Long Term Exposure: There is a limited evidence that this chemical is a teratogen in animals. It may damage the testes (male reproductive glands) and affect sperm production. Hexafluoroacetone can damage the liver, kidneys, and lungs. Repeated exposure may cause bronchitis. Prolonged exposure may affect blood cells.

Points of Attack: Eyes, skin, respiratory system, kidneys, reproductive system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, reproductive history for men. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with the liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 0.1 ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. (2) Color Code—Blue (*poison gas*): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from direct sunlight, water, heat, reducing agents, nitrates, and nitric acid. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Hexafluoroacetone requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. If hexafluoroacetone gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.9/1.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 5.2/8.4
Night 7.0+ /11.0+

Fire Extinguishing: HFA is nonflammable reactive gas. Poisonous gases, including carbon monoxide and hydrogen fluoride, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nonrefillable cylinders should be disposed of in accordance with local, state, and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

New Jersey Department of Health and Senior Services. (March 1999). *Hazardous Substances Fact Sheet: Hexafluoroacetone*. Trenton, NJ

Hexafluoroethane H:0260

Molecular Formula: C_2F_6

Synonyms: Ethane, hexafluoro-; F116; Freon 116; Perfluoroethane; R-116

CAS Registry Number: 76-16-4

RTECS® Number: KI4110000

UN/NA & ERG Number: UN2193/126

EC Number: 200-939-8 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hexafluoroethane is a colorless and odorless gas or liquid under pressure. Molecular weight = 138.02; Boiling point = −78°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: It is used as a coolant, in dielectric fluids, as a propellant, and as a refrigerant.

Incompatibilities: Active metals. Keep away from heat and sunlight.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 40,000 ppm
PAC-1: 40,000 ppm
PAC-2: 40,000 ppm
PAC-3: 40,000 ppm

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Hexafluoroethane can affect you when breathed in. Contact with the liquefied gas could cause frostbite. High levels in the air can cause you to feel dizzy, lightheaded, and to pass out. Very high levels could cause suffocation from lack of oxygen and death. Overexposure may also cause abnormal heart rhythms and even cause the heart to stop.

Points of Attack: Heart.

Medical Surveillance: Special 24-h EKG (Holter monitor). Consider chest X-ray following acute overexposure.

NIOSH lists the following tests as (F): chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles unless full face-piece respiratory protection is worn. Wear splash chemical goggles and face shield when working with the liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues.

Respirator Selection: Where there is potential for exposures to hexafluoroethane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metals, including aluminum, zinc, and beryllium, and from open flames or temperatures above 52°C. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hexafluoroethane is a nonflammable liquid and gas. Use extinguishing agents suitable for type of surrounding fire. Poisonous gases, including hydrofluoric acid and other fluoride gases, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

1,1,1,3,3,3-Hexafluoro-2-propanol H:0265

Molecular Formula: $C_3H_2F_6O$

Synonyms: Bis(trifluoromethyl)methanol; 1,1,1,3,3,3-Hexafluoro-2-hydroxypropane; 1,1,1,3,3,3-Hexafluoroisopropanol; Hexafluoroisopropanol; Hexafluoroisopropyl alcohol; 1,1,1,3,3,3-Hexafluoroisopropyl alcohol; 2,2,2-Trifluoro-1-(trifluoromethyl)ethanol; HFIP

CAS Registry Number: 920-66-1
RTECS Number: UB6450000
UN/NA & ERG Number: UN1760 (Corrosive liquid, n.o.s.)/154
EC Number: 213-059-4
Regulatory Authority and Advisory Bodies
Listed in the TSCA inventory.
SARA 311/312 codes: Immediate.
Canada: WHMIS Classification: D1B, E; Found on DSL list.
European/International Regulations: Hazard Symbol: T,C; Risk phrases: R20/21; R25; R34; R41; Safety phrases: S36; S37/39 (see Appendix 4).

Description: 1,1,1,3,3,3-Hexafluoro-2-propanol (HFIP) is a clear, colorless, oily, combustible liquid. Odor is described as aromatic. Molecular weight = 168.04; Specific gravity = 1.596 at 20°C; Freezing/Melting point = −4°C; Boiling point = 59°C at 760 mmHg; Vapor pressure: 556 mmHg at 51°C; 1468 mmHg at 75°C; Flash point: >93°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3; Flammability 0; Reactivity 0. Water soluble; solubility = $\geq$ 100 mg/mL at 20°C.

Potential Exposure: A specialty solvent for some polymers; a lavatory reagent.

Incompatibilities: HFIP is incompatible with acids, acid chlorides, and oxidizing agents.

Permissible Exposure Limits in Air:
Protective Action Criteria (PAC)
TEEL-0: 7.5 ppm
PAC-1: 25 ppm
PAC-2: 150 ppm
PAC-3: 750 ppm

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.66.

Routes of Entry: Ingestion, inhalation, or absorbed through the skin. Causes burns by all exposure routes.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive; causes burns to all internal or external area of contact. Dangerous if inhaled, swallowed, or absorbed through skin. Highly toxic by inhalation. Severe overexposure can result in death. Can cause blindness; immediate washing of the eye may not lessen the magnitude of eye damage. Prolonged skin contact may cause large blisters. Depending on the intensity and duration of exposure, this chemical can cause severe destruction of tissues of the mucous membranes and upper respiratory tract. Symptoms of exposure to this compound may include severe skin and eye irritation, irritation of the mucous membranes and upper respiratory tract, burning feeling, laryngitis, coughing and wheezing, shortness of breath, headache, nausea, and vomiting, blurred vision, incoordination. Inhalation of this chemical can be fatal, resulting from inflammation, bronchial pneumonia, edema of the larynx, bronchi, and pulmonary tract. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. LD_{50} = (oral-rat) 1500 mg/kg.

Long Term Exposure: The chronic properties of this material have not been fully investigated. May cause permanent skin damage; scarring. Repeated exposure to a highly toxic material such as HFIP may result in general deterioration of health and possible organ damage.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin or respiratory tract allergy.

First Aid: *Eyes*: Check the victim for contact lenses and remove. Flush victim's eyes with water or normal saline solution for 20−30 min, occasionally lifting lower and upper eyelids. Remove contaminated clothing and shoes. Get medical attention immediately. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water and wash for at least 15 min. Remove and isolate all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician. Transport the victim to a hospital for treatment. *Inhalation*: Remove victim to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately. *Ingestion*: *Do not induce vomiting*. If the victim is conscious and not convulsing, give large amount of water to dilute the chemical. Never give anything by mouth to an unconscious person. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician. In all cases get medical attention immediately. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body.

Personal Protective Methods: Maintain eyewash fountain and quick-drench facilities in work area. Unless full facepiece respiratory protection is worn, wear splash-proof protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Wear Tyvek-type disposable protective clothing or other impervious protective clothing, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical.

Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When working with this chemical, wear a NIOSH-approved full face chemical cartridge respirator equipped with the appropriate organic vapor cartridges. If that is not available, a half face respirator similarly equipped plus airtight goggles can be substituted. However, please note that half face respirators provide a substantially lower level of protection than do full face respirators.

Storage: Color Code—White stripe (store separately): Contact Hazard; not compatible with materials in solid white category. Storage precautions: you should store this chemical in a refrigerator and keep it away from oxidizing materials. Store away from sources of ignition. Protective clothing (minimum protective clothing): if Tyvek-type disposable protective clothing is not worn during handling of this chemical, wear disposable Tyvek-type sleeves taped to your gloves.

Shipping: Corrosive liquids, n.o.s. require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Nonfire response small spills and leakage: if you spill this chemical, first remove all sources of ignition. Then, use absorbent paper to pick up all liquid spill material. Seal the absorbent paper, as well as any of your clothing which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Wash any surfaces you may have contaminated with a soap and water solution. Do are a not reenter the contaminated area.

Fire Extinguishing: When heated to decomposition, HFIP emits toxic fumes of fluorine. On fire involving this compound, use dry chemical, carbon dioxide, or Halon extinguisher.

Disposal Method Suggested: May be incinerated. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hexamethylenediamine H:0270

Molecular Formula: $C_6H_{16}N_2$
Common Formula: $H_2N(CH_2)_6NH_2$
Synonyms: 1,6-Diaminohexane; 1,6-Hexamethylenediamine; Hexamethylenediamine; 1,6-Hexanediamine; HMDA; NCI-C61405
CAS Registry Number: 124-09-4
RTECS® Number: MO1180000
UN/NA & ERG Number: UN2280 (solid)/153; UN1783 (solution)/153
EC Number: 204-679-6 [*Annex I Index No.:* 612-104-00-9]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R21/22; R34; 37; Safety phrases: S1/2; S22; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: HMDA is a hygroscopic, colorless solid (pellets or flakes). Weak, fishy odor. odor threshold = 0.004 mg/m^3; Molecular weight = 116.13; Boiling point = 199°C; Freezing/Melting point = 39−42°C; Flash point = 71°C; 81°C (solution); Autoignition temperature = 310°C. Explosive limits: LEL = 0.7%; UEL = 6.3%. Soluble in water.

Potential Exposure: Compound Description: Reproductive Effector. HMDA is used as a textile intermediate; a raw material for nylon fiber and plastics; in wet strength resins; in the manufacture of oil-modified and moisture-area types of urethane coatings; in the manufacture of polyamides for printing inks, dimer acids, and textiles; and as an oil and lubricant additive (probably as a corrosion inhibitor); as boiler feed water additives; also used in paints and as a curing agent for epoxy resins; in making adhesives.

Incompatibilities: Forms explosive mixture with air. The aqueous solution is a strong base. A strong reducing agent. Reacts violently with oxidizers, acids, acid chlorides, acid anhydrides, carbon dioxide. Reacts with ethylene dichloride, organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks aluminum, copper, lead, tin, zinc and alloys. Absorbs carbon dioxide and water from air. Store under Nitrogen.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®[1]: 0.5 ppm/2.3 mg/m^3 TWA *as 1,6-hexanediamine*.

AIHA WEEL: 1 ppm TWA.

No TEEL available.

Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 2.3 mg/m^3, 2003; Russia: STEL 0.1 mg/m^3, 1993. Russia set a MAC of 0.001 mg/m^3 in the ambient air of residential areas on a momentary and a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Harmful Effects and Symptoms

Short Term Exposure: A very corrosive substance. Severely irritates and burns the eyes, skin, and respiratory tract. Can cause permanent eye damage. Inhalation can cause nosebleeds, sore throat, hoarseness, cough, phlegm, and/or difficult breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} = (oral-rat) 750 mg/kg (slightly toxic).

Long Term Exposure: Repeated or prolonged exposure can cause dermatitis, eczema, and liver damage, including hepatitis. There is limited evidence that this chemical can damage the developing fetus. Repeated exposure may cause bronchitis.

Points of Attack: Lungs, skin, liver.

Medical Surveillance: Lung function tests, liver function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If convulsions are not present, give a glass or two of water or milk to dilute the substance. Do not induce vomiting. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Store under nitrogen. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a cool, dry place away from oxidizers, strong acids, acid chlorides, acid anhydrides, carbon dioxide, and metals. Preferably store under an inert atmosphere in a tightly closed container.

Shipping: Solid or solution of HMDA requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Solid:* This chemical as a solid may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid: This chemical in solution is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

EC Number: 212-485-8 [*Annex I Index No.:* 615-011-00-1]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations (*822-06-0*): Hazard Symbol: T; Risk phrases: R23; R36/37/38; R42/43; Safety phrases: S1/2; S26; S28; S38; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hexamethylene diiso-cyanate is a colorless liquid with a sharp, irritating odor. Molecular weight = 168.22; Specific gravity (H_2O:1) = 1.04; Boiling point = 212.8°C; Freezing/Melting point = −67.2°C; Relative vapor density (air = 1): 5.8; Vapor pressure = 0.5 mmHg at 25°C; Flash point = 140°C; Autoignition temperature = 454°C. Explosive limits: LEL = 0.9%; UEL = 9.5. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Reacts with water.

Potential Exposure: Compound Description: Agricultural Chemical. Used to make other chemicals, coatings, and polyurethane. It is also used as a hardener in automobile and airplane paints.

Incompatibilities: Reacts violently with alcohols, amines, oxidizers, strong bases, carboxylic acids, organotin catalysts. Reacts slowly with water to form carbon dioxide, amines, and polyureas. Temperatures above 200°C can cause polymerization. Attacks copper.

Permissible Exposure Limits in Air

822-06-0

OSHA PEL: None.

NIOSH REL: 0.005 ppm/0.035 mg/m^3 TWA; 0.020 ppm/0.140 mg/m^3 [10 min] Ceiling Concentration.

ACGIH TLV®[1]: 0.005 ppm/0.034 mg/m^3 TWA.

Protective Action Criteria (PAC)

822-06-0

TEEL-0: 0.005 ppm

PAC-1: 0.03 ppm

PAC-2: 2 ppm

PAC-3: 2 ppm

DFG MAK: 0.005 ppm/0.035 mg/m^3 TWA; Peak Limitation Category I(1), a momentary value of 0.01 mL/m^3/0.070 mg/m^3 should not be exceeded; Danger of sensitization of the airways and skin; Pregnancy Risk Group D.

Belgium: TWA 0.005 ppm (0.034 mg/m^3), 1993; Denmark: TWA 0.005 ppm (0.035 mg/m^3), 1999; France: VME 0.01 ppm (0.075 mg/m^3), VLE 0.02 ppm (0.15 mg/m^3), 1999; Hungary: TWA 0.05 mg/m^3; STEL 0.1 mg/m^3, 1993; Japan; 0.005 ppm (0.034 mg/m^3), 1999; the Netherlands:

MAC-TGG 0.04 mg/m^3, 2003; Poland: MAC (TWA) 0.05 mg/m^3; STEL 0.15 mg/m^3, 1999; Russia: STEL 0.05 mg/m^3, [skin], 1993; Sweden: NGV 0.005 ppm (0.03 mg/m^3), TGV 0.01 ppm (0.07 mg/m^3), 1999; Switzerland: MAK-W 0.01 ppm (0.07 mg/m^3), KZG-W 0.02 ppm (0.14 mg/m^3), 1999; United Kingdom: TWA 0.02 mg[NCO]/m^3; STEL 0.07 mg[NCO]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.005 ppm. The state of Connecticut has set a guideline of 0.7 μg/m^3 for hexamethylene diisocyanate in ambient air.[60]

Determination in Air: Use NIOSH (IV), Methods, #5521, #5522,#5525; OSHA Analytical Method 42.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.1$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Hexamethylene diiso-cyanate can affect you when breathed in and by passing through your skin. Contact can irritate and may burn the eyes and skin. Skin contact may cause skin blisters. Eye contact may cause corneal damage. Exposure can cause headache, nausea, vomiting, and irritability. Just a few breaths of high levels of hydrogen sulfide in air can cause death. High levels can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Respiratory sensitization may result from high levels of exposure.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy with itching and skin rash. Repeated or prolonged inhalation exposure may cause a lung allergy (asthma) to develop. Once allergy develops, future exposure can cause cough, wheezing, and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 0.05 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 0.125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.25 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Hexamethylene diisocyanate should be stored away from moisture or water. This contact will cause it to polymerize and explode its container. Hexamethylene diiso-cyanate must be stored to avoid contact with amines, carboxylic acids, strong bases, and alcohols since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area at temperatures below 93°C/200°F.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, nitrogen oxides, and hydrogen cyanide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1999; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NIOSH: Potential occupational carcinogen.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat; Positive: *D. melanogaster*—reciprocal translocation; Positive: Rodent dominant lethal; Mammalian micronucleus; Positive: Sperm morphology—mouse; Sperm morphology—rabbit; Positive: *D. melanogaster* sex-linked lethal.

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (Sweden).[13]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88; male 10/1/94.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hexamethylphosphoric triamide is a colorless liquid with a spicy odor. Molecular weight = 179.24; Specific gravity (H_2O:1) = 1.03; Boiling point = 232.8°C; Freezing/Melting point = 6.1°C; Relative vapor density (air = 1) = 6.18; Vapor pressure = 0.03 mmHg at 20°C; Flash point = 104.4°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Hexamethylphosphoric triamide is a material possessing unique solvent properties and is widely used as a solvent; in small quantities, in organic and organometallic reactions in laboratories. This is the major source of occupational exposure to HMPA in the United States. It is also used as a processing solvent in the manufacture of aramid fibers. HMPA has been evaluated for use as an ultraviolet light absorber or inhibitor in polyvinyl chloride formulations; as an additive for antistatic effects; as a flame retardant; and as a deicing additive for jet fuels. Hexamethylphosphoric triamide has also been extensively investigated as an insect chemosterilant.

Incompatibilities: Violent reactions with oxidizers, strong acids, chemically active metals.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: No numerical value; [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.015 ppm

PAC-1: 0.05 ppm

PAC-2: 0.35 ppm

PAC-3: 40 ppm

DFG MAK: [skin]; Pregnancy risk Group C; Carcinogen Category 2.

Australia [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: [skin], carcinogen, 1993; Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: [skin], carcinogen, 1999; Switzerland: [skin], Carcinogen 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for HMPA in ambient air[60] ranging from zero (North Dakota) to 0.0024 ppb (Pennsylvania) to 0.03 μg/m^3 (New York) to 3.0 μg/m^3 (Virginia) to 14.5 μg/m^3 (South Carolina).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Hexamethylphosphoramide can affect you when breathed in and by passing through your skin. Exposure may irritate and damage the nose, throat, and lungs, causing a nasal discharge and lung changes. Very high levels may cause kidney and lung damage.

Long Term Exposure: Potential occupational carcinogen. May cause cancer of the nose. Hexamethylphosphoramide may cause mutations. Handle with extreme caution. There is limited evidence that HEMPA may damage the testes of males and affect sperm production. Repeated exposure may severely damage the kidneys and lungs. May damage the nose, causing chronic nasal discharge.

Points of Attack: Eyes, skin, respiratory system, central nervous system, gastrointestinal tract. Cancer site in animals: nasal cavity.

Medical Surveillance: For those with frequent or potentially high exposure (or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nose. Lung function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue (*potential human carcinogen*): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Hexamethylphosphoramide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric), and chemically active metals (such as potassium, sodium, magnesium, and zinc) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials. Sources of ignition, such as smoking and open flames, are prohibited where hexamethylphosphoramide is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphine, nitrogen oxides, phosphorus oxides, are produced in fire. Use dry chemical or carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*n-HEXANE*): Hazard Symbol: F, Xn, N; Risk phrases: R11; R38; R48/20; R62; R65; R67; R51/53; Safety phrases: S2; S9; S16; S29; S33; S36/37; S61; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (CAS: 110-54-3).

Description: Hexane is a highly flammable, colorless, volatile liquid with a gasoline-like odor. The water/odor threshold is 0.0064 mg/L and the air/odor threshold is 230−875 mg/m^3. Molecular weight = 86.20; Specific gravity (H_2O:1) = 0.66; Boiling point = 68.9°C; Freezing/Melting point = −139.4°C; Relative vapor density (air = 1) = 3.0; Vapor pressure = 124 mmHg at 20°C; Flash point = − 21.6°C (cc); Autoignition temperature = 225°C. Explosive limits: LEL = 1.1%, UEL = 7.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 0.002%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. *n*-Hexane is an industrial chemical, an emulsifier, used in the manufacture of plastics, resins; as a solvent, particularly in the extraction of edible fats and oils; as a laboratory reagent; and as the liquid in low-temperature thermometers. Technical and commercial grades consist of 45−85% hexane, as well as cyclopentanes, isohexane, and 1−6% benzene.

Incompatibilities: Forms explosive mixture with air. Contact with strong oxidizers may cause fire and explosions. Contact with dinitrogen tetraoxide may explode at 28°C. Attacks some plastics, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.53 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 500 ppm/1800 mg/m^3 TWA [skin].

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK (*n-hexane only*): 50 ppm/180 mg/m^3 TWA; Peak Limitation Category II(8) [skin]; Pregnancy Risk Group C; BAT: 5 mg [hexane-2,5-dione + 4,5-dihydroxy-2-hexanone]/L in urine at end-of-shift.

Australia: TWA 50 ppm (180 mg/m^3), 1993; Austria: MAK 50 ppm (180 mg/m^3), 1999; Belgium: TWA 50 ppm (176 mg/m^3), 1993; Denmark: TWA 25 ppm (90 mg/m^3), 1999; Finland: TWA 50 ppm (180 mg/m^3); STEL 150 ppm (530 mg/m^3), 1999; France: VME 50 ppm (170 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 90 mg/m^3, 2003; Norway: TWA 25 ppm (90 mg/m^3), 1999; the Philippines: TWA 500 ppm (1800 mg/m^3), 1993; Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 400 mg/me, 1999; Russia: TWA 40 ppm; STEL 300 mg/m^3, 1993; Sweden: NGV 25 ppm (90 mg/m^3), KTV 50 ppm (180 mg/m^3), 1999; Switzerland: MAK-W 50 ppm (180 mg/m^3), KZG-W 100 ppm (360 mg/m^3), 1999; Turkey: TWA 500 ppm (1800 mg/m^3), 1993; United Kingdom: TWA 20 ppm (72 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm [skin]. Russia[35, 43] set a MAC of 60 mg/m^3 in ambient air in residential areas on a momentary basis.

Hexane, other isomers other than n-hexane

OSHA PEL: None.

NIOSH REL: 100 ppm/350 mg/m^3 TWA; 510 ppm/1800 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 500 ppm/1750 mg/m^3 TWA; 1000 ppm/3500 mg/m^3 STEL.

All hexane isomers except n-hexane:

DFG MAK: 500 ppm/1800 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Determination in Air: Use NIOSH Analytical Method: for Hydrocarbons, Boiling point = 36−126°C, #1500, for Hydrocarbons, Boiling point = 36−126°C; #3800; OSHA Analytical Method 7. See also NIOSH Analytical Method: Volatile organic compound, #2549.

Permissible Concentration in Water: The EPA[48] has set a health advisory for *n*-hexane involving the calculation of a NOAEL of 570 mg/kg/day which results in a long-term health advisory of 14.3 mg/L for an adult. A health-based maximum contaminant level of 33 μg/L has been derived by the state of New Jersey[59] based on neurotoxic effects observed in rats exposed to *n*-hexane by inhalation. Arizona and Maine[61] have set guidelines of 4000 μg/L for *n*-hexane in drinking water.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.9.

Routes of Entry: Inhalation of vapor, ingestion, eye and skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, nose, and respiratory tract. Exposure can cause lightheadedness, giddiness, headaches, and nausea. High levels can lead to unconsciousness and death. *Inhalation:* Exposure to levels above 500 ppm may cause headaches, abdominal cramps, a burning feeling of the face, numbness and weakness of the fingers and toes. Levels above 1300 ppm may cause the above plus nausea and irritation of the nose and throat. Levels above 1500 ppm may cause the above plus blurred vision, loss of appetite, and loss of weight. Most symptoms disappear within a few months if exposure ceases. Breathing liquid into the lungs may cause chemical pneumonia. *Skin:* Contact may cause irritation, redness, swelling, blisters, and pain. Skin exposure may contribute to symptoms listed under inhalation. *Eyes:* Levels over 880 ppm may cause irritation. *Ingestion:* May contribute to symptoms listed under inhalation. Estimated lethal dose is 1 oz to one pint.

Long Term Exposure: High or repeated exposure can damage the nervous system, causing numbness, tingling, and/or muscle weakness in the hands, feet, arms, and legs. Repeated skin contact can cause irritation, dryness and cracking, and can lead to rash. May cause symptoms listed under inhalation. Exposure to levels above 650 ppm for 2−4 months can result in weakness and numbness of the arms and legs. Symptoms go away within a few months if exposure stops. Use by older children in the United States and Europe who have "sniffed" household chemicals containing *n*-hexane in an attempt to get "high" has caused paralysis of the arms and legs. In laboratory studies, animals exposed to high levels of *n*-hexane had signs of disturbed sleep, lung damage, and damage to the sperm-forming cells.

Points of Attack: Eyes, skin, respiratory system, central nervous system, peripheral nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), during exposure, expired air, expired air, during exposure; neurologic examination/electromyography; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol, Viton™, polyurethane, Teflon™, Viton™/chlorobutyl rubber, Silvershield™, and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* Sa (APF = 10) (any supplied-air respirator). *1100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. *n*-Hexane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where *n*-hexane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gallons or more of *n*-hexane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of *n*-hexane.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 203-852-3 [*Annex I Index No.:* 603-059-00-6]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; Safety phrases: S2; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hexanol is a flammable, colorless liquid. Molecular weight = 102.20; Boiling point = 157°C; Flash point = 63°C. Explosive limits: LEL = 1.2%; UEL = 7.7%.[41] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Those using hexanol as a solvent or in the synthesis of pharmaceuticals and textile chemicals. Also used as a plasticizer intermediate, specialty, ethoxylate intermediate, and a defoamer.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, caustics, aliphatic amines, isocyanates, strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 ppm

PAC-1: 2 ppm

PAC-2: 15 ppm

PAC-3: 75 ppm

DFG MAK: No numerical value established. Data may be available.

Russia has set a TLV of 2.4 ppm (10 mg/m^3).[43]

Determination in Air: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; IV (#1500, Hydrocarbons).

Permissible Concentration in Water: A value of 0.03 mg/L is the maximum allowed in drinking water.[11]

Routes of Entry: Skin contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Vapor irritates the eyes, skin, and respiratory tract. Contact causes smarting of the skin and first-degree burns on short exposure; may cause second-degree burns on long exposure. Believed to be moderately toxic upon ingestion. Exposure can cause headache, dizziness, confusion, muscle weakness, nausea, vomiting, and diarrhea.

Long Term Exposure: Repeated exposure may damage the nervous system.

Points of Attack: Skin, eyes, nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits,

gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with hexanol you should be trained on its proper handling and storage. Before entering confined space where hexanol may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hexazinone H:0320

Molecular Formula: $C_{11}H_{20}O_2N_3$

Synonyms: Brushkiller; 3-Cyclohexyl-6-dimethylamino-1-methyl-1,2,3,4-tetrahydro-1,3,5-triazine-2-,4-dione; 3-Cyclohexyl-6-(dimethylamino)-1-methyl-*s*-triazine-2,4(1H,3H)-dione; 3-Cyclohexyl-6-(dimethylamino)-1-methyl-1,3,5-triazine-2,4(1H,3H)-dione; 3-Cyclohexyl-1-methyl-6-(dimethylamino)-*s*-trazine-2,4(1H,3H)-dione; DPX 3674; *s*-Triazine-2,4(1H,3H)-dione, 3-cyclohexyl-6-(dimethylamino)-1-methyl-; 1,3,5-Triazine-2,4(1H,3H)-dione, 3-cyclohexyl-6-(dimethylamino)-1-methyl-; Velpar; Velpar weed killer

CAS Registry Number: 51235-04-2
RTECS$^{®}$ Number: XY7850000
UN/NA & ERG Number: UN2753/151
EC Number: 257-074-4 [*Annex I Index No.:* 613-132-00-4]

Regulatory Authority and Advisory Bodies

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R36; R50/53; Safety phrases: S2; S41; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hexazinone is a white crystalline solid that is practically odorless. Molecular weight = 252.36; Boiling point = decomposes; Freezing/Melting point = 115−117°C; Vapor pressure = 3.0×10^{-7} mmHg. Soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this contact and residual herbicide. It is a broad spectrum herbicide used in industrial and government right-of-way weed control for pipelines, drainage ditches, etc.[23]

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: The EPA has analyzed data on hexazinone and developed a no-observed-adverse-effect-level (NOAEL) of 25 mg/kg/day based on studies of dogs which resulted in a long-term health advisory of 8.75 mg/L. A NOAEL of 10 mg/kg/day was developed based on studies of rats which yielded a lifetime health advisory of 0.21 mg/L.

Determination in Water: Solvent extraction with methylene chloride followed by analysis by gas chromatography with a thermionic bead detector. Fish Tox = 24566.31408000 bbp MATC (VERY LOW). Octanol−water coefficient: Log K_{ow} = −4.4.

Routes of Entry: Skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause eye and skin irritation. The acute oral LD_{50} for rats is 1690 mg/kg (slightly toxic). In experience with humans, only one report was available on hexazinone. It involved a 26-year-old woman who inhaled hexazinone dust. Vomiting occurred within 24 h. Human Tox = 400.00000 ppb (VERY LOW).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area above 32°C.

Shipping: Hexazinone is classified as Triazine pesticides, solid, toxic n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only

respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used,

handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Avoid contact with liquid or vapor. Stay upwind and use water spray to "knock down" vapor. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil skimming equipment and sorbent (urethane) foams may be used for spills on water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Water may be ineffective. Use alcohol or polymer foam, dry chemical, or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

sec-Hexyl acetate H:0340

Molecular Formula: $C_8H_{16}O_2$

Common Formula: $CH_3COOCH(CH_3)CH_2CH(CH_3)CH_3$

Synonyms: Acetic acid-1,3-dimethylbutyl ester; 1,3-Dimethylbutyl acetate; Hexyl acetate; MAAC; Methylamyl acetate; Methylisoamyl acetate; Methylisobutylcarbinol acetate; Methylisobutylcarbinyl acetate; 4-Methyl-2-pentanol, acetate; 4-Methyl-2-pentyl acetate

CAS Registry Number: 108-84-9

RTECS® Number: A10875000

UN/NA & ERG Number: UN1233/130

EC Number: 203-621-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *sec*-Hexyl acetate is a colorless liquid with a mild, pleasant, fruity odor. Molecular weight = 144.24; Specific gravity (H_2O:1) = 0.86; Boiling point = 147.2°C; Freezing/Melting point = −63.8°C; Relative vapor density (air = 1) = 5.0; Vapor pressure = 3 mmHg: Flash point = 45°C; Autoignition temperature = 266°C. Explosive limits: LEL = 0.9%; UEL = 5.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. This material is used as a solvent in the spray lacquer industry. It is a good solvent for cellulose esters and other resins.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, strong alkalis, nitrates, strong oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.90 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/300 mg/m^3 TWA.

NIOSH REL: 50 ppm/300 mg/m^3 TWA.

ACGIH TLV®[1]: 50 ppm/295 mg/m^3 TWA.

NIOSH IDLH: 500 ppm.

No TEEL available.

Australia: TWA 50 ppm (300 mg/m^3), 1993; Austria: MAK 50 ppm (300 mg/m^3), 1999; Belgium: TWA 50 ppm (295 mg/m^3), 1993; Denmark: TWA 50 ppm (300 mg/m^3), 1999; Finland: TWA 50 ppm (300 mg/m^3); STEL 75 ppm (450 mg/m^3), 1999; France: VME 50 ppm (300 mg/m^3), 1999; the Netherlands: MAC-TGG 300 mg/m^3, 2003; the Philippines: TWA 50 ppm (300 mg/m^3), 1993; Switzerland: MAK-W 50 ppm (300 mg/m^3), KZG-W 100 ppm (600 mg/m^3), 1999; Turkey: TWA 50 ppm (300 mg/m^3), 1993; United Kingdom: TWA 50 ppm (299 mg/m^3); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 50 ppm TWA. Several states have set guidelines and standards for *sec*-hexyl acetate in ambient air[60] ranging from 3.0 mg/m^3 (North Dakota) to 6.0 mg/m^3 (Connecticut) to 7.143 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, gas chromatography/flame ionization. Use NIOSH Analytical Method 1450 for Esters; OSHA Analytical Method 7.[18]

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes and respiratory tract. May affect the central nervous system causing headache, dizziness, nausea, narcosis.

Long Term Exposure: May cause skin drying and cracking.

Points of Attack: Eyes, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: *Up to 500 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa* (APF = 10) (any supplied-air respirator); SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with hexyl acetate you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Oil-skimming equipment may be used to remove slicks from water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or

federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Water may be ineffective. Use alcohol foam, CO_2, or dry chemical extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 203-489-0 [*Annex I Index No.*: 603-053-00-3]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/38; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hexylene glycol is a colorless liquid with a mild, sweet odor. The odor threshold is 50 ppm. Molecular weight = 118.20; Specific gravity (H_2O:1) = 0.92; Boiling point = 197.8°C; Freezing/Melting point = −50°C (sets to glass); Vapor pressure = 0.05 mmHg at 20°C; Flash point = 98.3°C; Autoignition temperature = 260°C; 306°C. Explosive limits: LEL = 1.3%; UEL = 7.4%.[41] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Hexylene glycol is used in metal working fluids; the formulation of hydraulic brake fluids; in making printing inks. It is used as a fuel and lubricant additive; as an emulsifying agent; and as a cement additive.

Incompatibilities: Incompatible with strong acids, caustics, aliphatic amines, isocyanates, strong oxidizers. Hygroscopic (i.e., absorbs moisture from the air).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.83 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 25 ppm/125 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 25 ppm/121 mg/m^3 Ceiling Concentration.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 10 ppm

PAC-2: 25 ppm

PAC-3: 350 ppm

DFG MAK: 10 ppm/49 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Australia: TWA 25 ppm (125 mg/m^3), 1993; Belgium: STEL 25 ppm (121 mg/m^3), 1993; Denmark: TWA 25 ppm (125 mg/m^3), 1999; Finland: TWA 25 ppm (125 mg/m^3); STEL 40 ppm (190 mg/m^3), 1993; France: VLE 25 ppm (125 mg/m^3), 1999; the Netherlands: MAC 125 mg/m^3, 2003; Norway: TWA 20 ppm (100 mg/m^3), 1999; Switzerland: MAK-W 25 ppm, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 25 ppm. States which have set guidelines or standards for hexylene glycol in ambient air[60] include 1.25 mg/m^3 (North Dakota) and 2.976 mg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2101.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.6.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact can irritate and may burn the eyes and skin. Exposure may affect the central nervous system. Eye and throat irritation and respiratory discomfort were slight upon exposure to 100 ppm but more pronounced at

1000 ppm. Ingestion produces central nervous system depression. High exposure can cause dizziness, loss of coordination, and unconsciousness. Extremely high exposures can cause coma and kidney damage. Toxicity by Ingestion: Grade 2; $LD_{50} = 0.5-5$ g/kg.[CHRIS]

Long Term Exposure: Repeated exposure may cause dry skin, rash, sensitization, and allergy. May damage the kidney and liver, and may affect the nervous system. Many similar petroleum-based solvents have been shown to cause brain and nerve damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Evaluation by a qualified allergist. Evaluate for brain effects and refer positive and borderline individuals for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 25 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as peroxides, perchlorates, chlorates, permanganates, and nitrates). Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Hexylene glycol is not cited in DOT'S Performance-Oriented Packaging Standards.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hexyl trichlorosilane H:0360

Molecular Formula: $C_6H_{13}Cl_3Si$
Common Formula: $C_6H_{13}SiCl_3$
Synonyms: Silane, trichlorohexyl-; Trichlorohexylsilane
CAS Registry Number: 928-65-4
RTECS® Number: VV4320000
UN/NA & ERG Number: UN1784/156
EC Number: 213-178-1
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Hexyl trichlorosilane is a colorless liquid which fumes in moist air. Molecular weight = 219.63; Boiling point = 191−192°C; Flash point = 85°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Reacts with water.
Potential Exposure: Used in the manufacture of other silicon chemicals.
Incompatibilities: Reacts violently with strong oxidizers. Reacts violently with water, moisture, and steam producing chlorine and hydrogen chloride. Attacks active metals (e.g., aluminum and magnesium). Chlorosilanes on contact with ammonia forms a self-igniting product.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 0.2 ppm
PAC-1: **0.6** ppm
PAC-2: **7.3** ppm
PAC-3: **33** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Hexyl trichlorosilane can affect you when breathed in. Hexyl trichlorosilane is a corrosive chemical and can cause severe skin and eye burns leading to permanent eye damage. Exposure can severely irritate the respiratory tract causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.
Long Term Exposure: Highly irritating substances can cause lung irritation and bronchitis with cough, phlegm, and/or shortness of breath.
Points of Attack: Lungs.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposure to hexyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and steam. Hexyl trichlorosilane can give off corrosive hydrogen chloride gas on contact with water, steam, or moisture. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Hexyl trichlorosilane requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.9/1.5

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine and hydrogen chloride, are produced in fire. *Do not use water*, as poisonous and corrosive gases will form. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Department of Homeland Security Screening Threshold Quantity (pounds): 10,000.

Carcinogenicity: IARC: Animal Sufficient Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B 1999; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies; NIOSH: Potential occupational carcinogen.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat; Inconclusive: *D. melanogaster* sex-linked lethal.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (Belgium, Denmark) (UN).[13]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg).

US EPA Hazardous Waste Number (RCRA No.): U133.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations (*302-01-2*): Hazard Symbol: T, N; Risk phrases: R45; R10; R23/24/25; R34; R43; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*hydrazine and hydrate*).

