place sulfuric acid absorbed in vermiculite in sealed containers. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Notify proper authorities in case of water pollution. Do not touch spilled material. Use water spray to reduce vapor; do not get water inside container. Dike for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Sulfuric acid, fuming; Sulfuric acid, fuming, with not less than 30% free Sulfur trioxide

Small spills (*From a small package or a small leak from a large package*)

First: Isolate in all directions (feet/meters) 200/60

Then: Protect persons downwind (miles/kilometers)

Day 0.2/0.3

Night 0.6/1.4

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300

Then: Protect persons downwind (miles/kilometers)

Day 1.8/2.9

Night 3.6/5.7

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur oxides, are produced in fire or on contact with water. Contact with metal releases flammable and explosive hydrogen gas. Use carbon dioxide or dry chemical. Use water on combustibles burning in vicinity of this material, but use extreme care as water applied directly to this acid results in generation of heat and causes splattering. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to solution of soda ash and slaked lime with stirring; flush to drain with large volumes of water. Recovery and reuse of spent sulfuric acid may be a viable alternative to disposal, and processes are available.

Sulfurous acid 2-(*p-tert*-butylphenoxy)-1-methylethyl-2-chloroethyl ester S:0780

Molecular Formula: $C_{15}H_{23}ClO_4S$

Common Formula: $(CH_3)_3C-C_6H_4-OCH_2CH(CH_3)OSO_2-(CH_2)_2Cl$

Synonyms: 88-R; Acaracide; Aracide; Aramite®; Araramite-15W®; Aratron®; 2-(*p*-Butylphenoxy)isopropyl 2-chloroethyl sulfite; 2-(4-*tert*-Butylphenoxy)isopropyl-2-chloroethyl sulfite; Butylphenoxyisopropyl chloroethyl sulfite; 2-(*p*,*tert*-Butylphenoxy)isopropyl 2′-chloroethyl sulphite; 2-(*p*,*tert*-Butylphenoxy)-1-methylethyl 2-chloroethyl ester of sulphurous acid; 2-(*p*-Butylphenoxy)-1-methylethyl 2-chloroethyl sulfite; 2-(*p*,*tert*-Butylphenoxy)-1-methylethyl-2-chloroethyl sulfite ester; 2-(*p*,*tert*-Butylphenoxy)-1-methylethyl 2′-chloroethyl sulphite; 2-(*p*,*tert*-Butylphenoxy)-1-methylethyl sulphite of 2-chloroethanol; 1-(*p*,*tert*-Butylphenoxy)-2-propanol-2-chloroethyl sulfite; CES; 2-Chloroethanol-2-(*p*,*tert*-butylphenoxy)-1-methylethyl sulfite; 2-Chloroethanol ester with 2-(*p*,*tert*-butylphenoxy)-1-methylethyl sulfite; β-Chloroethyl-b′-(*p*,*tert*-butylphenoxy)-a′-methylethyl sulfite; β-Chloroethyl-β-(*p*,*tert*-butylphenoxy)-α-methylethyl sulphite; 2-Chloroethyl 1-methyl-2-(*p*, *tert*-butylphenoxy)ethyl sulphite; 2-Chloroethylsulfurous acid 2-[4-(1,1-dimethylethyl)phenoxy]-1-methylethyl ester; 2-Chloroethyl sulphite of 1-(*p*,*tert*-Butylphenoxy)-2-propanol; Compound 88R; ENT 16,519; *o*-Mite; Niagaramite

CAS Registry Number: 140-57-8

RTECS® Number: WT2975000

UN/NA & ERG Number: UN2902 (Pesticides, liquid, toxic, n.o.s.)/151

EC Number: None assigned.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human No Sufficient Data; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1987.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Hazardous Waste Constituent (EPA/RCRA).[5]

California Proposition 65 Chemical: Cancer 7/1/87.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Aramite® is a heavy, dark-amber liquid. Molecular weight = 334.89; Boiling point = 175°C at 0.1 mmHg; Freezing/Melting point = −32°C; Vapor pressure = 9 mmHg at 25°C. Practically insoluble in water.

Potential Exposure: Aramite® is a miticide and antimicrobial agent. Aramite is regulated by EPA under the Federal Insecticide, Fungicide, and Rodenticide Act and the Resource Conservation and Recovery Act. The significant regulatory action was a voluntary cancellation of the active ingredient registration by the sole producer in 1975.

Incompatibilities: Incompatible with alkaline material, such as lime or Bordeaux mixture (slaked lime and copper sulfate solution).

Permissible Exposure Limits in Air

No TEEL available.

A limit on Aramite® in ambient air has been set in Pennsylvania[60] at 18.07 $\mu g/m^3$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is slightly toxic (LD_{50} value for rats is 3900 mg/kg) but it is carcinogenic to animals.

Long Term Exposure: Aramite® is carcinogenic in the rat and dog following its oral administration. It produced liver tumors in the rat and carcinomas of the gall bladder and biliary ducts in the dog. Aramite® was tested in two strains of mice by the oral route and produced a significant increase of hepatomas in males of one strain.

Points of Attack: See above.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis, nitrates, and heat. This material may be thermally unstable (Verschueren). Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pesticides, liquid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group I to III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine and sulfur oxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Acid or alkaline hydrolysis followed by flushing to sewer.

Sax, N. I. (Ed.). (1981). *Dangerous Properties of Industrial Materials Report*, 1, No. 3, 79−80

Sulfur pentafluoride S:0790

Molecular Formula: $F_{10}S_2$

Common Formula: S_2F_{10}

Synonyms: Suflur decafluoride; Disulfur decafluoride; Disulphur decafluoride

CAS Registry Number: 5714-22-7

RTECS® Number: WS4480000

UN/NA & ERG Number: Not regulated

EC Number: 227-204-4 (disulphur decafluoride)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb (114 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sulfur pentafluoride is a colorless liquid or gas (above 29°C) with an odor like sulfur dioxide. Noncombustible liquid and nonflammable gas. Molecular weight = 254.12; Boiling point = 28.9°C; Freezing/Melting point = −92.2°C; Relative vapor density (air = 1) = 8.77; Specific gravity (H_2O:1) = 2.08 at 0°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Sulfur pentafluoride is encountered as a by-product in the manufacture of sulfur hexafluoride, which is made by the direct fluorination of sulfur or sulfur dioxide.

Incompatibilities: Fluorides form explosive and toxic gases on contact with strong acids and acid fumes. Reacts with strong caustics. Decomposed in temperatures above 400°C forming toxic and corrosive fumes of sulfur oxides and sulfur fluorides; and as this chemical decomposes, it acts as both a strong oxidizer and a fluorinating agent.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.39 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.025 ppm/0.25 mg/m^3 TWA.

NIOSH REL: 0.01 ppm/0.1 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.01 ppm/0.10 mg/m^3 Ceiling Concentration.
Protective Action Criteria (PAC)
TEEL-0: 0.01 ppm
PAC-1: 0.01 ppm
PAC-2: 0.01 ppm
PAC-3: 1 ppm
DFG MAK: No numerical value established. Data may be available.
NIOSH IDLH: 1 ppm.
Australia: TWA 0.01 ppm (0.1 mg/m^3), 1993; Austria: MAK 0.025 ppm (0.25 mg/m^3), 1999; Belgium: STEL 0.01 ppm (0.1 mg/m^3), 1993; Denmark: TWA 0.01 ppm (0.1 mg/m^3), 1999; Finland: TWA 0.025 ppm, STEL 0.075 ppm, [skin], 1999; Norway: TWA 0.01 ppm (0.1 mg/m^3), 1999; the Philippines: TWA 0.025 ppm (0.25 mg/m^3), 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 0.01 ppm (0.1 mg/m^3), KZG-W 0.02 ppm (0.2 mg/m^3), 1999; Turkey: TWA 0.025 ppm (0.25 mg/m^3), 1993; United Kingdom: TWA 0.025 ppm (0.26 mg/m^3), STEL 0.075 ppm, 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.01 ppm. Several states have set guidelines or standards for sulfur pentafluoride in ambient air[60] ranging from 0.8 μg/m^3 (Virginia) to 1.0 μg/m^3 (North Dakota) to 5.0 μg/m^3 (Connecticut) to 6.0 μg/m^3 (Nevada).