Description: Hydrazine is a colorless, oily liquid with an ammoniacal odor. The odor threshold is 3.7 ppm. Molecular weight = 32.06; Specific gravity (H_2O:1) = 1.01; Boiling point = 113.3°C; Freezing/Melting point = 2.2°C; Relative vapor density (air = 1) = 1.1; Vapor pressure = 10 mmHg at 20°C; Flash point = 38°C (cc); Autoignition temperature = from 24°C (on a rusty iron surface) to 270°C (on a glass surfaces). Explosive limits: LEL = 2.9%; UEL = 98%.[17] Hazard Identification (based on NFPA-704 M Rating System) (*anhydrous*): Health 4, Flammability 4, Reactivity 3. Soluble in water. The hydrate is a 64% solution in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Because of its strong reducing capabilities, hydrazine is used as an intermediate in chemical synthesis, and in photography and metallurgy. It is also used as a rocket fuel; in the preparation of anticorrosives; textile agents; pesticides; and as a scavenging agent for oxygen in boiler water. Hydrazine is widely used in pharmaceutical synthesis.

Incompatibilities: Forms explosive mixture with air. A highly reactive reducing agent and a medium strong base. Can ignite SPONTANEOUSLY on contact with oxidizers or porous materials, such as earth, wood, and cloth. Air or oxygen is not required for decomposition. Oxidizers, hydrogen peroxide, nitric acid, metallic oxides, acids, halogens can cause fire and explosions. Attacks cork, glass, some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.31 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/1.3 mg/m^3 TWA [skin].

NIOSH REL: 0.03 ppm/0.04 mg/m^3 [120 min] Ceiling Concentration; A potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.01 ppm/0.013 mg/m^3 [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 50 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.01 ppm

PAC-1: 0.1 ppm

PAC-2: **13** ppm

PAC-3: **35** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK; [skin] danger of skin sensitization; Carcinogen Category 2; TRK: [skin]; danger of skin sensitization; Sampling time: end of exposure or end-of-shift; 380 μg [creatinine]/L urine hydrazine; 340 μg/L plasma hydrazine.

Australia: TWA 0.1 ppm (0.1 mg/m^3), [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Denmark: TWA 0.1 ppm (0.13 mg/m^3), [skin], 1999; Finland: TWA 0.1 ppm; STEL 0.3 ppm, [skin], carcinogen, 1999; Japan: 0.01 ppm (0.013 mg/m^3), [skin], 1999; Norway: TWA 0.1 ppm (0.13 mg/m^3), 1999; the Philippines: TWA 1 ppm (1.3 mg/m^3), [skin], 1993; Poland: MAC (TWA) 0.05 mg/m^3, MAC (STEL) 0.1 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3, [skin], 1993; Sweden: NGV 0.1 ppm, KTV 0.3 ppm, [skin], carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (0.13 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 1 ppm (1.3 mg/m^3), [skin], 1993; United Kingdom: TWA 0.03 mg/m^3; STEL 0.13 mg/m^3, [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic[35]: MAC 0.05 mg/m^3. Several states have set guidelines or standards for hydrazine in ambient air[60] ranging from zero (North Carolina and North Dakota) to 0.003 μg/m^3 (Rhode Island) to 0.018 mg/m^3 (Massachusetts) to 0.24 μg/m^3 (Pennsylvania) to 0.33 μg/m^3 (New York) to 0.5 μg/m^3 (South Carolina) to 1.0 μg/m^3 (Connecticut, Florida and Virginia) to 2.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #3503 for hydrazine[18]; OSHA Analytical Method 20 or 108.[58]

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 18 μg/L based on health effects. Russia[35,43] set a MAC of 0.01 mg/L (10 μg/L) in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -3.1$.

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Hydrazine is corrosive to the eyes, skin, and respiratory tract. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the liver, kidneys, and central nervous system. Exposure may result in death. The effects may be delayed. Signs and symptoms of acute exposure to hydrazine may include severe eye irritation, facial numbness, facial swelling, and increased salivation. Hydrazine vapor may immediately irritate the nose and throat. Headache, twitching, seizures, convulsions, and coma may also occur. Gastrointestinal signs and symptoms include anorexia, nausea, and vomiting. Pulmonary edema and hypotension (low blood pressure) are common. Hydrazine is toxic to the liver, ruptures red blood cells, and may cause kidney damage. Dermal contact may result in irritation or severe burns. Target organs include central nervous system, respiratory system, skin, and eyes. Chronic exposure in humans may cause pneumonia, liver and kidney damage. Liver damage may be more severe than kidney damage. It is a suspected human carcinogen.

Long Term Exposure: Repeated or prolonged contact may cause sensitization and skin allergy. Hydrazine may affect the liver, kidneys, and central nervous system. A probable carcinogen in humans. Can irritate the lungs and may cause bronchitis. Can damage the nervous system causing weakness, shaking, and loss of balance and coordination. Exposure can cause blood damage and may cause anemia.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. Cancer site in animals: lungs, liver, blood vessels, and intestine.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: complete blood count. Liver and kidney function tests. Lung function tests. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may also be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Consider pyridoxine (25 mg/kg), which has been shown to be an effective anticonvulsant for hydrazine poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitrile, Silvershield™, PVC, Neoprene™, and butyl rubber are among the recommended protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red Stripe (*hydrazine and hydrazine hydrate*): Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where hydrazine may be present, check to make sure that an explosive concentration does not exist. Hydrazine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric); hydrogen peroxide, and metal oxides since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where hydrazine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever hydrazine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: (1) Hydrazine, anhydrous or hydrazine aqueous solutions with >64% hydrazine, by mass, requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I. (2) Hydrazine hydrate or hydrazine aqueous solutions, with not <37% but not >64% hydrazine, by mass, requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group II. (3) Hydrazine, aqueous solution, with not >37% hydrazine, by mass, requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup

is complete. Remove all ignition sources. Stay upwind; keep out of low areas. In case of contact with material, immediately flush skin or eyes with running water for at least 15 min. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including ammonia fumes, hydrogen and nitrogen oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and protective clothing. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Move container from fire area if you can do so without risk. Dike fire control water for later disposal, do not scatter material. Spray cooling water on containers that are exposed to flames until well after fire is out. It is a flammable/combustible material and may be ignited by heat, sparks, or flames. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with facilities for effluent scrubbing to abate any nitrogen compounds formed in the combustion process.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical: Cancer.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hydrazine sulfate is a white or colorless, crystalline powder; Freezing/Melting point = 254°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Soluble in water.

Potential Exposure: Used in analysis and refining of minerals, rare metals, determination of arsenic in metals, as a catalyst and an antioxidant, and in fungicides, germicides, and blood tests. Used as a catalyst for making acetate fibers.

Incompatibilities: A strong reducing agent. Reacts with oxidizers, bases.

Permissible Exposure Limits in Air

NIOSH REL: [for hydrazines] 0.03 ppm/0.04 mg/m^3 2-h Ceiling Concentration.

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3
PAC-1: 2 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 250 mg/m^3

Determination in Air: Use OSHA Analytical Method #20 or NIOSH Analytical Method #3503, Hydrazine.

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Highly corrosive. Irritates and burns the eyes, skin, and respiratory tract. Exposure can affect the brain and nervous system, causing dizziness and lightheadedness at first, followed by trembling and convulsions. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours.

Long Term Exposure: Hydrazine sulfate has been shown to cause liver and lung cancers in animals. Exposure can damage the liver and kidneys. Repeated exposure can damage blood cells, causing a low blood count (anemia). It can also cause methemoglobinemia with fatigue, shortness of breath, and even a bluish color to the nose, finger tips, and lips. May cause skin allergy to develop.

Points of Attack: Liver, kidneys, blood, central nervous system, skin.

Medical Surveillance: Liver and kidney function tests. Complete blood count (CBC). Examination of the nervous system. Blood methemoglobin level. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine. Pyridoxine (25 mg/kg) is an effective anticonvulsant for hydrazine poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (3) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, bases.

Shipping: Hydrazine sulfate must be labeled "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Hydrazoic acid H:0390

Molecular Formula: HN_3
Synonyms: Azoimide; Diazoimide; Hydrogen azide; Hydronitric acid; Stickstoffwasserstoffsaeure (German); Triazoic acid
CAS Registry Number: 7782-79-8
RTECS® Number: MW2800000
EC Number: 231-965-8
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: The pure and concentrated material is highly unstable and potentially explosive; should be handled only by experts. Hydrazoic acid is a colorless liquid with an intolerable, pungent odor. Molecular weight = 43.03; Boiling point = 37°C; Freezing/Melting point = −80°C. Soluble in water.

Potential Exposure: May be used in organic synthesis. Used in making heavy metal azide detonators for explosives.

Incompatibilities: Explosive when dry; a highly sensitive explosive hazard when subject to shock or exposed to heat. Forms unstable compounds (heavy metal azides) with heavy metals. Forms explosive salts with carbon disulfide. Violent reaction with cadmium, copper, nickel, nitric acid, fluorine, heat, and shock.

Permissible Exposure Limits in Air
No TEEL available.
DFG MAK: 0.1 ppm/0.18 mg/m^3 TWA; Peak Limitation Category I(2).

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin, eyes, and respiratory tract. Continued inhalation causes, cough, headache, dizziness, weakness, fall in blood pressure, chills and fever, and collapse. Prolonged exposure to high concentration can cause fatal convulsions and death. Highly toxic.

Long Term Exposure: Chronic exposure can affect the central nervous system, hypotension, palpitation, ataxia, and weakness.

Points of Attack: Central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: *Unstable and unpredictable explosive material.* Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Protect from heat and shock.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a dangerously explosive material. Poisonous gases, including nitrogen oxides, are produced in fire. Containers may explode in fire.

Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be destroyed by converting hydrazoic acid to sodium azide and the reaction mixture decomposed with nitrous acid (National Research Council, 1983).

Hydriodic acid H:0395

Molecular Formula: HI

Synonyms: Hydriodic acid solution; Hydrogen iodide

CAS Registry Number: 10034-85-2

RTECS® Number: MW3760000

UN/NA & ERG Number: UN1787 (solution)/154; UN2197 (anhydrous)/125

EC Number: 233-109-9 [*Annex I Index No.:* 053-002-00-9]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: C; Risk phrases: R35; Safety phrases: S1/2; S9; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 500 (≥95.33% concentration).

Description: Hydriodic acid is colorless when freshly made but rapidly turns yellowish or brown on exposure to light or air. Aqueous solution of hydrogen iodide, which is a gas (anhydrous) at room temperature. Molecular weight = 127.91; Boiling point = −35.4°C at 5 mmHg; Freezing/Melting point = −51°C; Relative vapor density (air = 1) = 4.42. Hazard Identification (based on NFPA-704 M Rating System) (*50% solution*): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: Hydriodic acid is used as a disinfectant, an analytical reagent, raw material for pharmaceuticals, and to make iodine salts.

Incompatibilities: Contact with water forms toxic and corrosive fumes. A strong reducing agent. Violent actions with strong acids, chemically active metals, magnesium, phosphorus, perchloric acid, strong oxidizers. Explodes on contact with ethyl hydroperoxide. Protect from moisture, heat, and shock.

Permissible Exposure Limits in Air

As iodides

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.35 ppm

PAC-1: **1.0** ppm

PAC-2: **22** ppm

PAC-3: **120** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to skin, eyes, and mucous membranes. Skin or eye contact can cause severe burns and permanent damage. Inhalation causes, cough, headache, fall in blood pressure, chills and fever and collapse, irritation of the nose and throat, and can cause spasms of the windpipe, which can be fatal. High concentration can cause fatal convulsions. A Japanese source[24] states that HI is painful at 0.15−0.2 ppm; intolerable at 0.3 ppm.

Long Term Exposure: Chronic exposure can cause injury to kidneys and spleen; can cause hypotension, palpitation, ataxia, and weakness. Highly irritating substances may cause lung damage. Prolonged absorption of iodides can cause skin rash, headache, irritation of mucous membranes with running nose.

Points of Attack: Lungs, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests, chest X-ray following acute overexposure, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to hydriodic acid, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Hydriodic acid must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), chemically active metals (such as potassium, sodium, magnesium, and zinc), and strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. Protect storage containers from physical damage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Hydriodic acid solution requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Hydrogen iodide, anhydrous, requires a shipping label of "POISON GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Neutralize with chemically basic substances, such as sodium bicarbonate, soda ash, or slaked lime. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including iodine, are produced in fire. Use water on fires in which hydriodic acid is involved. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to a large amount of soda ash and slaked lime in solution with stirring. Flush resulting solution to a sewer.[24]

New Jersey Department of Health and Senior Services. (June 2001). *Hazardous Substances Fact Sheet: Hydriodic Acid*. Trenton, NJ

Hydrogen H:0400

Molecular Formula: H_2

Synonyms: Hidrogeno (Spanish); Para Hydrogen; Hydrogen, compressed; Hydrogen, refrigerated liquid; Liquid hydrogen

CAS Registry Number: 1333-74-0

RTECS® Number: MW8900000

UN/NA & ERG Number: UN1049 (Hydrogen, compressed)/115; UN1966 (Hydrogen, refrigerated liquid)/115

EC Number: 215-605-7 [*Annex I Index No.:* 001-001-00-9]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Highly Reactive Substance and Explosive (World Bank).[15]

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Hydrogen is a highly flammable, colorless liquid or gas. Molecular weight = 2.02; Boiling point = −252°C; Autoignition temperature = 500−571°C. Explosive limits: LEL = 4.0%; UEL = 75%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 4, Reactivity 0. Slightly soluble in water.

Potential Exposure: Hydrogen is used as a fuel in weeding, as a raw material for ammonia manufacture, and in organic hydrogenation reactions.

Incompatibilities: Vapors form explosive or combustible mixture with air over a wide range of concentrations. Heating may cause violent reaction, combustion, or explosion. Ignites easily with oxygen. Violent reaction with strong oxidizers, halogens, acetylene, bromine, chlorine, fluorine, nitrous oxide, and other gases; metal catalysts (e.g., platinum and nickel) greatly enhance these reactions. Mild steel and most iron alloys become brittle at liquid hydrogen temperatures.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: Simple asphyxiant.

Note: The health effects caused by exposure to hydrogen are much less serious than its fire and explosion risk.

Protective Action Criteria (PAC)

TEEL-0: 65,000 ppm

PAC-1: 65,000 ppm

PAC-2: 230,000 ppm

PAC-3: 400,000 ppm

Hydrogen is classed as a simple asphyxiant.[1,33] Large amounts of hydrogen will decrease the amount of available oxygen. Oxygen content should be tested to ensure that it is at least 19% by volume in confined spaces.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Exposure to high levels can cause suffocation from lack of oxygen. Contact with liquid hydrogen can cause severe burns and frostbite.

Medical Surveillance: There are no special tests.

First Aid: *Contact With Liquid Hydrogen:* Put affected part into warm water. Seek medical attention. *Breathing:* Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: *Clothing:* Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn.

Respirator Selection: Exposure to hydrogen is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Hydrogen must be stored to avoid contact with heat, flames, sparks, and oxygen. Sources of ignition, such as smoking and open flames, are prohibited where hydrogen is used, handled, or stored. Metal containers involving the transfer of 5 gallons or more of hydrogen should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of hydrogen. Wherever hydrogen is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Hydrogen, compressed, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1. Hydrogen, refrigerated liquid, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: If hydrogen gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid hydrogen is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stop the leak or move the container to a safe area and allow the liquid to evaporate. Keep hydrogen out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations.

Fire Extinguishing: If spill has not ignited, use water spray to direct flammable gas−air mixtures away from sources of ignition. If it is desirable to evaporate a spill quickly, water spray may be used to increase the rate of evaporation, if the increased vapor evolution can be controlled. Do not discharge solid streams into liquid. Because of danger of reignition, hydrogen fires normally should not be extinguished until the supply of hydrogen has been shut off. If liquid hydrogen has ignited, use water to keep fire-exposed containers cool and to protect workers stopping the source of a spill. If it is necessary to extinguish small hydrogen fires, use dry chemical, carbon dioxide, or halogenated extinguishing agent. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Combustion.

Hydrogenated terphenyls H:0410

Molecular Formula: $(C_6H_n)_3$

Common Formula: $C_6H_{11}{-}C_6H_4{-}C_6H_5$

Synonyms: Hydrogenated diphenylbenzenes; Hydrogenated phenylbiphenyls; Hydrogenated triphenyls

CAS Registry Number: 61788-32-7

RTECS® Number: WZ6535000

EC Number: 262-967-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hydrogenated terphenyls are a complex mixture of partially hydrogenated terphenyl isomers. They are clear, oily, pale-yellow liquids with a faint odor. Molecular weight = 241.00; 298.00 (40% hydrogenated); Specific gravity (H_2O:1) = 1.00; Boiling point = 340°C (40% hydrogenated); Freezing/Melting point = 148°C (40% hydrogenated); Vapor pressure = 13 Pa at 25°C; Flash point = 157°C (cc); Autoignition temperature = 374°C. Insoluble in water.

Potential Exposure: These materials are used as high-temperature heat-transfer media and as plasticizers.

Incompatibilities: Strong oxidizers. When heated, irritating vapors will be released.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 12.19 mg/m^3 (40% hydrogenated) at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.5 ppm/5 mg/m^3 TWA.

ACGIH TLV®[1]: 0.5 ppm/4.9 mg/m^3 (nonirradiated) TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.5 ppm

PAC-1: 1.5 ppm

PAC-2: 2.5 ppm

PAC-3: 600 ppm

Australia: TWA 0.5 ppm (5 mg/m^3), 1993; Belgium: TWA 0.5 ppm (4.9 mg/m^3), 1993; Denmark: TWA 0.4 ppm (4.4 mg/m^3), 1999; France: VME 0.5 ppm (5 mg/m^3), 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 0.5 ppm (5 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm. States which have set guidelines or standards for hydrogenated terphenyls in ambient air include Virginia at 80.0 μg/m^3, Connecticut at 100.0 μg/m^3, and Nevada at 119.0 μg/m^3.[60]

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, respiratory system. Potential acute hazards consist of damage to the lungs and damage to the skin and eyes from burns from the hot coolant.

Long Term Exposure: Potential chronic hazards comprise damage to liver, kidney, and blood-forming organs with the possibility of induction of metabolic disorders and cancer.[53]

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, hemato system.

Medical Surveillance: Liver and kidney function tests. Complete blood count (CBC). Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a

NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Irritating vapors are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Hydrogen bromide H:0420

Molecular Formula: HBr

Synonyms: Acide bromhydrique (French); Anhydrous hydrobromic acid; Bromwasserstoff (German); HBr; Hydrobromic acid; Hydrobromic acid, anhydrous; Hydrogen bromide, anhydrous

CAS Registry Number: 10035-10-6

RTECS® Number: MW3850000

UN/NA & ERG Number: UN1048 (anhydrous)/125; UN1788 (hydrobromic acid solution)/154

EC Number: 233-113-0 [*Annex I Index No.:* 035-002-00-0]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 500 (≥95.33% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R35; R37; Safety phrases: S1/2; S7/9; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hydrogen bromide is a corrosive colorless gas with a sharp, irritating odor. The odor threshold is 2−6.6 ppm. Molecular weight = 80.92; Boiling point = −66.7°C (anhydrous); Freezing/Melting point = −86.7°C (anhydrous); Relative vapor density (air = 1) = 2.81; Vapor pressure = 20 atm. Soluble in water; solubility = 49%. A constant boiling dihydrate melts at −11°C and boils at 126°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2. Shipped as a liquefied compressed gas. Often used in an aqueous solution.

Potential Exposure: Hydrogen bromide gas and its aqueous solutions are used in the manufacture of organic and inorganic bromides; as a reducing agent and catalyst in controlled oxidations; in the alkylation of aromatic compounds; and in the isomerization of conjugated diolefins. It is used as an intermediate for pharmaceuticals, dyes, photographic chemicals.

Incompatibilities: The aqueous solution is a strong acid. Violent reaction with strong oxidizers, strong caustics, and many organic compounds, causing fire and explosion hazard. Reacts with water, forming toxic hydrobromic acid. Incompatible with aliphatic amines, alkanolamines, alkylene oxides, aromatic amines, amides, ammonia, ammonium hydroxide, calcium oxide, epichlorohydrin, fluorine, isocyanates, oleum, organic anhydrides, sulfuric acid, sodium tetrahydroborate, vinyl acetate. Hydrobromic acid is highly corrosive to most metals forming flammable hydrogen.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.31 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 3 ppm/10 mg/m^3 TWA.

NIOSH REL: 3 ppm/10 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 2 ppm/6.8 mg/m^3 TWA Ceiling Concentration (2001).
NIOSH IDLH: 30 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 1 ppm
PAC-1: **1.0** ppm
PAC-2: **22** ppm
PAC-3: **120** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 2 ppm/6.7 mg/m^3 TWA; Peak Limitation value I(1); Pregnancy Risk Group D.
Australia: TWA 3 ppm (10 mg/m^3), 1993; Austria: MAK 3 ppm (10 mg/m^3), 1999; Belgium: STEL 3 ppm (9.9 mg/m^3), 1993; Denmark: TWA 3 ppm (10 mg/m^3), 1999; Finland: STEL 3 ppm (10 mg/m^3) [skin]1999; Norway: TWA 3 ppm (10 mg/m^3), 1999; the Philippines: TWA 3 ppm (10 mg/m^3), 1993; Poland: MAC (TWA) 7 mg/m^3, MAC (STEL) 21 mg/m^3, 1999; Russia: STEL 2 mg/m^3, 1993; Switzerland: MAK-W 3 ppm (10 mg/m^3), KZG-W 6 ppm (20 mg/m^3), 1999; Turkey: TWA 5 ppm (17 mg/m^3), 1993; United Kingdom: STEL 3 ppm (10 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 3 ppm. Several states have set guidelines or standards for hydrogen bromide in ambient air[60] ranging from 80.0 μg/m^3 (Virginia) to 100.0 μg/m^3 (North Dakota) to 200.0 μg/m^3 (Connecticut and New York) to 238.0 μg/m^3 (Nevada).
Determination in Air: Collection using Si gel; workup with $NaHCO_3/Na_2CO_3$; Analysis by ion chromatography; NIOSH (IV), Method #7903, Inorganic Acids; OSHA Analytical Method ID-165SG.
Routes of Entry: Inhalation, ingestion, eye and/or skin contact.
Harmful Effects and Symptoms
Short Term Exposure: Hydrogen bromide is a corrosive chemical and contact can severely burn the eyes, with permanent damage. It can cause severe burns of the skin. Exposure can irritate the eyes, nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. Contact with liquid can cause frostbite.
Long Term Exposure: Long-term exposure can irritate the lungs and cause a chronic discharge. Bronchitis may develop with cough, phlegm, and/or shortness of breath. It may damage the sense of smell. Long-term exposure can also cause chronic indigestion and may damage the nervous system. Repeated skin contact can cause an acne-like rash to develop.
Points of Attack: Eyes, skin, respiratory system.
Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Serum bromine level. Examination of the nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Wear splash-proof chemical goggles and face shield when working with the liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *30 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprAg (APF = 25) [any powered, air-purifying respirator with acid gas cartridge(s)] or GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:*

GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Corrosive poison gas. (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (3) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Hydrogen bromide must be stored to avoid contact with strong oxidizers, caustics, metals, and moisture because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: Anhydrous hydrogen bromide requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Hydrobromic acid, with >49% hydrobromic acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II or III.

Hydrobromic acid, with *not* >49% hydrobromic acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II or III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN 1048:

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5
Night 2.8/4.5

Fire Extinguishing: Hydrogen bromide is noncombustible. Reacts with water to produce toxic hydrobromic acid. Fight surrounding fire with an agent appropriate for surrounding fire. Poisonous gases, including bromine and hydrogen bromide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Soda ash/slaked lime is added to give a neutral bromide solution which is discharged to sewers or streams with water dilution.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hydrogen chloride is a colorless to slightly yellow gas or fuming liquid with a pungent, irritating odor. May be shipped and stored as a cryogenic liquid. The aqueous solution is known as hydrochloric acid or muriatic acid and may contain as much as 38% HCl. Shipped as a liquefied compressed gas. The odor threshold is 0.77 ppm. Molecular weight = 36.46; Boiling point = −85°C; Freezing/Melting point = −114.4°C; Relative vapor density (air = 1) = 1.27; Vapor pressure = 40.5 atm. Hazard Identification (based on NFPA-704 M Rating System) (*40%*): Health 3, Flammability 0, Reactivity 2. Highly corosive. Soluble in water; solubility = 67% at 30°C.

Potential Exposure: Hydrogen chloride itself is used in the manufacture of pharmaceutical hydrochlorides, chlorine, vinyl chloride from acetylene; alkyl chlorides from olefins; arsenic trichloride from arsenic trioxide; in the chlorination of rubber; as a gaseous flux for babbitting operations; and in organic synthesis involving isomerization, polymerization, alkylation, and nitration reactions. The acid is used in the production of fertilizers, dyes, dyestuffs, artificial silk, and paint pigments; in refining edible oils and fats; in electroplating; leather tanning; ore refining; soap refining; petroleum extraction; pickling of metals; and in the photographic, textile, and rubber industries. It has been used as a choking/pulmonary agent.

Incompatibilities: The aqueous solution is a strong acid. Corrosive fumes emitted on contact with air. Reacts violently with bases, oxidizers forming toxic chlorine gas. Reacts, often violently, with acetic anhydride, active metals, aliphatic amines, alkanolamines, alkylene oxides, aromatic amines, amides, 2-aminoethanol, ammonia, ammonium hydroxide, calcium phosphide, chlorosulfonic acid, ethylene diamine, ethyleneimine, epichlorohydrin, isocyanates, metal acetylides, oleum, organic anhydrides, perchloric acid, 3-propiolactone, uranium phosphide, sulfuric acid, vinyl acetate, vinylidene fluoride. Highly corrosive to most metals, forming flammable hydrogen gas. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.49 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/7 mg/m^3 Ceiling Concentration.

NIOSH REL: 5 ppm/7 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 2 ppm/2.98 mg/m^3 Ceiling Concentration; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 0.5 ppm

PAC-1: **1.8** ppm

PAC-2: **22** ppm

PAC-3: **100** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm/3 mg/m^3; Peak Limitation Category I (2); Pregnancy Risk Group C.

NIOSH IDLH: 50 ppm.

Several states have set guidelines or standards for HCl in ambient air[60] ranging from 10 μg/m^3 (Massachusetts) to 70 μg/m^3 (North Dakota) to 120 μg/m^3 (Virginia) to 140 μg/m^3 (New York and South Dakota) to 167 μg/m^3 (Nevada) to 175 μg/m^3 (South Carolina) to 600−2000 μg/m^3 (Rhode Island) to 700 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH (IV), Method #7903, Inorganic Acids; OSHA Analytical Method ID-165SG.

Routes of Entry: Inhalation of gas or mist, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Signs and symptoms of acute ingestion of hydrogen chloride may be severe and include salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of hydrogen chloride. Acute inhalation exposure of hydrogen chloride may result in sneezing, hoarseness, choking, laryngitis, and respiratory tract irritation. Bleeding of nose and gums, ulceration of the nasal and oral mucosa, bronchitis, pneumonia, dyspnea (shortness of breath), chest pain, and pulmonary edema may also occur. If the eyes have come in contact with hydrogen chloride, irritation, pain, swelling, corneal erosion, and blindness may result. Dermal exposure may result in dermatitis (red, inflamed skin), severe burns, and pain.

Short Term Exposure: HCl is corrosive to the eyes, skin, and respiratory tract. Inhalation of high concentrations of vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May cause inflammation and destruction of the nasal passages, dental erosion, loss of voice, coughing, pneumonia, headaches, and rapid throbbing of the heart. May cause death in the range of 1000−2000 ppm. Skin contact can cause irritation or burns of the skin. Eye contact may cause irritation and severe damage to the surface of the eye, severe burns, and loss of sight. Contact with the liquid may cause frostbite. Ingestion may cause irritation of mouth, throat, and stomach; salivation, nausea, vomiting, chills and fever; holes in the intestinal tract; inflammation of the kidneys; and shock.

Long Term Exposure: Irritates the lungs, causing chronic bronchitis. May cause irritation and skin rash. Long-term exposure to low levels (greater than 5 ppm) of hydrogen chloride can cause some dental erosion. Aside from such dental erosions, no significant abnormalities have been associated with long-term low-level exposures. There is limited evidence that workers involved in the manufacturing of hydrogen chloride have an increased risk of respiratory cancers.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Decontamination*:* This is very important, and you have to decontaminate as soon as you can. The gas is very soluble in water, forming hydrochloric acid. Since the more concentrated the acid, the more dangerous it is; consequently, the acid must be diluted as much as possible. Decontamination must be started quickly before it has time to do much damage. Extra minutes before decontamination can make a big difference. Although hydrogen chloride is a gas, the victim cannot spread the agent to others. But, if the victim is wet, or the victim's clothes are wet, hydrochloric acid may be spread to others outside the hot and warm zones. So wash a victim thoroughly so that he cannot spread the acid to others. If you do not have the equipment and training, do not enter the hot zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and uphill direction. *Do not use household bleach or other bleach products* to decontaminate the victim. Wash the victim with warm water and soap. After decontamination, treat the acid burns as you would with burns from a fire. Decontaminate with water or with soap and water. Be sure that you have decontaminated the victims as much as you can before they leave the area. If you get any of the acid on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can following the incident.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 ppm:* CcrS* (APF = 10) (any NIOSH/MSHA- or European Standard EN 149-approved chemical cartridge respirator with cartridge(s) providing protection against the compound of concern) or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Hydrogen chloride must be stored to avoid contact with any alkali or active metals (such as potassium, sodium, and zinc) because violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: Anhydrous hydrogen chloride requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. Hydrogen chloride, *refrigerated liquid*, requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 8. Hydrochloric acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Spill Handling: *Gas:* If hydrogen chloride gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If hydrogen chloride solution is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Collect material in a convenient manner and deposit in sealed containers. If necessary, dilute and/or neutralize the material before collection. It may be necessary to contain and dispose of hydrogen chloride as a hazardous waste. Contact the NJ Department of Environmental Protection (DEP) of the federal Environmental Protection Agency (EPA) for specific recommendations.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Hydrogen chloride, anhydrous, used as a weapon—not covered in the current DOT tables.

UN1050 Hydrogen chloride, anhydrous

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.9/1.5

Hydrogen chloride, refrigerated liquid

Small spills (from a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)
First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 1.7/2.8
Night 6.3/10.2

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. (The material itself does not burn, but contact with metals produces hydrogen gas which will increase the chance of explosion). Poisonous gases, including chlorine and hydrogen chloride, are produced in fire. Use extinguishers suitable for surrounding fires other than water. Contact with water will produce heat and hydrochloric acid. If water is used, it must be used in flooding quantities. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not apply water to cryogenic liquid containers. If cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged periods, withdraw to a secure location. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Soda ash—slaked lime is added to form the neutral solution of chloride of sodium and calcium. This solution can be discharged after dilution with water.[22] Alternatively, hydrogen chloride can be recovered from a variety of process waste streams.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hydrogen cyanide (AC) is a volatile, colorless or pale-blue liquid; or a colorless gas. AC gas has a distinctive bitter almond odor (others describe a musty “old sneakers smell”), but a large proportion of people cannot detect it; the odor does not provide adequate warning of hazardous concentrations. It also has a bitter burning taste and is often used as a solution in water. The odor threshold is 0.58 ppm. Odor is *not* a reliable indicator of toxic amounts of vapor. Often used as a 96% solution in water. It is intensely poisonous, highly flammable, and explosive. Molecular weight = 27.03; Specific gravity (H_2O:1) = 0.69 (liquid); Boiling point = 25.6°C (96%); Freezing/Melting point = −13.9°C (96%); Vapor pressure = 630 mmHg at 20°C; Flash point = −17.8°C (cc) (96%); Autoignition temperature = 537.8°C (96%). Explosive limits: LEL = 5.6%; UEL = 40.0%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Human Data. Hydrogen cyanide is used in chemical synthesis of sequestrants, polymers, weed killers, and pharmaceuticals; as a fumagant; in electroplating, mining, chemical synthesis, and the production of synthetic fibers, plastics, dyes, and pesticides; in chemical synthesis of acrylates and nitriles, particularly acrylonitrile. It may be generated in blast furnaces, gas works, and coke ovens. Cyanide salts have a wide variety of uses, including steel hardening, gold and silver extraction from ores. AC is used as a chemical warfare agent (blood agent); systemic agent. It forms cyanide in the body.

Incompatibilities: Unless stabilized and maintained, samples stored more than 90 days are hazardous. The gas can form an explosive mixture with air. Material containing more than 2−5% water are less stable than dry material and can be self-reactive, forming an explosive mixture with air. Heat above 50−60°C or contact with heat, water, alkaline material, amines, or strong bases can cause polymerization. The aqueous solution is a weak acid. Violent reaction with oxidizers, acetaldehyde, acids, hydrogen chloride in alcoholic mixtures, sodium carbonate, caustic substances, causing fire and explosion hazard. Incompatible with amines, strong acids, sodium hydroxide, calcium hydroxide, sodium carbonate, ammonia. Attacks some plastics, rubber, and coatings.

DFG MAK: 1.9 ppm/2.1 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C.
Arab Republic of Egypt: TWA 10 ppm (10 mg/m^3), 1993; Australia: TWA 10 ppm (10 mg/m^3), [skin], 1993; Austria: MAK 10 ppm (11 mg/m^3), [skin], 1999; Denmark: TWA 5 ppm (5 mg/m^3), [skin], 1999; Finland: STEL 10 ppm (11 mg/m^3), [skin], 1999; France: VME 2 ppm (2 mg/m^3), VLE 10 ppm (10 mg/m^3), 1999; Hungary: TWA 0.3 mg/m^3; STEL 0.6 mg/m^3, [skin], 1993; the Netherlands: MAC 11 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (5 mg/m^3), 1999; the Philippines: TWA 10 ppm (11 mg/m^3), [skin], 1993; Poland: MAC (TWA) 0.3 mg/m^3, ceiling 10 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 0.3 mg/m^3, 1993; Sweden: ceiling 5 mg/m^3, [skin], 1999; Switzerland: MAK-W 10 ppm (11 mg/m^3), KZG-W 20 ppm (22 mg/m^3), [skin], 1999; Thailand: TWA 10 ppm (11 mg/m^3), 1993; Turkey: TWA 10 ppm (11 mg/m^3), [skin], 1993; United Kingdom: STEL 10 ppm (11 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 4.7 ppm [CN] [skin]. Several states have set guidelines or standards for hydrogen cyanide in ambient air[60] raging from 33 μg/m^3 (New York) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (North Dakota) to 220 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada) to 250 μg/m^3 (South Carolina) to 120−1000 μg/m^3 (North Carolina). The Czech Republic: MAC 0.3 mg/m^3. In ambient air in residential areas, Russia set a MAC of 0.01 mg/m on a daily average basis. In ambient air in residential areas, the

Czech Republic[35] has set 0.008 mg/m^3 on both a momentary and daily average basis.

Determination in Air: Use NIOSH (IV), Method #6010; #6017. Also Use NIOSH Analytical Method #7904 Cyanides (aerosol and gas).

Permissible Concentration in Water: A USPHS drinking water criterion for alternate source selection is 100 μg/L.[32]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.25$.

Routes of Entry: Inhalation of vapor; percutaneous absorption of liquid and concentrated vapor; ingestion; and eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Hydrogen cyanide can irritate and burn the skin and eyes. Inhalation can irritate the respiratory tract. Lacrimation (tearing) and a burning sensation of the mouth and throat are common. Can cause dizziness, headache, weakness, anxiety, confusion, pounding heart, difficult breathing and nausea. These can rapidly lead to convulsions and death unless exposure is immediately stopped and proper first aid is applied. High exposure can cause sudden death. Signs and symptoms of acute exposure to hydrocyanic acid may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red mucous membranes and blood may be noted. Cardiac arrhythmias and other cardiac abnormalities are common. Cyanosis (blue tint to the skin and mucous membranes) may be observed. Weakness, headache, vertigo (dizziness), agitation, giddiness, salivation, nausea, and vomiting; may be followed by combative behavior, convulsions, paralysis, protruding eyeballs, dilated and unreactive pupils, and coma. Tachypnea (rapid, shallow respirations) or hyperpnea (rapid, deep respirations) may be followed by respiratory depression. Lung hemorrhage and pulmonary edema may also occur. *Inhalation:* At less than 20 ppm, exposure to hydrogen cyanide may produce headache, dizziness, nausea, and vomiting. Concentrations greater than 50 ppm may cause difficulty in breathing, rapid throbbing of the heart, paralysis, unconsciousness, respiratory arrest, or death. 30-min exposure to 135 ppm may cause death and to 270 ppm has caused immediate death. *Skin:* Hydrogen cyanide is readily absorbed through the skin. Symptoms are similar to above. *Eyes:* Hydrogen cyanide is irritating to the eye and rapidly absorbed. *Ingestion:* Symptoms are similar to above. Death has resulted from ingestion of 570 mg/kg or 1.4 oz for a 150-lb person.

Long Term Exposure: Repeated exposure can interfere with thyroid function and can cause goiter. Itching, scarlet rash, red bumps, severe nose itch leading to bleeding, and possibly holes in the nose may result from long-term exposure to hydrogen cyanide. Headache, nausea, vomiting, weakness, and enlarged thyroid gland have also been reported at exposures from 4 to 12 ppm. May damage the nervous system.

Points of Attack: Central nervous system, cardiovascular system, thyroid, blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), lactic acid, pH (Hydrogen ion concentration), carboxyhemoglobin; blood plasma, bicarbonate, electrocardiogram, on workers over 40 years; expired air. Preplacement and periodic examinations should include the cardiovascular and central nervous systems, liver and kidney function, blood, history of fainting or dizzy spells. Blood cyanide test. Evaluation of thyroid function. Examination of the nervous system. Urinary thiocyanate levels have been used but are nonspecific and are elevated in smokers.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you do not have the equipment and training, do not enter the hot zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let anything get into the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Be sure that you have decontaminated the victims as much as you can before they leave the area so that they do not spread the agent. If you get some of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal and other items.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. 47 ppm:* Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials and conditions (see above). Store outdoors, if possible, or indoors in standard combustible liquid storage room or cabinet, away from sources of ignition. Protect containers against physical damage. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Hydrocyanic acid, aqueous solutions or Hydrogen cyanide, solutions with not >20% hydrogen cyanide requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Hydrogen cyanide, stabilized, with <3% water requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Hydrogen cyanide, stabilized, with <3% water and absorbed in a porous inert material requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stay upwind; keep out of low areas. Ventilate closed spaces before entering. Use water spray to reduce vapors. Do not touch spilled material; stop leak if you can do it without risk. Shut off ignition; no flares, smoking, or flames in hazard area. Isolate area until gas is dispersed. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

AC, when used as a weapon

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 2.4/3.8
Night 4.5/7.2

Hydrogen cyanide; Hydrocyanic acid

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5
Night 2.5/4.1

Fire Extinguishing: Poisonous gases, including cyanide, are produced in fire. If material is on fire and conditions permit, do not extinguish; combustion products are less toxic than the material itself. Cool exposures using unattended monitors. *Do not use water* directly on fire as cyanide gas may form. Use water to control only vapors. May react with itself without warning with explosive violence.

Gas: This chemical is a flammable gas. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Evacuate area endangered by gas. See isolation distance above if tank car or truck is involved in fire. Use dry chemicals, alcohol-resistant (AFFF) foam, or carbon dioxide. *Small fires*: let burn unless leak can be stopped immediately. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Stay away from ends of tanks. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Cool container with water using unmanned device until well after fire is out. Isolate area until gas has dispersed. Firefighting should be done from a safe distance. A few whiffs of gas, or liquid penetrating firefighter's protective clothing, could be fatal. Only special protective clothing should be worn.

Liquid: This chemical is a flammable liquid. Use dry chemical, carbon dioxide, or alcohol-resistant (AFFF) foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames of the surface of the burning liquid. Do not direct straight streams into the liquid. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chemical conversion to ammonia and carbon dioxide using chlorine or hypochlorite in a basic media. Controlled incineration is also adequate to totally destroy cyanide.[22] Alternatively, HCN can be recovered from ammonoxidation process waste streams, for example. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Hydrogen fluoride is a colorless, fuming liquid below 19.4°C or gas with a strong, irritating odor. Hydrogen fluoride mixes readily with water, forming hydrofluoric acid. odor threshold = 0.03 mg/m^3. Molecular weight = 20.01; Specific gravity (H_2O:1) = 1 (liquid at 19.5°C); Boiling point = 19.5°C; Freezing/Melting point = −83°C; Vapor pressure = 783 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2₩. Highly soluble in water.
Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data; Primary Irritant. Hydrogen fluoride, its aqueous solution hydrofluoric acid, and its salts, are used in special metallurgical process; nuclear engineering; making organic and inorganic fluorine compounds, such as fluorides and plastics; as a catalyst, particularly in paraffin alkylation in the petroleum industry; as an insecticide; and to arrest the fermentation in brewing. It is utilized in the fluorination processes, especially in the aluminum industry; in separating uranium isotopes; in cleaning cast iron, copper, and brass; in removing efflorescence from brick and stone; in removing sand from metallic castings; in frosting and etching glass and enamel; in polishing crystal; in decomposing cellulose; in enameling and galvanizing iron; in working silk; in dye and analytical chemistry; and to increase the porosity of ceramics.
Incompatibilities: A super-strong acid; aqueous solutions are less strong. Reacts violently with bases. Reacts, possibly with violence, with many compounds including acetic anhydride, aliphatic amines, alcohols, alkanolamines, alkylene oxides, aromatic amines, amides, 2-aminoethanol, ammonia, ammonium hydroxide, arsenic trioxide, bismuthic acid, calcium oxide, ethylene diamine, ethyleneimine, epichlorohydrin, isocyanates, metal acetylides, nitrogen trifluoride, oleum, organic anhydrides, oxygen difluoride, phosphorous pentoxide, sulfuric acid, strong oxidizers, vinyl acetate, vinylidene fluoride. Attacks glass, concrete, ceramics, and other silicon-containing compounds. Attacks metals, some plastics, rubber, and coatings.
Permissible Exposure Limits in Air
As fluorides
OSHA PEL: 3 ppm/2.5 mg [F]/m^3 TWA.

Several states have set guidelines or standards for hydrogen fluoride in ambient air[60] ranging from 3.4 μg/m^3 (Massachusetts) to 8.3 μg/m^3 (New York) to 20.0 μg/m^3 (Virginia) to 25.0 μg/m^3 (North Dakota and South Carolina) to 30.0 μg/m^3 (Rhode Island) to 50.0 μg/m^3 (Connecticut and South Dakota) to 60.0 μg/m^3 (Nevada) to 25.0−250.0 μg/m^3 (North Carolina) to 830.0 μ/m^3 (Kentucky).

Determination in Air: Use NIOSH Analytical Method #3800, #7902, #7903, #7906; OSHA Analytical Method ID-110.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.23$.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Hydrogen fluoride is corrosive to the eyes, skin, and the respiratory tract. Eye burns may not be immediately painful. Inhalation of this gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High levels of exposure can cause death. Acute exposure to hydrogen fluoride will result in irritation, burns, ulcerous lesions, and necrosis of the eyes, skin, and mucous membranes. Total destruction of the eyes is possible. Other effects include nausea, vomiting, diarrhea, pneumonitis (inflammation of the lungs), and circulatory collapse. Ingestion of an estimated 1.5 g produced sudden death without gross pathological damage. Repeated ingestion of small amounts resulted in moderately advanced hardening of the bones. Contact of skin with anhydrous liquid produces severe burns. Inhalation of anhydrous hydrogen fluoride or hydrogen fluoride mist or vapors can cause severe respiratory tract irritation that may be fatal. Hydrogen fluoride may induce hypocalcemia, causing cardiac and renal failure.

Long Term Exposure: The substance may cause fluorosis. Can irritate the lungs and may cause bronchitis. Long-term exposure may damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, bones.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray; electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once (contact lenses *should not be worn* when working with HF) and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and flush immediately with large amounts of water. Immerse exposed skin area in iced 70% ethyl alcohol. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should *not* be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *30 ppm:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SA* (any supplied-air respirator) or SCBA (any self-contained breathing apparatus). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Hydrogen fluoride must be stored to avoid contact with metals, concrete, glass, and ceramics because it can severely corrode these materials. See also "Incompatibilities;" listed above. Contact with metals may form a flammable gas. Keep away from heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Hydrogen fluoride, anhydrous, requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I.

Hydrofluoric acid, with >60% strength, requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I.

Hydrofluoric acid, with *not* >60% strength, requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of spill or leak. If a gas, stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If in liquid form, allow to vaporize and disperse the gas, or cover with sodium carbonate or an equal mixture of soda ash and slaked lime. After mixing, add water if necessary to form a slurry. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN 1052, anhydrous

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.2/3.5

Fire Extinguishing: Hydrogen fluoride is a noncombustible liquid or gas. Contact with metals may form flammable hydrogen gas which can cause fire and explosion. Use chemical extinguishers. Poisonous gases, including fluorine, are produced in fire. Vapors are slightly lighter than air. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Use dry chemicals, foam, carbon dioxide. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reaction with excess lime followed by lagooning and either recovery or landfill disposal of the separated calcium fluoride. The supernatant liquid from this process is diluted and discharged to the sewer.[22] Alternatively, hydrogen can be recovered and recycled in many cases. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Conc. >52%:

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 7500 lb.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg) (Conc. >52%).

Reportable Quantity (RQ): 1000 lb (454 kg) (Conc. >52%).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: O, C; Risk phrases: R5; R8; R20/22; R34; Safety phrases: S1/2; S17; S26; S28; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Hydrogen peroxide is a colorless liquid with a sharp odor and bitter taste. Molecular weight = 34.02; Specific gravity (H_2O:1) = 1.39; Boiling point = 141°C (90%); 125°C (70%); 106°C (30%); Freezing/Melting point = −39°C (70%); −11°C (90%); Vapor pressure = 5 mmHg at 30°C. Hazard Identification (based on NFPA-704 M Rating System): (30% solution) Health 3, Flammability 0, Reactivity 1 (Oxidizer) . Hydrogen peroxide is completely miscible with water and is commercially sold in concentrations of 3%, 35%, 50%, 70%, and 90% solutions. It is not flammable.

Potential Exposure: Compound Description: Drug, Tumorigen, Mutagen, Human Data; Hormone, Primary Irritant (90%); Mutagen, Human Data (20%). Hydrogen peroxide is used in the manufacture of acetone, antichlor, antiseptics, benzoyl peroxide, buttons, disinfectants, pharmaceuticals, felt hats, plastic foam, rocket fuel, sponge rubber, and pesticides; as a food and feed additive; flavor; as a packaging material; in bleaching bone; feathers, flour, fruit, fur, gelatin, glue, hair, ivory, silk, soap, straw, textiles, wax, and wood pulp; and as an oxygen source in respiratory protective equipment. Other specific occupations with potential exposure include liquor and wine agers, dyers, electroplaters, fat refiners, photographic film developers, wool printers, veterinarians, and water treaters.

Incompatibilities: Contact with combustible material may result in SPONTANEOUS combustion. A powerful oxidizer; attacks many substances. Attacks many organic substances, such as wood, textile, and paper. Contact with most organic, readily oxidizable materials, reducing agents, and combustibles causes fire and explosions, particularly in the presence of metals. Contact with iron, copper, brass, bronze, chromium, zinc, lead, manganese, silver, and catalytic metals (and their salts), especially in a basic (pH 7 or above) environment, causes rapid decomposition with evolution of oxygen gas, which increases fire hazard. Attacks, and may ignite, some plastics, rubber, and coatings. Decomposes slowly at ordinary temperatures and builds up pressure in a closed container. The rate of decomposition doubles for each 50°F/10°C rise (1.5 times for each 10°C rise) in temperature and becomes self-sustaining at 285°F/141°C.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.39 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/1.4 mg/m^3 TWA.

NIOSH REL: 1 ppm/1.4 mg/m^3 TWA.

ACGIH TLV®[1] 1 ppm/1.4 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 75 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **10** ppm

PAC-2: **50** ppm

PAC-3: **100** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Protective Action Criteria (PAC) (30%)

TEEL-0: 3.33 ppm

PAC-1:33.3 ppm

PAC-2: 167 ppm

PAC-3: 333 ppm

DFG MAK: 0.5 ppm/0.71 mg/m^3 TWA; Peak Limitation Category I(1); Carcinogen Category 4; Pregnancy Risk Group C.

Australia: TWA 1 ppm (1.5 mg/m^3), 1993; Belgium: TWA 1 ppm (1.4 mg/m^3), 1993; Finland: TWA 1 ppm (1.4 mg/m^3); STEL 3 ppm (4.2 mg/m^3), 1999; France: VME 1 ppm (1.5 mg/m^3), 1993; the Netherlands: MAC-TGG 1.4 mg/m^3, 2003; Norway: TWA 1 ppm (1.4 mg/m^3), 1999; the Philippines: TWA 1 ppm (1.4 mg/m^3), 1993; Turkey: TWA 1 ppm (1.4 mg/m^3), 1993; United Kingdom: TWA 1 ppm (1.4 mg/m^3; STEL 2 ppm (2.8 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for hydrogen peroxide in ambient air[60] ranging from 15 μg/m^3 (North Dakota) to 25 μg/m^3 (Virginia) to 28 μg/m^3 (Connecticut) to 36 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #ID126SG.

Routes of Entry: Inhalation of vapor or mist, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Hydrogen peroxide is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Signs and symptoms of acute exposure to hydrogen peroxide may be severe and include irritation or burns to the skin, eyes, respiratory tract, mouth, esophagus, stomach, and intestines. Distension or rupture of the stomach and other hollow viscera may occur; vomiting is common. Corneal ulceration may develop.

Long Term Exposure: Because this is a mutagen, handle it as a possible cancer-causing substance—with extreme caution. Can irritate the lungs. Repeated exposure may cause bronchitis. Repeated skin contact can cause a rash with redness and blisters.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected: consider chest X-ray if pulmonary edema is suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For hydrogen peroxide (30−70%), Neoprene™ + Natural rubber; and Neoprene™/natural rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Where fumes or vapor are excessive, workers should be provided with gas masks with full face-pieces and proper canisters or supplied-air respirators. Additional health hazards may occur from the decomposition of hydrogen peroxide. Oxygen, possibly at high pressure, may form, which may create an explosion hazard. Hydrogen peroxide is generally handled in a closed system to prevent contamination. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *75 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD, PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White (30% solution): Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Hydrogen peroxide must be stored to avoid contact with iron, copper, chromium, brass, bronze, lead, silver, manganese, and their salts since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from alcohols, glycerol, organic materials, and radiant heat, including sunlight. Containers should be protected from physical and mechanical disturbances. Sources of ignition, such as smoking and open flames, are prohibited where hydrogen peroxide is used, handled, or stored in manner that could create a potential fire or explosion hazard. Wherever hydrogen peroxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Hydrogen peroxide, stabilized, or hydrogen peroxide *aqueous solutions*, stabilized with >60% hydrogen peroxide, require a shipping label of “OXIDIZER, CORROSIVE.” It falls in Hazard Class 5.1 and Packing Group I.

Hydrogen peroxide, *aqueous solutions with >40% but not >60% hydrogen peroxide* (stabilized as necessary), requires a shipping label of “OXIDIZER, CORROSIVE.” It falls in Hazard Class 5.1 and Packing Group II.

Hydrogen peroxide, aqueous solutions with not <20% but not >40% hydrogen peroxide (stabilized as necessary), requires a shipping label of “OXIDIZER, CORROSIVE.” It falls in Hazard Class 5.1 and Packing Group II.

Hydrogen peroxide, aqueous solutions with not <8% but <20% hydrogen peroxide (stabilized as necessary), requires a shipping label of “OXIDIZER” It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use a large quantity of water to wash down spills and reduce the flammable vapors. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible, but highly reactive and can increase the intensity of fire. Fires should be fought only with water. Do not use dry chemical, carbon dioxide, or foams. *Large fires:* flood fire area with water. Flammable vapors may accumulate in storage areas and containers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilution with water to release the oxygen. After decomposition, the waste stream may be discharged safely.[22]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 150 lb.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 500 lb (227 kg).

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hydrogen selenide is a colorless, flammable gas with a very offensive odor, resembling decayed horseradish. The odor threshold is 0.3 ppm (higher than the occupational exposure limits); many people rapidly lose the ability to detect the odor of hydrogen selenide, so it is not a reliable warning of exposure. Molecular weight = 80.98; Specific gravity (H_2O:1) = 2.1 (liquid); Boiling point = −41°C; Freezing/Melting point = −66°C; Relative vapor density (air = 1): 2.80; Vapor pressure = 9.5 atm at 21°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 0. Soluble in water; solubility = 0.9% at 22.7°C.

Potential Exposure: Hydrogen selenide is used in semiconductor manufacture. Also, it may be produced by the reaction of acids or water and metal selenides, or hydrogen and soluble selenium compounds.

Incompatibilities: Forms an explosive mixture with air. Contact with air causes the emission of toxic and corrosive fumes of selenium dioxide. A strong reducing agent. Reacts violently with oxidizers, causing fire and explosion hazard. Incompatible with strong acids, water, halogenated hydrocarbons. Decomposes above 100°C, forming toxic and flammable products including selenium and hydrogen.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.31 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.05 ppm[Se]/0.2 mg/m^3 TWA.

NIOSH REL: 0.05 ppm/0.2 mg/m^3 TWA.

ACGIH TLV®[1]: 0.05 ppm/0.16 mg/m^3 TWA.

Several states have set guidelines or standards for H_2Se in ambient air[60] ranging from 2 g/m^3 (North Dakota) to 3 μ/m^3 (Virginia) to 4 μg/m^3 (Connecticut) to 5 μg/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: No criteria set, but EPA[32] suggests a permissible ambient goal of 10 μg/L (the same as for selenium) based on health effects.

Routes of Entry: Inhalation, eye and/or skin contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause dizziness, fatigue, nausea, vomiting, and diarrhea. *Inhalation:* The odor of hydrogen selenide in small concentrations (e.g., below 1 ppm) disappears rapidly because of olfactory fatigue. The odor and irritating effects are not a reliable warning to gradually increasing concentrations. Low levels have caused coughing, sneezing, and difficulty in breathing. Levels of 0.2 ppm may cause nausea, vomiting, a metallic taste in the mouth, and garlic breath. Levels of 1.5 ppm may cause intolerable irritation of mouth and nose. Inhalation of the gas may cause pneumonitis. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* May cause irritation and red coloration of nails. Contact can cause a burning sensation on contact and rash. Contact with liquid may cause freezing burns. *Eyes:* Levels of 1.5 ppm are described as intolerable.

Long Term Exposure: Repeated exposure can cause garlic odor on breath, dizziness, nausea, vomiting, labored breathing, bluing of skin, pulmonary edema, metallic taste, coughing, nasal secretion, pain in the chest, difficulty in breathing, irritation of the eyes, irritation of the respiratory tract resulting in bronchitis and conjunctivitis. It may also cause anemia. Animal studies suggest that liver damage and lung impairment are also possible.

Points of Attack: Eyes, respiratory system, liver, blood.

Medical Surveillance: Consider the points of attack in replacement and periodic physical examinations. Liver function tests. Complete blood count (CBC). Urine test for selenium (normal is less than 100 μg/L of urine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Wear splash-proof chemical goggles and face shield when working with the liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 1 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (2) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with hydrogen selenide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store at room temperature away from contact with oxidizers, acids, water, and halogenated hydrocarbons. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Hydrogen selenide requires a shipping label of "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Warn other workers of leak. Evacuate area. Put on proper protective clothing and equipment. Stop flow of gas. Ventilate area. Remove sources of ignition. If leak cannot be stopped, move leaking cylinder to safe place out of doors. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 2.9./4.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 5.4/8.7
Night 7.0+ /11.0+ distance can be larger in certain atmospheric conditions

Fire Extinguishing: This chemical is a flammable gas. Do not extinguish fire unless flow of gas can be stopped. *Small fires:* dry chemical or carbon dioxide. Stay upwind and uphill; keep out of low areas. Wear self-contained breathing apparatus and full protective clothing. Use water in flooding quantities as fog. Cool containers that are exposed to flames with water until well after the fire is out. Decomposes above 100°C forming toxic and flammable selenium and hydrogen. Gas is heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Hydrogen sulfide is a flammable, colorless gas with a characteristic rotten egg odor. The odor threshold is 0.008 ppm. Sense of smell becomes rapidly fatigued and CANNOT be relied upon to warn of the continuous presence of H_2S. Shipped as a liquefied compressed gas. Molecular weight = 34.08; Boiling point = −60.6°C; Freezing/Melting point = −85.6°C; Vapor pressure = 17.6 atm at 25°C; Relative vapor density (air = 1) = 1.19; Autoignition temperature = 260°C. Explosive limits: LEL = 4.0%; UEL = 44.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 0. Soluble in water; solubility = 0.45% at 20°C.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. Hydrogen sulfide is used in the synthesis of inorganic sulfides, sulfuric acid, and organic sulfur compounds; as an analytical reagent; as a disinfectant in agriculture; and in metallurgy. It is generated in many industrial processes as a by-product and also during the decomposition of sulfur-containing organic matter, so potential for exposure exists in a variety of situations. Hydrogen sulfide is found in natural gas, volcanic gas, and in certain natural spring waters. Its may also be encountered in the manufacture of barium carbonate, barium salt, cellophane, depilatories, dyes, pigments, felt, fertilizer, adhesives, viscose rayon, lithopone, synthetic petroleum products; in the processing of sugar beets; in mining, particularly where sulfide ores are present; in sewers and sewage treatment plants; during excavation of swampy or filled ground for tunnels, wells, and caissons; during drilling of oil and gas wells; in purification of hydrochloric acid and phosphates; during the low-temperature carbonization of coal; in tanneries, breweries, slaughterhouses; in fat rendering; and in lithography and photoengraving.

Incompatibilities: A highly flammable and reactive gas; heating may cause violent combustion or explosion. Forms explosive mixture with air. Incompatible with acetaldehyde, barium pentafluoride; chlorine monoxide; chlorine trifluoride; chromic anhydride; copper, lead dioxide; nitric acid; nitrogen iodide; nitrogen trichloride; nitrogen trifluoride; oxygen difluoride; oxidizers, phenyl diazonium chloride; sodium, sodium peroxide. Reacts with alkali metals. Attacks some plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.40 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 20 ppm Ceiling Concentration; 50 ppm [10-min maximum peak; once per 8-h shift].

NIOSH REL: 10 ppm/15 mg/m^3 [10 min] Ceiling Concentration.

ACGIH TLV®[1]: 1 ppm/1.4 mg/m^3 TWA; 5 ppm/7 mg/m^3 STEL.

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.51 ppm

PAC-1: **0.51** ppm

PAC-2: **27** ppm

PAC-3: **50** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 5 ppm/7.1 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 10 ppm (14 mg/m^3), 1993; Australia: TWA 10 ppm (14 mg/m^3), STEL 15 ppm, 1993; Austria: MAK 10 ppm (15 mg/m^3), 1999; Belgium: TWA 10 ppm (14 mg/m^3); STEL 15 ppm, 1993; Denmark: TWA 10 ppm (15 mg/m^3), 1999; Finland: TWA 10 ppm (15 mg/m^3); STEL 15 ppm (20 mg/m^3), [skin], 1999; France: VME 5 ppm (7 mg/m^3), VLE 10 ppm (14 mg/m^3), 1999; Japan: 10 ppm (14 mg/m^3), 1999; the Netherlands: MAC-TGG 15 mg/m^3, 2003; Norway: TWA 10 ppm (15 mg/m^3), 1999; the Philippines: TWA 10 ppm (15 mg/m^3), 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 20 mg/m^3, 1999; Russia: TWA 10 ppm, STEL 10 mg/m^3, 1993; Sweden:

NGV 10 ppm (14 mg/m^3), KTV 15 ppm (20 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (15 mg/m^3), KZG-W 20 ppm (30 mg/m^3), 1999; Thailand: STEL 20 ppm, 1993; Turkey: TWA 10 ppm (15 mg/m^3), 1993; United Kingdom: TWA 10 ppm (14 mg/m^3), STEL 15 ppm (21 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm. Russia[43] set a MAC of 0.008 mg/m^3 in ambient air of residential areas on both a momentary and a daily average basis. Several states have set guidelines or standards for hydrogen sulfide in ambient air[60] ranging from 14.0 μg/m^3 (South Carolina) to 230.0 μ/m^3 (Virginia) to 280.0 μg/m^3 (Connecticut) to 333.0 μg/m^3.

Determination in Air: Use NIOSH (IV), Method #6013; OSHA Analytical Method ID-141.

Permissible Concentration in Water: EPA[32] suggests a permissible ambient goal of 207 μg/L based on health effects. EPA has established that hydrogen sulfide is a regulated toxic substance and is a hazardous substance defined under the Federal Water Pollution Control Act.

Routes of Entry: Inhalation of gas, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Signs and symptoms of acute exposure to hydrogen sulfide may include tachycardia (rapid heart rate) or bradycardia (slow heart rate), hypertension (low blood pressure), cyanosis (blue tint to skin and mucous membrane), cardiac palpitations, and cardiac arrhythmias. Dyspnea (shortness of breath), tachypnea (rapid respiratory rate), bronchitis, pulmonary edema, respiratory depression, and respiratory paralysis may occur. Neurological effects include giddiness, irritability, drowsiness, weakness, confusion, delirium, amnesia, headache, sweating, and dizziness. Muscle cramping, tremor, excessive salivation, cough, convulsions, and coma may be noted. Nausea, vomiting, and diarrhea are commonly seen. Exposure to hydrogen sulfide gas may result in skin irritation, lacrimation (tearing), inability to detect odors, photophobia (heightened sensitivity to light), and blurred vision.

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the central nervous system. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Levels of 20 ppm may cause headache, loss of appetite, and dizziness. 50 ppm may cause muscle fatigue. 300 ppm may cause muscle cramps, low blood pressure, and unconsciousness after 20 min. Levels of 500 ppm can cause immediate loss of consciousness, slowed respiration, and death in 30−60 min. At levels of 700 ppm and above, respiratory paralysis and death can occur in seconds. Nonfatal cases may recover fully or may experience abnormal reflexes, dizziness, sleep disturbances, and loss of appetite that last for months or years. *Skin:* Readily absorbed. May cause irritation, reddening, and swelling. Contact with liquid can cause freezing burns. *Eyes:* Irritation may be felt at levels as low as 0.1 ppm. Levels of 10 ppm and above can cause irritation, pain, tearing, and increased light sensitivity. Liquid may cause freezing burns.

Long Term Exposure: Long-term exposure to low levels can cause pain and redness of the eyes with blurred vision. Repeated exposure can cause fatigue, loss of appetite, headaches, irritability, poor memory, dizziness, troubled sleeping, and nausea. Can cause irritation of the lungs and bronchitis with cough, phlegm, and/or shortness of breath. Animals studies showed that pigs that ate food containing hydrogen sulfide had diarrhea after a few days and weight loss after about 105 days.

Points of Attack: Eyes, lungs.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), carboxyhemoglobin; blood plasma; chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood sulfide level (normal is less than 0.05 mg/L).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™ and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Because of poor warning signs, it may cause olfactory paralysis, and some persons are congenitally unable to smell H_2S. Accidental exposure may occur when workers enter sewage tanks and other confined areas in which hydrogen sulfide is formed by decomposition. In a number of cases workers enter unsuspectingly and collapse almost immediately. Workers, therefore, should not enter enclosed spaces without proper precautions. All federal standard and other safety precautions must be observed when tanks or other confined spaces are to be entered. In areas where the exposure to hydrogen sulfide exceeds the standards, workers should be provided with full-face canister gas masks or preferable supplied-air respirators. When liquid H_2S is involved, wear clothing to prevent skin freezing. Wear eye protection to prevent any reasonable probability of eye contact. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 100 ppm:* PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with hydrogen sulfide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Hydrogen sulfide must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and nitric acid since violent reactions occur. Outdoor or detached storage is preferred. Indoors, store in a cool, well-ventilated area. Sources of ignitions, such as smoking and open flames, are prohibited where hydrogen sulfide is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of hydrogen sulfide. Wherever hydrogen sulfide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Hydrogen sulfide requires a shipping label of "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (*from a small package or a small leak from a large package*)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (*from a large package or from many small packages*)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.3/2.0
Night 3.9/6.2

Fire Extinguishing: A very flammable gas. This chemical is a flammable gas. Poisonous gases, including sulfur dioxide, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas.

Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrogen sulfide can be recovered as such or converted to elemental sulfur or sulfuric acid. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hydroquinone is light-tan, light-gray, or colorless crystals. Molecular weight = 110.12; Specific gravity (H_2O:1) = 1.33; Boiling point = 285°C; Freezing/Melting point = 170°C; Vapor pressure = 0.00001 mmHg at 20°C; Flash point = 165°C (molten); Autoignition temperature = 516°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water; solubility = 7%; 5.9% at 15°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Hydroquinone is a reducing agent and is used as an industrial chemical, chemical intermediate, pharmaceutical, and veterinary drug; as a photographic developer; and as an antioxidant or stabilizer for certain materials, which polymerize in the presence of oxidizing agents. Many of its derivatives are used as bacteriostatic agents, and others, particularly 2,5-

bis(ethyleneimino) hydroquinone, have been reported to be good antibiotic and tumor-inhibiting agents.

Incompatibilities: Hydroquinone is a reducing agent. Dust forms an explosive mixture with air. May explode on contact with oxygen. Incompatible with strong oxidizers, caustics; reacts violently with sodium hydroxide. May be oxidized to quinone at room temperatures in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: 2 mg/m^3 TWA.

NIOSH REL: 2 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 1 mg/m^3 TWA; danger of sensitization; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 50 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 50 mg/m^3

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2; Germ Cell Mutagen Category 3A.

Australia: TWA 2 mg/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3; STEL 4 mg/m^3 [skin] 1999; France: VME 2 mg/m^3, 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; the Philippines: TWA 2 mg/m^3, 1993; Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 4 mg/m^3, 1999; Sweden: NGV 0.5 mg/m^3, KTV 1.5 mg/m^3, 1999; Switzerland: MAK-W 2 mg/m^3, KZG-W 4 mg/m^3, 1999; Turkey: TWA 2 mg/m^3, 1993; United Kingdom: LTEL 2 mg/m^3; STEL 4 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia set a MAC of 0.02 mg/m^3 in ambient air in residential areas on a once-daily basis.[35] Several states have set guidelines or standards for hydroquinone in ambient air[60] ranging from 6.67 μg/m^3 (New York) to 20.0 μg/m^3 (Florida and South Carolina) to 20.0−40.0 μg/m^3 (North Dakota) to 35.0 μg/m^3 (Virginia) to 40.0 μg/m^3 (Connecticut) to 48.0 μg/m^3 (Nevada).

Determination in Air: NIOSH (IV), Method #5004; OSHA Analytical Method PV-2094.

Permissible Concentration in Water: Russia set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.60$.

Routes of Entry: Inhalation of dust, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Can cause conjunctivitis, keratitis (inflammation of the cornea). Can affect the central nervous system and cause excitement. Signs and symptoms of acute exposure to hydroquinone may be severe and include dyspnea (shortness of breath); a sense of suffocation; increased respiratory rate; and respiratory failure. Pallor (paleness of skin); cyanosis (blue tint to skin and mucous membranes); and cardiovascular collapse may also occur. Neurologic effects include headache, tinnitus (ringing in the ears), dizziness, delirium, muscle twitching, tremor, and convulsions. Nausea, vomiting, and the production of green to brown-green urine may also occur. Ingestion may cause respiratory failure. This material is very toxic; the probable oral lethal dose for humans is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb person. Fatal human doses have ranged from 5 to 12 g but 300−500 mg has been ingested daily for 3−5 months without ill effects. Death is apparently initiated by respiratory failure or anoxia.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Hydroquinone causes changes in color of the conjunctiva, cornea, and skin. Over the years this can cause clouding of the eyes and permanent vision damage. May cause genetic damage, mutations in humans. Such chemicals have a cancer risk.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: NIOSH lists the following tests: ophthalmic examination; pulmonary function tests. Careful examination of the eyes, including visual acuity and slit lamp examinations, should be carried out in preplacement and periodic examinations. Also, the skin should be examined. Hydroquinone is excreted in the urine as a sulfate ester although this has not been helpful in following worker exposure to dust.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, natural rubber, and Viton are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended for this chemical by NIOSH. See NIOSH Criteria Document #78-155.

Respirator Selection: *Up to 50 mg/m^3:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed at 50 and 100 mg/m^3.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Hydroquinone must be stored to avoid contact with sodium hydroxide since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing materials. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stay upwind; keep out of low areas. Remove all ignition sources. Do not touch spilled material; stop leak if you can do it without risk. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hydroquinone may burn but does not readily ignite. For small fires use dry chemical, carbon dioxide, water spray, or foam. Move container from fire area if you can do so without risk. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum), then scrub to remove harmful combustion products.[22]

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: E, Xn, N; Risk phrases: R2; R21/22; R37/38; R40; R41; R43; R48/22; Safety phrases: S2; S26; S36/37/39; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hydroxylamine is a white crystalline substance. Molecular weight = 33.04; Specific gravity (H_2O:1) = 1.23; Boiling point = 70°C (decomposes below BP); Freezing/Melting point = 32°C; it is very hygroscopic and unstable; Flash point = 129°C (explosive); Autoignition temperature = 265°C. NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3. Soluble in water.

Potential Exposure: Compound Description: Mutagen. Those involved in chemical synthesis or use of hydroxylamine. Used as a reducing agent.

Incompatibilities: Self-reactive. Contaminants, temperatures above 129.4°C, or open flame can cause explosive decomposition, especially in the presence of moisture and carbon dioxide. Incompatible with strong acids, organic anhydrides, isocyanates, aldehydes, sodium, finely divided zinc, some metal oxides. Aqueous solution is a weak base. Contact with strong oxidizers may cause a fire and explosion hazard. Attacks some metals. Contact with calcium or zinc forms a heat-sensitive explosive [bis(hydroxylamide)] (Sax).

Permissible Exposure Limits in Air

7803-49-8

Protective Action Criteria (PAC)

TEEL-0: 0.25 mg/m^3

PAC-1: 0.75 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 25 mg/m^3

DFG MAK: Danger of skin sensitization.

Routes of Entry: Inhalation and ingestion of dust.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to skin, eyes, and mucous membranes. May cause methemoglobinemia. The effects may be delayed. Exposure can cause headache; vertigo (dizziness); tinnitus (ringing of ear); dyspnea (difficult breathing); nausea and vomiting, cyanosis, proteinuria and hematuria, jaundice, restlessness, and convulsion; yellowish brown deposit on conjunctiva and cornea; astigmatism; reddening of hair and exposed skin.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and eczema. May affect the nervous system. May cause anemia and liver damage.

Points of Attack: Skin, blood, liver, nervous system.

Medical Surveillance: Annual physical examinations including renal and hepatic. Examination by a qualified allergist. Complete blood count (CBC). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Note to physician: Treat for methemoglobinemia. Test urine for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Protect against physical damage. Store in cool, noncombustible buildings and separate from oxidizing materials. Open airtight containers occasionally to relieve pressure from decomposition products.

Shipping: Toxic solid, corrosive, inorganic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in DOT/UN Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Cover spill with sodium bisulfite and sprinkle with water. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extreme caution in approaching a fire because the material may explode when exposed to heat or flame. No attempt should be made to fight fires except for remotely activated fire extinguishing equipment. Evacuate the surrounding area. Water or foam may cause frothing. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add sodium bisulfite solution and flush to sewer or incinerate.

2-Hydroxypropyl acrylate H:0510

Molecular Formula: $C_6H_{10}O_3$

Common Formula: $CH_2{=}CHCOOCH_2CHOHCH_3$

Synonyms: Acrylic acid 2-hydroxypropyl ester; HPA; Hydroxypropyl acrylate; β-Hydroxypropyl acrylate; 1,2-Propanediol 1-acrylate; Propylene glycol monoacrylate

CAS Registry Number: 999-61-1

RTECS® Number: AT1925000

UN/NA & ERG Number: UN1760 (Corrosive liquids, n.o.s.)/154

EC Number: 213-663-8 [*Annex I Index No.:* 607-108-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; R34; R43; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Hydroxypropyl acrylate is a clear to light-yellow liquid with a sweetish, solvent odor. Molecular weight = 130.16; Specific gravity (H_2O:1) = 1.05; Boiling point = 191°C also listed at 205°C; Relative vapor density (air = 1) = 4.5; Flash point = 65°C. Explosive limits: LEL = 1.8%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: 2-Hydroxypropyl acrylate is used as a bifunctional monomer for acrylic resins; it is used as a binder in nonwoven fabrics and may be used in the production of detergent lube oil additives.

Incompatibilities: 2-Hydroxypropyl acrylate can polymerize due to heating, initiators, UV light. Can become unstable at high temperatures and pressures or may react with water with some release of energy but not violently. Reacts with oxidizers, strong acids, nitrates.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.33 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.5 ppm/3 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.5 ppm/2.8 mg/m^3 TWA [skin] danger of skin sensitization.

No TEEL available.

DFG MAK: danger of skin sensitization.

Australia: TWA 0.5 ppm (3 mg/m^3), [skin], 1993; Belgium: TWA 0.5 ppm (2.8 mg/m^3), [skin], 1993; Denmark: TWA 0.5 ppm (3 mg/m^3), [skin], 1999; France: VME 0.5 ppm (3 mg/m^3), [skin], 1999; Norway: TWA 0.5 ppm (2.9 mg/m^3), 1999; Russia: STEL 1 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.5 ppm (2.7 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 3 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm [skin], skin sentitzer. Several states have set guidelines or standards for hydroxypropyl acrylate in ambient air[60] ranging from 30 μg/m^3 (North Dakota) to 50 μg/m^3 (Virginia) to 60 μg/m^3 (Connecticut) to 71 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Eye contact can cause burns and permanent damage. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} = (oral-rat) 250 gm/kg (moderately toxic).