Determination in Air: Gaseous fluorides collected by impinger using caustic; particulates by filter. Analysis is by ion-specific electrode per NIOSH Analytical Method 7902.[18]

Permissible Concentration in Water: The EPA has set a standard of 4 mg/L for fluoride[61] and the state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Fluorides can irritate and may damage the eyes. Skin contact can cause irritation, rash, or burning sensation. High repeated exposure can cause nausea, vomiting, loss of appetite, and bone and teeth changes. Extremely high levels could be fatal. Breathing can irritate the nose and throat, and cause nausea, headaches, and nosebleeds. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Very high exposure can cause fluoride poisoning with stomach pain, weakness, convulsions, collapse, and death. These effects do not occur at the level of fluorides used in water for preventing cavities in teeth. In animals: pulmonary edema, hemorrhage.

Long Term Exposure: Repeated high exposures can cause deposits of fluorides in the bones (fluorosis), which may cause pain, disability, and mottling of the teeth. May cause kidney damage.

Points of Attack: Respiratory system, central nervous system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential. Also consider kidney function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 0.1 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Fluorides must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Fluorides form explosive gases on contact with nitric acid. Store in tightly closed containers in a cool, well-ventilated area away from water. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Gas:* If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156

Sulfur tetrafluoride S:0800

Molecular Formula: F_4S

Common Formula: SF_4

Synonyms: Sulfur fluoride (SF_4),(*t*-4)-; Sulphur fluoride; Sulphur tetrafluoride; Tetraflurosulfurane; Tetrafluoruro de azufre (Spanish); Tétrafluorure de soufre (French)

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sulfur tetrafluoride is a colorless gas with an odor like sulfur dioxide. Shipped as a liquefied compressed gas. Molecular weight = 108.06; Specific gravity (H_2O:1) = 10.5 at 21°C; Boiling point = −40°C; Freezing/Melting point = −120°C; Relative vapor density (air = 1) = 3.78; Vapor pressure = 10.5 atm at 25°C. Reacts with water; highly soluble.

Potential Exposure: Sulfur tetrafluoride is used as a selective fluorinating agent in making water-repellent and oil-repellent materials and lubricity improvers. It is also used as a pesticide intermediate.

Incompatibilities: Moisture, concentrated sulfuric acid, dioxygen difluoride. Readily hydrolyzed by moisture, forming hydrofluoric acid and thionyl fluoride.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.42 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 0.1 ppm/0.4 mg/m^3 Ceiling Concentration.
ACGIH TLV®[1]: 0.1 ppm/0.44 mg/m^3 Ceiling Concentration.
Protective Action Criteria (PAC)
TEEL-0: 0.1 ppm
PAC-1: 0.3 ppm
PAC-2: 2.08 ppm
PAC-3: 2.08 ppm

Australia: TWA 0.1 ppm (0.4 mg/m^3), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: STEL 0.1 ppm (0.44 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.4 mg/m^3), 1999; Finland: TWA 0.1 ppm (0.4 mg/m^3), STEL 0.3 ppm, [skin], 1999; Norway: TWA 0.1 ppm (0.4 mg/m^3), 1999; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 2 mg[HF]/m^3, 1999; the Netherlands: MAC 0.4 mg/m^3, 2003; United Kingdom: TWA 0.1 ppm (0.45 mg/m^3), STEL 0.3 ppm (1.3 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV®: Ceiling Concentration 0.1 ppm. Several states have set guidelines or standards for sulfur tetrafluoride in ambient air[60] ranging from 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Nevada).

Determination in Air: Bubbler; Sodium hydroxide; Ion-specific electrode; OSHA Analytical Method. #ID11.

Permissible Concentration in Water: No criteria set. (SF_4 reacts violently with water to give SO_2 and HF).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can severely irritate the nose, throat, and lungs. May cause skin burns (from SF_4 releasing hydrofluoric acid on exposure to moisture). High levels can cause a buildup of fluid in the lungs (pulmonary edema) with cough and shortness of breath. This can lead to death. Contact with liquid may cause frostbite. Sulfur tetrafluoride is about as toxic as phosgene. It is a strong irritant. The toxic effects are attributed largely to fluorine which is released upon hydrolysis. In animals: dyspnea (breathing difficulty), weakness, rhinorrhea (discharge of thin nasal mucous).

Long Term Exposure: May cause lung damage. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis), which may cause pain, disability, and mottling of the teeth. May cause kidney damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Urine test for fluoride level (should not be above 4 mg/L). If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Fluorides: 12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PAPRDM*† *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 mg/m^3*: HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAF

(APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Sulfur tetrafluoride must be stored to avoid contact with water, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, or acids to avoid the production of toxic fumes. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Sulfur tetrafluoride requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.6/2.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 2500/800
Then: Protect persons downwind (miles/kilometers)
Day 2.9/4.7
Night 6.4/10.3

Fire Extinguishing: This chemical is a nonflammable gas. Poisonous gases, including sulfur dioxide and hydrogen fluoride, are produced in fire. *Do not use water*. For small fires, use dry chemical or carbon dioxide. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg). This material is a reactive solid. The TPQ does not default to 10,000 pounds for nonpowder, nonmolten, nonsolution form.
Reportable Quantity (RQ): 100 lb (45.4 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sulfur trioxide is a crystalline solid which has 3 forms: *alpha-, beta-*, and *gamma-*; and can also exist as a gas or liquid. Molecular weight = 80.06; Boiling point = 45°C (all forms); Freezing/Melting point = 17°C (*gamma-*); 32.5°C (*beta-*); 62°C (*alpha-*); Vapor pressure = 433 mmHg at 250°C. An explosive increase in vapor pressure occurs when the *alpha*-form melts. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Reacts with water. Combustible and Corrosive.

Potential Exposure: Compound Description: Tumorigen; Human Data. Sulfur trioxide is used as a sulfating and sulfonating agent for detergent, lubricating oil additives, and other organic compounds; in solar energy collectors. It is also used as an intermediate in sulfuric acid manufacture and in making explosives.

Incompatibilities: Reacts violently with water, steam, or moisture, releasing corrosive hydrosulfuric acid. Violent reactions occur on contact with strong bases, strong acids, chemically active metals, reducing agents, cyanides, nitrates, picrates, fulminates, chlorates, sulfides, carbides, phosphorus, dioxygen difluoride, barium oxide, lead oxide, diphenyl mercury, alcohols, nitryl chloride, acetonitrile, dioxane, tetrafluoroethylene.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 0.06 mg/m^3
PAC-1: **0.20** mg/m^3
PAC-2: **8.7** mg/m^3
PAC-3: **160** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Finland: STEL 1 ppm (3 mg/m^3), [skin], 1999; Hungary: STEL 1 mg/m^3, 1993; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 3 mg/m^3, 1999; Russia: STEL 1 mg/m^3, [skin], 1993.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: This material is highly toxic and corrosive. Contact can severely irritate and burn the skin and eyes with possible permanent eye damage. It is an irritant and corrosive to mucous membranes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Poisonous if inhaled or swallowed. Contact causes severe burns to skin and eyes. This material may cause coughing, choking, and severe discomfort at a concentration of 1 ppm.
Long Term Exposure: Repeated exposure can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture and incompatible materials listed above. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I. A plus (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Avoid inhalation. Do not touch spilled material. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Dike spill for later disposal; do not apply water unless directed to so. Clean up only under supervision of an expert. Remove all ignition sources. *Solid:* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate and wash area after cleanup is complete. *Gas:* Ventilate area of leak to disperse gas. Stop flow of gas if it can be done without harm to personnel. If the source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Sulfur trioxide, used as a weapon—not listed in current DOT tables.