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis and eczema; sensitization.

Points of Attack: Skin, lungs.

Medical Surveillance: Lung function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where 2-Hydroxypropyl acrylate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Corrosive liquids, n.o.s. require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous and acid fumes, including acrylic acid, acrolein, are produced in fire. Water may be ineffective. Use dry chemical, alcohol foam, or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

I

Incapacitating agents

Incapacitating agents are chemical warfare agents that produce temporary disabilities and/or render individuals incapable of performing tasks or assigned duties because of physical or mental impairment. Unlike lethal agents, which are primarily designed to kill, incapacitating agents are often meant to be nonlethal, but, under certain conditions or when a victim receives a potent enough dose, they can also kill. The major chemical warfare agent in this category and its code name is listed below along with its record number for quick access.
Quinuclidinyl benzilate, agent BZ see Q:0120.

Indene I:0100

Molecular Formula: C_9H_8
Common Formula: $CH{=}CHCH{=}CHC{=}CCH{=}CHCH_2$
Synonyms: IH-Indene; Indonaphthene
CAS Registry Number: 95-13-6
RTECS® Number: NK8225000
UN/NA & ERG Number: UN1993 (Combustible liquid, n.o.s.)/128. Only regulated when shipped in bulk.
EC Number: 202-393-6
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Indene is a colorless liquid from coal tars. The odor threshold is 0.015 ppm. Molecular weight = 116.17; Specific gravity (H_2O:1) = 0.997; Boiling point = 181.6°C; Freezing/Melting point = −1.7°C; Vapor pressure = 1.1 mmHg at 25°C; Flash point = 78.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Insoluble in water.
Potential Exposure: Indene is used in the preparation of synthetic resins, such as coumarone indene resins. It is also used as an organic intermediate. It is an asphalt and naphtha constituent; from petroleum refining and coke processing.
Incompatibilities: Contact with strong oxidizers and strong acids may cause fire and explosion hazard. Polymerizes and oxidizes on standing. Sunlight can cause polymerization. It has exploded during nitration with sulfuric acid + nitric acid.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.75 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 10 ppm/45 mg/m^3 TWA.
ACGIH TLV®[1]: 5 ppm/24 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 5 ppm
PAC-1: 5 ppm
PAC-2: 5 ppm
PAC-3: 300 ppm
Australia: TWA 10 ppm (45 mg/m^3), 1993; Belgium: TWA 10 ppm (48 mg/m^3), 1993; Denmark: TWA 10 ppm (45 mg/m^3), 1999; Finland: TWA 10 ppm (47 mg/m^3); STEL 20 ppm (95 mg/m^3), 1999; France: VME 10 ppm (45 mg/m^3), 1999; the Netherlands: MAC-TGG 45 mg/m^3, 2003; Norway: TWA 10 ppm (45 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (45 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm. Several states have set guidelines or standards for indene in ambient air[60] ranging from 450−700 μg/m^3 (North Dakota) to 750 μg/m^3 (Virginia) to 900 μg/m^3 (Connecticut) to 1071 μg/m^3 (Nevada).
Determination in Air: No method listed. The following are used for coal tar products: OSHA Analytical Method 58. See also NIOSH Analytical Method #5506 by HPLC; #5515 by GC.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 621 μg/L based on health effects.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: May cause eye, skin, and respiratory irritation. Animal studies have shown that liver damage and, occasionally, spleen and kidney injury result from exposure to high (800−900 ppm) vapor concentrations. Liquid indene defatted the skin but did not cause dermatitis. Aspiration of liquid into the lung caused pneumonitis, pulmonary edema, and hemorrhage in laboratory animals.
Long Term Exposure: May cause skin sensitization and allergy. Has caused liver, kidney, and spleen injury in laboratory animals.
Points of Attack: Eyes, skin, respiratory system, liver, kidneys, spleen.
Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Examination by a qualified allergist to diagnose skin allergy. Medical surveillance shall be made available, as specified below, to all employees occupationally exposed to coal tar products. *Preplacement Medical Examinations:* These examinations shall include: Comprehensive initial medical and work histories, with special emphasis directed toward identifying preexisting disorders of the skin, respiratory tract, liver, and kidneys. A physical examination giving particular attention to the

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00009-6

oral cavity, skin, and respiratory system. This shall include posteroanterior and lateral chest X-rays (35 cm × 42 cm). Pulmonary function tests, including forced vital capacity (FVC) and forced expiratory volume at 1 s (FEV 1.0); and a sputum cytology examination shall be offered as part of the medical examination of exposed employees. Other tests, such as liver function and urinalysis, should be performed as considered appropriate by the responsible physician. In addition, the mucous membranes of the oral cavity should be examined. A judgment of the employee's ability to use positive pressure respirators. *Periodic Examinations:* These examinations shall be made available at least annually and shall include: Interim medical and work histories. A physical examination as outlined above. *Initial Medical Examinations:* These examinations shall be made available to all workers as soon as practicable after the promulgation of a standard based on these recommendations. *Pertinent Medical Records:* These records shall be maintained for at least 30 years after termination of employment. They shall be made available to medical representatives of the government, the employer, or the employee.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green (*small quantities*): General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from sunlight, air, strong acids; oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where indene is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Only regulated when shipped in bulk as a Class 3 combustible liquid, Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Indene is a combustible liquid. Indene may burn, but does not readily ignite. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Indeno(1,2,3-c,d)pyrene is a yellow crystalline solid. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings. Molecular weight = 276.34; Boiling point = 536°C; Freezing/Melting point = 162.5−164°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen. Found in internal combustion engine exhausts; cigarette smoke condensate; soot, coal tar pitch.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene-soluble aerosol); Confirmed Human Carcinogen.

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)
TEEL-0: 0.15 mg/m^3
PAC-1: 0.5 mg/m^3
PAC-2: 3.5 mg/m^3
PAC-3: 15 mg/m^3

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2.

Austria: carcinogen, 1999; France: carcinogen, 1993.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: A drinking water standard for PAH as a class has been developed. The 1970 World Health Organization European Standards for Drinking Water recommends a concentration of PAH not to exceed 0.2 μg/L. This recommended standard is based on the composite analysis of six PAHs in drinking water: fluoranthene, benzo(a)pyrene, benzo(ghi)perylene, benzo (b)fluoranthene, benzo(k)fluoranthene, and indeno(1,2,3-cd)-pyrene. The US EPA addressed PAHs as one of the 65 priority toxic pollutants.[6] They found that there was insufficient data to propose a criterion for the protections of freshwater or of saltwater aquatic life. For the protection of human health, the concentration is preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 0.028 μg/L. Kansas[61] has set a guideline of 0.029 μg/L for drinking water.

Determination in Water: Methylene chloride extraction followed by high-performance liquid chromatography (HPLC); with fluorescence or UV detection; or gas chromatography (EPA Method 610; by gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 6.6.

Routes of Entry: Ingestion, inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Long Term Exposure: May be carcinogenic in humans. Repeated exposure may cause dermatitis, bronchitis. Indeno (1, 2, 3-cd)pyrene is a complete carcinogen and an initiator for skin carcinogenesis in the mouse. Subcutaneous injections in mice produce local sarcomas.

Points of Attack: Respiratory system, skin, bladder, kidneys. Cancer site for coal tar pitch volatiles is lung, kidney, and skin.

Medical Surveillance: Medical surveillance shall be made available, as specified below, to all employees occupationally exposed to coal tar products. *Preplacement Medical Examinations:* These examinations shall include: Comprehensive initial medical and work histories, with special emphasis directed toward identifying preexisting disorders of the skin, respiratory tract, liver, and kidneys.

A physical examination giving particular attention to the oral cavity, skin, and respiratory system. This shall include posteroanterior and lateral chest X-rays (35 cm × 42 cm). Pulmonary function tests, including forced vital capacity (FVC) and forced expiratory volume at 1 s (FEV 1.0); and a sputum cytology examination shall be offered as part of the medical examination of exposed employees. Other tests, such as liver function and urinalysis, should be performed as considered appropriate by the responsible physician. In addition, the mucous membranes of the oral cavity should be examined. A judgment of the employee's ability to use positive-pressure respirators. *Periodic Examinations:* These examinations shall be made available at least annually and shall include: Interim medical and work histories. A physical examination as outlined above. *Initial Medical Examinations:* These examinations shall be made available to all workers as soon as practicable after the promulgation of a standard based on these recommendations. *Pertinent Medical Records:* These records shall be maintained for at least 30 years after termination of employment. They shall be made available to medical representatives of the government, the employer, or the employee.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with IP you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, bulk quantities, may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. IP itself burns only with difficulty. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Indeno(1,2,3-cd)pyrene may be destroyed by permanganate oxidation, by high-temperature incineration with scrubbing equipment, or by microwave plasma treatment. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (all indium compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned (all above CAS numbers).

Description: Indium metal, In, is malleable, ductile, shiny, and softer than lead. May be found as a white or gray powder. The two most important indium compounds are the oxide and sulfate. Indium, elemental unless otherwise specified: Specific gravity = 7.31; Molecular weight = 114.82; 221.17 (chloride); Boiling point = 2075°C; Freezing/Melting point = 157°C. Insoluble in water. Finely divided indium forms hydroxide on contact with water. Indium sulfate is a grayish-white, hygroscopic powder. Soluble in water.

Trichloride

Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1.

Potential Exposure: Compound Description: (chloride) Mutagen; Reproductive Effector. Indium and its compounds are used as a dental alloy; used to make high-quality solders and braze-bonded connectors; in automotive bearings (Europe only); in low-pressure sodium lamps (Europe). Also used in nuclear reactor control rod alloys; catalysts; indium oxide fuel cells; cryogenic gasket material. Indium oxide is used in coloring glass: a light to dark brown can be obtained, depending on the amount used. Indium sulfate is used in electroplating to prepare sulfate electrolytes. Radioisotopes of indium and indium compounds are also used for medical treatment of cancer and diagnostic organ scanning.

Incompatibilities: Not flammable in bulk; however, dust or powdered form may ignite when dispersed in air. Violent reaction with acetonitrile, dinitrogen tetroxide, mercury(II) bromide (at 350°C), sulfur (mixtures ignite when heated). Oxidizes readily at higher temperatures. Keep away from oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA; also applies to other indium compounds [as In].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA.

Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg[In]/m^3, 1999; Finland: TWA 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, 1999; United Kingdom: TWA 0.1 mg[In]/m^3; STEL 0.3 mg[In]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3. Several states have set guidelines or standards for indium in ambient air[60] ranging from zero (Connecticut) to 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Nevada).

Indium chloride

United Kingdom: TWA 0.1 mg [In]/m^3; STEL 0.3 mg [In]/m^3, 2000; the Netherlands: MAC-TGG 0.1 mg [In]/m^3, 2003.

Determination in Air: NIOSH II(5) Method #7303, P&CAM #173; OSHA Analytical Method ID-121.

Determination in Water: Neutron activation has been used to analyze indium in seawater. The detection limit is 0.006 ng/L. Polarography has also been used to determine indium in water with a detection limit of 1.0 μg/L.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Indium can affect you when breathed in. Contact can irritate the skin and eyes. Exposure to high levels may damage the kidneys and liver. Indium can irritate the lungs and may cause permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Possible liver, kidney, heart, blood effects (NIOSH). Indium may damage the developing fetus. May damage the lungs.

Points of Attack: Irritation of eyes, skin, respiratory system; possible liver, kidney, heart, blood effects.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests, complete blood count. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green (metal): General storage may be used. Bulk quantities of indium *powder* are pyrophoric and require a Red Code. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where powder or dust may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from mineral acids and sulfur. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources and nonsparking tools when cleaning up powder and dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Indium itself does not burn, but indium powder and dust is flammable and may ignite when exposed to heat or flame. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Indium and its compounds are rated moderately toxic. Recovered indium has a recycled value, so a minimum quantity is discarded. Closed containers are required for the disposal of indium and its compounds. The environmental hazard from indium appears to result from the use and disposal of radioactive isotopes and not chemical toxicity.

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-186-5

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Indomethacin is a pale yellow to tan crystalline powder. Molecular weight = 357.81; Freezing/Melting point = 155−162°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: This material is used as an anti-inflammatory, antipyretic, analgesic medication.

Incompatibilities: Strong alkalis.

Permissible Exposure Limits in Air

No standards or TEEL available. Material is poisonous.

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is classified as very toxic. Probable oral lethal dose in humans is 50−500 mg/kg or between one teaspoon and one ounce for a 70-kg (150-lb) person. Symptoms of exposure include gastrointestinal complaints (loss of appetite; nausea, abdominal pain; ulcers, diarrhea); dizziness, lightheadedness, mental confusion; severe depression; psychosis, hypersensitivity reactions (e.g., rashes, asthma, urticaria, and so on); ringing in the ears; coma and convulsions. Acute pancreatitis, neutropenia, and thrombocytopenia have also been reported. Persons with renal disease or ulcerative lesions of stomach or intestines are at risk. Pregnant women and nursing mothers should be removed from any possible exposure to this material. Use cautiously for elderly patients.

Long Term Exposure: May cause liver and kidney effects.

Points of Attack: Kidney, liver.

Medical Surveillance: Liver function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis.

Shipping: This may be classified as a medicine, poisons, solid n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire (material itself burns with difficulty). Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide, or dry chemical. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

FDA—over-the-counter drug.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; Class E.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20/21; R50; Safety phrases: S2; S23; S25; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (CAS: 7553-56-2) 3/8/06.

Description: Iodine is a blue-black or violet solid with a sharp, characteristic odor. Molecular weight = 253.80; Specific gravity (H_2O:1) = 4.93; Boiling point = 185°C; Freezing/Melting point = 113.3°C; Vapor pressure = 0.3 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Practically insoluble in water; solubility = 0.01%.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. Iodine is used as a drinking water disinfectant; in the manufacture of organic chemicals, especially pharmaceuticals; as a catalyst in organic reactions. It is used in the manufacture of silver iodide for use in photography.

Incompatibilities: Contact with ammonia forms a shock-sensitive compound which will explode, causing fires. A powerful oxidizer. Violent reaction with reducing agents, combustibles, acetylene, acetaldehyde, antimony, cesium, francium, lithium, potassium, powdered metals, rubidium, phosphorous, sodium, sulfur.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.38 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/1 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.1 ppm/1 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA; 0.1 ppm/1 mg/m^3 STEL.

NIOSH IDLH: 2 ppm.

Protective Action Criteria (PAC)*

Iodine and iodine-125

TEEL-0: 0.01 ppm

PAC-1: **0.1** ppm

PAC-2: **0.5** ppm

PAC-3: **5** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Arab Republic of Egypt: TWA 0.1 ppm (0.1 mg/m^3), 1993; Australia: TWA 0.1 ppm (1 mg/m^3), 1993; Austria: MAK 0.1 ppm (1 mg/m^3), 1999; Belgium: STEL 0.1 ppm (1 mg/m^3), 1993; Denmark: TWA 0.1 ppm (1 mg/m^3), 1999; Finland: STEL 0.1 ppm (1 mg/m^3), [skin], 1999; France: VLE 0.1 ppm (1 mg/m^3), 1999; Japan: 0.1 ppm (1 mg/m^3), 1999; Norway: TWA 0.1 ppm (1 mg/m^3), 1999; the Netherlands: MAC 1 mg/m^3, 2003; the Philippines: TWA 0.1 ppm (1 mg/m^3), 1993; Poland: MAC (TWA) 1 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 1 mg/m^3, [skin], 1993; Sweden: ceiling 0.1 ppm (1 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (1 mg/m^3), KZG-W 0.2 ppm, 1999; Thailand: TWA 0.1 ppm (1 mg/m^3), 1993; Turkey: TWA 0.1 ppm (1 mg/m^3), 1993; United Kingdom: STEL 0.1 ppm (1.1 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.1 ppm. Several states have set guidelines or standards for iodine in ambient air[60] ranging from 8 μg/m^3 (Virginia) to 10 μg/m^3 (North Dakota) to 20 μg/m^3 (New York) to 24 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6005; OSHA Analytical Method ID-212. See also OSHA Analytical Method ID-177.

Permissible Concentration in Water: Maine[61] has set a guideline of 340 μg/L for iodine in drinking water.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.5$.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Iodine irritates the eyes, skin, and respiratory tract. *Note:* Individuals with thyroid, lung, and kidney disease should consult a physician before working with iodine. *Inhalation:* May cause some irritation at a concentration of 0.1 ppm. However, work is difficult at 0.15−0.2 ppm, and impossible at 0.3 ppm. Concentrations of 1 ppm are highly irritating. Iodine vapor can severely irritate eyes, nose, and throat; action of iodine is similar to that of chlorine, but is more irritating to lungs. Leads to tearing, tightness in the chest, sore throat, and headache. Painful cough and difficult breathing may continue for several weeks following severe exposure. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Solid, vapor, or iodine solution can stain, irritate, damage, and penetrate the skin. May produce symptoms similar to those under inhalation. *Eyes:* A concentration of 0.57 ppm for 5 min was reported to cause eye irritation. Irritation was experienced within 2 min at 1.63 ppm. Contact with saturated vapor for 3−4 min caused brown staining and subsequent loss of outer layer of the cornea, followed by complete healing in 2−3 days. *Ingestion:* Small doses of iodine preparations produce salivation, excessive tearing, swelling of eyelids, soreness and swelling of salivary glands, metallic taste, skin rash, fever, and enlarged lymph glands. Larger doses cause severe vomiting, diarrhea, abdominal pain; thirst, shock, fever, total suppression of urine; delirium, stupor, and death. Ingestion of one milliliter (1/30 fluid ounce) of tincture of iodine or 1 g (1/30 ounce) of iodine crystals results in similar symptoms including giddiness, faintness, pallor, rapid and feeble pulse; excitement and convulsions; collapse and unconsciousness. Fatal dose for an adult is about 1/15 ounce. Some individuals may be more susceptible than others.

Long Term Exposure: Prolonged exposure to iodine or compounds leads to iodism and deficiency of thyroid hormone. Since iodine or iodine compounds are potent sensitizers, repeated contact may be followed by rash, swelling of the vocal cords, severe generalized allergic reaction, and joint pain and swelling.

Points of Attack: Eyes, skin, respiratory system; central nervous system; cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). If symptoms develop or overexposure is suspected, the following may be useful: thyroid function tests, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: *Solid:* Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** Saranex™ coated suits. **4 h:** polyethylene gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Liquid:* Avoid skin contact with liquids of >7% content or repeated or prolonged contact with liquids of <7% content. Wear eye protection to prevent any possibility of eye contact with liquids of >7% iodine content. Employees should wash immediately with soap when skin is wet or contaminated with liquids of >7% content. Remove nonimpervious clothing immediately if wet or contaminated with liquids containing >7% and promptly remove if liquid contains <7% iodine. Provide emergency showers and eyewash if liquids containing >7% contaminants are involved.

Respirator Selection: *Up to 1 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 2 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Iodine must be stored to avoid contact with aqueous ammonia, acetylene, acetaldehyde, powdered aluminum, or chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above.

Shipping: Shipping: This material requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.[20,21]

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Extinguish fire using an agent suitable for type of surrounding fire. Iodine itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: React with large volumes of reducing agent (hypo- or bisulfites or ferrous salts) solution, neutralize and flush to sewer with water. Alternatively, iodine may be recovered from various process waste streams.

Iodine monochloride I:0150

Molecular Formula: ClI

Common Formula: ICl

Synonyms: Iodine chloride; Iodochlorine; Protochlorure diode (French); Wijs' chloride

CAS Registry Number: 7790-99-0

RTECS® Number: NN1650000

UN/NA & ERG Number: UN1792/157

EC Number: 232-236-7

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Iodine monochloride is a black crystalline solid or reddish-brown liquid. Molecular weight = 162.38; Boiling point = 97.4°C and decomposes at 100°C; Freezing/Melting point = 27°C (α-form); 14°C (β-form). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3₩. Soluble in water.

Potential Exposure: This material is used as a chemical reagent.

Incompatibilities: A strong oxidizer. Reacts with air, forming iodine pentoxide; heat may cause explosions. Violent reaction with water, steam, and other forms of moisture (forming toxic and corrosive fumes); organic matter; aluminum foil; cadmium sulfide, hydrides, lead sulfide; metal powders, phosphorus, phosphorus trichloride; potassium, reducing agents, rubber, silver sulfide; sodium, zinc sulfide, and other metals. Handle and store under nitrogen.

Permissible Exposure Limits in Air

No TEEL available.

No occupational exposure limits have been established for this iodine compound. This does not mean that this substance is not harmful. Safe work practices should always be followed. However, because this chemical can release iodides and iodine gas, the OSHA permissible exposure limit (PEL) of 0.1 ppm for iodine should not be exceeded at any time.

Determination in Air: Use NIOSH Analytical Method (IV) #6005.

Harmful Effects and Symptoms

Short Term Exposure: Iodine monochloride is a corrosive chemical and exposure can severely irritate, and may burn, the eyes, skin, nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Irritates the lungs. Repeated exposure may cause bronchitis.

Points of Attack: Lungs.

Medical Surveillance: NIOSH lists the following tests for iodine: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as iodine): *Up to 1 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 2 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Yellow Stripe (strong oxidizer): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Should be handled and stored under nitrogen. Iodine monochloride must be stored to avoid contact with aluminum foil, cadmium sulfide, lead sulfide, organic matter, phosphorus, phosphorus trichloride, potassium, rubber, silver sulfide, sodium, zinc sulfide, and other metals, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where iodine monochloride is used, handled, or stored a manner that could create a potential fire or explosion hazard. It also reacts with water or steam, producing toxic and corrosive fumes. If iodine monochloride is heated to decomposition (100°C), it gives off poisonous chlorine and iodine gases, and may explode.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Iodine monochloride may burn, but does not readily ignite. *Do not use water* as poisonous gases are produced. Use dry chemical, CO_2, or foam extinguishers. If iodine monochloride is heated to decomposition (100°C), it gives off poisonous chlorine, hydrogen iodide, and may explode. Containers may explode in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Iodine pentafluoride I:0160

Molecular Formula: F_5I
Common Formula: IF_5
Synonyms: Iodine fluoride; Pentafluoriodine
CAS Registry Number: 7783-66-6
RTECS® Number: NN1770000
UN/NA & ERG Number: UN2495/144
EC Number: 232-019-7

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Iodine pentafluoride is a colorless to yellow liquid. The material gives off pungent, irritating, and toxic fumes when exposed to the air. Molecular weight = 221.90; Boiling point = 104.5°C; Freezing point = 9.4°C. Decomposes violently in water.

Potential Exposure: This material is used as a fluorinating agent and in explosives.

Incompatibilities: A powerful oxidizer. Reacts with almost all organic materials. Violent reaction with benzene, dimethylaminotrimethyl silane, dimethyl sulfoxide; limoline + tetrafluoroethylene; potassium, molten sodium; tetraiodoethylene, potassium hydroxide; calcium carbide; metals, nonmetals (such as boron, silicon, red phosphorus, sulfur, arsenic, antimony, bismuth, molybdenum, and tungsten). Attacks glass. Violent reaction with water or steam.

Permissible Exposure Limits in Air

No TEEL available.

No occupational exposure limits have been established for this iodine compound. This does not mean that this substance is not harmful. Safe work practices should always be followed. However, because this chemical can release iodides and iodine gas, the OSHA permissible exposure limit (PEL) of 0.1 ppm for iodine should not be exceeded at any time.

Determination in Air: Use NIOSH Analytical Method (IV) #6005.

Routes of Entry: Inhalation, skin, and/or eyes.

Harmful Effects and Symptoms

Short Term Exposure: Iodine pentafluoride can affect you when breathed in. Exposure can severely irritate the skin, eyes, nose, throat, bronchial tubes, and lungs. Contact can burn the eyes and skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposures can cause skin rash to develop. Can irritate the lungs; may cause bronchitis.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests for iodine: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: To bind the active fluorides in an insoluble form, to relieve pain and limit burn extension, consider the use of calcium gluconate gel, or a slurry calcium gluconate gel in either water or glycerine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as iodine): *Up to 1 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 2 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Iodine pentafluoride must be stored to avoid contact with water, steam, acids, organic materials (such as paper, wood, and oil); sulfur, phosphorus, silicon, bismuth, tungsten, arsenic, and other metals; benzene and calcium carbide, since violent reactions occur. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 5.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Do not use water* or wet method. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 2.6/4.2

Fire Extinguishing: Iodine pentafluoride gives off highly toxic fluorine and iodine gases when heated, or on contact with acids. It also reacts violently with water or steam and gives off poisonous gases. *Do not use water*. Use dry chemical or soda ash to extinguish fire. Iodine pentafluoride can explode on contact with organic materials such as wood, paper, and oil. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Iodobutane I:0170

Molecular Formula: C_4H_9I

Synonyms: *sec*-Butyl iodide; Butyl iodide; 2-Iodobutane; 2-Jodbutan (German)

CAS Registry Number: 513-48-4

RTECS® Number: EK4410000

UN/NA & ERG Number: UN2390/129

EC Number: 208-163-1

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (gavage); no evidence: mouse, rat.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Iodobutane is a clear to amber liquid. Molecular weight = 184.03; Boiling point = 130.5°C (1-isomer); 117−118°C (2-iodo isomer); Freezing/Melting point = −103.8°C; Flash point = 23°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Drug, Tumorigen, Mutagen. This material is used as an antiseptic, disinfectant on superficial wounds; and in the female reproductive tract; as a laboratory research chemical.

Incompatibilities: Violent reaction with oxidizers. Light sensitive.

Permissible Exposure Limits in Air

As iodides

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA.

No TEEL available.

Safe work practices should always be followed. However, because iodobutane can release iodides and iodine gas, the OSHA permissible exposure limit (PEL) of 0.1 ppm (Ceiling Concentration) for iodine should not be exceeded at any time.

Determination in Air: Use NIOSH Analytical Method (IV) #6005.

Routes of Entry: Inhalation, skin.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, skin, and respiratory tract. High exposure may cause running nose, headache, and irritation of mucous membranes.

Long Term Exposure: There is limited evidence that iodobutane causes cancer in animals; it may cause lung cancer. Prolonged or repeated contact can cause skin rash with the development of pimples, boils, redness, blisters, and black-and-blue spots in severe cases. Repeated exposure to iodides can cause weakness, loss of weight, general depression, and anemia.

Points of Attack: Skin, blood.

Medical Surveillance: NIOSH lists the following tests for iodine: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as iodine): *Up to 1 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 2 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Protect iodobutane from the light. Sources of ignition, such as smoking and open flames, are prohibited where iodobutane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of iodobutane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of iodobutane. Wherever iodobutane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Iodobutane is a flammable liquid. Use dry chemical, CO_2, water spray; or foam extinguishers. Poisonous gases, including iodine and iodides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Iodoform I:0180

Molecular Formula: CHI_3

Synonyms: Methane, triiodo-; NCI-C04568; Triiodomethane

CAS Registry Number: 75-47-8

RTECS® Number: PB7000000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-874-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Iodoform is a bright yellow or greenish-yellow crystalline solid with a disagreeable, pungent odor. The odor threshold is 0.005−1.1 ppm; 0.4 ppb.[NTP] Molecular weight = 393.72; Specific gravity (H_2O:1) = 4.01; Boiling point = (decomposes) 210°C; Freezing/Melting point = 119°C. It is nonflammable. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Practically insoluble in water; solubility 0.1%.

Potential Exposure: Iodoform has been used as a topical anti-infective and in veterinary medicine as an antiseptic and disinfectant for superficial lesions.

Incompatibilities: Reacts violently with strong oxidizers, strong bases, lithium, acetone, balsam, metallic salts (e.g., mercuric oxide, silver nitrate), calomel, tannin. Violent reaction with steam.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 16.10 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.6 ppm/10 mg/m^3 TWA.

ACGIH TLV®[1]: 0.6 ppm/10 mg/m^3 TWA.

No TEEL available.

Australia: TWA 0.6 ppm (10 mg/m^3), 1993; Belgium: TWA 0.6 ppm (10 mg/m^3), 1993; Denmark: TWA 0.2 ppm (3 mg/m^3), 1999; France: VME 0.6 ppm (10 mg/m^3), 1999;

Norway: TWA 0.2 ppm (3 mg/m^3), 1999; Switzerland: MAK-W 0.6 ppm (10 mg/m^3), 1999; United Kingdom: TWA 0.6 ppm (9.8 mg/m^3); STEL 1 ppm, 2000; the Netherlands: MAC-TGG 3 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.6 ppm. Several states have set guidelines or standards for iodoform in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Iodoform can affect you when breathed in and by passing through your skin. Irritates the eyes. A generalized allergic reaction, with fever and rash, sometimes occurs. Exposure to very high levels may cause nervous system effects, such as confusion, irritability, and/or poor muscle coordination. Iodoform may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash. High exposures may damage the liver and kidneys.

Long Term Exposure: Repeated or prolonged contact with skin may cause allergy. May cause liver, kidney, heart damage, visual disturbance.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, heart.

Medical Surveillance: NIOSH lists the following tests for iodine: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). If symptoms develop or overexposure is suspected, the following may be useful: skin testing with dilute iodoform may help diagnose allergy, if done by a qualified allergist. Liver and kidney function tests. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.6 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Iodoform must be stored to avoid contact with lithium and steam, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from mercuric oxide, calomel, silver nitrate, tannin, balsam, and acetone.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including iodine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be

trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Iron I:0190

Molecular Formula: Fe

Synonyms: 3ZhP; Ancor EN 80/150; Armco iron; Carbonyl iron; EFV 250/400; Elemental iron; EO 5A; Ferrovac E; GS 6; Iron carbonyl (FCC); Iron, electrolytic; Iron, elemental; Iron, reduced (FCC); Loha; Iron, soluble salts; NC100; PZh2M; PzhO; Remko; SUY-B 2

CAS Registry Number: 7439-89-6

RTECS® Number: NO4565500

UN/NA & ERG Number: UN1376 (iron oxide, spent)/135; UN3089 (Metal powder, flammable, n.o.s.)/170

EC Number: 231-096-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Iron is a malleable, silver-gray metal or a gray powder. Molecular weight = 55.85; Boiling point = 3000°C; Freezing/Melting point = 1535°C. Ignition temperature of dust cloud = 420°C; Minimum Explosive concentration = 0.10 oz/ft^3.[USBM] Hazard Identification (based on NFPA-704 M Rating System): (*powder*) Health 1, Flammability 3, Reactivity 1. Insoluble in water. Relative explosion hazard of dust: Strong.

Potential Exposure: Iron is alloyed with carbon to produce steel. The addition of other elements (e.g., manganese, silicon, chromium, vanadium, tungsten, molybdenum, titanium, niobium, phosphorus, zirconium, aluminum, copper, cobalt, and nickel) imparts special characteristics to the steel. Occupational exposures occur during mining, transporting, and preparing of ores; and during the production and refining of the metal and alloys. In addition, certain workers may be exposed while using certain iron-containing materials—welders, grinders, polishers, silver finishers, metal workers, and boiler scalers.

Incompatibilities: Dust forms an explosive mixture with air. Ultrafine iron powder is pyrophoric and may be potentially explosive. Violent reaction with strong oxidizers, acetaldehyde (HEAT plus any of the following: ammonium nitrate, bromine pentafluoride, nitryl fluoride, sodium peroxide). Violent reaction with ammonium peroxodisulfate, chloric acid, chlorine trifluoride, chloroform amidinium nitrate, chlorine, dinitrogen tetroxide, hydrogen peroxide, liquid fluorine, peroxyformic acid, potassium perchlorate, potassium dichromate, sodium acetylide.

Permissible Exposure Limits in Air

OSHA PEL: 10 mg[Fe]/m^3 TWA (dust and fume).

ACGIH TLV®[1]: 5 mg[Fe]/m^3 (vapor, dust) TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 75 mg/m^3

NIOSH IDLH: 2500 mg[Fe]/m^3.

DFG MAK: 1.5 mg[Fe]/m^3 respirable fraction.

Arab Republic of Egypt: TWA 3 ppm (5 mg/m^3) (fume), 1993; Australia: TWA 5 mg/m^3 (fume), 1993; Austria: MAK 6 mg/m^3 (*dust*), 1999; Denmark: TWA 3.5 mg[Fe]/m^3, 1999; Finland: TWA 5 ppm (fume), 1999; France: VME 5 mg/m^3 (fume), 1999; the Netherlands: MAC-TGG 5 mg [Fe]/m^3, 2003; MAC-TGG 10 mg/m^3, 2003; Norway: TWA 3 mg/m^3, 1999; the Philippines: TWA 10 mg/m^3 (fume), 1993; Poland: MAC (TWA) (fume) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Sweden: NGV 3.5 mg/m^3 (fume), 1999; Switzerland: MAK-W 6 mg/m^3 (fume), 1999; Thailand: TWA 10 mg/m^3 (fume), 1993; Turkey: TWA 10 mg/m^3 (fume), 1993; United Kingdom: TWA 5 mg[Fe]/m^3; STEL 10 mg[Fe]/m^3, 2000; TWA 10 mg/m^3, rouge, total inhalable dust, 2000; TWA 4 mg/m^3, rouge, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

As iron, soluble salts [as Fe]

NIOSH REL: 1 [Fe]mg/m^3 TWA.

ACGIH TLV®[1]: 1 [Fe]mg/m^3 TWA.

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Elements.

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes and 0.05 mg/L in seawater used for fishery purposes. A standard of 1000 μg/L has been set by Illinois[61] for drinking water; Kansas has set a guideline of 300 μg/L.

Routes of Entry: Inhalation, ingestion, eyes.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Iron dust and fresh iron oxide fumes may cause respiratory irritation and metal fume fever, characterized by metallic taste, dry irritated throat, coughing, shortness of breath, weakness, fatigue, fever, chills, sweating, and pain in the muscles and joints. *Skin:* Hot metal may cause burns and irritation. *Eyes:* Dust may cause irritation and inflammation. *Ingestion:* May cause drowsiness, sluggishness, paleness, increased heart and respiration rates, shock, bloody vomiting, and diarrhea.

Long Term Exposure: Excessive intake of iron compounds may result in increased accumulation of iron in body, especially the liver, spleen, and lymphatic system. Inhalation of dusts may cause mottling of the lung. Benign pneumoconiosis with X-ray shadows indistinguishable from fibrotic pneumoconiosis (siderosis). There is limited evidence of an increase in lung cancer among iron ore miners. Iron oxide's role in this increase is unclear at this time. Prolonged or repeated contact can discolor the eyes, causing permanent iron staining.

Points of Attack: Respiratory system, skin.

Medical Surveillance: NIOSH lists the following tests (iron oxide fume): chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give eggs or milk. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: Gastric lavage is only beneficial if done within 1 h of ingestion. Deferoxamine may be beneficial in reducing systemic levels. Serum iron levels may be useful in determining severity of exposure if measured during acute phase of intoxication. In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing (leather gauntlets, welding masks, steel-toed shoes as needed) to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: To prevent exposure to dusts, wear a dust mask.

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe (*iron powder and chips*): Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials (see above). Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Iron oxide, spent, or iron sponge, spent or obtained from coal gas purification must be labeled "SPONTANEOUSLY COMBUSTIBLE," Hazard Class 4.2, and Packing Group III. For Metal powders, flammable, n.o.s. the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall into Hazard Class 4.2 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Fine iron powder is pyrophoric and potentially explosive. Use special mixtures of dry chemical for metal fires. For large fires use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfilling. Remove metal with an electromagnet and salvage.

Iron dextran I:0200

Molecular Formula: $[C_6H_{10}O_3]_n[Fe(OH)_3]_n$

Synonyms: B 75; Chinofer; Dextran ion complex; Dextrofer 75®; Eisendextran (German); Fe-Dextran; Fenate®; Ferdex 100®; Ferric dextran; Ferridextran; Ferrodextran; Ferroflukin 75; Ferroglucin; Ferroglukin 75; Imferon®; Imposil; Iro-Jex; Iron dextran; Iron dextran injection; Iron hydrogenated dextran; Ironorm injection; Myofer 100®; Polyfer; Prolongal®; Ursoferran®

CAS Registry Number: 9004-66-4; 9061-47-6 (powder)

RTECS® Number: NI2200000

UN/NA & ERG Number: Not regulated.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; California Proposition 65 Chemical: Cancer 1/1/88.

Note: Iron dextrin complex (*CAS: 9004-51-7*) IARC: Animal Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Iron-dextran complex is a sterile, dark-brown colloidal solvent. It is soluble in water. Iron dextran is a complex of ferric hydroxide with dextran. Dextrans are polysaccharides produced by bacterial action on sucrose. Compounds in this group are pharmaceuticals containing some form of iron associated with carbohydrates of varying complexity.

Incompatibilities: Strong oxidizers. Excessive heat; store between 15°C and 20°C.

Potential Exposure: Iron-dextran complex is a parenteral form of medication used in iron-deficiency anemia in humans and baby pigs. The product for human use is a sterile, dark-brown colloidal solution in saline. The products designed for animal use are more concentrated.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Long Term Exposure: Iron dextran is carcinogenic in mice and rats after subcutaneous or intramuscular injection, producing local tumors. There have been case reports of sarcomas associated with injections of iron dextran. The tumors appeared at the probable site of the injections, and the similarity of the local effect in humans and animals was noted. Intramuscular injections of iron dextran can cause severe anaphylactic reactions.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Iron oxide I:0210

Molecular Formula: Fe_2O_3

Synonyms: Anchred standard; Anhydrous iron oxide; Armenian bole; Bauxite residue; Black oxide of iron; Blended red oxides of iron; Burnt island red; Burnt sienna; Burnt umber; Calcotone red; Caput mortuum; C.I.77491; C. I. Pigment red 101 Mortuum; Colloidal ferric oxide; Deanox; English red; Ferric oxide; Ferrugo; Indian red; Iron (III) oxide; Iron oxide red; Iron sesquioxide; Jeweler's rouge; Levanox red 130A; Light red; Manufactured iron oxides; Mars brown; Mars red; Natural iron oxides; Natural red oxide; Ochre; Prussian brown; Raddle; Red iron oxide; Rouge; Rubigo; Sienna; Specular iron; Stone red; Supra; Synthetic iron oxide; Venetian red; Vitrol red; Vogel's iron red; Yellow ferric oxide; Yellow oxide of iron

CAS Registry Number: 1345-25-1; 1309-37-1 *(ferric oxide; diiron trioxide)*; *(alt.)* 8011-97-0; 1317-61-9 *[iron(II,III) oxide; ferrosoferric oxide]*; 1317-60-8 (*hematite*)

RTECS® Number: NO7400000 (III); NO7525000 (fume)

UN/NA & ERG Number: UN1376 (spent); UN3178 (flammable solid, inorganic, n.o.s.)/133

EC Number: 215-721-8 (iron oxide); 215-168-2 (diiron trioxide); 215-275-4 (hematite)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; No Human Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987 (III, dust).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Iron oxide is a reddish-brown powder; Iron(II) oxide is a black solid material. Molecular weight = 159.70 (III and fume); 71.85 (II); Specific gravity (H_2O:1) = 5.24; Freezing/Melting point = 1462°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Iron oxide fumes are produced when iron containing materials are heated very hot, as in arc welding, and are composed of particles too small to see. Used in metallurgy, paint pigments; coloring rubber; polishing compounds; gas purification; in electronic components: permanent magnets, computer memory cores; magnetic tapes. Used as a mordant, laboratory reagent; as a catalyst, feed additive.

Incompatibilities: Keep away from calcium hypochlorite. Contact with hydrogen peroxide, ethylene oxide, and calcium hypochlorite will cause explosions. Reacts violently with powdered aluminum, hydrazine, and hydrogen trisulfide.

Permissible Exposure Limits in Air

Fe_2O_3

OSHA PEL: 10 mg[Fe]/m^3 TWA (fume); Rouge: TWA; 15 mg[Fe]/m^3, total dust: 5 mg[Fe]/m^3, respirable fraction.

ACGIH TLV®[1]: 5 mg[Fe]/m^3 respirable fraction TWA; Rouge: same as F_2O_2; not classifiable as a human carcinogen.

Nuisance particulates; (fume) 10 mg[Fe]/m^3 TWA.

NIOSH IDLH: 2500 mg[Fe]/m^3.

Protective Action Criteria (PAC)

1345-25-1

TEEL-0: 1.5 mg/m^3
PAC-1: 4.5 mg/m^3
PAC-2: 7.5 mg/m^3
PAC-3: 500 mg/m^3

1309-37-1

TEEL-0: 10 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 400 mg/m^3
PAC-3: 500 mg/m^3

DFG MAK (*Fe_2O_3 and FeO*): 1.5 mg[Fe]/m^3, respirable fraction; 4 mg[Fe]/m^3 (fume; inhalable fraction).

Arab Republic of Egypt: TWA 3 ppm (5 mg/m^3) (fume), 1993; Australia: TWA 5 mg/m^3 (fume), 1993; Austria: MAK 6 mg/m^3 (*dust*), 1999; Denmark: TWA 3.5 mg[Fe]/m^3, 1999; Finland: TWA 5 ppm (fume), 1999; France: VME 5 mg/m^3 (fume), 1999; the Netherlands: MAC-TGG 5 mg[Fe]/m^3, 2003; MAC-TGG 10 mg/m^3, 2003; Norway: TWA 3 mg/m^3, 1999; the Philippines: TWA 10 mg/m^3 (fume), 1993; Poland: MAC (TWA) (fume) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Sweden: NGV 3.5 mg/m^3 (fume), 1999; Switzerland: MAK-W 6 mg/m^3) (fume), 1999; Thailand: TWA 10 mg/m^3 (fume), 1993; Turkey: TWA 10 mg/m^3 (fume), 1993; United

Kingdom: TWA 5 mg[Fe]/m^3; STEL 10 mg[Fe]/m^3, 2000; TWA 10 mg/m^3, rouge, total inhalable dust, 2000; TWA 4 mg/m^3, rouge, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for iron oxide fume in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μm g/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Filter; Acid; Inductively coupled plasma (ICP); NIOSH Analytical Method (IV) #7300, Elements. See also OSHA Analytical Methods ID-121 and ID-125G.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Iron oxide fume can affect you when breathed in. Exposure can cause metal fume fever. This is a flu-like illness with symptoms of metallic taste, fever and chills, aches, chest tightness, and cough.

Long Term Exposure: Prolonged or repeated contact can cause permanent iron staining of the eyes. Repeated exposure to iron oxide fume can cause changes on the chest X-ray. Benign pneumoconiosis with X-ray shadows indistinguishable from fibrotic pneumoconiosis (siderosis).

Points of Attack: Respiratory system.

Medical Surveillance: NIOSH lists the following tests (iron oxide fume): chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); urine (chemical/metabolite). Sometimes, iron-containing metals also contain metals which scar or damage the lungs, such as cobalt, nickel, cadmium, or chromium. See also NIOSH #8310, Metals in Urine; NIOSH Profile (Welding and Brazing).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *125 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *2500 mg/m^3*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe (*iron powder and chips*): Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Iron oxide fume must be stored to avoid contact with calcium hypochlorite, aluminum, ethylene oxide, and hydrazine, since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Iron oxide requires a shipping label of "FLAMMABLE SOLID." Based on this description, it would fall in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered

material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a noncombustible solid. Use extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Iron pentacarbonyl is a highly flammable colorless to yellow to dark-red viscous liquid. Molecular weight = 195.90; Specific gravity (H_2O:1) = 1.46−1.52; Boiling point = 102.8°C at 749 mmHg; Freezing/Melting point = −25°C; Freezing/Melting point = −21°C; Vapor pressure = 40 mmHg at 30°C; Flash point = −15°C (cc); Autoignition temperature = 50°C; Explosive limits: LEL = 3.7%; UEL = 12.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Organometallic. Iron carbonyl is used as a catalyst in organic reactions; to make carbonyl iron, which is used in high-frequency coils for the radio and television industry; and as an antiknock agent in motor fuels; to make finely divided iron.

Incompatibilities: May explode on heating. Pyrophoric; ignites spontaneously on contact with air. Iron pentacarbonyl is decomposed by heat, light, producing toxic gases, including iron oxides and carbon monoxide. The substance is a strong reducing agent and reacts violently with oxidizers, nitrogen oxide, acetic acid, strong bases, water, amines, halogens, hydrogen, carbon tetrachloride, phosgene, mercaptans, transition metal halides (zinc + cobalt halides). Store under nitrogen.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 ppm[Fe]/0.23 mg/m^3 TWA; 0.2 ppm/0.45 mg/m^3 [Fe] STEL.

ACGIH TLV®[1]: 0.1 ppm/0.23 mg/m^3 TWA; 0.2 ppm/0.45 mg/m^3 STEL.

Protective Action Criteria (PAC)*

TEEL-0: 0.06 ppm

PAC-1: 0.06 ppm

PAC-2: **0.060** ppm

PAC-3: **0.18** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.1 ppm/0.81 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Australia: TWA 0.1 ppm (0.8 mg/m^3); STEL 0.2 ppm, 1993; Austria: MAK 0.1 ppm (0.8 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.23 mg/m^3); STEL 0.2 ppm, 1993; Denmark: TWA 0.1 ppm (0.8 mg/m^3), 1999; Finland: STEL 0.01 ppm (0.08 mg/m^3), 1999; France: VME 0.1 ppm (0.8 mg/m^3), 1999; the Netherlands: MAC-TGG 0.08 mg/m^3, 2003; Russia: STEL 0.1 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.1 ppm (0.8 mg/m^3), KZG-W 0.2 ppm, 1999; United Kingdom: TWA 0.01 ppm (0.08 mg [Fe]/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.2 [Fe]ppm. Several states have set guidelines or standards for iron pentacarbonyl in ambient air[60] ranging from 8−16 μg/m^3 (North Dakota) to 13 μg/m^3 (Virginia) to 16 μg/m^3 (Connecticut) to 19 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Iron pentacarbonyl can irritate the respiratory tract causing cough and/or shortness of breath. Inhalation may result in dizziness, nausea, and vomiting; if exposure continues, unconsciousness will follow. Twelve to twenty-four hours later, fever, cough, and shortness of breath may follow. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Contact can cause irritation of the skin. Toxicity of this compound is high via all routes of entry. Cyanosis (bluish discoloration of skin) and circulatory collapse may occur after exposure. Death may result. Pneumonitis and injury to the kidneys, liver, and central nervous system may also occur.

Long Term Exposure: Iron pentacarbonyl can cause lung irritation and bronchitis may develop. Repeated exposures can damage the liver, lungs, and brain.

Points of Attack: Eyes, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Consider chest X-ray after acute overexposure. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 0.1 ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where iron pentacarbonyl may be present, check to make sure that an explosive concentration does not exist. Store under nitrogen. Iron pentacarbonyl must be stored to avoid contact with water, since violent reactions occur. Store away from contact with light and air, oxidizers, and other incompatible materials listed above. Iron pentacarbonyl should be handled in an automatic mechanized fashion at all times. Containers should be flushed with nitrogen before opening. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Do not breathe vapors. Shut off or remove ignition sources in hazard area. Do not touch spilled material. Stop leak if this can be done without risk. Use water spray to reduce vapors. Take up *small spills* with sand or other noncombustible absorbent material and place into containers for later disposal. Dike far ahead of *large spills* for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (*from a small package or a small leak from a large package*)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.9/3.1

Large spills (*from a large package or from many small packages*)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 3.5/5.5
Night 5.5/8.9

Fire Extinguishing: This chemical is a flammable liquid and can ignite in air. Poisonous gases, including carbon monoxide, are produced in fire. This material is incompatible with water. Use dry chemical, carbon dioxide, water spray, or foam for small fires. Specially trained personnel operating from a safe distance can fight large fires using dry chemical or foam. Move material from fire area if this can be done without risk. Dike fire control water for later disposal. Isolate hazard area and deny entry. Stay upwind and keep out of low areas. Isolate area in all directions if tank car or truck is involved in fire. See isolation distances above. Wear positive pressure breathing apparatus and special protective clothing. Cool containers exposed to flames with water until fire is out. This material presents a vapor explosion and poison hazard indoors, outdoors, or in sewers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 204-662-3 [*Annex I Index No.*: 607-130-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

TSCA: 40CFR712.(e)10; 40CFR716.120(d)10.

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

European/International Regulations: Hazard Symbol: None listed; Risk phrases: R10; R66; Safety phrases: S2; S23; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isoamyl acetate is a clear, colorless liquid with a banana-like odor. Odor threshold = 0.22 ppm. Molecular weight = 130.21; Specific gravity (H_2O:1) = 0.87; Boiling point = 142.2°C; Freezing/Melting point = −78.3°C; Vapor pressure = 4 mmHg at 20°C; Flash point = 25°C; Autoignition temperature = 360°C. Flammability limits: LEL = 1.0% at 100°C; UEL = 9.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a solvent in making lacquers, paints, perfumes, artificial fruit flavorings, smokeless powder, airplane "dopes," dry cleaning compounds.

Incompatibilities: Forms explosive mixture with air. Strong alkalis, strong acids, nitrates, oxidizers. Violent reaction with reducing agents. Attacks asbestos; softens and dissolves many plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/525 mg/m^3 TWA.

NIOSH REL: 100 ppm/525 mg/m^3 TWA.

ACGIH TLV®[1]: (*all isomers of amyl acetates*) 50 ppm/266 mg/m^3 TWA; 100 ppm/532 mg/m^3 STEL.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 100 ppm

PAC-2: 200 ppm

PAC-3: 1000 ppm

DFG MAK: 50 ppm/270 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

Australia: TWA 100 ppm (525 mg/m^3), 1993; Belgium: TWA 100 ppm (532 mg/m^3), 1993; Denmark: TWA 100 ppm (525 mg/m^3), 1999; France: VME 100 ppm (525 mg/m^3), 1999; Japan: 100 ppm (530 mg/m^3), 1999; Norway: TWA 50 ppm (260 mg/m^3), 1999; the Philippines: TWA 100 ppm (525 mg/m^3), 1993; Russia: TWA 100 ppm, 1993; Switzerland: MAK-W 50 ppm (270 mg/m^3), [skin], 1999; United Kingdom: LTEL 100 ppm (525 mg/m^3); STEL 125 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 100 ppm.

Determination in Air: Use NIOSH Analytical Method (IV) #1450, Esters I; OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure to high concentrations of vapors can cause headache, drowsiness, dizziness, lightheadedness, fatigue, and unconsciousness.

Long Term Exposure: Prolonged contact can cause skin drying and cracking. Can irritate the lungs with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Lung function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Move to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1000 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD, PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Amyl acetates must be labeled "FLAMMABLE LIQUID." They fall in Hazard Class 3 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isoamyl alcohols I:0240

Molecular Formula: $C_5H_{12}O$

Common Formula: $(CH_3)_2CHCH_2CH_2OH$

Synonyms: *primary:* Alcool isoamylique (French); Fermentation amyl alcohol; Fusel oil; Isoamyl alcohol (primary); Isoamyol; Isobutyl carbinol; Isopentyl alcohol; 3-Methyl-1-butanol; 3-Methyl-1-butanol; Potato spirit oil; Primary isoamyl alcohol

secondary: Isoamyl alcohol (*sec-*); 2-Methyl-3-butanol; Secondary isoamyl alcohol

CAS Registry Number: 123-51-3 (*primary-*); 6032-29-7 (*secondary-*); 137-32-6 (*active primary-*); 8013-75-0 (mixture of isoamyl alcohols)

RTECS® Number: EL5425000

UN/NA & ERG Number: UN1105/129

EC Number: 232-395-2 (CAS: 8013-75-0); 204-633-5 (3-methylbutan-1-ol); 227-907-6 (pentan-2-ol); 205-289-9 [*Annex I Index No.:* 603-006-00-7] (2-methylbutan-1-ol)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*primary*).

Description: Isoamyl alcohol is a colorless liquid. It has a disagreeable odor which causes coughing. Molecular weight = 88.17 (*primary- and secondary-*); Specific gravity (H_2O:1) = 0.81 at 13.9°C; Boiling point = 132°C (primary); 112.2°C (secondary); Freezing/Melting point = −117.2°C (*primary-*); Vapor pressure = 28 mmHg (*primary-*); 1 mmHg (*secondary-*); Flash point = 43°C (cc); 55°C (oc) (*primary-*); 35°C (*secondary-*); Autoignition temperature = 350°C. Explosive limits: LEL (*primary-*) = 1.2% at 100°C; UEL (*primary-*) = 9.0% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 2% at 13.9°C.

Potential Exposure: Compound Description: (*primary-*) Tumorigen, Human Data; Primary Irritant; (*secondary-* and *active primary-*) Primary Irritant. Amyl alcohols are used in the manufacture of lacquers, paints, varnishes, paint removers; shoe cements; perfumes, pharmaceuticals, chemicals, rubber, plastics, fruit essences; explosives, hydraulic fluids; ore flotation agents; in the preparation of other amyl derivatives; in the extraction of fats; and in the textile and petroleum refining industries.

Incompatibilities: Isoamyl alcohol forms explosive mixture with air. Violent reaction with strong oxidizers, reducing agents, hydrogen trisulfide, causing explosion hazard. Not compatible with acid anhydrides, acid chlorides. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

primary- and secondary-

Conversion factor: 1 ppm = 3.61 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/360 mg/m^3.

NIOSH REL: 100 ppm/360 mg/m^3 TWA; 125 ppm/450 mg/m^3 STEL.

ACGIH TLV®[1] (*primary-*): 100 ppm/361 mg/m^3 TWA; 125 ppm/452 mg/m^3 STEL.

NIOSH IDLH: 500 ppm (*primary- and secondary-*).

Protective Action Criteria (PAC)

primary-

TEEL-0: 100 ppm

PAC-1: 125 ppm

PAC-2: 125 ppm

PAC-3: 500 ppm

secondary-6032-29-7

TEEL-0: 20 ppm

PAC-1: 20 ppm

PAC-2: 100 ppm
PAC-3: 500 ppm
DFG MAK (primary): 20 ppm/73 mg/m^3 TWA; Peak Limitation Category II(4); Pregnancy Risk Group C.

Australia: TWA 100 ppm (360 mg/m^3); STEL 125 ppm, 1993; Austria: MAK 100 ppm (360 mg/m^3), 1999; Belgium: TWA 100 ppm (361 mg/m^3); STEL 125 ppm (452 mg/m^3), 1993; Denmark: TWA 100 ppm (360 mg/m^3), 1999; France: VME 100 ppm (360 mg/m^3), 1999; Japan: 100 ppm (360 mg/m^3), 1999; the Netherlands: MAC-TGG 360 mg/m^3, 2003; the Philippines: TWA 100 ppm (360 mg/m^3), 1993; Russia: TWA 100 ppm; STEL 5 mg/m^3, 1993; Switzerland: MAK-W 100 ppm (360 mg/m^3), KZG-W 200 ppm (720 mg/m^3), 1999; Turkey: TWA 100 ppm (360 mg/m^3), 1993; United Kingdom: TWA 100 ppm (366 mg/m^3); STEL 125 ppm (458 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 125 ppm. Several states have set guidelines or standards for isoamyl alcohol in ambient air[60] ranging from 3.6–4.5 mg/m^3 (North Dakota) to 7.2 mg/m^3 (Connecticut, Florida and New York) to 8.571 mg/m^3 (Nevada).

secondary-

Denmark: TWA 100 ppm (360 mg/m^3), 1999; Norway: TWA 50 ppm (180 mg/m^3), 1999; Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 450 mg/m^3, 1993.

Determination in Air: Use NIOSH Analytical Method (IV) s (*primary- and secondary-*) #1402, for Alcohols III; (*primary-*) #1405 for Alcohols Combined.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient level goal for all primary pentanols of 5000 μg/L, based on health effects.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.42 (*primary-*).

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. If ingested, may affect the central nervous system. Isoamyl alcohol can affect you when breathed in and by passing through your skin. Contact can cause severe burns of the eyes, leading to permanent damage. It can irritate the nose and throat. Higher levels may irritate the lungs, causing coughing and/or shortness of breath. Higher exposure can cause dizziness, lightheadedness, headache, cough, dyspnea (breathing difficulty), nausea, vomiting, diarrhea, narcosis, unconsciousness, and death.

Long Term Exposure: Repeated or prolonged exposure to isoamyl alcohol can cause drying and cracking of the skin. May cause liver damage. Isoamyl alcohol can irritate the lungs and may cause bronchitis.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, liver function tests.

First Aid: If isoamyl alcohol gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** butyl rubber gloves, suits, boots; Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where Isoamyl alcohol may be present, check to make sure that an explosive concentration does not exist. Isoamyl alcohol must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where isoamyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Amyl alcohols require a shipping label of "FLAMMABLE LIQUID." They fall in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is flammable. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

Very Toxic Substance (World Bank).[15]

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (454/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isobenzan is a white to light brown crystalline powder. Molecular weight = 411.73; Freezing/Melting point = 121.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, or application of this insecticide.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 2 mg/m^3

Routes of Entry: Inhalation, ingestion, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This material is highly toxic. It is absorbed by the skin as well as by the respiratory and gastrointestinal tracts. Symptoms may last for a long time because the material is eliminated slowly; its half-life in human blood is 2.77 years. Symptoms of exposure include headache, dizziness, drowsiness, irritability, and numbness of the legs. Convulsions may occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Use positive pressure, pressure-demand, full face-piece self-contained breathing apparatus or pressure-demand supplied-air respirator with escape SCBA and fully encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus (SCBA) with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This material falls under organochlorine pesticides, solid, toxic, n.o.s. This class of compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep upwind. Avoid bodily contact with the material. Keep unnecessary people away; isolate hazard area and deny entry. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use agent suitable for type of surrounding fire. Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide, or dry chemical. Avoid breathing dusts and fumes from burning material. Keep upwind. Avoid bodily contact with the material. Wear full protective clothing including boots, protective gloves, goggles; and wear self-contained breathing apparatus. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

US Environmental Protection Agency. (November 30, 1987). *Chemical Hazard Information Profile: Isobenzan.* Washington, DC: Chemical Emergency Preparedness Program

Isobutane I:0260

Molecular Formula: C_4H_{10}
Common Formula: $(CH_3)_3CH$
Synonyms: 1,1-Dimethylethane; Isobutano (Spanish); LPG; 2-Methylpropane; Propane, 2-methyl; Trimethylmethane
CAS Registry Number: 75-28-5
RTECS® Number: TZ4300000

UN/NA & ERG Number: UN1969/115; UN1075 (Petroleum gases, liquefied or Liquefied petroleum gas)/115

EC Number: 200-857-2 [*Annex I Index No.:* 601-004-00-0]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16.

Description: Isobutane is a colorless gas with a gasoline-like or natural gas odor. Shipped as a liquefied compressed gas. Molecular weight = 58.14; Specific gravity (H_2O:1) = 0.6 (liquid); Boiling point = −12°C; Freezing/Melting point = 159.4°C; Relative vapor density (air = 1) = 2.06; Vapor pressure = 3.1 atm; Flash point = Flammable gas (−60°C); Autoignition temperature = 460°C. Explosive limits: LEL = 1.8%; UEL = 8.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Practically insoluble in water.

Potential Exposure: It is used as a refrigerant, fuel, and aerosol propellant.

Incompatibilities: Forms explosive gas mixture with air. Strong oxidizers (e.g., nitrates, perchlorates, chlorine, fluorine) and nickel carbonyl + oxygen may cause fire and explosions. Reacts with acetylene, halogens, and nitrous oxides. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.38 mg/m^3 at 25°C & 1 atm.

Large amounts of isobutane will decrease the amount of available oxygen. Before entering a confined space, oxygen content should be tested to ensure that it is at least 19% by volume.

OSHA PEL: None.

NIOSH REL: 800 ppm/1900 mg/m^3 TWA.

ACGIH TLV®[1]: 800 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 800 ppm

PAC-1: 2400 ppm

PAC-2: 4000 ppm

PAC-3: 15,000 ppm

DFG MAK: 1000 ppm (2400 mg/m^3) (isobutane and butane isomers).

Austria: MAK 800 ppm (1900 mg/m^3), 1999; Switzerland: MAK-W 800 ppm (1900 mg/m^3), 1999; United Kingdom: LTEL 600 ppm (1430 mg/m^3); STEL 750 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 800 ppm.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.78.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Isobutane can affect you when breathed in. Isobutane vapor may irritate and burn the eyes. Contact with the liquid can cause frostbite. Exposure to very high amounts can cause dizziness, lightheadedness, irregular heartbeat, and unconsciousness. With extremely high levels, death can occur from lack of oxygen.

Long Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking.

Points of Attack: Central nervous system, skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Prevent possible skin freezing from direct liquid contact. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to isobutane is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where isobutane may be present, check to make sure that an explosive concentration does not exist. Isobutane cylinders should be stored in a cool, well-ventilated dry area of noncombustible construction. Protect containers against physical damage. Store away from sources of heat or ignition and from oxygen, chlorine, and other oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where isobutane is handled, used, or stored. Ground and bond all lines and equipment used with isobutane. Wherever isobutane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep isobutane out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Isobutane is a flammable gas or liquid. Stop the flow of gas if it can be done safely. Use dry chemical or CO_2 extinguishers. Use water to keep fire-exposed containers cool. Poisonous gases, including carbon monoxide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

New Jersey Department of Health and Senior Services. (March 1999). *Hazardous Substances Fact Sheet: Isobutane*. Trenton, NJ

Isobutyl acrylate I:0270

Molecular Formula: $C_7H_{12}O_2$

Common Formula: $CH_2{=}CHCOOCH_2CH(CH_3)_2$

Synonyms: Acrylic acid isobutyl ester; Isobutyl 2-propenoate; Isobutyl propenoate; 2-Methylpropyl acrylate; 2-Propenoic acid 2-methylpropyl ester

CAS Registry Number: 106-63-8

RTECS® Number: AT2100000

UN/NA & ERG Number: UN2527/129

EC Number: 203-417-8 [*Annex I Index No.:* 607-115-00-0]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20/21; R38; R43; Safety phrases: S2; S9; S24; S37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Isobutyl acrylate is a clear, colorless liquid. Molecular weight = 128.19; Boiling point = 138°C (61−63°C at 15 mm); Flash point = 30°C; Autoignition temperature = 427°C. Explosive limits: LEL = 1.9%; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 4, Reactivity 1. Slightly soluble in water.

Potential Exposure: This material is used as a monomer for acrylate resins.

Incompatibilities: Forms explosive mixture with air. Heat and contamination may cause polymerization. Reacts with strong acids, aliphatic amines, alkanolamines.

Permissible Exposure Limits in Air

No standards or TEEL available for isobutyl acrylate. See *n*-butyl acrylate 141-32-2.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to skin, eyes, nose, and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Moderately toxic when swallowed. LD_{50} = (oral-rat) 7070 mg/kg (insignificantly toxic). Contact with the eyes causes minor irritation no worse than that produced by hand soap.

Long Term Exposure: Can irritate the lungs. May cause bronchitis to develop.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where isobutyl acrylate may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof cool area. Protect from air and light for long-term storage. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorbent may be used to consolidate spills on land (such as sorbent polyurethane foams). Oil skimming equipment may be used for spills on water. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray into incinerator. Flammable solvent may be added.

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq 1.00\%$ concentration).

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); equivocal evidence: rat; no evidence: mouse.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

US EPA Hazardous Waste Number (RCRA No.): D001.

European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S19; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Isobutylene, an aliphatic hydrocarbon, is a colorless gas, or liquid under pressure, with a sweet, gasoline odor. Molecular weight = 56.12; Specific gravity (H_2O:1) = 0.588; Boiling point = −7°C. Freezing point = −140°C; Relative vapor density (air = 1) = 1.94; Vapor pressure = 3278 mmHg at 37.7°C; Flash point = −76°C (cc); Autoignition temperature = 465°C. Explosive Limits: LEL = 1.8%; UEL = 9.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 1. Practically insoluble in water.

Potential Exposure: Used in the production of aviation gasoline, butyl rubbers; resins, other intermediates and chemicals; making antioxidants for food, packaging, and plastics.

Incompatibilities: Flammable gas; forms explosive mixture with air. Polymerizes easily. Violent reaction with strong oxidizers, strong acids, hydrogen bromide, nitrogen oxides, and with numerous other materials. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 250 ppm

PAC-1: 750 ppm

PAC-2: 1250 ppm

PAC-3: 100,000 ppm

Russia: STEL 100 mg/m^3, 1993.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.4.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Contact with the liquid can cause frostbite. Can cause headache, dizziness, lightheadedness, and fatigue. Higher levels can cause coma and death.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; *do not* rub the affected areas or flush them with water. In order to prevent further tissue damage, *do not* attempt to remove frozen clothing from frostbitten areas. If frostbite has *not* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact-resistant goggles when working with gas. Wear splash-proof chemical goggles and face shield when working with liquids unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with Isobutylene you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Where possible, automatically pump isobutylene from cylinders or from other storage containers to process containers. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Isobutylene requires a shipping label of “FLAMMABLE GAS.” It falls in Hazard Class 2.1.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isobutyl isocyanate I:0290

Molecular Formula: C_5H_9NO
Synonyms: 1-Isocyanato-2-methyl propane
CAS Registry Number: 1873-29-6
RTECS® Number: NQ9208000
UN/NA & ERG Number: UN2486/155
EC Number: 217-495-6

Regulatory Authority and Advisory Bodies

US DOT Inhalation Hazard Chemicals.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isobutyl isocyanate is a highly flammable, colorless liquid with a pungent odor; Flash point = <23°C. Soluble in water; reactive.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Reacts with water. Oxidizers can cause a fire and explosion hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Isocyanate-bearing waste (as CNs, n.o.s.)

TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Isobutyl isocyanate can affect you when breathed in and by passing through your skin. Little is known about the health effects of isobutyl isocyanate. However, similar chemicals can irritate the eyes, skin, nose, throat, and lungs.

Long Term Exposure: Many isocyanates cause an asthma-like lung allergy. It is not known for sure if isobutyl isocyanate does.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if the person is not having an attack at the time of the test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/

clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to isobutyl isocyanate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where isobutyl isocyanate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of isobutyl isocyanate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tool and equipment, especially when opening and closing containers of isobutyl isocyanate.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II. A plus symbol (+) indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (*from a small package or a small leak from a large package*)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.1/1.8

Large spills (*from a large package or from many small packages*)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 3.0
Night 4.6

Fire Extinguishing: Isobutyl isocyanate is a flammable liquid. Poisonous gas is produced in fire. Containers may explode in fire. Use dry chemical, CO_2, or foam extinguishers. *Do not use water*. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isobutyraldehyde I:0300

Molecular Formula: C_4H_8O

Common Formula: $(CH_3)_2CHCHO$

Synonyms: Isobutaldehyde; Isobutanal; Isobutiraldehido (Spanish); Isobutyl aldehyde (DOT); Isobutyral; Isobutyric aldehyde; Isobutyryl aldehyde; Isopropyl aldehyde; Isopropylformaldehyde; 2-Methyl-1-propanal; 2-Methylpropanal; Methylpropanal; α-Methylpropionaldehyde; 2-Methylpropionaldehyde; NCI-C60968; Propanal, 2-methyl-; Valine aldehyde

CAS Registry Number: 78-84-2

RTECS® Number: NQ4025000

UN/NA & ERG Number: UN2045/130

EC Number: 201-149-6

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); no evidence: mouse, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isobutyraldehyde is a colorless liquid with a pungent odor. The odor threshold is 0.05 ppm. Molecular weight = 72./12; Specific gravity (H_2O:1) = 0.8; Boiling point = 61°C; Freezing/Melting point = − 65°C; Flash point = −18°C; Autoignition temperature = 196°C. Explosive limits: LEL = 1.6%; UEL = 10.6%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water; solubility = 7% at 20°C.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Primary Irritant. Isobutyraldehyde is used in the organic synthesis of pantothenic acid, valine, leucine, and cellulose ester; in making gasoline additives, perfumes, flavors, and plasticizers.

Incompatibilities: Forms explosive gas mixture with air. Incompatible with strong acids, caustics, reducing agents, aliphatic amines, alkanolamines, aromatic amines, strong oxidizers.

Permissible Exposure Limits in Air

AIHA WEEL: 25 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 25 ppm

PAC-1: 300 ppm

PAC-2: 1500 ppm

PAC-3: 1500 ppm

Poland: MAC (TWA) 100 mg/m^3, 1999; Russia: STEL 5 mg/m^3, [skin], 1993.

Determination in Air: Use NIOSH Analytical Method #2539, aldehydes, screening.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.2.

Routes of Entry: Skin absorption, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Isobutyraldehyde can affect you when breathed in and by passing through your skin. Corrosive to the eyes, skin, and respiratory tract. High levels can irritate the lungs. High levels can cause you to feel dizzy, lightheaded, and to pass out. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Corrosive on ingestion. Exposure may result in death.

Long Term Exposure: Can irritate the lungs and may cause bronchitis to develop. Repeated exposure can cause skin dryness, itching, and rash.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to isobutyraldehyde, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where isobutyraldehyde is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of isobutyraldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isobutyraldehyde. Wherever isobutyraldehyde is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 201-195-7 [*Annex I Index No.:* 607-063-00-9]

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below), as isomer of butyric acid.

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isobutyric acid is a colorless liquid with a sharp odor of rancid butter fat; Freezing/Melting point = −47°C. Molecular weight = 88.12; Boiling point = 152°C; Flash point = 56°C (oc); Autoignition temperature = 481.6°C. Flammability limits: LEL = 2.0%; UEL = 9.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Isobutyric acid is used to make solvents, flavors, perfumes, varnishes, disinfectants; in tanning; in nonalcoholic beverages and processed foods.

Incompatibilities: Forms explosive mixture with air. Aqueous solution forms a medium strong acid. Incompatible with oxidizers, sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides, epichlorohydrin. Attacks aluminum and other metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.3 ppm

PAC-1: 1 ppm

PAC-2: 6 ppm

PAC-3: 35 ppm

This chemical can be absorbed through the skin, thereby increasing exposure. For butyric acid the former USSR-UNEP/IRPTC joint project MAC value is 2.5 ppm (10 mg/m^3)[43] for work-place air. They also cite a momentary MAC value of 0.015 mg/m^3 and an allowable average daily MAC of 0.01 mg/m^3 in ambient air of residential areas.

Determination in Air: No method available.

Permissible Concentration in Water: Designated a hazardous substance and regulated under section 311 of the Federal Water Pollution Control Act and the Clean Water Act Amendments. See reportable quantity above, for discharges of this substance.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Can cause severe eye and skin irritation and burns leading to permanent damage. Inhalation can cause respiratory tract irritation, coughing, wheezing, and/or shortness of breath. Ingestion is poisonous and causes irritation of mouth and stomach; between 1 teaspoonful and 1 ounce may be fatal. The LD_{50} is 280 mg/kg (oral, rat).

Long Term Exposure: May affect the blood. Repeated exposures may cause bronchitis to develop with coughing, phlegm, and/or shortness of breath. May cause kidney damage.

Points of Attack: Kidneys, lungs, blood.

Medical Surveillance: Kidney function tests, complete blood count (CBC), lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, heat, food, and water. Where possible, automatically pump liquid from drums or other storage containers to process containers. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored.

Shipping: Isobutyric acid requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 20,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 20,000 lb (9080 kg).

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Isobutyronitrile is a colorless liquid. Molecular weight = 69.12; Boiling point = 101°C; Freezing/Melting point = −65°C; Flash point = 8°C; Autoignition temperature = 482°C. Explosive limits: LEL = 1.6%; UEL = 10.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Isobutyronitrile is used in organic synthesis, as an intermediate for insecticides, and as a gasoline additive.

Incompatibilities: Reacts with oxidants, strong reductants, and strong bases.

Permissible Exposure Limits in Air

NIOSH REL: 8 ppm/22 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 8 ppm

PAC-1: **10** ppm

PAC-2: **18** mg/m^3

PAC-3: **68** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Determination in Air: See NIOSH Criteria Document 212 *Nitriles*.

Harmful Effects and Symptoms

Short Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Corrosive on ingestion. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Lacrimation (tearing) and burning sensation of the mouth and throat are common. Signs and symptoms of acute exposure to isobutyronitrile may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red (and potentially bloody) mucous membranes, cardiac arrhythmias, and other cardiac abnormalities are common. Cyanosis (blue tint to skin and mucous membranes) may also be found. Tachypnea (rapid respiratory rate) may be followed by respiratory depression. Lung hemorrhage may occur. Headache, vertigo (dizziness), agitation, giddiness, salivation, nausea, and vomiting may be followed by combative behavior, convulsions, and coma. *Warning:* Heart palpitation may occur within minutes after exposure. High doses can stop breathing. Vital signs should be monitored closely. Caution is advised.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, immediately begin administering 100% oxygen to all victims. Monitor victims for respiratory distress and remove from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, evaluate vital signs and proceed as earlier in this section. Rush to a health-care facility. Do not induce vomiting or attempt to neutralize. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **4 h:** Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Isobutyronitrile requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Keep sparks, flames, and other sources of ignition away. Establish forced ventilation to keep levels below explosive limit. Build dikes to control flow as necessary. Attempt to stop leak if this can be done without hazard. Use water spray to disperse vapors and dilute standing pools of liquid. Avoid breathing vapors. Keep upwind. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Wear positive pressure breathing apparatus and special protective clothing. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish with dry chemical, carbon dioxide, water spray, foam, or fog. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Isolate for 1/2 mile in all directions if tank car or truck is involved in fire. Move container from fire area if you can do so without risk. Dike fire control water for later disposal; do not scatter the material. Toxic oxides of nitrogen are produced during combustion. It is a flammable/combustible material and may be ignited by heat, sparks, or flames. Vapor explosion and poison hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isocyanatobenzotrifluoride I:0330

Molecular Formula: $C_8H_4F_3NO$

Common Formula: $C_6H_4(CF_3)NCO$

Synonyms: Benzene, isocyanato(trifluoromethyl)-; Isocyanato trifluoromethyl benzene; Trifluoromethylphenyl isocyanate

CAS Registry Number: 71121-36-3

RTECS® Number: NR0200500

UN/NA & ERG Number: UN2285/156 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isocyanatobenzotrifluoride is a highly flammable liquid. May react with water.