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.6/1.4

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.8/2.9
Night 3.6/5.7

Fire Extinguishing: Sulfur trioxide may burn but does not easily ignite. *Do not use water*. Use dry chemical or carbon dioxide extinguishers. *Small fires:* dry chemical or carbon dioxide. Spray cooling water on containers that are exposed to flames until well after fire is out. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

PAC-2: 21 ppm
PAC-3: 64 ppm
Australia: TWA 5 ppm (20 mg/m^3), STEL 10 ppm, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: TWA 5 ppm (21 mg/m^3), STEL 10 ppm (42 mg/m^3), 1993; Denmark: TWA 5 ppm (20 mg/m^3), 1999; Finland: TWA 5 ppm (20 mg/m^3), STEL 10 ppm (40 mg/m^3), 1999; France: VME 5 ppm (20 mg/m^3), 1999; Norway: TWA 5 ppm (20 mg/m^3), 1999; the Netherlands: MAC-TGG 20 mg/m^3, 2003; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg[HF]/m^3, 1999; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 5 ppm (20 mg/m^3), 1999; United Kingdom: TWA 5 ppm (21 mg/m^3), STEL 10 ppm (42 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 ppm. Several states have set guidelines or standards for sulfuryl fluoride in ambient air[60] ranging from 200−400 μg/m^3 (North Dakota) to 350 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut) to 476 μg/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Method (IV) #6012, Sulfuryl fluoride.
Routes of Entry: Inhalation, eye and/or skin contact (liquid).
Harmful Effects and Symptoms
Short Term Exposure: May cause conjunctivitis, rhinitis, pharyngitis, paresthesia. Contact with the liquid may cause frostbite. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Overexposure can cause nausea, vomiting, itching, muscle twitching, tremors, and seizures.
Long Term Exposure: May cause kidney damage. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis), which may cause pain, disability, and mottling of the teeth.
Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. The fluoride level in urine (for fluoride in urine use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, kidney function tests, examination of the nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush

them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 50 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 200 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Poison gas. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and strong acids. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Sulfuryl fluoride requires a shipping label of "POISON GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 3.1/4.9

Fire Extinguishing: This chemical is a nonflammable gas. Poisonous gases, including sulfur dioxide and hydrogen fluoride, are produced in fire. For small fires, use dry chemical or carbon dioxide extinguishers. Gas is heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Addition of soda ash−slaked lime solution to form the corresponding sodium and calcium salt solution. This solution can be safely discharged after dilution. The precipitated calcium fluoride may be buried or added to a landfill. Small amounts could also be released directly to the atmosphere without serious harm.

Sulphamic acid S:0830

Molecular Formula: H_3NO_3S

Common Formula: H_2NSO_3H

Synonyms: Amidosulfonic acid; Amidosulfuric acid; Aminosulfonic acid; Sulfamic acid; Sulfamidic acid

CAS Registry Number: 5329-14-6

RTECS® Number: WO5950000

UN/NA & ERG Number: UN2967/154

EC Number: 226-218-8 [*Annex I Index No.:* 016-026-00-0]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA, 1998 Status of Pesticides: Unsupported.

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R36/38; R52/53; Safety phrases: S2; S26; S28; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Sulphamic acid is a white crystalline solid. Molecular weight = 97.10; Freezing/Melting point = about 205°C (decomposition). Soluble in water; slowly reactive.

Potential Exposure: Compound Description: Agricultural Chemical; Primary Irritant. Sulphamic acid is used in metal and ceramic cleaning, bleaching paper pulp, and textiles; in acid cleaning; as a stabilizing agent for chlorine and hypochlorite in swimming pools; cooling towers; and paper mills.

Incompatibilities: The aqueous solution is a strong acid. Reacts violently with strong acids (especially fuming nitric acid), bases, chlorine. Reacts slowly with water, forming ammonium bisulfate. Incompatible with ammonia, amines, isocyanates, alkylene oxides, epichlorohydrin, oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 12.5 mg/m^3

PAC-1: 40 mg/m^3

PAC-2: 250 mg/m^3

PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Sulphamic acid can affect you when breathed in. Contact can burn the skin and eyes. Breathing the dust (crystals) or vapor can irritate the nose, mouth, and lower airways; and may cause cough with phlegm. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause dermatitis and skin allergy. Some closely related sulfonates cause skin allergy. May affect the lungs.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to sulphamic acid, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Sulphamic acid must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from chlorine and nitric acid.

Shipping: Sulfamic acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Sulphamic acid may burn, but does not readily ignite. Use dry chemical, CO_2, dry sand. *Do not use water* directly on material. If large quantities of combustibles are involved, use water in flooding quantities as spray and fog. Poisonous gases, including oxides of sulfur and nitrogen, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 252-545-0

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Banned or Severely Restricted (Germany, Malaysia) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Sulprofos is a tan colored liquid. Molecular weight = 322.46; Specific gravity (H_2O:1) = 1.20 at 25°C; Boiling point = 155−158°C at 0.1 mmHg; Vapor pressure = 63 mmHg at 20°C. Poor solubility in water.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector. Those involved in the manufacture, formulation, and application of this insecticide that is used for control of certain lepidopterous, dipterous, and hemipterous insects on cotton, etc.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.008 ppm/0.1 mg/m^3 measured as inhalable fraction and vapor TWA; not classifiable as a human

carcinogen; BEI_A issued for acetylcholinesterase inhibiting pesticides.
No TEEL available.
Australia: TWA 1 mg/m^3, 1993; Belgium: TWA 1 mg/m^3, 1993; France: VME 1 mg/m^3, 1999; Switzerland: MAK-W 1 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines of standards for sulprofos in ambient air[60] ranging from 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada) to 100.0 μg/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides; OSHA Analytical Method PV-2037, Sulprofos.

Determination in Water: Fish Tox = 63.99264000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: May affect the nervous system, causing convulsions and respiratory failure. Shows typical anticholinesterase effects. Sulprofos can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is an organophosphate pesticide. Exposure can cause rapid severe poisoning with headaches, sweating, nausea and vomiting, diarrhea, loss of coordination, convulsions, respiratory failure, and death. This is considered a moderately toxic compound (LD_{50} for rats is 65 mg/kg).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Human Tox = 21.00000 ppb (INTERMEDIATE).

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA

1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 12,000 (Estimate).

Fire Extinguishing: Sulprofos may burn, but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including oxides of sulfur and phosphorus, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 2,4,5-T acid is an odorless, colorless to tan crystalline solid. Molecular weight = 255.48; Specific gravity (H_2O:1) = 1.80 at 25°C; Boiling point = (decomposes); Freezing/Melting point = 152.8°C; Vapor pressure = 1×10^{-7} mmHg. Slightly soluble in water; solubility = 0.03% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Those engaged in the manufacture, formulation, and application of this herbicide used to control woody and herbaceous weeds. The EPA has issued a rebuttable presumption against registration of 2,4,5-T for pesticide uses, however. The Vietnam war era defoliant, Agent Orange, was a mixture of 2,4,5-T and 2,4-D.