Incompatibilities: Reacts with oxidants, strong reductants, and strong bases. Contact with acids and bases may initiate explosive polymerization. Contact with water may release carbon dioxide and amines.

Potential Exposure: Used as an intermediate in pesticide manufacture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Isocyanate-bearing waste (as CNs, n.o.s.)

TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: The health effects are not known at this time, but similar chemicals can severely irritate the eyes, skin, nose, throat, air passages, and lungs.

Long Term Exposure: Very irritating substances, such as this one, can cause lung irritation and may cause bronchitis to develop.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to isocyanatobenzotrifluoride, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete.

Fire Extinguishing: Isocyanatobenzotrifluoride may burn, but does not readily ignite. Do not use water or regular foam as toxic gases may be released. Poisonous gases, including nitrogen oxides and fluorides, are produced in fire. Use dry chemical, dry sand, alcohol-resistant foams, carbon dioxide extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 202-590-7

Regulatory Authority and Advisory Bodies

Listed in the TSCA inventory.

Canada: WHMIS category D2B; on DSL List.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R36/37/38; R43; Safety phrases: S24/25; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: A viscous, pale yellow oily liquid. Odor is spicy carnation clove. This chemical is combustible. Molecular Weight = 164.204; Density = 1.082 g/cm^3; Specific Gravity = 1.08 at 25°C; Boiling Point: 266°C at 760 mmHg; Freezing/Melting point = −10°C; Vapor Pressure = 0.2 Pa at 25°C; Flash point = 134°C; 132°C at 981 mbar. Hazard Identification (based on NFPA-704 M Rating System): Health 2; Flammability 0; Reactivity 0. Moderately soluble in water; solubility = 700–805 mg/L.

Potential Exposure: Occurs naturally in ylang-ylang (*Cananga odorata*) oil and other essential oils. Found in cloves, tobacco, other plants and flowers. Used as a fragrance ingredient; in household cleaning, maintenance, and personal products; perfumes, skin-care products; deodorants, soaps, shampoos, detergents; in manufacture of vanillin.

Incompatibilities: Keep away from strong oxidizers, strong acids.

Permissible Exposure Limits in Air:

No OELs or TEEL available.

Determination in Air:

No NIOSH or OSHA method available.

Permissible Concentration in Water: Not found.

Determination in Water: Octanol–water partition coefficient: Log $P_{ow} = 3.04$.

Routes of Entry: Ingestion, eyes, dermal route.

Harmful Effects and Symptoms

Short Term Exposure: This compound is a primary irritant and sensitizer; may be able to cause contact allergy from dermal exposure. LD_{50} = (oral-rat) 1560 mg/kg. Moderately toxic.

Long Term Exposure: This compound may be irritating to the skin and eyes.

Points of Attack: Skin, eyes.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin or respiratory tract allergy.

First Aid: *Eyes*: Check the victim for contact lenses and remove. Flush victim's eyes with water or normal saline solution for 20–30 min, lifting lower and upper eyelids occasionally. Remove contaminated clothing and shoes. Get medical attention immediately. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water and wash for at least 15 min. Remove and isolate all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician. Transport the victim to a hospital for treatment. *Inhalation*: Remove victim to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately. *Ingestion*: *Do not induce vomiting*. If the victim is conscious and not convulsing, give large amount of water to dilute the chemical. Never give anything by mouth to an unconscious person. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician. In all cases get medical attention immediately. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body.

Personal Protective Methods: Wear protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Recommended gloves: Ansell 5.109 (Latex); thickness: 0.18 mm; Breakthrough time: *15 min*; Edmont 29-870 (Neoprene); thickness: 0.51 mm; Breakthrough time: *135 min*; North Model F-091 (Viton); thickness: 0.41 mm; Breakthrough time: *480 min*.

Respirator Selection: Follow the regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA- or European Standard EN 149-approved respirator; or use a billboard November 6, 1948 half-face respirator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas, and SO_2) with a dust/mist filter.

Storage: Color Code—Green: General storage may be used. Store this material in a refrigerator at 0−6°C.

Shipping: Not regulated.

Spill Handling: Remove all sources of ignition. Provide ventilation. Use inert material (e.g., vermiculite, sand, or earth) to pick up all liquid spill material. All contaminated clothing and absorbent material should be sealed in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the safety officer (or other responsible person) has verified that the area has been properly cleaned. Avoid runoff into storm sewers and ditches which lead to waterways. Clean up spills immediately, observing precautions in the Protective Equipment section.

Fire Extinguishing: This compound is not very flammable but any fire involving this compound may produce dangerous vapors. You should evacuate the area. All firefighters should wear full-body protective clothing and use self-contained breathing apparatuses. You should extinguish any fires involving this chemical with a dry chemical, carbon dioxide, foam, or halon extinguisher.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

Very Toxic Substance (World Bank).[15]

US EPA Hazardous Waste Number (RCRA No.): P060.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.021; Nonwastewater (mg/kg), 0.066.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R26/27/28; R50/53; Safety phrases: S1/2; S13; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isodrin is a crystalline solid. Molecular weight = 364.90; Freezing/Melting point = 241°C. Decomposes above 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. May be dissolved in flammable liquids.

Potential Exposure: Those involved in the manufacture, formulation, and application of this pesticide. An isomer of aldrin. See also "Aldrin" entry.

Incompatibilities: Incompatible with concentrated mineral acids, acid catalysts, acid oxidizing agents, phenols, reactive metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 7 mg/m^3

PAC-3: 7 mg/m^3

Determination in Air: There is no OEL established for Isodrin. However, this chemical is an isomer of aldrin. See Aldrin.

Routes of Entry: Inhalation, ingestion, eyes and/or skin.

Harmful Effects and Symptoms

Short Term Exposure: Isodrin is classified as extremely toxic. Probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 2 teaspoonsful for a 70-kg (150-lb) person. It causes renal damage and hyperactivity of sympathetic nervous system. Symptoms experienced are similar to poisoning by dieldrin and aldrin, including overall discomfort, headache, nausea, vomiting, dizziness, tremors, convulsions, rise in blood pressure; fever, disturbances in sleep and behavior; and rapid heartbeat. Death from respiratory arrest may occur in coma.

Long Term Exposure: May cause dermatitis, skin rash, and acne. May cause liver and/or kidney damage.

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: Liver function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Isodrin falls into the category of Organochlorine pesticides, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry containers and cover/move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but may not ignite readily. Fire and runoff from fire control water may produce irritating or poisonous gases, including chlorine. Extinguish by using water spray, dry chemical, foam, or carbon dioxide. Use water to keep fire exposed containers cool. Wear full protective clothing including positive pressure breathing apparatus. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 200-247-6

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P043.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ) = 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isoflurophate is an oily, colorless to faintly yellow liquid. Molecular weight = 184.17; Boiling point = 62°C at 9 mmHg; Freezing/Melting point = −82°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: An insecticide. This organophosphate compound is used as a research tool in neuroscience for its ability to inhibit cholinesterase (by phosphorylation) on an acute/subacute basis and to produce a delayed neuropathy. Used as a basis for "nerve gases."

Incompatibilities: Forms hydrofluoric acid in the presence of water. In the presence of moisture attacks metals, rubbers, plastics, coatings, and silica-containing materials, such as glass. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.6 mg/m^3

PAC-3: 3.6 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. Isoflurophate is extremely toxic: probable oral lethal dose in humans is 5−50 mg/kg, between 7 drops and 1 teaspoonful for 70-kg person. Even traces of the vapor cause pinpoint pupils. High exposures may cause pulmonary edema.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or

authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Use positive pressure, pressure-demand, full face-piece self-contained breathing apparatus or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus (SCBA) with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and steam.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. would be the applicable category here. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Use water spray to reduce vapors. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. Dike far ahead of *large spills* for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but will not ignite readily. Container may explode in heat of fire. Fire and runoff from fire control water may produce irritating or poisonous gases of fluorine and phosphorus oxides. Use dry chemical, carbon dioxide. For large fires, water spray, fog, or foam. Fight fire from maximum distance. Dike fire control water for later disposal. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Potential Exposure: **AMHP** Compound Description: Agricultural Chemical; Mutagen. This material is a systemic aphicide used in Europe. It is not registered as a pesticide in the United States, and is currently of little commercial interest.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3.5 mg/m^3
PAC-2: 5.6 mg/m^3
PAC-3: 5.6 mg/m^3
Harmful Effects and Symptoms
Short Term Exposure: Isolan® is classified as extremely toxic. Probable oral lethal dose in humans is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150-lb person. A cholinesterase inhibitor; although it is not an organic phosphate, it resembles that group in action. Can cause death due to respiratory arrest. Symptoms include cool extremities; trembling, fixed pinpoint pupils; nausea; vomiting, slight bluing of skin, lips, and nail beds; tearing, diarrhea, excessive salivation; sweating, slurring of speech; jerky movements; loss of bladder control; convulsions, coma, and death.
Short Term Exposure: A mutagen and may be carcinogenic.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Use positive pressure, pressure-demand full face-piece self-contained breathing apparatus or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus (SCBA) with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: Carbamate pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid breathing vapors. Treat as a liquid carbamate pesticide. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is

designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use methods for liquid carbamate pesticides. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. As with other liquid carbamate pesticides, keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Isooctyl alcohol I:0370

Molecular Formula: $C_8H_{18}O$

Common Formula: $C_7H_{15}CH_2OH$

Synonyms: 2-Ethylhexanol; Isodibutol; Isooctanol; Oxooctyl alcohol

CAS Registry Number: 26952-21-6

RTECS® Number: NS7700000

UN/NA & ERG Number: NA1993/128 (A number with the prefix "NA" is not recognized for international shipments, except between the United States and Canada).

EC Number: 248-133-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Isooctyl alcohol is a clear, combustible liquid. Molecular weight = 130.26; Specific gravity (H_2O:1) = 0.83; Boiling point = 186°C; Freezing/Melting point = < −76°C; Vapor pressure = 0.4 mmHg at 20°C; Flash point = 82°C (oc); Autoignition temperature = 277°C. Explosive limits: LEL = 0.9%; UEL = 5.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: It is used to form phthalate, maleate, adipate, and sebacate esters with the corresponding acids for use as plasticizers. It is used as a raw material for surfactants and as an antifoaming agent, emulsifier, and solvent.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine, and fluorine) can cause fire and explosion hazard. Incompatible with strong acids, caustics, amines, isocyanates.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 50 ppm/270 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 50 ppm/266 mg/m^3 TWA [skin].

No TEEL available.

Australia: TWA 50 ppm (270 mg/m^3), [skin], 1993; Belgium: TWA 50 ppm (266 mg/m^3), [skin], 1993; Denmark: TWA 50 ppm (270 mg/m^3), [skin], 1999; France: VME 50 ppm (270 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 270 mg/m^3, 2003; Norway: TWA 25 ppm (135 mg/m^3), 1999; Russia: STEL 50 mg/m^3, 1993; Switzerland: MAK-W 50 ppm (270 mg/m^3), [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm [skin]. Russia[43] set a MAC of 0.15 mg/m^3 for ambient air in residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for *iso*-octyl alcohol in ambient air[60] ranging from 2.7 mg/m^3 (North Dakota) to 4.5 mg/m^3 (Connecticut) to 6.429 mg/m^3 (Nevada).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Isooctyl alcohol can affect you when breathed in and by passing through your skin. Exposure irritates the eyes, nose, and throat, and possibly the lungs. Contact can irritate the skin and prolonged contact may cause skin burns. Contact can irritate and burn the eyes and cause possible permanent damage. Inhalation of the vapor can cause depression of the central nervous system; can cause dizziness, lightheadedness, headache, confusion, and unconsciousness. Exposure can cause nausea, vomiting, diarrhea, and irregular heartbeat.

Long Term Exposure: Defats the skin, causing redness, drying, and rash. May damage the liver and kidneys. Inhalation can cause lung irritation causing coughing and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system, liver, and kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 50 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full face-piece powered air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, permanganates, chlorates, nitrates, and peroxides). Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter or has a flash point above 60.5°C/141°F but below 93°C/200°F. A number with the prefix "NA" is not recognized for international shipments, except between the United States and Canada. It falls in Hazard Class "COMBUSTIBLE LIQUID," Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol-resistant foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably in admixture with a more flammable solvent.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List (isopentane not listed) *n*-pentane Concentration 1%.

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; Safety phrases: S2; S9; S16; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Isopentane is a volatile, colorless, watery liquid with a gasoline-like odor. Molecular weight = 72.17; Boiling point = 28°C. Freezing point = − 161°C; Flash point ≤ −51°C (cc); Autoignition temperature = 420°C. Flammability limits: LEL = 1.4%; UEL = 7.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water.

Potential Exposure: Used as expanding or blowing agent in polystyrene foam beads; as a process solvent, chemical intermediate; in the manufacture of chlorinated derivatives; and as an antiknock additive in gasoline.

Incompatibilities: Highly volatile liquid; mixture with air may explode. Contact with oxidizers may cause fire and explosion hazard. Attacks some paints, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: 1000 ppm/2950 mg/m^3 TWA.

NIOSH REL: 120 ppm/350 mg/m^3 TWA.

ACGIH TLV®[1]: 600 ppm/1770 TWA.

NIOSH IDLH: 1500 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 600 ppm

PAC-1: 600 ppm

PAC-2: 610 ppm

PAC-3: 20.000 ppm

DFG MAK: 1000 ppm/3000 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Austria: MAK 600 ppm (1899 mg/m^3), 1999; Denmark: TWA 500 ppm (1500 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 600 ppm. United Kingdom[33] TWA 600 ppm (1800 mg/m^3); STEL of 750 ppm (2250 mg/m^3) (all isomers of pentane).

Determination in Air: Use NIOSH Analytical Method (IV) #1500, for Hydrocarbons.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Can irritate the eyes and respiratory tract. Skin contact can cause a rash or burning sensation on contact. Can cause headache, nausea, weakness, dizziness, sleepiness, loss of coordination, and loss of consciousness. Ingestion may cause aspiration into the lungs and chemical pneumonitis. May affect the central nervous system.

Long Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as pentane): *1200 ppm*: Sa (APF = 10) (any supplied-air respirator). *1500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Pentanes require a label of "FLAMMABLE LIQUID." They fall in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Safe Drinking Water Act: Priority List (55 FR 1470).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R21/22; R36/37; R40; Safety phrases: S2; S13; S23; S36/37/39; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isophorone, a cyclic ketone, is a colorless or pale liquid with a peppermint-like odor. The odor threshold is 5.4 ppm in water; 0.2 ppm in air. Molecular weight = 138.23; Specific gravity (H_2O:1) = 0.92; Boiling point = 215°C; Freezing/Melting point = −8°C; Vapor pressure = 0.3 mmHg at 20°C; Flash point = 84°C (cc); Autoignition temperature = 460°C. Explosive limits: LEL = 0.8%; UEL = 3.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 1%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Isophorone is an industrial chemical synthesized from acetone and used commercially as a solvent or cosolvent for polyvinyl and nitrocellulose resins, pesticides, herbicides, fats, oils, and gums. It is used as a solvent and emulsifier; in some printing inks, paints, lacquers, and adhesives. It is also used as a chemical feedstock for the synthesis of 3,5-xylenol, 2,3,5-trimethyl-cyclohexanol, and 3,5-dimethylaniline. Although this is an industrial chemical, it also occurs naturally in cranberries.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Incompatible with aliphatic amines. Attacks some plastics, resins, and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.65 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/140 mg/m^3 TWA.

NIOSH REL: 4 ppm/23 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/28 mg/m^3 TWA Ceiling Concentration; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 200 ppm.

Protective Action Criteria (PAC)

TEEL-0: 4 ppm

PAC-1: 4 ppm

PAC-2: 5 ppm

PAC-3: 200 ppm

DFG MAK: 2 ppm/11 mg/m^3 TWA; Peak Limitation Category I(2); Carcinogen Category 3B; Pregnancy Risk Group C.

Australia: TWA 5 ppm (25 mg/m^3), 1993; Austria: MAK 5 ppm (28 mg/m^3), 1999; Belgium: STEL 5 ppm (28 mg/m^3), 1993; Denmark: TWA 5 ppm (25 mg/m^3), 1999; Finland: TWA 5 ppm (28 mg/m^3); STEL 10 ppm (56 mg/m^3), 1999; France: VLE 5 ppm (25 mg/m^3), 1999; the Netherlands: MAC 25 mg/m^3, 2003; the Philippines: TWA 25 ppm (140 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3, MAC 25 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: KTV 5 ppm (30 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (28 mg/m^3), 1999; Turkey: TWA 25 ppm (149 mg/m^3), 1993; United Kingdom: STEL 5 ppm (29 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 ppm. Several states have set guidelines or standards for isophorone in ambient air[60] ranging from 83.3 μg/m^3 (New York) to 200.0 μg/m^3 (Virginia) to 250.0 μg/m^3 (North Dakota and South Carolina) to 460.0 μg/m^3 (Connecticut) to 595 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2508; #2556; OSHA Analytical Method 7.

Permissible Concentration in Water: The EPA recommends that levels in lakes and streams should be limited to 8.4 μg/L. *To protect freshwater aquatic life:* 117,000 μg/L, on an acute toxicity basis. *To protect saltwater aquatic life:* 12,900 μg/L, on an acute toxicity basis. *To protect human health:* 5200 μg/L.[6] The state of Kansas has set a guideline of 5200 μg/L for drinking water.[61]

Determination in Water: Methylene chloride extraction followed by exchange to toluene, gas chromatography with flame ionization detection (EPA Method 609) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 1.7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Because of the odor and taste of isophorone, ingestion is not expected unless by accident.

Harmful Effects and Symptoms

Short Term Exposure: Isophorone can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Exposure may cause headaches, nausea, and a drunken feeling. Higher levels can cause you to pass out. Contact can burn the eyes, causing permanent damage. Exposure can irritate the eyes, nose, and throat. Repeated exposure may cause chronic irritation with eye and nasal discharge. Long-term exposure can cause drying and cracking of the skin.

Long Term Exposure: Repeated or prolonged contact will cause dry skin, cracking, dermatitis. May cause chronic irritation of the eyes and nose, with discharge. May cause liver and kidney damage. Many solvents and other similar petroleum-based chemicals have been shown to cause brain or other nerve damage. Some animal studies suggest that isophorone may cause birth defects and slower growth in the offspring of rats and mice that breathed the vapors during pregnancy. These studies found some harmful health effects in adult female animals. High doses fed to male rats caused kidney disease and tumors of the kidney, liver, and lymph and reproductive glands.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests. If symptoms develop or overexposure is suspected, the following may be useful: examination of the eyes and nose for chronic inflammation, kidney function tests. Liver function tests. Interview for brain effects and refer positive and borderline individuals for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** Responder™ suits. **4 h:** polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 40 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa* (APF = 10) (any supplied-air respirator). *Up to 100 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 200 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isophorone must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter or has a flash point above 60.5°C/141°F but below 93°C/200°F. A number with the prefix "NA" is not recognized for international shipments, except between the United States and Canada. It falls in Hazard Class "COMBUSTIBLE LIQUID," Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23; R36/37/39; R42/43; R51/53; Safety phrases: S1/2; S26; S28; S38; S45; S61.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Isophorone diisocyanate is a colorless to yellowish liquid with a pungent odor. Molecular weight = 222.32; Specific gravity (H_2O:1) = 1.06; Boiling point = 158°C; Freezing/Melting point = −60°C; Vapor pressure = 0.0003 mmHg at 20°C; Flash point = 155°C (cc); Autoignition temperature = 430°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Decomposes in water (soluble).

Potential Exposure: Compound Description: Reproductive Effector. Isophorone diisocyanate is used as a raw material for polyurethane paints, varnishes, and elastomers which are exceptionally stable to atmospheric and chemical attack.

Incompatibilities: Forms explosive mixture with air. Reacts with water, forming carbon dioxide. Reacts with all acids, caustics, ammonia, aliphatic amines, alkanolamines, aromatic amines, amides, alcohols, glycols, caprolactum, oxidizers, phenols, mercaptans, urethanes, ureas. Attacks many metals, plastics, and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.09 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.005 ppm/0.045 mg/m^3 TWA; 0.02 ppm/0.18 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.005 ppm/0.045 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.005 ppm

PAC-1: 0.02 ppm

PAC-2: 0.135 ppm

PAC-3: 1.5 ppm

DFG MAK: 0.005 ppm/0.046 mg/m^3 TWA; Peak Limitation Category I(1), a momentary value of 0.01 mL/m^3/0.092 mg/m^3 should not be exceeded; [skin] danger of sensitization of the airways and the skin; Pregnancy Risk Group D.

Austria: MAK 0.01 ppm (0.09 mg/m^3), 1999; Belgium: TWA 0.005 ppm (0.045 mg/m^3), [skin], 1993; Denmark: TWA 0.005 ppm (0.045 mg/m^3), [skin], 1999; France: VME 0.01 ppm (0.09 mg/m^3), VLE 0.02 ppm (0.18 mg/m^3), 1999; the Netherlands: MAC-TGG 0.05 mg/m^3, 2003; Norway: TWA 0.005 ppm (0.045 mg/m^3), 1999; Switzerland: MAK-W 0.01 ppm (0.09 mg/m^3), KZG-W 0.02 ppm (0.18 mg/m3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.005 ppm. Several states have set guidelines or standards for IPDI in ambient air[60] ranging from 0.09 μg/m^3 (Connecticut) to 1.5 μg/m^3 (Virginia) to 9.0 μg/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method #5525; OSHA Analytical Method PV-2034.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the skin and eyes. Permanent eye damage may result. Inhalation can cause coughing, wheezing, shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Isocyanates can cause itching and skin rashes, tearing of the eyes, inflammation of the mucous membrane of the nose, and lung problems. This material is highly toxic by inhalation and moderately toxic through the skin. People with skin or respiratory problems should avoid exposure.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy with itching and skin rash. Isophorone diisocyanate may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness. Permanent damage to the lungs could also occur. Permanent lung damage may occur, even if no allergic symptoms are noticed.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves; Viton™ gloves, suits; Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 0.05 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 0.125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.25 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, alcohol, phenols, amines, urethanes, mercaptans, and ureas.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Avoid inhalation. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not readily ignite. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. *Small fires:* dry chemical, carbon dioxide, water spray, or polymer foam. *Large fires:* water spray, fog, or foam. Poisonous gases, including cyanide, nitrogen oxide, and carbon monoxide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 100 lb (45.4 kg).
California Proposition 65 Chemical: Cancer 5/1/96.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: F+, T, N; Risk phrases: R45; R12; R68; R50/53; Safety phrases: S53; S45; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*July 27, 2005*).

Description: Isoprene is a colorless liquid with a mild petroleum-like odor. Vapor is heavier than air; will collect in low areas. The odor threshold is 0.005 ppm. Molecular weight = 68.13; Boiling point = 34°C; Freezing/Melting point = −146°C; Flash point = −54°C; Autoignition temperature = 395°C. Explosive limits: LEL = 1.5%; UEL = 8.9%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Isoprene is used in the manufacture of synthetic rubber and in elastomer plastics; in the production of *cis*-1,4-polyisoprene rubber, styrene/isoprene/styrene block polymers.

Incompatibilities: Isoprene is a highly flammable and reactive liquid, and a dangerous fire and explosive hazard. Store under inert atmosphere (preferably nitrogen) with at least 50 ppm *tert*-butylcatechol present as an inhibitor. Forms explosive mixture with air. Air contact forms explosive peroxides; heat, buildup of peroxides; and contact with many materials may cause violent polymerization, with fire or explosion hazard. Violent reaction with oxidizers, strong acids, reducing agents, strong bases, acid chlorides, alcohols, causing fire and explosion hazard. Attacks some paints, rubber, and coatings. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air
AIHA WEEL: 2 ppm TWA.
Protective Action Criteria (PAC)
TEEL-0: 2 ppm
PAC-1: 5 ppm
PAC-2: 1000 ppm
PAC-3: 4000 ppm
DFG MAK: 3 ppm/8.5 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group C; Germ Cell Mutagen Category 5; Carcinogen Category 5.
Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 300 mg/m^3, 1999; Russia: STEL 40 mg/m^3, 1993. Russia has set[35] a MAC of 0.04 mg/m^3 in ambient air in residential areas on a once-daily basis.

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.005 mg/L in water bodies used for domestic purposes and 0.01 mg/L in surface water used for fishery purposes.

Routes of Entry: Inhalation, eyes and/or skin.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, skin, and respiratory tract. Contact irritates the eyes and skin. Higher levels can affect the central nervous system and cause dizziness, lightheadedness, confusion, and unconsciousness.

Long Term Exposure: Lungs may be affected by repeated or prolonged exposure; bronchitis may develop. There is limited evidence that isoprene can cause cancer of the testes in animals, in high concentrations. This substance is possibly carcinogenic to humans. High exposures may affect blood cells.

Points of Attack: Lungs, blood cells.

Medical Surveillance: Lung function tests, complete blood count (CBC), consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to isoprene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isoprene must be stored to avoid contact with strong acids (such as chlorosulfonic, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, flame, and oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where isoprene is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of isoprene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment especially when opening and closing containers of isoprene. Wherever isoprene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Isoprene, inhibited, requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable and reactive liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or polymer foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isopropanolamine dodecylbenzene sulfonate is a colorless solid. Molecular weight 385.5; 401.61; Vapor pressure = 13–15 mmHg at 20°C; Flash point = >149°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used as a surface active ingredient in soaps and detergents; in the fragrance industry.

Incompatibilities: May act as a base and react with acids. May react with strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Can irritate and burn the eyes and skin on contact. Inhalation can cause irritation of the nose and throat with coughing and wheezing.

Long Term Exposure: Unknown at this time.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

2-Isopropoxyethanol I:0440

Molecular Formula: $C_5H_{12}O_2$

Synonyms: Dowanol Eipat; Ethanol, isopropoxy-; Ethylene glycol isopropyl ether; Ethylene glycol, monoisopropyl ether; β-Hydroxyethyl isopropyl ether; IPE; Isopropoxyethanol; Isopropyl cellosolve; Isopropyl glycol; Isopropyloxitol; 2-(1-Methylethoxy)ethanol; Monoisopropyl ether of ethylene glycol

CAS Registry Number: 109-59-1

RTECS® Number: KL5075000

UN/NA & ERG Number: UN1987 (alcohols, n.o.s.)/127

EC Number: 203-685-6 [*Annex I Index No.:* 603-013-00-5]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono- and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol $R-(OCH_2CH_2)_n-OR'$ where $n = 12$ or 3; $R =$ alkyl or aryl groups; $R' = R$, H, or groups which when removed, yield glycol ethers with the structure: $R-(OCH_2CH)_n-OH$. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. R—$(OCH_2CH_2)_n$—OR′; Where $n = 12$ or 3; R = alkyl C7 or less; or R = phenyl or alkyl substituted phenyl; R′ + H, or alkyl C7 or less; or OR′ consisting of carboxylic ester, sulfate, phosphate, nitrate, or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R20/21; R36; Safety phrases: S2; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isopropoxyethanol is a clear, colorless liquid with an ethereal odor. Molecular weight = 104.14; Specific gravity (H_2O:1) = 0.9; Boiling point = 139.4°C. Vapor pressure = 3 mmHg at 20°C; Flash point = 33°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Used in lacquers and other coatings; and as a solvent for resins, dyes, and textiles.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers can cause a fire or explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: None established; See *NIOSH Pocket Guide*, Appendix D.

ACGIH TLV®[1]: 25 ppm/106 gm/m^3 TWA [skin].

No TEEL available.

DFG MAK: 5 ppm/22 mg/m^3 TWA; Peak Limitation Category II(8) [skin]; Pregnancy Risk Group C.

Australia: TWA 25 ppm (105 mg/m^3), 1993; Austria: MAK 5 ppm (22 mg/m^3), [skin], 1999; Belgium: TWA 25 ppm (106 mg/m^3), 1993; Denmark: TWA 25 ppm (105 mg/m^3), 1999; France: VME 25 ppm (105 mg/m^3), 1999; Norway: TWA 20 ppm (80 mg/m^3), 1999; the Netherlands: MAC-TGG 44 mg/m^3, 2003; MAC-TGG 44 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm [skin].

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the eyes and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High exposure through skin contact or inhalation can cause severe damage to the kidneys, blood, and liver. This can cause bloody urine and death.

Long Term Exposure: Exposure can cause anemia. Prolonged contact can degrease and irritate the skin. Very irritating substances, such as IPE, may affect the lungs.

Points of Attack: Eyes, skin, respiratory system, blood.

Medical Surveillance: Lung function tests. Liver and kidney function tests. Complete blood count (CBC). Urinalysis. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24—48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. The use of alcoholic beverages may enhance the toxic effect.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Alcohols, flammable, toxic, n.o.s. require a label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." This compound falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; R36; R66; R67; Safety phrases: S2; S16; S26; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isopropyl acetate is a colorless liquid with a fruity odor. The odor threshold = 4.1 ppm. Molecular weight = 102.15; Specific gravity (H_2O:1) = 0.87; Boiling point = 90°C; Freezing/Melting point = −68.8°C; Vapor pressure = 42 mmHg at 20°C; Flash point = 2.2°C; Autoignition temperature = 460°C. Explosive limits: LEL = 1.8% at 38°C; UEL = 8.0%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Moderately soluble in water; solubility = 3%.

Potential Exposure: Compound Description: Human Data; Primary Irritant. This material is used as an organic solvent for nitrocellulose and other resins, fats, oils, waxes, and gums. It is used in synthetic perfumes and food flavorings.

Incompatibilities: Forms explosive mixture with air. Contact with strong oxidizers may cause fire and explosions. Incompatible with strong acids, caustics, nitrates. Dissolves rubber and many plastic materials. Contact with steel may cause slow decomposition. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.18 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 250 ppm/950 mg/m^3 TWA.

NIOSH REL: None established; See Appendix D of the *NIOSH Pocket Guide.*

ACGIH TLV®[1]: 100 ppm/418 mg/m^3 TWA; 200 ppm/950 mg/m^3 STEL (2001).

NIOSH IDLH: 1800 ppm.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 200 ppm

PAC-2: 200 ppm

PAC-3: 1800 ppm

DFG MAK: 100 ppm/420 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.
Australia; TWA 200 ppm (950 mg/m^3); STEL 310 ppm, 1993; Austria: MAK 200 ppm (840 mg/m^3), 1999; Belgium: TWA 250 ppm (1040 mg/m^3); STEL 310 ppm (1290 mg/m^3), 1993; Denmark: TWA 150 ppm (625 mg/m^3), 1999; France: VME 250 ppm (950 mg/m^3), VLE 300 ppm (1140 mg/m^3), 1999; Hungary: TWA 400 mg/m^3; STEL 800 mg/m^3, 1993; Norway: TWA 100 ppm (240 mg/m^3), 1999; the Philippines; TWA 250 ppm (950 mg/m^3), 1993; Switzerland: MAK-W 200 ppm (840 mg/m^3), KZG-W 400 ppm (1680 mg/m^3), 1999; United Kingdom: STEL 200 ppm (849 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 310 ppm. Several states have set guidelines or standards for isopropyl acetate in ambient air[60] ranging from 1.4 mg/m^3 (Massachusetts) to 3.3 mg/m^3 (New York) to 9.5−11.85 mg/m^3 (North Dakota) to 16.0 mg/m^3 (Virginia) to 19.0 mg/m^3 (Connecticut) to 22.619 mg/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #1454, #1460; OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Health effects can occur below the legal exposure limit. Eye contact can cause severe irritation or burns. The vapors can cause eye, nose, and throat irritation. Coughing and chest tightness can also occur. Higher levels cause headaches, drowsiness, poor coordination, and passing out. Ingestion may cause chemical pneumonitis.

Long Term Exposure: Repeated exposure can cause dry, cracking skin and may damage the liver. Can irritate the lungs and may cause bronchitis to develop. Although this chemical has not been adequately evaluated, many solvents and similar petroleum-based chemicals have been shown to cause brain or other nerve damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests; evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1800 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from nitrates and strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric) and strong alkalis. Sources of ignition, such as smoking and open flames, are prohibited where isopropyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of isopropyl acetate should be grounded and bonded.

Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropyl acetate.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isopropyl alcohol is a flammable liquid with a slight odor resembling that of a mixture of ethanol and acetone. The odor threshold is 22 ppm. Molecular weight = 60.11; Specific gravity (H_2O:1) = 0.79; Boiling point = 82.5°C; Freezing/Melting point = − 90°C; Vapor pressure = 33 mmHg at 20°C; Flash point = 12°C; Autoignition temperature = 399°C. Explosive limits: LEL = 2.0%; UEL = 12.7% at 93°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Isopropyl alcohol is a chemical widely used as an analytical reagent and to manufacture acetone, glycerol, and isopropyl acetate; in liniments, skin lotions, cosmetics, permanent wave preparations; pharmaceuticals and hair tonics. It is also employed as a solvent in perfumes, in extraction processes; as a preservative; in lacquer formulations; and in many dye solutions. In addition, it has been employed as an ingredient of antifreezes, soaps, and window cleaners. It may also be used as a raw material for the manufacture of various isopropyl derivatives, such as pesticides.

Incompatibilities: Forms explosive mixture with air. Incompatible with alkaline earth and alkali metals, crotonaldehyde, phosgene, strong acids, amines, ammonia, caustics, strong oxidizers. Attacks some plastics, rubber, and coatings. Reacts with metallic aluminum at high temperatures.

Permissible Exposure Limits in Air

PAC-3: 2000 ppm

DFG MAK: 200 ppm/500 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C; BAT 50 mg[acetone]/L blood/end-of-shift; 50 mg[acetone]/L urine/end-of-shift; Pregnancy Risk Group C.

Australia: TWA 400 ppm (980 mg/m^3); STEL 500 ppm, 1993; Austria: MAK 400 ppm (980 mg/m^3), 1999; Belgium: TWA 400 ppm (985 mg/m^3); STEL 500 ppm, 1993; Denmark: TWA 200 ppm (490 mg/m^3), 1999; France: VLE 400 ppm, 1999; Japan: STEL 400 ppm (980 mg/m^3), 1999; the Netherlands: MAC-TGG 650 mg/m^3, 2003; the Philippines: TWA 400 ppm (980 mg/m^3), 1993; Poland; MAC (TWA) 900 mg/m^3, MAC (STEL) 1200 mg/m^3, 1999; Russia: STEL 400 ppm (10 mg/m^3), 1993; Sweden: NGV 150 ppm (350 mg/m^3), KTV 250 ppm (600 mg/m^3), 1999; Switzerland: MAK-W 400 ppm (980 mg/m^3), KZG-W 800 ppm (1960 mg/m^3), 1999; Turkey: TWA 200 ppm (500 mg/m^3), 1993; United Kingdom: TWA 400 ppm (999 mg/m^3); STEL 500 ppm (1250 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 500 ppm. Russia[43] has set a MAC value of 0.6 mg/m^3 in the ambient air of residential areas both on a momentary and on a daily average basis. Several states have set guidelines or standards for isopropanol in ambient air[60] ranging from 3.267 mg/m^3 (New York) to 9.8 mg/m^3 (Florida) to 9.8−12.25 mg/m^3 mg/m^3 (North Dakota) to 16.5 mg/m^3 (Virginia) to 19.6 mg/m^3 (Connecticut and South Dakota) to 23.333 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with 2-butanol in CS$_2$, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1400.[18]

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 13,500 μg/L based on health effects. Russia[43] set a MAC of 0.25 mg/L in water bodies used for domestic purposes. Maryland[61] has set a guideline of 3.0 mg/L for isopropanol in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Isopropyl alcohol irritates the eyes, skin, and respiratory tract. *Inhalation:* Irritation of the nose and throat may occur at 400 ppm and above. *Skin:* 5% solution may cause irritation and dryness. *Eyes:* Vapor levels of 20 ppm or above may result in irritation. Liquid may cause corneal burns and eye damage. *Ingestion:* 22.5 mL (2/3 oz) has caused salivation, reddening of face, stomach pain, depression, dizziness, headache, vomiting, and unconsciousness. Ingestion of 100 mL (3 oz) has caused death.

Long Term Exposure: Repeated or prolonged contact may cause dry, cracking skin. There is an increased incidence of nasal sinus cancer in workers involved in the manufacture of IPA by the strong acid process. Although this chemical has not been adequately evaluated, many solvents and similar petroleum-based chemicals have been shown to cause brain or other nerve damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite). Also, NIOSH recommends that workers subject to isopropyl alcohol exposure have comprehensive preplacement medical examinations. Periodic medical examinations shall be made available on an annual basis. Particular attention will be given in these medical examinations to the skin sinuses, and respiratory system. Isopropyl alcohol and its metabolite, acetone, may be detected in blood, urine, and body tissues. Evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves, CPF3™ suits; Responder™ suits. **4 h:** Neoprene™ rubber gloves, suits, boots; Teflon™ gloves, suits, boots Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/

clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full-face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD, PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isopropyl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where isopropyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of isopropyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropyl alcohol.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

NTP: Carcinogenesis studies; selected, October 2000.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F+, Xi; Risk phrases: R12; R36/37/38; Safety phrases: S2; S16; S26; S29 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Isopropylamine is a colorless liquid with a pungent ammonia-like odor. A gas above the boiling point. The odor threshold is 0.21 ppm. Molecular weight = 59.13; Specific gravity (H_2O:1) = 0.69; Boiling point = 34.4°C; Freezing/Melting point = −101°C; Vapor pressure = 460 mmHg at 20°C; Flash point = −37°C; Autoignition temperature = 402°C. Explosive limits: LEL = 2.0%; UEL = 10.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Primary Irritant. Isopropyl amine is used to produce rubber accelerators, oil-soluble emulsifiers; in the synthesis of pharmaceuticals, pesticides, dyes, and surface active agents.

Incompatibilities: Forms explosive mixture with air. A strong base. Reacts with alkali metals, alkaline earth, acid anhydrides, acid chlorides. Reacts violently with strong oxidizers (fire and explosions), strong acids (explosive spattering), nitroparaffins, halogenated hydrocarbon, aldehydes, ketones, epoxides, and many other substances. Attacks some plastics, rubber, and coatings. Attacks copper and its compounds, lead, zinc, tin.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.42 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/12 mg/m^3 TWA.

NIOSH REL: None established; See Appendix D of the *NIOSH Pocket Guide*.

ACGIH TLV®[1]: 5 ppm/12 mg/m^3 TWA; 10 ppm/24 mg/m^3 STEL.

NIOSH IDLH: 750 ppm.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 10 ppm

PAC-2: 150 ppm

PAC-3: 750 ppm

DFG MAK: 5 ppm/12 mg/m^3 TWA; Peak Limitation Category I(2), a momentary value of 10 mL/m^3/25 mg/m^3 should not be exceeded; Pregnancy Risk Group C.

Australia: TWA 5 ppm (12 mg/m^3); STEL 10 ppm, 1993; Austria: MAK 5 ppm (12 mg/m^3), 1999; Belgium: TWA 5 ppm (12 mg/m^3); STEL 10 ppm (24 mg/m^3), 1993; Denmark: TWA 5 ppm (12 mg/m^3), 1999; France: VME 5 ppm (12 mg/m^3), 1999; the Netherlands: MAC-TGG 12 mg/m^3, 2003; Norway: TWA 5 ppm (12 mg/m^3), 1999; Poland: MAC (TWA) 12 mg/m^3, MAC (STEL) 24 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: TWA 5 ppm (12 mg/m^3); STEL 10 ppm (25 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (12 mg/m^3), KZG-W 10 ppm (24 mg/m^3), 1999; Turkey: TWA 5 ppm (12 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 ppm. The OSHA PEL is 5 ppm TWA. NIOSH, the DFG MAK[3] and the ACGIH[1] TWA value is 5 ppm (12 mg/m^3) and the STEL is 10 ppm (24 mg/m^3). Russia[43] set a MAC of 1.0 mg/m^3 in work-place air and Russia set a MAC value of 0.01 mg/m^3 for ambient air in residential areas. Several states have set guidelines or standards for monoisopropylamine in ambient air[60] ranging from 40 μg/m^3 (New York) to 120 μg/m^3 (Florida) to 120−240 μg/m^3 (Nevada) to 300 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH II(3), Method #S147.

Permissible Concentration in Water: Russia[35,43] set a MAC of 2.0 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Isopropylamine is corrosive to the eyes, skin, and respiratory tract. Contact with the liquid or vapor can cause severe burns of the eyes and skin; can cause blurred vision or seeing halos around lights, with loss of vision and scarring. Corrosive on ingestion. Swallowing the liquid may cause chemical pneumonitis. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated or prolonged contact can cause thickening and cracking of the skin. Repeated exposure can cause loss of vision and scarring. Can irritate the lungs and may cause bronchitis.

Points of Attack: Lungs, eyes.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, examination of the eyes and vision. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Tychem 1000™ suits. **4 h:** Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *250 ppm:* CcrFS (APF = 50) [any air-purifying full-face-piece respirator equipped with cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *750 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isopropylamine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where isopropylamine is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of isopropylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropylamine. Wherever isopropylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Isopropylamine will attack some forms of plastics, rubber, and coatings.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID, CORROSIVE.” It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides and hydrogen cyanide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

UN/NA & ERG Number: UN2810/Guide 153

EC Number: 212-196-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isopropyl aniline is a yellowish liquid with a sweet, aromatic odor. Molecular weight = 135.23; Specific gravity (H_2O:1) = 0.93 at 15.6°C; Boiling point = 202.6°C; Freezing/Melting point = −50°C; Vapor pressure = 0.03 mmHg at 20°C; Flash point = 87.7°C. Insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. *N*-isopropyl aniline is used in the dyeing of acrylic fibers and as a chemical intermediate.

Incompatibilities: Strong oxidizers; strong acids.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.53 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 2 ppm/10 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 2 ppm/11 mg/m^3 TWA [skin]; BEI$_M$ issued for Methemoglobin inducers.

No TEEL available.

Australia: TWA 2 ppm (10 mg/m^3), [skin], 1993; Belgium: TWA 2 ppm (11 mg/m^3), [skin], 1993; Denmark: TWA 2 ppm (10 mg/m^3), [skin], 1999; France: VME 2 ppm (10 mg/m^3), [skin], 1999; Norway: TWA 2 ppm (11 mg/m^3), 1999; Switzerland: MAK-W 2 ppm (11 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 10 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 ppm [skin]. North Dakota has set a standard for *N*-Isopropyl aniline in ambient air or 100 μg/m^3.[60]

Determination in Air: Use OSHA Analytical Method 78.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *N*-Isopropyl aniline reduces the blood's ability to supply oxygen to the body, resulting in the formation of methemoglobin. Exposure can cause cyanosis (the lips, ears, and other skin areas turn blue). The effects may be delayed. It can also cause headaches and lightheadedness. High exposures can cause trouble breathing, collapse, and even death. Contact may irritate the eyes and skin.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Repeated high exposures may cause headaches, dizziness, poor appetite, and anemia.

Points of Attack: Eyes, skin, respiratory system, blood, cardiovascular system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation recommended.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Toxic, liquids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. *Do not use water.* Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isopropyl chloroformate I:0490

Molecular Formula: $C_4H_7ClO_2$

Common Formula: $(CH_3)_2CHOOCCl$

Synonyms: Carbonochloride acid 1-methyl ester; Carbonochloridic acid, 1-methylethyl ester; Chloroformic acid isopropyl ester; Cloruro de isopropilo (Spanish); Isopropyl chlorocarbonate; Isopropyl chloromethanoate

CAS Registry Number: 108-23-6

RTECS® Number: LQ6475000

UN/NA & ERG Number: UN2407/155

EC Number: 203-563-2

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 15,000 ($\geq$ 1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg).

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isopropyl chloroformate is a highly flammable, clear, colorless liquid with a pungent odor. Molecular weight = 122.56; Boiling point = 105°C; Flash point = 28°C (oc); Autoignition temperature ≥ 500°C. Explosive limits: LEL = 4%; UEL = 15%. Insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. Isopropyl chloroformate is used as an intermediate for free-radical polymerization initiators and in organic synthesis.

Incompatibilities: Decomposes slowly in cold water and above 20°C. Store under refrigeration. Contact with iron salts may cause explosive thermal decomposition. Incompatible with oxidizers, metal salts, acids, alkalis, amines, alcohols.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*
TEEL-0: 0.15 ppm
PAC-1: 0.4 ppm
PAC-2: **3.3** ppm
PAC-3: **10** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Netherlands: MAC-TGG 5 mg/m^3, 2003; Russia: STEL 0.1 mg/m^3, 1993; United Kingdom: TWA 1 ppm (5.1 mg/m^3), 2000.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: A phosgene derivative. Inhalation exposures at elevated concentrations cause death by immediate lung damage; lower concentrations cause difficult breathing, collapse, and convulsions. Can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation of material may cause death or permanent injury. Eye irritations, irritation of upper respiratory tract, and surface burns have been observed. Eye irritation may persist after exposure ceases, and skin sensitization may occur. Ingestion can be fatal.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in refrigeration, below 20°C. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, iron salts, acids, alkalis, amines, alcohols. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

In case of spills or leaks, shut off ignition sources and keep away flares, smoke, or flames. Do not touch spilled material. Use water to reduce vapors but do not get water inside containers. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. For *large spills*, dike far ahead of spill for later disposal.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (*from a small package or a small leak from a large package*)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.2/0.3

Large spills (*from a large package or from many small packages*)

First: Isolate in all directions (feet/meters) 200/60

Then: Protect persons downwind (miles/kilometers)

Day	0.5/0.8
Night	0.9/1.5

Fire Extinguishing: This chemical is a flammable liquid. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind and keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Vapor explosion hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. *See above for isolation distances.* Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. Cool containers exposed to flame with water until well after fire is out. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isopropyl formate I:0500

Molecular Formula: $C_4H_8O_2$

Common Formula: $HCOOCH(CH_3)_2$

Synonyms: Formic acid, isopropyl ester; Isopropyl methanoate

CAS Registry Number: 625-55-8

RTECS® Number: LQ8750000

UN/NA & ERG Number: UN1281/129

EC Number: 210-901-2 [*Annex I Index No.:* 607-016-00-2]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36/37; R67; Safety phrases: S2; S9; S16; S24; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Isopropyl formate is a clear liquid with a pleasant odor. Molecular weight = 88.11; Boiling point = 67°C; Flash point = − 6°C (cc); Autoignition temperature = 485°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1.

Potential Exposure: Used as a fumigant and in organic synthesis.

Incompatibilities: Oxidizing materials.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation of vapor can cause irritation of eyes and nose. High concentrations can cause unconsciousness in a few minutes, with death within a few hours. Contact with liquid formic acid, isopropyl ester can cause irritation of eyes and skin. Ingestion can result in irritation of the mouth and stomach, with loss of consciousness and death occurring if untreated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Propyl formates require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Isopropyl glycidyl ether I:0510

Molecular Formula: $C_6H_{12}O_2$

Common Formula: $CH_2-(O)-CH-CH_2-O-CH(CH_3)_2$

Synonyms: 1,2-Epoxy-3-isopropoxypropane; Glycidyl isopropyl ether; IGE; Isopropil glicidil eter (Spanish); Isopropyl epoxypropyl ether; (Isoproxymethyl)oxirane; NCI-C56439; Oxyde de 2,3-epoxypropyle et d'isopropyle (French)

CAS Registry Number: 4016-14-2

RTECS® Number: TZ3500000

UN/NA & ERG Number: UN1993/128

EC Number: 223-672-9

Regulatory Authority and Advisory Bodies

Carcinogenicity: DFG Carcinogen Category 3 (suspected).

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as glycol ethers.

EPCRA Section 313: Form R *de minimis* concentration reporting level: 1.0% as glycol ethers.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: IGE is a colorless liquid. Molecular weight = 116.18; Specific gravity (H_2O:1) = 0.92; Boiling point = 137.2°C; Vapor pressure = 9 mmHg at 25°C; Flash point = 33.3°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 1. Soluble in water; solubility = 19%.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. IGE is used as a reactive diluent for epoxy resins; as a stabilizer for organic compounds; and as an intermediate for the synthesis of ethers and esters.

Incompatibilities: Forms explosive mixture with air. Contact with moist air and light can form explosive polymerization. Contact with caustics can cause explosive polymerization. Oxidizers can cause fire and explosion hazard. Attacks some rubbers and plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.75 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/240 mg/m^3 TWA.

NIOSH REL: 50 ppm/240 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 50 ppm/238 mg/m^3 TWA; 75 ppm/356 mg/m^3 STEL.

NIOSH IDLH: 400 ppm.

No TEEL available.

DFG MAK: Carcinogen Category 3B.

Australia: TWA 50 ppm (240 mg/m^3); STEL 75 ppm, 1993; Austria: Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (238 mg/m^3); STEL 75 ppm (356 mg/m^3), 1993; Denmark: TWA 50 ppm (240 mg/m^3), 1999; Finland: STEL 50 ppm (240 mg/m^3), 1999; France: VME 50 ppm (240 mg/m^3), 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; Switzerland: MAK-W 50 ppm (240 mg/m^3), KZG-W 100 ppm (480 mg/m^3), 1999; Turkey: TWA 30 ppm (240 mg/m^3), 1993; United Kingdom: TWA 50 ppm (241 mg/m^3); STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 75 ppm. Several states have set guidelines or standards for IGE in ambient air[60] ranging from 2.4 mg/m^3 (Connecticut) to 2.4−3.6 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 5.714 mg/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #1620, Isopropyl glycidyl ether; OSHA Analytical Method 7.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.48.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the central nervous system, causing headache, dizziness, and loss of consciousness.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization. Lungs may be affected by inhalation of high concentrations of the vapor, and may cause bronchitis. Possible hematopoietic effects.

Points of Attack: Eyes, skin, respiratory system, blood, reproductive system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Complete blood count. Pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in an explosion-proof refrigerator. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: Flammable liquid n.o.s. require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.

Isopropyl isocyanate I:0520

Molecular Formula: C_4H_7NO
Common Formula: $(CH_3)_2CHNCO$
Synonyms: 2-Isocyanatopropane; Propane, 2-isocyanato
CAS Registry Number: 1795-48-8
RTECS® Number: NQ9230000
UN/NA & ERG Number: UN2483/155
EC Number: 217-276-5
Regulatory Authority and Advisory Bodies
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Isopropyl isocyanate is a colorless liquid with a strong odor. Molecular weight = 85.10; Boiling point = 73°C; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Flash point = − 10°C. Insoluble in water.
Potential Exposure: Isopropyl isocyanate is used in making other chemicals and pesticides.
Incompatibilities: Forms explosive mixture with air. Reacts with acetaldehyde, alcohols, oxidizers.
Permissible Exposure Limits in Air
Isocyanate-bearing waste (as CNs, n.o.s.)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3
Routes of Entry: Inhalation, passing through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Although little is known about the health effects of isopropyl isocyanate, similar chemicals can cause severe irritation of the eyes, skin, nose, throat, and lungs; and cause lung allergy to develop. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.
Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this

chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where isopropyl isocyanate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropyl isocyanate.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

UN 2483 (Isopropyl isocyanate) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water*: Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

K

Kerosene K:0100

Synonyms: Coal Oil; Deobase; Fuel oil No. 1; Illuminating oil; Jet fuel JP-1; Lamp oil; Light petroleum; Range oil; Straight run kerosene

CAS Registry Number: 8008-20-6

RTECS® Number: OA5500000

UN/NA & ERG Number: UN1223/128

EC Number: 232-366-4 [*Annex I Index No.*: 650-001-02-5]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC (as jet fuel): Animal Limited Evidence, Group 3, 1989.

FDA—over-the-counter drug (8008-20-6).

US EPA, FIFRA 1998 Status of Pesticides: Canceled (8008-20-6).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R65; Safety phrases: S2; S23; S24; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Kerosene is a pale yellow or clear, mobile liquid, composed of a mixture of petroleum distillates, having a characteristic odor. The odor threshold is 0.6 mg/m^3. The taste threshold is 0.1 mg/L in water.[59] A refined petroleum solvent (predominantly C9–C16), which typically is 25% normal paraffins, 11% branched paraffins, 30% monocycloparaffins, 12% dicycloparaffins, 1% tricycloparaffins, 16% mononuclear aromatics, and 5% dinuclear aromatics. Molecular weight = 170 (approx.); Specific gravity (H_2O:1) = 0.81; Boiling point = 175–325°C; Freezing/Melting point = −23°C; Vapor pressure = 5 mmHg at 37.8°C; Flash point = 35–72°C; Autoignition temperature = 210–220°C. Explosive limits: LEL = 0.7%; UEL = 5.0%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen, Human Data; Primary Irritant; (petroleum, hydrotreated) Tumorigen. Kerosene is used as a fuel for lamps, stoves, jets, and rockets. It is also used for degreasing and cleaning metals and as a vehicle for insecticides. Jet fuels JP-5 and JP-8 are used as aircraft fuels by the military. JP-8 is the primary jet fuel used by the US Navy and Air Force. Kerosene is the primary component of both JP-5 and JP-8.

Incompatibilities: Explosive mixture in air. Oxidizers may cause fire and explosion hazard. Incompatible with nitric acid. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: None, but both OSHA and the Air Force Office of Safety and Health have set an exposure limit of 400 mg/m^3 of petroleum product for an 8-h workday, 40-h workweek.

NIOSH REL: 100 mg/m^3 TWA.

ACGIH TLV®[1]: 200 mg/m^3 TWA [skin] avoid prolonged and repeated skin contact; may be associated with an increase in skin cancer.

Protective Action Criteria (PAC)*

TEEL-0: 200 mg/m^3

PAC-1: **290** mg/m^3

PAC-2: **1100** mg/m^3

PAC-3: 1100 mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 300 mg/m^3, 1999; Russia[43] set a MAC of 300 mg/m^3 in work-place air.

Determination in Air: Use NIOSH Analytical Method (IV) #1550, Naphthas.

Permissible Concentration in Water: MAC concentrations in water bodies used for domestic purposes ranging from 0.10 mg/L have been set by Russia.[43] New Jersey[59] has declined to set a maximum contaminant level for kerosene in water because of its variable composition.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) > 500 mg/kg. Slightly irritates the skin and respiratory tract. *Inhalation:* Does not evaporate fast enough to cause health effects except when heated or in enclosed spaces. Headache, tiredness, stupor, dizziness, nausea, coma, and death may occur with increasing exposure. *Skin:* If not promptly removed, may cause reddening, blisters, itching, and an increased risk of infection. *Eyes:* Irritation may occur. *Ingestion:* Accidental ingestion of unknown amounts has caused irritation of mouth, throat, and stomach, nausea, vomiting, rapid breathing, blue skin coloration, and convulsions. Death may result from as little as 1-fluid ounce. Inhalation into lungs following ingestion may result in bronchitis, chemical pneumonia, accumulation of fluid and blood in lungs, and death. As little as 1/30 oz may be fatal in this way.

Long Term Exposure: Repeated or prolonged skin contact may cause defatting, itching, and rash. Absorption through skin is slow but repeated skin contact over many years has caused muscular weakness, anemia, changes in white blood cells, fever, and death. Can irritate the lungs; bronchitis may develop. May cause kidney damage. A study on the use of kerosene stoves found an increase in oral cancer in humans who used kerosene stoves. Skin tumors were seen in mice when their skin was exposed to jet fuel JP-5 for 60 weeks.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00010-2

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** nitrile rubber gloves, suits, boots; polyethylene gloves, suits, boots; Viton™ gloves, suits. **4 h:** Neoprene™ rubber gloves, suits, boots; polyvinyl alcohol gloves; polyvinyl chloride gloves, suits, boots; Barricade™ coated suits; Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol, nitrile, and nitrile + PVC are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1000 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *2500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *5000 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD, PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Kerosene requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Spray into furnace after mixing with a more flammable solvent.

Ketene K:0110

Molecular Formula: C_2H_2O

Common Formula: $H_2C{=}C{=}O$

Synonyms: Carbomethene; Ethenone; Keto-ethylene

CAS Registry Number: 463-51-4

RTECS® Number: OA7700000

EC Number: 207-336-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ketene is a flammable, colorless gas with a sharp, disagreeable odor. Molecular weight = 42.04; Boiling point = −54.4°C; Freezing/Melting point = −148.3°C; Relative vapor density (air = 1): 1.45; Vapor pressure = <1 atm. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 3. Reacts with water.

Potential Exposure: Ketene is used as an acetylating agent in cellulose acetate and aspirin manufacture; it is used in the conversion of higher acids to their anhydrides; in the production of spices, acetic anhydride, diethylamino gestrinone; ethyl acetate; ethyl acetoacetate; sorbic acid; vitamin A.

Incompatibilities: Forms an explosive mixture with air. Ketene readily polymerizes. Decomposes in water, alcohol, and ammonia. Reacts with water to form acetic acid. Contact with hydrogen peroxide forms explosive diacetyl peroxide. Reacts violently with reducing agents, oxidizers, and many organic compounds. Can dimerize to diketene even at low temperatures. Diketene forms an explosive mixture with air.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.72 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.5 ppm/0.9 mg/m^3 TWA.

NIOSH REL: 0.5 ppm/0.9 mg/m^3 TWA; 1.5 ppm/3 mg/m^3 STEL.

ACGIH TLV®[1]: 0.5 ppm/0.86 mg/m^3 TWA; 1.5 ppm/2.6 mg/m^3 STEL.

NIOSH IDLH: 5 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.19 ppm

PAC-1: 0.19 ppm

PAC-2: 0.66 ppm

PAC-3: 2 ppm

Arab Republic of Egypt: TWA 0.5 ppm (0.9 mg/m^3), 1993; Australia: TWA 0.5 ppm (0.9 mg/m^3); STEL 1.5 ppm, 1993; Austria: MAK 0.5 ppm (0.9 mg/m^3), 1999; Belgium: TWA 0.5 ppm (0.89 mg/m^3); STEL 1.5 ppm, 1993; Denmark: TWA 0.5 ppm (0.9 mg/m^3), 1999; Finland: STEL 0.5 ppm (0.9 mg/m^3), 1999; France: VME 0.5 ppm (0.9 mg/m^3), 1999; the Netherlands: MAC-TGG 0.9 mg/m^3, 2003; Norway: TWA 0.5 ppm, 1999; the Philippines: TWA 0.5 ppm (0.9 mg/m^3), 1999; Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 1.5 mg/m^3, 1999; Switzerland: MAK-W 0.5 ppm (0.9 mg/m^3), KZG-W 1 ppm (1.8 mg/m^3), 1999; Turkey: TWA 0.5 ppm (0.9 mg/m^3), 1993; United Kingdom: TWA 0.5 ppm (0.87 mg/m^3); STEL 0.5 ppm (2.6 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 1.5 ppm; Several states have set guidelines or standards for ketene in ambient air[60] ranging from 3.3 μ/m^3 (New York) to 4.5 μ/m^3 (South Carolina) to 9.0 μ/m^3 (Florida) to 9.0−30.0 μ/m^3 (North Dakota) to 18.0 μ/m^3 (Connecticut) to 21.0 μ/m^3 (Nevada) to 25.0 μ/m^3 (Virginia).

Determination in Air: Use NIOSH (II-2),[2] Method #S92.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ketene can affect you when breathed in. Breathing the vapor can irritate the lungs, causing coughing, chest pain, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Repeated or high exposure may cause permanent lung damage. Exposure can irritate the eyes, nose, and throat.

Long Term Exposure: Repeated or prolonged exposure may cause permanent lung damage, resulting in emphysema and fibrosis. Prolonged skin contact may cause skin rash.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, or to rule out scarring in persons with a history of suspected repeated overexposures.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 ppm:* Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Ketene cannot be stored. Ketene must be kept away from water and a wide variety of organic compounds, since violent reactions occur. Ketene must be kept in tightly closed containers in a cool, well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Ketene is not shipped as a rule, but is generated at the point of use in a chemical process by acetone pyrolysis. It polymerizes readily and hence immediate use is preferred.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. *Do not use water* because it reacts violently with ketene. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not use water*. This chemical is a flammable gas. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

L

Lactonitrile L:0050

Molecular Formula: C_3H_5NO
Common Formula: $CH_3CHOHCN$
Synonyms: Acetaldehyde cyanohydrin; 2-Hydroxypropionitrile; Lactonitrilo (Spanish); NSC-7764; Propionitrile, 2-hydroxy-
CAS Registry Number: 78-97-7
RTECS® Number: OD8225000
UN/NA & ERG Number: UN3276 (Nitriles, toxic, liquid, n.o.s.)/151
EC Number: 201-163-2
Regulatory Authority and Advisory Bodies
SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Lactonitrile is a colorless to straw-colored liquid. Molecular weight = 71.09; Boiling point = 183°C (slight decomposition); Freezing/Melting point = −40°C; Flash point = 77°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.
Potential Exposure: This material is used as a solvent and as an intermediate in the production of ethyl lactate and lactic acid.
Incompatibilities: Alkalis form hydrogen cyanide. Violent reaction with strong oxidizers.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 3.5 mg/m^3
PAC-1: 10 mg/m^3
PAC-2: 18 mg/m^3
PAC-3: 150 mg/m^3
Determination in Air:
NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.
Permissible Concentration in Water: See NIOSH Criteria Document 212 *Nitriles*.
Routes of Entry: Inhalation, ingestion, skin contact.
Harmful Effects and Symptoms
Short Term Exposure: Signs and symptoms of acute exposure to lactonitrile may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red mucous membranes and blood, cardiac arrhythmias; other cardiac abnormalities are common. Cyanosis (blue tint to the skin and mucous membranes) may be present, following exposure to lactonitrile. Salivation, nausea, and vomiting may also occur. Tachypnea (rapid respiratory rate) may be followed by respiratory depression. Lung hemorrhage and pulmonary edema may occur. Headache, vertigo (dizziness), agitation, and giddiness may be followed by combative behavior, convulsions, paralysis, protruding eyeballs, dilated and unreactive pupils, and coma. Lactonitrile is irritating to the skin and mucous membranes. Lacrimation (tearing) and a burning sensation of the mouth and throat are common. *Warning:* Heart palpitations may occur within minutes after exposure. Caution is advised. Vital signs should be monitored closely. Symptoms may be delayed.
Long Term Exposure: May cause liver and kidney damage.
Points of Attack: Respiratory system, central nervous system, cardiovascular system, liver, kidneys.
Medical Surveillance: Liver function tests. Kidney function tests. See also NIOSH Criteria Document 212 *Nitriles*.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. The NIOSH REL for nitriles is a Ceiling Concentration of 6 mg/m^3, not to be exceeded in any 15-min work period.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00011-4

chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and alkalis. Store in a refrigerator under an inert atmosphere and protect from light for prolonged storage. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Nitriles, toxic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." This chemical falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.1
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.9

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including cyanide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as lead compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains lead as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as lead compounds, soluble, n.o.s.

California Proposition 65 Chemical: Cancer; 10/1/92; Developmental/Reproductive toxin (male, female) 2/27/87

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as inorganic compounds, n.o.s.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Inorganic lead includes lead oxides, metallic lead, lead salts, and organic salts, such as lead soaps, but excludes lead arsenate and organic lead compounds. Lead is a blue−gray metal which is very soft and malleable. Lustrous when freshly cut; tarnishes in moist air. Specific gravity (H_2O:1) = 11.34; Molecular weight = 207.19; Boiling point = 1750°C; Freezing/Melting point = 327°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Organometallic; Reproductive Effector; Human Data. Metallic lead is used for lining tanks, piping, and other equipment where pliability and corrosion resistance are required, such as in the chemical industry in handling corrosive gases and liquids used in the manufacture of sulfuric acid; in petroleum refining; and in halogenation, sulfonation, extraction, and condensation processes; and in building industry. It is also used as an ingredient in solder, a body filler in the automobile industry, and a shielding material for X-rays and atomic radiation, in manufacture of tetraethyl lead and organic and inorganic lead compounds, pigments for paints and varnishes, storage batteries, fling glass, vitreous enameling, ceramics as a glaze, litharge rubber, plastics, and electronic devices. Lead is utilized in metallurgy and may be added to bronze, brass, steel, and other alloys to improve their characteristics. It forms alloys with antimony, tin, copper, etc. It is also used in metallizing to provide protective coatings and as a heat treatment bath in wire drawing. Exposures to lead dust may occur during mining, smelting, refining, and to fume, during high temperature (>500°C) operations, such as welding or spray coating of metals with molten lead. There are numerous applications for lead compounds, some of the more common being in the plates of electric batteries and accumulators; as compounding agents in rubber manufacture; as ingredients in paints, glazes, enamels, glass, pigments; and in the chemical industry. In addition, to these usual levels of exposure from environmental media, there exist miscellaneous sources which are hazardous. The level of exposure resulting from contact is highly variable. Children with pica for paint chips or for soil may experience elevation in blood lead, ranging from marginal to sufficiently great to cause clinical illness. Certain adults may also be exposed to hazardous concentrations of lead in the workplace, notably in lead smelters and storage battery manufacturing plants. Again, the range of exposure is highly variable. Women in the workplace are more likely to experience adverse effects from lead exposure than men due to the fact that their hematopoietic system is more lead-sensitive than men. Because of health concerns, lead from gasoline, paints, and ceramic products, caulking, and pipe solder, has been dramatically reduced in recent years.

Incompatibilities: Lead dust is flammable in air and may explode when exposed to heat or flame. Reacts with sulfuric acid, hot concentrated nitric acid, boiling concentrated hydrochloric acid. Powdered lead can react (possibly violently) with strong oxidizers, ammonium nitrate, chlorine trifluoride, chemically active metals, concentrated hydrogen peroxide, sodium acetylide. Incompatible with sodium azide, disodium acetylide, hydrogen peroxide, active metals—sodium, potassium, zirconium. Lead is attacked by pure water and weak organic acids in the presence of oxygen. Attacked at room temperature by chlorine, fluorine.

Permissible Exposure Limits in Air

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other inorganic lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers “lead” to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called “soaps;” all other lead compounds are excluded from this definition.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers “lead” to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead “soaps” but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

NIOSH IDLH: 100 mg [Pb]/m^3

Metallic lead

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 0.25 mg/m^3

PAC-3: 100 mg/m^3

European OEL: 0.15 mg[Pb]/m^3 TWA (2002)

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Austria: MAK 0.1 mg/m^3, 1999; Denmark: TWA 0.1 mg/m^3, 1999; Japan 0.1 mg/m^3, 1999; Norway: TWA 0.05 mg/m^3, 1999; Poland: MAC (TWA) 0.05 mg/m^3, 1999; Sweden: TWA 0.05 mg/m^3 (resp. dust), 1999; Sweden: TWA 0.1 mg/m^3 (total dust), 1999; the Netherlands: MAC-TGG 0.15 mg/m^3, 2003. The EPA requires lead in air not to exceed 1.5 μg/m^3 averaged over 3 months; the Czech Republic at 0.7 μg/m^3 on a daily average basis *and* at 2.0 μg/m^3 on a momentary basis. Several states have set guidelines or standards for lead in ambient air[60] ranging from 0.068 μg/m^3 (Massachusetts) to 0.357−1.5 μg/m^3 (North Dakota and Pennsylvania) to 2.5 μg/m^3 (New York) to 3.0 μg/m^3 (Connecticut) to 4.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Ingestion of dust, inhalation of dust or fume, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The effects of exposure to fumes and dusts of inorganic lead may be slow to develop. Extremely high exposures can lead to seizures, coma, and death, but symptoms occur after weeks to months of exposure. The earliest symptoms may include tiredness, decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, constipation, abdominal pains and decreased appetite, moodiness (mostly irritability and depression). Skin contact may cause irritation. Eyes contact may cause irritation. Ingestion of large amounts of lead may lead to seizures, coma, and death.

Long Term Exposure: Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include high blood pressure, anemia, pale skin, a blue line at the gum margin, paralysis of forearm, wrist joint, and fingers, causing decreased hand-grip strength, abdominal pain, severe constipation, nausea, vomiting. Prolonged exposure to high enough levels may result in serious, permanent kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, mood and personality changes, retarded mental development, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead is a probable teratogen in humans. Continuous exposure can result in decreased fertility in males and females. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects. May cause retarded development of the newborn.

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs. The effects may be delayed. Medical observation is recommended. The biological half-life (PB) in the bones of humans = 10 years.

Points of Attack: Eyes, gastrointestinal tract, central nervous system, kidneys, blood, gingival tissue.

Medical Surveillance: OSHA mandated medical tests: whole blood (chemical/metabolite), blood lead level, hemoglobin, hematocrit, zinc protoporphyrin, blood urea nitrogen, serum creatinine, urinalysis (routine), microscopic examination. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

NIOSH lists the following tests: whole blood (chemical/metabolite); blood lead level; biologic tissue/biopsy; complete blood count; nerve conduction studies; neurologic examination/electromyography; red blood cells/count; red blood cells/count: zinc protoporphyrin; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), 24-h collection; Zinc Protoporphyrin; Zinc Protoporphyrin, after 1-month exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention.

Antidotes and special procedures: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Prevent skin contact: Any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Vacuum clothing with HEPA. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH 78-158 *Lead, inorganic dusts, and fumes*.

Respirator Selection: OSHA: *0.5 mg/m³:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators]. *1.25 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m³:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Lead is regulated by OSHA Standard 1910. 1025. All requirements of the standard must be followed.

Shipping: For Metal powder, flammable, n.o.s. the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall into Hazard Class 4.2 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Get all workers out of spill area. Put on necessary protective equipment including respirators. If spill is a solution, cover with absorbent and shovel into suitable container. If spill is in powder form, vacuum (HEPA) whenever possible to avoid raising dust by sweeping or blowing. Place in suitable container. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead powder is flammable when exposed to heat or flame. *Do not use water*. Use dry chemicals appropriate for extinguishing metal fires. Generally the problem is to fight a fire based on the surrounding combustible material since metallic lead is not combustible. Poisonous fumes, including lead, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recycle wherever possible. May be treated with HNO_3 to give lead nitrate; the lead may be precipitated as sulfide, which is then sent to a lead recovery plant.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Lead acetate is a white, flaky crystalline substance with a slight odor of acetic acid. Commercial grades may be powdered granules, or brown or gray lumps. Molecular weight = 325.29; Boiling point = 280°C; Freezing/Melting point = 75°C (decomposes above 200°C). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water, but absorbs carbon dioxide upon exposure to air, and may become insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Organometallic, Mutagen; Reproductive Effector; Human Data. Lead acetate is used as a color additive in hair dyes, as a mordant in cotton dyes, in the lead coating of metals, as a drier in paints, varnishes and pigment inks, and in medicines such as astringents.

Incompatibilities: Reacts violently with strong oxidizers, bromates, strong acids, chemically active metals, phosphates, carbonates, phenols. Contact with strong acids forms acetic acid. Incompatible with strong bases, ammonia, amines, cresols, isocyanates, alkylene oxides, epichlorohydrin, sulfites, resorcinol, salicylic acid, chloral hydrate.

ACGIH TLV®[1]: No listing for organic lead compounds.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This material is poisonous. It emits toxic fumes of lead when heated to decomposition. Symptoms of exposure include irritation on the eyes, respiratory tract, and alimentary tract; headache, nausea, vomiting, colic, constipation, leg cramps; muscle weakness; paralysis, paresthesias, depression, dizziness, loss of consciousness; coma; and death. High levels of exposure to lead acetate may affect the central nervous system and blood, causing anemia, nervous disorders, kidney impairment.

Long Term Exposure: Repeated exposure may cause lead to accumulate in the body and may cause lead poisoning. See above for symptoms. May affect the blood, bone marrow, cardiovascular system, kidneys, nervous system including weakness and poor coordination in the arms and legs, hemolytic anemia, increase in blood pressure, paralysis, brain damage, behavioral effects including irritability, reduced memory, and disturbed sleep. Has been shown to cause kidney cancer in animals; possibly carcinogenic to humans. A probable teratogen. May cause reduced growth of offspring after birth while also decreasing fertility in males.

Points of Attack: Kidneys, brain, nervous system, blood.

Medical Surveillance: OSHA mandated medical tests: whole blood (chemical/metabolite), blood lead level, hemoglobin, hematocrit, zinc protoporphyrin, blood urea nitrogen, serum creatinine, urinalysis (routine), microscopic examination. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines “exposure” for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

NIOSH lists the following tests: whole blood (chemical/metabolite); Blood Lead Level; biologic tissue/biopsy; Complete blood count; Nerve Conduction Studies; Neurologic Examination/Electromyography; red blood cells/count; red blood cells/count: Zinc Protoporphyrin; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), 24-h collection; Zinc Protoporphyrin; Zinc Protoporphyrin, after 1-month exposure.

First Aid: ***Skin Contact***[52]***:*** Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Avoid dust inhalation; wear NIOSH and US Bureau of Mines approved dust mask. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH 78-158 *Lead, inorganic dusts and fumes.*

Respirator Selection: OSHA: *0.5 mg/m^3:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators]. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place and keep tightly covered and avoid contact with oxidizers, strong acids, chemically active metals. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid airborne dust then transfer material to vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead acetate may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous fumes of lead are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Convert to nitrate using nitric acid, evaporate, then saturate with H_2S, wash and dry the sulfide and ship to the supplier.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2A, 1987; Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (In Agriculture in India, Japan) (UN).[13]

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025 and 1910. 1018).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as lead compounds, n.o.s.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 2/27/87; 10/1/92 (lead and compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R23/25; Safety phrases: S1/2; S20/21; S28; S45 as arsenic compounds.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Lead arsenate is an odorless, heavy, white powder, or crystals. Molecular weight = 347.12; Freezing/Melting point = (decomposes) approximately 280°C. Also listed at 1042°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in cold water; soluble in hot water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen. Used as an insecticide, herbicide, and in manufacture of drugs and veterinary tapeworm medicine.