Incompatibilities: The aqueous solution is a weak acid. Incompatible with sulfuric acid, bases, ammonia, aliphatic amines; alkanolamines, isocyanates, alkylene oxides; epichlorohydrin; strong oxidizers, such as chlorine, bromine, fluorine, and strong bases.

Permissible Exposure Limits in Air
OSHA PEL: 10 mg/m^3 TWA

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 10 mg/m^3 [skin], 1999; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 5 mg/m^3 [skin], 1999; France: VME 10 mg/m^3, 1993; Hungary: TWA 1 mg/m^3, STEL 2 mg/m^3 [skin], 1993; the Netherlands: MAC-TGG 10 mg/m^3, 2003; the Philippines: TWA 10 mg/m^3, 1993; Switzerland: MAK-W 10 mg/m^3, STEL 50 mg/m^3 [skin], 1999; Thailand: TWA 10 mg/m^3, 1993; United Kingdom: TWA 10 mg/m^3, STEL 20 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Not classifiable as a human carcinogen. Several states have set guidelines or standards for 2,4,5-T in ambient air[60] ranging from 1.0 $\mu g/m^3$ (Pennsylvania) to 100.0 $\mu g/m^3$ (North Dakota) to 160 $\mu g/m^3$ (Virginia) to 238.0 $\mu g/m^3$ (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5001, 2,4,5-T.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00019-9

Permissible Concentration in Water: The EPA (see "References" below) has set a lifetime health advisory of 21.0 μg/L. Mexico[35] has set limits of 100 μg/L in estuaries and 10 μg/L in coastal waters. The state of Kansas[61] has set a guideline for drinking water of 700.0 μg/L.

Determination in Water: Liquid−liquid extraction and gas chromatography (see EPA reference below). Fish Tox = 79154.36150000 ppb (VERY LOW). Octanol−water coefficient: Log $K_{ow} = 3.99$.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* Increasingly severe symptoms may include nose and throat irritation; weakness, tiredness, metallic taste in mouth; loss of appetite; diarrhea, heart problems; heart failure and death. *Skin:* Reddening and itching may develop. Absorption is slow, but may contribute significantly to total exposure. *Eyes:* Irritation may develop. *Ingestion:* 350 mg (0.01 oz) produces only a metallic taste in the mouth, lasting about 2 h. Approximately 4 teaspoonfuls (150-lb man) may cause weakness, tiredness, loss of appetite; diarrhea, heart problems, heart failure; and death.

Note: Reported effects of 2,4,5-T are due to accidental exposures, often at unknown levels or duration. In addition, 2,4,5-T may be contaminated with very small amounts of another more toxic compound 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD, Dioxin). Therefore, some of the symptoms of exposure to 2,4,5,-T may be due to contaminants.

Long Term Exposure: Levels above the standard may produce skin irritation, acne-like skin sores; loss of skin coloration in small patches; GI tract ulcer; and nerve disorders resulting in difficulty controlling muscles. Animal studies also indicate the possibility of an increased susceptibility to infection. Changes in generic material and birth defects have been reported in laboratory studies and may be due to 2,4,5-T or its contaminant. Whether these effects are produced in humans is unknown. In animals: ataxia, skin irritation; acne-like rash; liver damage. Human Tox = 70.00000 ppb (LOW).

Points of Attack: Skin, liver, gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: blood plasma; urine (chemical/metabolite); urine (chemical/metabolite), 24-h collection. If symptoms develop or overexposure is suspected, liver or kidney function tests may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: If ingested, remove by lavage or emesis. Use general supportive measures for CNS depression. Use quinidine for myotonia.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 mg/m³:* Qm (APF = 25) (any quarter-mask respirator). *100 mg/m³:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *250 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or PAPRDM, if not present as a fume (any powered, air-purifying respirator with a dust and mist filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, such as chlorine, bromine, fluorine, and strong bases. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This material falls under "Phenoxy pesticides, solid, toxic, n.o.s." This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 80.

Fire Extinguishing: 2,4,5-T Acid may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including phosgene, hydrogen chloride, and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Two disposal procedures have been discussed for 2,4,5-T: (1) Mix with excess sodium carbonate, add water and let stand for 24 h before flushing down the drain with excess water; and (2) pour onto vermiculite and incinerate with wood, paper, and waste alcohol.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

RTECS® Number: TB4550000

UN/NA & ERG Number: UN2810/153

EC Number: None assigned.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g.

Carcinogenicty: GA is not listed by the International Agency for Research on Cancer (IARC), American Conference of Governmental Industrial Hygienists (ACGIH), Occupational Safety and Health Administration (OSHA), or National Toxicology Program (NTP) as a carcinogen.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical.

Note: Army Regulation, AR 50-6, deals specifically with the shipment of chemical agents; must be escorted in accordance with Army Regulation, AR 740-32.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions.

Canada, National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tabun (GA), an organophosphorous compound, is a nerve agent, and among the most toxic of the known chemical warfare agents. Exposure to tabun can cause death in minutes. A fraction of an ounce (1−10 mL) of tabun on the skin can be fatal. GA is a clear, colorless to brownish, oily liquid, with a slight fruity odor, like almonds. No odor when pure. *Warning:* Odor is not a reliable indicator of the presence of toxic amounts of tabun. It is tasteless. Molecular weight = 162.12; Specific gravity (H_2O:1) = 1.07 at 25°C; Boiling point = 230°C (decomposition); Freezing/Melting point = −50°C; Vapor density (air = 1) = 5.6; Vapor pressure = 0.057 mmHg at 25°C/0.07 at 24°C; Volatility = 490 mg/m^3 at 25°C; Flash point = 78°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0. Soluble in water; readily hydrolyzed forming hydrogen cyanide; solubility = 9.8% at 25°C/7.2 at 20°C. It is chemically similar to malathion or parathion, and other organophosphates.

Potential Exposure: GA is a highly persistent (may remain as liquid for more than 24 h) chemical warfare agent; military nerve gas. Nerve agents are more toxic and potent than insecticides. *Note:* If used as a weapon, notify US Department of Defense: Army. Damage and/or death may occur before chemical detection can take place. Use M8 paper if available (Detection: yellow) or M256-A1 Detector Kit (Detection limit: 0.005 mg/m^3).

Persistence of Chemical Agent: Tabun (GA): Summer: 10 min to 24 h; Winter: 2 h to 3 days.

Incompatibilities: Tabun (GA) decomposes slowly in water. Under acid conditions, GA hydrolyzes to form hydrofluoric acid (HF). Raising the pH increases the rate of decomposition significantly. Rapidly hydrolyzed in basic solutions (Na_2CO_3, NaOH, or KOH) with a half-life of 1.5 min at pH 11 at 25°C. GA and its hydrolysis products exhibit no significant phototransformations in sunlight. Tabun and its hydrolysis products are thermally stable at temperatures less than 49°C. Contact with metals may evolve flammable hydrogen gas. Reacts with oxidizing materials. Tabun is destroyed by bleaching powder, but the reaction produces cyanogen chloride (CNCl). Decomposes within 6 months at 60°C. Complete decomposition in 3.5 h at 150°C. May produce hydrogen cyanide, oxides of nitrogen; oxides of phosphorus; carbon monoxide; and hydrogen cyanide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) GA*
TEEL-0: 0.000125 ppm
PAC-1: 0.00042 ppm
PAC-2: **0.0053** ppm
PAC-3: **0.039** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

STEL: **0.0001** mg/m^3

The suggested permissible airborne exposure concentration for GA for an 8-h workday or a 40-h workweek is an 8 h time weight average (TWA) of 0.0001 mg/m^3 (2×10^{-5} ppm). This value is based on the TWA of GA as proposed in the USAEHA Technical Guide 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents, GA, GB, GD, and VX.*

WPL (Worker population limit): 0.00003 mg/m^3.

GPL (General population limit): 0.000001 mg/m^3.

Determination in Air: Military chemical agent detection papers and kits (M18A2 for liquid; M256A1, M8A1, M18A2, ICAD, CAM for vapor). M8, M9 paper will quickly detect the presence of a nerve agent but will not identify the type of agent being used. Also, the following may be helpful: "Accuro®" or "Accuro® 2000" (Draeger®) Air Sampling/Gas (Vapor) System; or use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides; NIOSH Analytical Method #7904, Cyanides.

Determination in Water: Log K_{ow} = (estimated) 0.29; also listed at 1.4. Tabun dissolves in water and remains very dangerous. To prevent anyone from drinking water mixed with tabun, notify local health and pollution control officials. Also, notify operators of nearby water intakes and advise shutting water intakes. Use M272 Chemical Agent Water Testing Kit. Detection limit for nerve agents is 0.02 mg/L. Also, for cyanides, distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid). If used as a weapon, utilize an M272 Water Detection Kit (Detection limit: 0.02 mg/L). Dangerous to aquatic life in high concentrations. May be dangerous if it enters water intakes. This material will be broken down in water quickly, but small amounts may evaporate. This material will be broken down in moist soil quickly. Small amounts may evaporate into the air or travel below the soil surface and contaminate groundwater. Persists 1½ to 2 days in soil. Bleaching powder (chlorinated line) destroys tabun but gives rise to cyanogen chloride (CAS: 506-77-4). See table of contents or name index for location of entry for cyanogen chloride.

Routes of Entry: Skin absorption, absorption through eyes; and inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Tabun is a nerve agent; it acts as a cholinesterase inhibitor. The median lethal dosage (vapor/respiratory) LCt_{50} = 400 mg-min/m^3 for humans; the median incapacitating dosage is 300 mg-min/m^3. Respiratory lethal dosages kill in 1−10 min; liquid in the eye kills nearly as rapidly. The LD_{50} (skin) = 1.0g/70 kg/156.8 lb [human] (*Medical Aspects of Chemical and Biological Warfare, Part I*, Walter Reed Medical Center, 1997). Skin absorption great enough to cause death may occur in 1−2 min, but may be delayed for 1−2 h. Nerve agent symptoms include difficulty in breathing; drooling, nausea, vomiting, cramps, involuntary defecation and urination; twitching, jerking, staggering, headache, confusion, drowsiness, coma, and convulsions. Inhalation causes dimness of vision and pinpointing of the pupils. GA is an anticholinesterase agent similar in action to GB (sarin). Although only about half as toxic as GB (sarin) by inhalation, GA in low concentrations, is more irritating to the eyes than GB (sarin). The number and severity of symptoms which appear are dependent on the quantity, and rate of entry of the nerve agent which is introduced into the body (very small skin dosages sometimes cause local sweating and tremors with few other effects). Individuals poisoned by GA display approximately the same sequence of symptoms regardless of the route by which the poison enters the body (whether by inhalation, absorption, or ingestion). These symptoms, in normal order of appearance, runny nose; tightness of chest; dimness of vision and pinpointing of the eye pupils; difficulty in breathing; drooling and excessive sweating; nausea, vomiting, cramps; and involuntary defecation and urination; twitching, jerking, staggering, headaches, confusion, drowsiness, coma, and convulsions. These symptoms are followed by cessation of breathing and death. Onset Time of Symptoms: Symptoms appear much more slowly from skin dosage than from respiratory dosage. Although skin absorption great enough to cause death may occur in 1–2 min, death may be delayed for 1–2 h. Respiratory lethal dosages kill in 1–10 min, and liquid in the eye kills almost as rapidly. Median Lethal Dosage, animals: LD_{50} (monkey, percutaneous) = 9.3 mg/kg (shaved skin); LCt_{50} (monkey, inhalation) = 187 mg-min/m^3 ($t = 10$); Median Lethal Dosage, Man: LCt_{50} (man, inhalation) = 135 mg-min/m^3 ($t = 0.5–2$ min) at RMV (Respiratory Minute Volume) of 15 l/min; 200 mg-min/m^3 at RMV of 10 l/min.

GA is not listed by the International Agency for Research on Cancer (IARC); American Conference of Governmental Industrial Hygienists (ACGIH); Occupational Safety and Health Administration (OSHA); or National Toxicology Program (NTP) as a carcinogen.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase. Liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Complete blood count (CBC). Evaluation of thyroid function. Liver function tests. Kidney function tests. Central nervous system tests. EKG.

First Aid: *Inhalation:* Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil construction, a lack of coordination, etc.), immediately administer, in rapid succession, all three Nerve Agent Antidote Kit(s), Mark I injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated at 5- to 20-min intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. Seek medical attention *immediately*.

Eye contact: immediately flush eyes with water for 10–15 min then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken immediately to the medical treatment facility for observation.

Skin contact: Don respiratory protection mask and remove contaminated clothing. Immediately wash contaminated skin with copious amounts of soap and water, 10% sodium carbonate solution, or 5% liquid household bleach. Rinse well with water to remove decontaminate. Use M258A1 and/or M291 kit for skin decontamination. Speed in removing material from skin is of extreme importance. Administer an intramuscular injection with the MARK I kit injectors only if local sweating and muscular twitching symptoms are observed. Seek medical attention *immediately*.

Ingestion: Do not induce vomiting. First symptoms are likely to be gastrointestinal. *Immediately* administer 2 mg intramuscular injection of the MARK I kit auto-injectors. Seek medical attention *immediately*.

Medical treatment: Electrocardiogram (ECG), and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5–10 mg in adults and 0.2–0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6–12 h to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.

Decontamination*:* This is very important. The rapid physical removal of a chemical agent is essential. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim canmot move, decontaminate without touching and without entering the hot or the warm zone. Nerve gases stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Do not wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Wash–strip–wash–evacuate upwind and uphill: Patients exposed to nerve agent by vapor only should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; Patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild-to-moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Remember that the water you use to decontaminate the victims is dangerous. Be sure you've decontaminated the victims as much as you can before they are released from the area, so they do not spread the nerve gas. Rinse the eyes, mucous membranes; or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

*The following can be used in addition to household bleach: (1) solids, powders and solutions containing various types of bleach ($NaOCl$ or $Ca(OCl)_2$); (2) DS2 (2% $NaOH$, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide ($NaOH$) dissolved in water, phenol, ethanol, and ammonia.

Note: Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes, and other items.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber gloves and Tyvek® "F" decontamination suits provide barrier protection against chemical warfare agents. Although resistant to liquid chemical agents, impermeable protective clothing may be penetrated after a few hours of exposure to heavy concentration of agent. Consequently, liquid contamination on the clothing must be neutralized or removed as soon as possible. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. The M40 Series mask (which replaced the M17A1 protective mask) provides respiratory protection against all known military toxic chemical agents, but it cannot be used in an oxygen-deficient environment and is *not approved for civilian use*. It does not afford protection against industrial toxics, such as ammonia and carbon monoxide.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone A] require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Spills must be contained by covering with vermiculite, diatomaceous earth; clay, fine sand; sponges, and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous sodium hydroxide solution (a minimum 10% wt.). Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. The decontamination solution must be treated with excess bleach to destroy the CN formed during hydrolysis. Cover the contents with additional bleach before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA, and DOT regulations. Dispose of the material per IAW waste disposal methods provided below. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 10% wt. sodium hydroxide is not available then the following decontaminants may be used instead and are listed in order of preference: Decontaminating Solution No. 2 [DS2: (2% $NaOH$, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate and Supertropical

Bleach Slurry (STB). Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

GA, when used as a weapon

Small spills (From a small package or a small leak from a large package).

First: Isolate in all directions (feet/meters) 100/30.
Then: Protect persons downwind (miles/kilometers).
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages).

First: Isolate in all directions (feet/meters) 300/100.
Then: Protect persons downwind (miles/kilometers).
Day 0.4/0.6
Night 0.4/0.6

Fire: If tank, rail car, or tank truck is involved in fire, isolate for at least 800 m (½ mile) in all directions; also, consider initial evacuation for 800 m (½ mile) in all directions.

Fire Extinguishing: Tabun is a combustible liquid. When heated, vapors may form explosive mixtures with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Water, fog, foam, carbon dioxide—avoid using extinguishing methods that will cause splashing or spreading of the GA. Poisonous gases, including hydrogen cyanide, oxides of nitrogen, oxides of phosphorus; carbon monoxide; and hydrogen cyanide may be produced in fire. Respiratory protection is required. Positive pressure, full face-piece, NIOSH-approved self-contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing. Complete protection required; have decontaminants available (bleach, alkali) and atropine. Bleaching powder (chlorinated line) destroys tabun but gives rise to cyanogen chloride. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: A minimum of 56 g of decontamination solution is required for each gram of GA. The decontamination solution is agitated while GA is added and the agitation is maintained for at least 1 h. The resulting solution is allowed to react for 24 h. At the end of 24 h, the solution must be titrated to a pH between 10 and 12. After completion of the 24-h period, the decontamination solution must be treated with excess bleach (2.5 mole OCl-/mole GA) to destroy the CN formed during hydrolysis. Scoop up all material and place in a fully removable head drum with a high density polyethylene liner. Cover the contents with additional bleach before affixing the drum head. All contaminated clothing will be placed in a fully removable head drum with a high density polyethylene liner. Cover the contents of the drum with decontaminating solution as above before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled per IAW, state, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, state, EPA, and DOT regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

Regulatory Authority and Advisory Bodies

Carcinogencity: IARC: Sufficient (*for talc containing asbestiform fibers*) Group 1; Human Inadequate Evidence (*talc not containing asbestiform fibers*) group 3; NTP (*for talc containing asbestiform fibers*): Known to be a human carcinogen; NCI: Carcinogenesis Studies (inhalation); clear evidence: rat; no evidence: mouse.

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer (*talc containing asbestiform fibers*) 4/1/90

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Talc is an odorless solid which exists in both a nonasbestos form and a fibrous form. This entry will be concerned with the nonfibrous form. Molecular weight = 96.33; Freezing/Melting point = 900°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Natural Product; Primary Irritant. Talc is used in the ceramics, paint, roofing, insecticide, paper, cosmetics, lubricant, pharmaceutical, and rubber industries; electrical insulation.

Incompatibilities: None reported.

Permissible Exposure Limits in Air

For talc containing asbestos fibers: See Asbestos.

The following is for talc containing NO asbestos fibers.

OSHA PEL (*containing less than 1% quartz*): 20 mppcf TWA.

NIOSH REL: 2 mg/m^3 TWA, respirable dust.

ACGIH TLV®[1]: 2 mg/m^3 TWA (respirable fraction, for particulate matter containing no asbestos and <1% crystalline silica); not classifiable as a human carcinogen.

NIOSH IDLH: 1000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 2.5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 2 mg/m^3, 1993; Finland: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 2 mg/m^3 (respirable dust), 1999; United Kingdom: TWA 1 mg/m^3, respirable dust, 2000; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use NIOSH (III) P&CAM, Method #355.

Routes of Entry: Inhalation of dust, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Talc can affect you when breathed in. Can cause eye and lung irritation.

Long Term Exposure: May affect the lungs, causing talc fibrotic pneumoconiosis. Repeated high exposure can cause scarring of the lungs. Symptoms of shortness of breath and cough can develop. This disease can be disabling and fatal. Talc can cause the chest X-ray to become abnormal. Contact can cause eye irritation, and may lead to a reaction causing serious eye damage.

Points of Attack: Eyes, respiratory system; cardiovascular system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Chest X-ray every 1−3 years, after five or more years of heavy exposure should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 10 mg/m³:* Qm (APF = 25) (any quarter-mask respirator). *Up to 20 mg/m³:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 50 mg/m³:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 100 mg/m³:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); SaF (any supplied-air respirator with a full face-piece). *Up to 1000 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue (*only for talc containing asbestiform fibers*): Health Hazard/Poison: Store in a secure poison location. Color Code—Green (*talc powder or tablets*): General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Talc itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent (*metal and oxide*).

Description: Tantalum is a refractory metal in Group V-B of the periodic table. The pure metal is ductile, steel-blue to gray solid or black, odorless powder. Molecular weight = 180.95; Specific gravity (H_2O:1) = 16.65 (*metal*); 14.40 (powder) at 25°C; Boiling point = 5425°C; Freezing/Melting point = 2996°C; 1872 (oxide); Maximum Explosive concentration (MEC) = <200 g/m^3. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen. Tantalum metal is used in electronic components: electric capacitors; rectifiers, in chemical equipment; in nuclear reactor components; in chemical equipment; body implants. Tantalum carbide is used in metal cutting tools and wear-resistant parts. Some tantalum salts are used in catalysts.

Incompatibilities: A combustible solid; the dry powder ignites spontaneously in air. Incompatible with lead chromate, strong oxidizers; bromine trifluoride; fluorine. Tantalum metal is attacked by hydrogen fluoride, fused alkalis, fuming sulfuric acid.

Permissible Exposure Limits in Air

(*metal, oxides, and dusts*)

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA; 10 mg[Ta]/m^3 STEL.

ACGIH TLV®[1]: Withdrawn due to insufficient data.

NIOSH IDLH: 2500 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK (*metal*): 1.5 mg/m^3, respirable fraction (previously "fine dust"); 4 mg[Ta]/m^3, inhalable fraction (previously "total dust"); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.1 mg/m^3, 1993; Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg. Several states have set guidelines or standards for tantalum in ambient air[60] ranging from 50−100 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Permissible Concentration in Water: No criteria set. Insoluble.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. In animals: pulmonary irritation.

Long Term Exposure: May be a systemic poison.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 50 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or PaprTHie

(APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2,500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) (100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red (*pyrophoric powder*): Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage.

Sipping: Metal powder, in bulk, may be pyrophoric. Flammable powder requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sanitary landfill if necessary; recover if possible because of economic value. Technology exists for tantalum recovery from spent catalysts, for example.

TDE T:0140

Molecular Formula: $C_{14}H_{10}Cl_4$

Common Formula: $ClC_6H_4CH(CHCl_2)C_6H_4Cl$

Synonyms: Benzene, 1,1′-(2,2-dichloroethylidene)bis(4-chloro-); 1,1-Bis(*p*-chlorophenyl)-2,2-dichloroethane; 1,1-Bis (4-chlorophenyl)-2,2-dichloroethane; 2,2-Bis(*p*-chlorophenyl)-1,1-dichloroethane; 2,2-Bis(4-chlorophenyl)-1,1-dichloroethane; DDD; *p,p*′-DDD (EPA); 1,1-Dichlor-2,2-bis(4-chlor-phenyl)-aethan (German); 1,1-Dichloro-2,2-bis(*p*-chlorophenyl) ethane; 1,1-Dichloro-2,2-bis(4-chlorophenyl)ethane; 1,1-Dichloro-2,2-bis(*p*-chlorophenyl)ethane; 1,1-Dichloro-2,2-di(4-chlorophenyl)ethane; *p*-,*p*-'-Dichlorodiphenyldichloroethane; Dichlorodiphenyldichloroethane; Diclorodifeniltricloroetano (Spanish); Dilene; ENT 4,225; ME-1700; NCI-C00475; Rhothane; Rhothane D-3; Rothane; *p*-,*p*-'-TDE; Tetrachlorodiphenylethane

CAS Registry Number: 72-54-8

RTECS® Number: KI070000

UN/NA & ERG Number: UN2761/151

EC Number: 200-783-0

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (feed); clear evidence: rat; no evidence: mouse.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR423, Appendix A, Priority Pollutants.

US EPA Hazardous Waste Number (RCRA No.): U060.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.023; Nonwastewater (mg/kg), 0.087.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (0.1); 8270 (10).

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer 1/1/89.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: TDE is a colorless, combustible, crystalline compound. Molecular weight = 320.04; Vapor pressure = 1×10^{-6} mmHg at 20°C; Freezing/Melting point = 109−110°C. Insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide. In an action of March 18, 1971, EPA canceled all pesticide uses of this product which is a metabolite of DDT. Hence it is no longer manufactured commercially.

Incompatibilities: Incompatible with alkalis, strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 35 mg/m^3
PAC-3: 500 mg/m^3

Permissible Concentration in Water: For the protection of freshwater aquatic life, the value is 0.6 μg/L, based on acute toxicity. For saltwater aquatic life, the value is 3.6 μg/L, based on acute toxicity. For the protection of human health, with respect to TDE, see criteria proposed for DDT, since TDE is a metabolite of DDT. Mexico[35] has set a limit of 30 μg/L in estuaries and 3 μg/L in coastal waters. Russia set a MAC of zero in surface water used for fishery purposes.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen-specific detection (EPA Method #608) or gas chromatography plus mass spectrometry (EPA Method #625). Fish Tox = 0.59514000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Since DDD is a metabolite of DDT, as well as a contaminant of commercial preparations of DDT, many of the effects of DDT could be mediated through DDD. Irritates the eyes, skin, and respiratory tract. May affect the central nervous system, causing convulsions and respiratory failure. Exposure may result in death. Symptoms of exposure include lethargy, anorexia, nausea, vomiting, diarrhea, paresthesia of tongue, lips, face; tremor, apprehension, dizziness, confusion, malaise (vague feeling of discomfort), headache, fatigue; convulsions; paresis of hands.

Long Term Exposure: Based on DDT, the chemical may affect the central nervous system. May damage the liver. A Suspected Human Carcinogen; there is some evidence that DDD is carcinogenic in mice; however, in other species, it appears to be noncarcinogenic. DDD has been shown to be mutagenic in drosophila, but not in yeast or bacteria. In cell culture, DDD causes chromosomal breaks.

Points of Attack: Eyes, skin, central nervous system; kidneys, liver, peripheral nervous system.

Medical Surveillance: Kidney and liver function tests. Examination of the nervous system.

First Aid: *Skin Contact*[52]*:* Flood all areas of the body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. Medical observation is recommended following acute overexposure.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Organochlorine pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC

MATERIALS." This material falls in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Dampen spilled material with acetone to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 10,000.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a unit operating above 850°C equipped with HCl scrubber. Incineration above 1200°C for 1−2 s is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Tellurium T:0150

Molecular Formula: Te

Synonyms: Aurum paradoxum; Elemental tellurium; Metallum problematum; Telloy; Telurio (Spanish); Tellurium elemental

CAS Registry Number: 13494-80-9; *(alt.)* 137322-20-4

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

RTECS® Number: WY2625000 (elemental)

UN/NA & ERG Number: Available for Te compounds only: 3284 (tellurium compound, n.o.s.)/151

EC Number: 236-813-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tellurium is a grayish or silvery white, lustrous, crystalline, semimetallic element. It may exist in a hexagonal crystalline form or an amorphous powder. It is found in sulfide ores and is produced as a by-product of copper or bismuth refining. Molecular weight = 127.60; Specific gravity (H_2O:1) = 6.24 at 25°C; Boiling point = 990°C; Freezing/Melting point = 450°C; Autoignition temperature = 340°C. Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. The primary use of tellurium is in the vulcanization of rubber and as an additive in ferritic steel production. It is also used as a carbide stabilizer in cast iron, a chemical catalyst; a coloring agent in glazes and glass; a thermocoupling material in refrigerating equipment; as an additive to selenium rectifiers; in alloys of lead, copper, steel, and tin for increased resistance to corrosion and stress, workability, machinability, and creep strength; and in certain culture media in bacteriology. Since tellurium is present in silver, copper, lead, and bismuth ores, exposure may occur during purification of these ores.

Incompatibilities: Finely divided powder or dust may be flammable and explosive. Violent reaction with halogens, interhalogens, zinc and lithium silicide; with incandescence. Incompatible with oxidizers, cadmium; strong bases; chemically active metals; silver bromate; nitric acid.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Te]/m^3 TWA.

NIOSH REL: 0.1 mg[Te]/m^3 TWA, *except tellurium hexafluoride and bismuth telluride*.

ACGIH TLV®[1]: 0.1 mg[Te]/m^3 TWA, *except hydrogen telluride*.

NIOSH IDLH: 25 mg[Te]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 25 mg/m^3

Australia: TWA 0.1 mg/m^3, 1993; Austria: MAK 0.1 mg/m^3, 1999; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA

0.1 mg/m^3, 1999; Finland: TWA 0.1 mg/m^3, STEL 0.3 mg/m^3, 1999; France: VME 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg[Te]/m^3, 2003; the Philippines: TWA 0.1 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3; MAC (STEL) 0.03 mg/m^3, 1999; Sweden: NGV 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.5 mg/m^3, 1999; Turkey: TWA 0.1 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg[Te]/m^3. Several states have set guidelines or standards for tellurium in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7900. See also #7300, Elements: #7301; #7303; #9102; OSHA Analytical Method ID-121.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[43] set a MAC for tellurium in water bodies used for domestic purposes of 0.01 mg/L.

Routes of Entry: Inhalation of dust or fume; percutaneous absorption from dust, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Causes central nervous system depression. Moderate skin and eye irritant. Tellurium is capable of doing harm within the body by replacing the essential element sulfur. Signs and symptoms of acute exposure to tellurium may include garlicky breath, metallic taste; sweating; dry mouth; drowsiness, no sweating headache; drowsiness, malaise, fatigue, lassitude, weakness, and dizziness. Gastrointestinal symptoms may include nausea, vomiting, anorexia, and constipation. High levels of the dust or fume may cause bronchitis or pneumonia to develop. In animals: central nervous system; red blood cell changes.

Long Term Exposure: Repeated exposure can cause garlic odor on the breath, nausea, vomiting, anorexia, metallic taste, and irritability. Kidney damage, liver injury, and pulmonary effects may also occur. Dermal exposure may result in dermatitis; red, inflamed skin; drying and cracking. At doses which are severely toxic to the mother, tellurium produces teratogenic effects. May damage the unborn fetus. High exposures may cause damage to the nervous system.

Points of Attack: Skin, central nervous system; kidneys, liver.

Medical Surveillance: Oral hygiene and the respiratory tract should receive special attention in preplacement or periodic examinations. Liver and kidney function tests. Blood tests for liver and kidney function. Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Give a slurry of activated charcoal in water to drink. Seek medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from tellurium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 1* mg/*m^3:* 95QX [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 25 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, chlorine, cadmium. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Toxic solid, inorganic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Use water spray. Tellurium will burn only slowly in air. Straight water streams will scatter molten tellurium oxide. Wear goggles, rubber gloves, and proper respirator with filter. Poisonous gases, including tellurium, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Several states have set guidelines or standards for TeF_6 in ambient air[60] ranging from 2.0 μg/m^3 (North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II (3), Method #S-187.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Capable of causing death or permanent injury. *Acute*: the material is highly toxic by inhalation exposure and a strong irritant to skin, eyes, lungs, throat, and stomach. Death can occur from filling of the lungs with fluid (pulmonary edema) or from asphyxiation due to spasm of the throat (larynx), or bronchi. Signs and symptoms of acute exposure to tellurium hexafluoride may include drowsiness, malaise, lassitude, weakness, and dizziness.

Long Term Exposure: Dermal exposure may result in dermatitis; red, inflamed skin; drying and cracking. May cause kidney and liver injury. A metallic taste; garlicky breath; and profuse sweating may develop. Gastrointestinal effects may include nausea, vomiting, anorexia, and constipation.

Points of Attack: Respiratory system, liver, and kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from tellurium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.2 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 1 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA

(APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Poison gas. Color Code—White Stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Color Code—Blue: Health Hazard/ Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water.

Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: Tellurium hexafluoride requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3 and Packing Group I. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse vapors. Stop the flow of the leak. Remove the leaking container to a safe place in the open air and allow the leak to disperse. Use water spray to reduce vapor but do not put water on leak or spill area. *Small spills:* flush area with flooding amounts of water. *Large spills:* dike far ahead of spill for later disposal. Do not get water inside container. Isolate area until gas has dispersed. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 600/200.
Then: Protect persons downwind (miles/kilometers).
Day 0.8/1.2
Night 2.7/4.3/4.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000.
Then: Protect persons downwind (miles/kilometers).
Day 5.9/9.4
Night 7.0 + /11.0+

Fire Extinguishing: This chemical is a nonflammable gas. *Small fires:* dry chemical or carbon dioxide. *Large fires:* water spray, fog, or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and full protective clothing. Do not get water inside container. Move container from fire area if you can do so without risk. Stay away from ends of tanks. Spray cooling water on containers that are exposed to flames until well after fire is out. Isolate area until gas has dispersed. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

ACGIH TLV®[1]: 1 mg/m^3 TWA, inhalable fraction and vapors [skin]; not classifiable as a human carcinogen; BEI$_A$ issued for acetylcholinesterase inhibiting pesticides.

No Teel available.

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; France: VME 10 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3 [skin], 1993; Switzerland: MAK-W 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3. Several states have set guidelines or standards for temephos in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #0500, #0600; NIOSH Analytical Method PV-2056.

Permissible Concentration in Water: No criteria set. Experience in the field for a period of more than 1 year has shown, however, that 1 mg/L in drinking water is without effect.

Determination in Water: Techniques used for residue determination include colorimetry and gas liquid chromatography, and may be applicable to water analysis. Fish Tox = 16.53952000 ppb (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = 5.96.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Temephos can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic organophosphate chemical. Exposure can cause rapid severe poisoning with headache, sweating, nausea, and vomiting; diarrhea, loss of coordination; and death.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 3.50000 ppb (HIGH).

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair promptly if contaminated. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with the crystals, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a pesticide cartridge. Increased protection is obtained from full-face-piece air-purifying respirators. Where there is potential for exposure *over 10 mg/m*^{3} as liquid temephos or for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids and bases. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur and phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Essentially complete, hydrolysis occurs upon heating in concentrated KOH for 20 min.[22] Incineration is recommended for large quantities. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies: Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

US EPA Hazardous Waste Number (RCRA No.): P111.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50; Safety phrases: S1/2; S36/37/39; S38; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: TEPP is a colorless to amber liquid with a faint, fruity odor. Molecular weight = 290.22; Specific gravity (H_2O:1) = 1.19 at 25°C; Boiling point = Decomposes below BP at 170°C; 138°C under 2.3 mmHg; Freezing/Melting point = 0°C; Vapor pressure = 2×10^{-4} mmHg at 25°C. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug; Human Data. Those engaged in the manufacture, formulation, and application of this aphicide and acaricide; used as an insecticide to control aphids, thrips, and mites; as an anticholinesterase.

Incompatibilities: Strong oxidizers, alkalis, water. Hydrolyzes quickly in water to form pyrophosphoric acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 11.87 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.05 mg/m^3 TWA [skin].

NIOSH REL: 0.05 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.01 mg/m^3, measured as inhalable fraction and vapor TWA [skin]; BEI$_A$ issued for acetylcholinesterase inhibiting pesticides.

NIOSH IDLH: 5 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.01 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 5 mg/m^3

DFG MAK: 0.005 ppm/0.06 mg/m^3; Peak Limitation Category II(2) [skin].

Arab Republic of Egypt: TWA 0.004 ppm (0.05 mg/m^3) [skin], 1993; Australia: TWA 0.004 ppm (0.05 mg/m^3) [skin], 1993; Austria: MAK 0.005 ppm (0.05 mg/m^3) [skin], 1999; Belgium: TWA 0.004 ppm (0.047 mg/m^3) [skin], 1993; Denmark: TWA 0.004 ppm (0.05 mg/m^3) [skin], 1999; France: VME 0.004 ppm (0.05 mg/m^3) [skin], 1999; the Netherlands: MAC-TGG 0.05 mg/m^3 [skin], 2003; the Philippines: TWA 0.05 mg/m^3 [skin], 1993; Switzerland: MAK-W 0.005 ppm (0.05 mg/m^3) [skin], 1999; Turkey: TWA 0.05 mg/m^3 [skin], 1993 Occupational Exposure Limit United Kingdom: TWA 0.004 ppm (0.05 mg/m^3), STEL 0.1 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 mg/m^3 (skin).

Several states have set guidelines or standards for TEPP in ambient air[60] ranging from 1.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (North Dakota) to 80,000 μg/m^3 (Virginia) to a much higher value for Nevada.

Determination in Air: Use NIOSH Analytical Method (IV) #2504, Tetraethyl Pyrophosphate; see also NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure include eye pain; blurred vision; lacrimation (discharge of tears); rhinorrhea (discharge of thin nasal mucous); headache, chest tightness; cyanosis, anorexia, nausea, vomiting, diarrhea, weakness, twitching, paralysis, Cheyne−Stokes respiration, convulsions, low blood pressure; cardiac irregular/irregularities; sweating. TEPP is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg (a taste) for a 150 lb person. A small drop in the eye may cause death. Small doses at frequent intervals are additive. Poisonings always develop at a rapid rate. It is a cholinesterase inhibitor.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Eyes, respiratory system; central nervous system; cardiovascular system, gastrointestinal tract; blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink. *Do NOT* induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 0.5 mg/m^3: Sa (APF = 10) (any supplied-air respirator). 1.25 mg/m^3: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). 2.5 mg/m^3: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). 5 mg/m^3: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Organophosphorus pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.