Incompatibilities: Violent reactions occur from contact with oxidizers, chemically active metals, strong acids. Acids and acid mists cause the release of arsine, a deadly gas. Decomposes above 270°C forming toxic fumes including arsenic and lead compounds.

Permissible Exposure Limits in Air

As arsenic

OSHA PEL: 0.01 mg[As]/m^3 TWA; cancer hazard that can be inhaled, see 29CFR1910.1018.

NIOSH REL: 0.002 mg[As]/m^3 [15 min] Ceiling Concentration. Limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: TLV® [withdrawn].

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/end-of-shift; Carcinogen Category; Germ Cell Mutagen Group 3A.

NIOSH IDLH: 5 mg[As]/m^3.

Protective Action Criteria (PAC)

3687-31-8

TEEL-0: 0.06 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 30 mg/m^3

Dibasic, *7784-40-9*

TEEL-0: 0.0463 mg/m^3

PAC-1: 23.2 mg/m^3

PAC-2: 23.2 mg/m^3

PAC-3: 23.2 mg/m^3

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Lead:

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Argentina[35] has set 0.15 mg/m^3 as a TWA ambient air[60] ranging from 0.5 μg/m^3 (New York) to 0.75 μg/m^3 (South Carolina) to 0.5 μg/m^3 (Florida and North Dakota) to 2.5 μg/m^3 (Virginia) to 3.0 μg/m^3 (Connecticut) to 4.0 μg/m^3 (Nevada).

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Lead arsenate irritates the eyes, skin, and respiratory tract. Skin contact can cause burning sensation, itching, and rash. High exposure can cause poor appetite; nausea, vomiting, and muscle cramps. May affect the heart, with abnormal EKG, gastrointestinal tract, and nervous system. Arsenic intoxication: nausea, diarrhea, inflammation of skin and mucous membranes; lead intoxication: abdominal pain, appetite loss, constipation, tiredness, weakness, nervousness, paresthesia. A rebuttable presumption against registration for pesticide uses was issued on October 18, 1978 by EPA on the basis of oncogenicity, teratogenicity, and mutagenicity.

Long Term Exposure: Lead arsenate is a carcinogen and has been shown to cause skin, lung, and liver cancer. Lead arsenate may also affect the gastrointestinal tract, nervous system, kidneys, and blood. Lead and certain lead compounds may be teratogens and cause reproductive damage in humans. See entry on "lead" for additional information on lead poisoning.

Points of Attack: Kidneys, blood, gingival tissue, lymphatic, skin, gastrointestinal system, central nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

Also seek prompt medical evaluation if health effects are noticed. With each visit, careful attention should be given to the inner nose, skin, nails, and nervous system. A test for serum arsenic is recommended. NIOSH recommends urine arsenic should not be greater than 50−100 μg/L of urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic and may be of SOME value in the case of lead poisoning. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Persons with significant lead poisoning can be treated with Ca EDTA while hospitalized. Since this drug causes a rush of lead from body organs into the blood and kidneys, and thus has its own hazards, it must be done by experienced medical persons under careful observation. It or other "chelating" drugs should never be used to prevent poisoning while exposure continues, as severe kidney damage can result.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document *#78-158, Lead, inorganic dusts and fumes.*

Respirator Selection:

As inorganic arsenic

At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

As lead

OSHA (lead): OSHA: *0.5 mg/m^3:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators]. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead arsenate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Avoid the presence of acids since arsine, a very deadly gas, is released in the presence of acid or acid mist. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Lead arsenates require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Protect against exposure to dust or fumes. Poisonous gases of lead and arsenic are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Long-term storage in large, weatherproof, and sift-proof storage bins or silos; may be disposed of by conversion to soluble salt, such as chloride, precipitation as sulfide, and return to supplier.[22]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead chloride is a white crystalline powder. Molecular weight = 278.00; Boiling point = 950°C; Freezing/Melting point = 501°C; Vapor pressure = 1 mmHg at 547°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in cold water; more soluble in hot water.

Potential Exposure: Used to make lead salts, lead chromate pigments, as an analytical reagent for making other chemicals, making printed circuit boards, as a solder and flux.

Incompatibilities: Violent reaction with oxidizers, chemically active metals, and explosive with calcium + warming.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.0671 mg/m^3

PAC-1: 0.201 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 134 mg/m^3

Lead

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

The National primary and secondary ambient air quality standards for lead and its compounds (measured as elemental Pb) = 1 mg[Pb]/m^3, maximum arithmetic mean averaged over a calendar quarter. In addition, Russia[43] set a MAC of 0.0017 mg/m^3 in the ambient air of residential areas (on a daily average basis; about 6 times the same limits for lead compounds in general).

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: 0.1 mg/L Pb in drinking water may cause chronic poisoning. The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation, skin. Can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short Term Exposure: Lead chloride can irritate the eyes on contact. Inhalation can irritate the nose and throat. Skin contact can cause burning, itching, rash, and pigment changes. Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, constipation, abdominal pains, and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death.

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: Lead chloride causes mutations. Such chemicals have a cancer risk. May damage the developing fetus. High levels can cause lead poisoning with symptoms of headache, irritability, disturbed sleep, tiredness, reduced memory, and personality changes. Higher levels can cause muscle or joint pains, weakness, and easy fatigue. Exposure can increase the risk of high blood pressure. May cause kidney and brain damage and anemia. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, papaverine). Consider morphine sulfate for severe pain. Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*), are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *0.5 mg/m^3:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators]. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, chemically active metals, calcium, and heat. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: Lead compounds, soluble, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." Lead chloride falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous fumes, including lead and chlorine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as lead compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains lead as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as lead compounds, soluble, n.o.s.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08; (lead and compounds) Cancer 10/1/92.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R61; R62; R33; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead chromate is an orange or orange-yellow crystalline solid or powder. Molecular weight = 323.19; 546.38 (lead chromate oxide); Boiling point = (decomposes); Freezing/Melting point = 844°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. Lead chromate is used to make paint pigments for wood and metal.

Incompatibilities: Oxidizers, active metals; hydrazine, sodium and potassium; organics at elevated temperature. Reacts with aluminum dinitronaphthalene, iron(III) hexacyanoferrate (IV).

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.01 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen.

ACGIH TLV®[1] (*as lead*): 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

DFG MAK (lead chromate & lead chromate oxide): Carcinogen Category 3B.

Protective Action Criteria (PAC)

7758-97-6

TEEL-0: 0.0311 mg/m^3

PAC-1: 0.186 mg/m^3

PAC-2: 93.2 mg/m^3

PAC-3: 93.2 mg/m^3

As chromium(VI), inorganic insoluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.01 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen.

DFG MAK: Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

As lead:

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: Carcinogen Category 3B.

Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Austria: Suspected: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, carcinogen, 1993; Denmark: TWA 0.02 mg[Cr]/m^3, 1999; TWA 0.1 mg[Pb]/m^3, 1999; Finland: carcinogen, 1999; France: VME 0.05 mg[Cr]/m^3, VME 0.15 mg[Pb]/m^3, 1999; Japan 0.01 mg[Cr]/m^3, 1999; 0.1 mg[Pb]/m^3, 1999; Norway: TWA 0.1 mg[CrO_3]/m^3, 1999; Norway: TWA 0.05 mg[Pb]/m^3, 1999; Poland: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, 1999; Poland: MAC (TWA) 0.05 mg[Pb]/m^3, 1999; Sweden: TWA 0.02 mg[Cr]/m^3, carcinogen, 1999; Switzerland: MAK-W 0.05 mg[Cr]/m^3, carcinogen, 1999; United Kingdom: TWA 0.05 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. Several states have set guidelines or standards for lead chromate in ambient air[60] ranging from 0.5 μg/m^3 (Connecticut and Virginia) to 1.0 μg/m^3 (Nevada).

Determination in Air: For lead use NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206; #7024 for chromium, hexavalent.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the respiratory tract. Lead chromate is a carcinogen—handle with extreme caution. Lead poisoning symptoms may include poor appetite, colic, upset stomach, headache, irritability, muscle or joint pains, and weakness. Permanent kidney damage can result from long term or high exposure. Breathing lead chromate can cause a hole in the inner nose. Irritation of nose, throat, or bronchial tubes can also occur, with cough and/or wheezing. Skin contact with concentrated lead chromate can cause burns, deep ulcers, or an allergic skin rash.

Long Term Exposure: Lead chromate has been shown to cause kidney cancer. Repeated or prolonged contact may cause skin sensitization; dermatitis, irritation, chronic ulcers, eczema. Repeated or prolonged inhalation exposure may cause asthma. Lead chromate may affect the kidneys. May cause increased blood pressure. May cause reproductive toxicity and genetic damage in humans. May cause lead poisoning with symptoms of poor appetite, upset stomach, colic, headache, irritability, muscle or joint pains and weakness, constipation, disturbed sleep, and reduced memory. See also "Lead" entry.

Points of Attack: Kidneys, skin, lungs.

Medical Surveillance: NIOSH lists the following tests for chromates: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires employers to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: (*as chromic acid and chromates*) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129 *Chromium(VI)* and NIOSH 78-158 *Lead, inorganic dusts and fumes.*

Respirator Selection:

As lead

OSHA: *0.5 mg/m^3:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators]. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

As chromates:

NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead chromate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, zinc and ferric ferrocyanide), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." Lead chromate falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead chromate may burn but does not easily ignite. NFPA recommends the use of water on fire. Poisonous gases, including lead and chromium, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.
Description: Lead Dioxide is a dark brown crystalline solid or powder. Molecular weight = 239.19; Freezing/Melting point = (decomposes) 290°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 3 (Oxidizer). Insoluble in water.
Potential Exposure: This material is used in electrodes for lead-acid batteries, in matches, explosives, and as a curing agent for polysulfide elastomers.
Incompatibilities: A powerful oxidizer. Violent reaction with many compounds, including reducing agents, chemically active metals, combustible materials.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
1309-60-0
TEEL-0: 0.0577 mg/m^3
PAC-1: 0.173 mg/m^3
PAC-2: 0.3 mg/m^3
PAC-3: 115 mg/m^3
As inorganic lead
OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition. See 29CFR1910.1025.
NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.
ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.
European OEL: 0.15 mg[Pb]/m^3 TWA (2002).
NIOSH IDLH: 100 mg [Pb]/m^3.
DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.
Determination in Air: Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.
Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.
Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Lead dioxide can affect you when breathed in. Irritates eyes, skin, and respiratory tract. Lead

dioxide should be handled as a teratogen with extreme caution. Lead poisoning can cause poor appetite, colic, upset stomach, headaches, irritability, muscle or joint pains and weakness. Permanent kidney damage can result from high exposures.

Long Term Exposure: Repeated, prolonged, or high exposures may cause kidney damage. May cause lead poisoning with symptoms of poor appetite, upset stomach, colic, headache, irritability, muscle or joint pains and weakness, constipation, disturbed sleep, and reduced memory. See also "Lead" entry.

Points of Attack: Kidneys.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158, *LEAD, inorganic dusts and fumes.*

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Lead dioxide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates) chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials, such as wood, paper, and oil. Lead dioxide is regulated by OSHA Standard 1910.1025. All requirements of the standard must be followed. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Lead dioxide requires a shipping label of “OXIDIZER.” It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep combustibles (wood, paper, oil) away from spilled material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead dioxide does not burn but it will increase the intensity of a fire. Use extinguisher suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Conversion to soluble salt, precipitation as sulfide, and return to supplier.

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2A, 1987; Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

Air Pollutant Standard set. See below, “Permissible Exposure Limits in Air” section.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025).

Hazardous Substance (EPA) (RQ = 5000/2270).[4]

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as lead compounds, n.o.s.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as lead inorganic compounds, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead fluoborate is a nonflammable colorless liquid or crystalline powder with a faint odor. Specific gravity (H_2O:1) = 1.75 at 20°C; Molecular weight = 380.81. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water (decomposes).

Potential Exposure: This material is used in material finishing operations.

Incompatibilities: Aqueous solution is acidic. Incompatible with oxidizers, bases, active metals. Decomposes in water or alcohol. Attacks most metals, especially aluminum.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) *13814-96-5*

TEEL-0: 0.0919 mg/m^3

PAC-1: 0.276 mg/m^3

PAC-2: 0.459 mg/m^3

PAC-3: 184 mg/m^3

As inorganic lead

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition. See 29CFR1910.1025.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

European OEL: 0.15 mg[Pb]/m^3 TWA (2002).

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Lead fluoborate can affect you when breathed in and if swallowed from food, drinks, or cigarettes. Contact can cause skin and eye irritation and burns. Irritates the respiratory tract. Can cause headache, irritability, mood changes, reduced memory, and disturbed sleep.

Long Term Exposure: Repeated exposure causes lead fluoborate build up in the body and lead to lead or fluoride poisoning. Low levels may cause tiredness, mood changes, headaches, stomach problems, and trouble sleeping. Higher levels may cause aching, weakness, and concentration or memory problems. May damage the nervous system causing numbness, "pins and needles" weakness in the hands and feet. Lead fluoborate can also cause serious permanent kidney, brain damage, and damage the blood cells, causing anemia. Lead fluoborate exposure increases risk of high blood pressure. Lead compounds have been determined to be teratogens and may also cause reproductive damage, such as reduced fertility and interference with menstrual cycles. Lead fluoborate should be handled as a teratogen with extreme caution.

Points of Attack: Kidneys, nervous system, brain, blood.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

NIOSH lists the following tests for fluorides: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158, *LEAD, inorganic dusts and fumes*.

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead fluoborate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: Lead compounds, soluble, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate and wash area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead fluoborate itself does not burn. Use any agent suitable for type of surrounding fire.

Poisonous fumes including lead and fluorine are in fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead fluoride is a white to colorless, odorless crystalline (rhombic, orthorhombic) solid. Molecular weight = 245.19; Boiling point = 1292°C; Freezing/Melting point = 825°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used to make other chemicals, underwater paints, electronic and optical parts (for growing single-crystal, solid-state lasers), in high-temperature dry-film lubricants, and for making special grades of glass.

Incompatibilities: Violent reaction with oxidizers, chemically active metals, calcium carbide. May ignite combustibles, such as wood, paper, oil, etc.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

7783-46-2

TEEL-0: 0.0592 mg/m^3

PAC-1: 0.178 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 118 mg/m^3

As inorganic lead

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in “nonferrous foundries with less than 20 employees” is 0.075 mg/m^3. OSHA considers “lead” to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called “soaps;” all other lead compounds are excluded from this definition. See CFR1910.1025.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers “lead” to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead “soaps” but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

As inorganic fluorides
OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.
NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15-min Ceiling Concentration.
ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.
DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.
NIOSH IDLH: 250 mg[F]/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: 0.1 mg/L Pb in drinking water may cause chronic poisoning. The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation, skin. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause skin and eye irritation and burns. Inhalation can irritate the nose and throat. Lead fluoride can cause headache, irritability, mood changes, reduced memory, and disturbed sleep. The fluoride ion can cause protoplasmic poisoning at higher concentrations. See also entry on "Fluorides."

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: While lead fluoride has not been identified as a teratogen, or a reproductive hazard, lead and certain lead compounds have been determined to be teratogens and may also cause reproductive damage, such as reduced fertility and interfere with menstrual cycles. Handle with extreme caution. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*), are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

As fluorides

NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: Toxic solid, inorganic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." Lead fluoride falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical does not burn. Use any extinguishing agent suitable for surrounding fire. Poisonous gases, including hydrogen fluoride, lead oxide, and lead fumes, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead Iodide is a heavy, bright-yellow, odorless powder. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Lead iodide is used in bronzing, gold pencils, mosaic gold, printing, and photography.

Incompatibilities: Contact with oxidizers or active metals may cause violent reaction.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) *10101-63-0*

TEEL-0: 0.111 mg/m^3

PAC-1: 0.334 mg/m^3

PAC-2: 0.556 mg/m^3

PAC-3: 222 mg/m^3

As iodides

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA.

As inorganic lead

OSHA PEL: 0.050 $mg[Pb]/m^3$ TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition. See CFR1910.1025.

NIOSH REL: 0.050 $mg[Pb]/m^3$ TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than

0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 μm filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Can cause headache, irritability, reduced memory, and disturbed sleep. Lead poisoning can cause poor appetite, colic, upset stomach, headaches, irritability, muscle or joint pains, and weakness.

Long Term Exposure: Permanent kidney damage can result from long-term or high exposures. Repeated exposure may cause brain damage, and damage to the blood cells, leading to anemia. Higher levels can cause muscle and joint pains, weakness, and fatigue. May cause nerve damage. Lead exposure increases the risk of high blood pressure. Lead iodide should be handled as a teratogen, with extreme caution. Repeated exposure may cause lead poisoning and/or iodism. Symptoms of iodism can include running nose, headache, mucous membrane irritation, and skin rash.

Points of Attack: Kidneys, brain, nervous system, blood.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158, *LEAD, inorganic dusts and fumes*.

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead iodide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Lead iodide is regulated by an OSHA Standard, 1910.1025. All requirements of the standard must be followed.

Shipping: Toxic solid, inorganic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." Lead fluoride falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous fumes of lead and iodine are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Description: Lead phosphate is a white powder or colorless crystals. Molecular weight = 811.51; Freezing/Melting point = 1012°C. Hazard Identification (based on NFPA-704 M Rating System) (estimated): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Lead phosphate is used as a stabilizer in styrene and casein plastics.

Incompatibilities: Oxidizers, active metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
7446-27-7
TEEL-0: 0.0653 mg/m^3
PAC-1: 0.196 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 131 mg/m^3
As inorganic lead

OSHA PEL: 0.05 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition. See 29CFR-1910.1025.

NIOSH REL: 0.05 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.
NIOSH IDLH: 100 mg [Pb]/m^3.
DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Lead phosphate can cause headache, irritability, reduced memory, and disturbed sleeping patterns. Lead enters the body by breathing and from contaminated food, beverages, or cigarettes. Lead poisoning can cause poor appetite, colic, upset stomach, headaches, irritability, muscle or joint cramps, and weakness.

Long Term Exposure: Lead phosphate is a carcinogen, handle with extreme caution. Lead phosphate should be handled as a teratogen, with extreme caution. Permanent kidney damage can result from long term or high exposures. Lead exposure increases the risk of high blood pressure. High or repeated exposure may damage the nerves resulting in loss of coordination in the arms and legs. Can cause brain damage and anemia.

Points of Attack: Kidneys, blood, nervous system, brain.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158, *LEAD, inorganic dusts and fumes*.

Respirator Selection: OSHA: *0.5 mg/m³:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m³:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, strong acids. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." Lead fluoride falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or extinguishers. Poisonous gases, including lead and phosphorus oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity (*as organic lead compounds*): IARC: Organic lead compounds are not classifiable as to their carcinogenicity to humans, (Group 3, 2004).

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1025).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as lead compounds, n.o.s.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

Canada, WHMIS, organic lead compounds are *not* included on the Ingredients Disclosure List.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead stearate is an organic lead compound. It is a white powder with a slight fatty odor. Molecular weight = 1734.87; Freezing/Melting point = 116°C; Flash point = 232°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: It is used in extreme-pressure lubricants and as a drier in varnishes.

Incompatibilities: Oxidizers, strong acids. Dust may explode at high temperature or with source of ignition.

Permissible Exposure Limits in Air

As organic lead

ACGIH TLV®[1]: No listing for organic lead compounds.

Determination in Air: Use (*for inorganic lead*) NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: 0.1 mg/L Pb in drinking water may cause chronic poisoning. The EPA limits lead in drinking water to 15 μg per liter. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Ingestion, skin contact. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short Term Exposure: Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, constipation, abdominal pains, and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death. Between 1 oz and 1 lb of lead stearate may be fatal.

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: While lead stearate has not been identified as a teratogen, or a reproductive hazard, lead and certain lead compounds have been determined to be teratogens and may also cause reproductive damage such as reduced fertility and interfere with menstrual cycles. Handle with extreme caution. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: *for inorganic lead.* Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*), are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *for inorganic lead* OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m³:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, strong acids. Dust may explode at high temperature. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: Toxic solids, organic, n.o.s. requires the label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous fumes including lead are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: Carcinogenicity (*as organic lead compounds*): IARC: Organic lead compounds are not classifiable as to their carcinogenicity to humans, (Group 3, 2004).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds.

US EPA Hazardous Waste Number (RCRA No.): U146.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/89.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R61; R33; R40; R48/22; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead subacetate is a white, heavy powder or gelatinous solid. Molecular weight = 807.71. Hazard

Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Permissible Exposure Limits in Air

Basic; subacetate

TEEL-0: 35 mg/m^3

PAC-1: 100 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

As organic lead

ACGIH TLV®[1]: No listing for organic lead compounds.

Potential Exposure: Used as a decolorizing agent in sugar solutions and as an analytical chemical.

Incompatibilities: Oxidizers, strong acids.

Determination in Air: Use (*for inorganic lead*) NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: 0.1 mg/L Pb in drinking water may cause chronic poisoning. The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation, skin. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short Term Exposure: Lead subacetate can cause headache, irritability, mood changes, reduced memory, and disturbed sleep.

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: Lead subacetate may be a carcinogen in humans since it has been shown to cause kidney, lung, and brain cancer in animals. May be a teratogen in humans. May damage the testes. Repeated exposure may cause lead poisoning with symptoms of headache, irritability, disturbed sleep, tiredness, reduced memory, and personality changes. Higher levels can cause muscle or joint pains, weakness, disturbed sleep, and easy fatigue. Exposure can increase the risk of high blood pressure. May cause kidney and brain damage and anemia. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: (*for inorganic lead*) Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*), are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *for inorganic lead* OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, strong acids. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Lead acetate requires a shipping label of "POISONOUS/TOXIC MATERIALS." Lead acetate falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, alcohol foam or polymer foam extinguishers. Poisonous gases, including lead oxide and carbon monoxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead sulfate is a heavy, white crystalline powder. Molecular weight = 303.25; Freezing/Melting point = 1170°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: Lead sulfate is used in storage batteries and paint pigments. Used in the making of alloys, fast-drying oil varnishes, weighting fabrics, in lithography.

Incompatibilities: Contact with oxidizers and chemically active metals may cause violent reactions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

7446-14-2

TEEL-0: 0.0732 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 146 mg/m^3

As inorganic lead

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in “nonferrous foundries with less than 20 employees” is 0.075 mg/m^3. OSHA considers “lead” to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called “soaps;” all other lead compounds are excluded from this definition. See 29CFR1910.1025.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers “lead” to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead “soaps” but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: This chemical is corrosive. Skin contact can cause severe irritation and burns, itching, rash, and pigment changes. Eye contact can cause severe irritation and burns. Inhalation can cause irritation of the respiratory tract. Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, constipation, abdominal pain, and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death.

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: Highly irritating and corrosive substances can cause lung irritation that may lead to bronchitis. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Lungs, blood, kidneys, brain.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Note to physician: whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*), are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158, *LEAD, inorganic dusts and fumes*.

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead sulfate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Lead sulfate with more than 3% free acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead sulfate is not combustible. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous fumes including lead and sulfur oxides are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence*, possibly carcinogenic to humans*, Group 2A, 1987; Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Hazardous Substance (EPA) (RQ = 5000/2270).[4]

Section 261 Hazardous Constituents, waste number not listed, as lead compounds, n.o.s.

EPCRA Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds.

RCRA Section 313: Includes any unique chemical substance that contains lead as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as lead compounds, soluble, n.o.s.

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead sulfide is a silvery to black crystalline powder. Molecular weight = 239.25; Boiling point = 1281°C (sublimes); Freezing/Melting point = 1114°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Practically insoluble in water (0.000086 g/100-cc water at 13°C).

Potential Exposure: Lead sulfide is used in ceramics, infrared radiation detectors, and semiconductors.

Incompatibilities: Contact with oxidizers and chemically active metals may cause violent reactions. Sulfides react with acids to produce toxic and flammable vapors of hydrogen sulfide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

1314-87-0

TEEL-0: 0.0577 mg/m^3
PAC-1: 0.173 mg/m^3
PAC-2: 115 mg/m^3
PAC-3: 115 mg/m^3

As inorganic lead

OSHA PEL: 0.050 mg[Pb]/m^3 TWA. [*Note*: The PEL also applies to other lead compounds (as Pb).] Other OSHA requirements can be found in 29 CFR 1910.1025. The OSHA PEL (8-h TWA) for lead in "nonferrous foundries with less than 20 employees" is 0.075 mg/m^3. OSHA considers "lead" to mean metallic lead; all inorganic lead compounds (lead oxides and lead salts); and a class of organic compounds called "soaps;" all other lead compounds are excluded from this definition. See 29CFR1910.1025.

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb).] *Note:* NIOSH considers "lead" to mean metallic lead, lead oxides, and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (Note: The TLV also applies to lead, inorganic compounds.) *Note:* women of child-bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 mg [Pb]/m^3.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age <45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

In addition, Russia[43] set a MAC of 0.0017 mg/m^3 in the ambient air of residential areas (on a daily average basis; about 6 times the same limits for lead compounds in general).

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45-μm filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Lead sulfide is very slightly soluble in water, and sulfides react with water, forming hydrogen sulfide. Eye contact may cause eye irritation and damage. Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance; headache, aching bones and muscles, constipation, abdominal pains, and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death. *Note:* Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Lungs, blood, kidneys, brain.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Note to physician: whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*) are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158, *LEAD, inorganic dusts and fumes*.

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Lead sulfide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture and acids. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." Lead fluoride falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including lead and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 10/1/92 (lead and compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as lead compounds, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lead thiocyanate is a white or light yellow, odorless, crystalline powder. Odorless. Molecular weight = 323.36; Specific gravity (H_2O:1) = 3.82; Freezing/Melting point = 190°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water; solubility = <0.05%.

Potential Exposure: An explosive, thermally unstable material. Used in making safety matches, primers for small-arms cartridges, pyrotechnic devices, and in dyes.

Incompatibilities: Oxidizers, strong acids. Contact with acids or acid fumes caused decomposition with fumes of cyanide. Will decompose in hot water.

Permissible Exposure Limits in Air

No TEEL available.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Determination in Water: 0.1 mg/L Pb in drinking water may cause chronic poisoning. The EPA limits lead in drinking water to 15 μg/L. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Routes of Entry: Inhalation, skin. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact can cause irritation and burns. Lead thiocyanate can cause headache, irritability, mood changes, reduced memory, and disturbed sleep.

Note: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long Term Exposure: Repeated exposure can cause lead poisoning with symptoms of headache, irritability, disturbed sleep, tiredness, reduced memory, and personality changes. Higher levels can cause muscle or joint pains, weakness, disturbed sleep, and easy fatigue. Exposure can increase the risk of high blood pressure. May cause kidney and brain damage and anemia. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a build up of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 μg of lead or more in a cubic meter of air. OSHA (1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you.

Note: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 mL blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 mL blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women <45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*), are generally useful in the therapy of acute lead intoxication.

Antidotes and special procedures for lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control, as severe kidney damage can result.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *0.5 mg/m^3:* Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators. *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from hot water, heat, oxidizers, acids, acid fumes. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: Lead compounds, soluble, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Neutralize with lime or sodium bicarbonate. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is slightly flammable when exposed to heat or flame. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases, including cyanides, nitrogen oxides, sulfur oxides, and lead oxide are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be

trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 244-472-8 [*Annex I Index No.:* 015-093-00-3]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (many countries) (UN).[13]

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R21; R25; R39/25; R50/53; Safety phrases: S1/2; S25; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Leptophos is a tan, waxy solid. Molecular weight = 412.07; Freezing/Melting point = about 70°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.028%.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide. Its use is not permitted in the United States.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 6 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 30 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 6.3$.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. This material is highly toxic; it is capable of causing death or permanent injury by exposure during normal use. LD_{50} = (oral-rat) 30 mg/kg.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Leptophos is classified as an organophosphorus pesticide, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, cargo dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases, including bromine, chlorine, phosphorus oxides, sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be treated with alkali and then burned in a landfill. Large quantities should be incinerated in a unit with effluent gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Lewisite (Agents L-1, L-2, L-3, & HL−WMD) L:0250

Molecular Formula: $C_2H_2AsCl_3$

Common Formula: $ClCH{=}CHAsCl_2$

Synonyms: (2-Chloroethenyl)arsenous dichloride; β-Chlorovinylbichloroarsine; (2-Chlorovinyl)dichloroarsine; 2-Chlorovinyldichloroarsine; Dichloro(2-chlorovinyl)arsine; L-1, L-2, L-3 (military designations); Levista (Spanish); Lewisite (arsenic compound)

Mustard-Lewisite: Agent HL; Sulfur mustard/Lewisite

CAS Registry Number: 541-25-3 (L-1); 40334-69-8 (L-2); 40334-70-1 (L-3); 1306-02-1

RTECS® Number: CH2975000

UN/NA & ERG Number: UN2810/153; UN3162 (Liquefied gas, poisonous, n.o.s.)

UN/NA & ERG Number: None assigned.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g. (L1, L2, or L3).

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); List of high-risk pollutants (Section 63.74), as arsenic compounds.

Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as arsenic compounds, n.o.s., waste number not listed.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%. (as organic arsenic compound) inhalation hazard.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates.

US DOT 49CFR172.101, Inhalation Hazard Chemical.

WGK (German Aquatic Hazard Class): No value assigned (all above CAS numbers).

Description: Lewisite is a colorless, odorless liquid when pure. Industrially produced lewisite is an amber to dark brown oily liquid with an odor of geraniums. It turns violet to black or green with age. Odor is not a reliable indicator of the presence of toxic amount of vapor. Blister agent, lewisite (L) rapidly decomposes in relative humidity over 70%. Molecular weight = 207.32; Density (20°C) = 1.89 g/cm^3; Volatility = 2500 mg/m^3 at 20°C; Specific gravity = 1.89 at 20°C; Boiling point = 190°C (decomposes); Freezing/Melting point = 0.1°C. Flash point = None. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1. Sinks in water and is slightly soluble; solubility = 0.5 g/L.

Lewisite is a complex mixture of several *cis*- and *trans*-isomer compounds. In chemical-agent-grade lewisite, the L-1 isomer [2-Chlorovinylarsonous dichloride] generally predominates. The three homologues, L-1, L-2 [Bis(2-chlorovinyl)arsinous chloride], and L-3 [Tris(2-chlorovinyl)arsine] form from the catalyzed reaction of arsenic trichloride and acetylene. L-1 forms initially, but it continues to react with acetylene to form L-2 and L-3. L-1 is the vesicant agent. L-2 and L-3 are also toxic but considerably less than L-1.

Mustard−lewisite (military designation HL) is a liquid mixture of distilled mustard (HD) and lewisite (L) and has some properties of both. HL is both a blister agent (vesicant) and an alkylating agent (causes damage to the DNA of rapidly dividing cells). The mustard−lewisite mixture requires lower ambient temperatures before it will freeze; this property allows for improved ground dispersal and aerial spraying. Due to its low freezing point, the mixture remains a liquid in cold weather and at high altitudes. The mixture with the lowest freezing point consists of 63% Lewisite and 37% mustard. Mustard−Lewisite mixture may have a garlic odor. Odor however, should not be depended on to detect HL mixture.[NIOSH] Exposure to large amounts of HL may be fatal.

Potential Exposure: Those involved in the manufacture or use of this chemical warfare agent which is a vesicant. L-1, L-2, and L-3 have been used as a blister-agent-type war gas.

Mustard−lewisite mixture was developed to achieve a lower freezing point for ground dispersal and aerial spraying.

Persistence of Chemical Agent: Agents L or HL: Summer: 1−3 days; Winter: May last for weeks.

Incompatibilities: Lewisite reacts with water and sweat; and, as it breaks down in water or sweat, it produces arsenic-containing materials which are less dangerous than lewisite but still dangerous. Heating causes lewisite to yield arsenic trichloride, tris-(2-chlorovinyl)arsine, and bis-(2-chlorovinyl)chloroarsine. Mustard−lewisite mixture is rapidly corrosive to brass at 65°C and will corrode steel at a rate of 0.0001 in. of steel per month at 65°C. It will hydrolyze into hydrochloric acid, thiodiglycol, and nonvesicant arsenic compounds.

Permissible Exposure Limits in Air The Surgeon General's Working Group (US Department of Health and Human Services) recommends (for the working place) 0.003 mg/m^3, Ceiling Concentration.

Protective Action Criteria (PAC) L-1; L-2; L-3

TEEL-0: 0.12 mg/m^3

PAC-1: 0.12 mg/m^3

PAC-2: 0.12 mg/m^3

PAC-3: 0.74 mg/m^3

Determination in Water: Lewisite dissolves rapidly in water and breaks down into toxic products that are much less dangerous than lewisite, but still poisonous, containing arsenic products. Warn pollution control authorities and advise shutting water intakes. Octanol−water coefficient: Log K_{ow} (estimated) = 2.56. Log $K_{benzene-water}$ = 0.15.

Routes of Entry: Inhalation, ingestion, skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Lewisite is a cell irritant, blister agent, and systemic poison that can be absorbed through skin; a few drops can cause death. It produces an immediate searing sensation in the eye and permanent loss of sight *if not decontaminated within 1 min.* It produces an immediate and strong stinging sensation to the skin, followed by reddening within 30 min and blistering after about 13 h. This material causes pulmonary edema, diarrhea, restlessness, weakness, subnormal temperature, and low blood pressure. Inhalation of high concentrations may be fatal in as short a time as 10 min. Lethal dose in humans is 6 ppm (inhalation), 20 mg/kg (skin). Eye injury below 300 mg-min/m^3. Pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long term Exposure: May cause sensitization and chronic lung impairment. It is a suspected carcinogen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Wash—strip—wash—evacuate upwind and uphill: the approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available), and then move away from the hot zone in an upwind and up-hill direction. Wash the victim with warm water and soap. There are differing guidelines for decontamination and more research is needed to identify the optimal decontamination method. The effect of lewisite and mustard−lewisite can be prevented by rapid topical application of 2,3-dimercaptopropanol, known as British anti-lewisite (BAL) which reacts with Lewisite to form a stable nontoxic cyclic product. Decontaminate with diluted household bleach (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Be sure you have decontaminated the victims as much as you can before they leave the area so that they do not spread the Lewisite. Use the antidote "Anti-Lewisite." Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes, and other items.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full face-piece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe (UN3162): Flammability Hazard: Store separately from all other flammable materials. Color Code—Blue (UN2810): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone A] requires a shipping label of "POISONOUS/TOXIC MATERIALS." Inhalation Hazard. Technical name required.

Spill Handling: BACK OFF! Isolate a wide area around the release and call for expert help. If in a building, evacuate and confine vapors by closing doors and shutting down HVAC systems. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid contact with eyes and skin; avoid breathing vapors. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with

time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (*From a small package or a small leak from a large package*)

Agents L-1, L-2, L-3, & HL when used as a weapon

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (*From a large package or from many small packages*)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.7/1.2

Small spills: Cover with vermiculite, diatomaceous earth, clay, or fine sand and neutralize as soon as possible using large amounts of alcoholic caustic, carbonate, or Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)]. Caution: acetylene given off. Place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Can be decontaminated by supertropical bleach or caustic soda. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Heating causes lewisite to yield arsenic compounds such as arsenic trichloride (A: 1570), tris-(2-chlorovinyl)arsine, and bis-(2-chlorovinyl)chloroarsine. Firefighting gear (including SCBA) does not provide adequate protection. Use unattended equipment whenever possible. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Specially trained personnel operating from a safe distance can fight fires using foam or dry chemicals, or use fog streams to extinguish burning liquids. Poisonous gases, including chlorine and arsenic, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray from unattended equipment to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

List of Stockholm Convention POPs: Annex A (Elimination).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R20/21; R25; R48/22; R64; R50/53; Safety phrases: S1/2; S13; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Lindane is a white to yellow, crystalline powder with a slight, musty odor (pure material is odorless). Molecular weight = 390.82; Specific gravity (H_2O:1) = 1.85; Boiling point = 323.3°C; Freezing/Melting point = 112.8°C; Vapor pressure = 0.00001 mmHg; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water. Noncombustible solid but may be dissolved in flammable liquids.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Lindane has been used against insects in a wide range of applications including treatment of animals, buildings, humans for ectoparasites, clothes, water for mosquitoes, living plants, seeds, and soils. Some applications have been abandoned due to excessive residues, e.g., stored foodstuffs. Formulators, distributors, and users of lindane represent a special risk group. The major use of lindane in recent years has been to pretreat seeds. Thus, those engaged in treatment and planting can be exposed.

Incompatibilities: Lindane decomposes on contact with powdered iron, aluminum, zinc, and with alkalis producing trichlorobenzene. Corrosive to metals.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 50 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 50 mg/m^3

DFG MAK: 0.1 mg/m3, inhalable fraction; [skin]; Carcinogen Category 4; Pregnancy Risk Group C.

Austria: MAK 0.5 mg/m^3, [skin], 1999; Denmark: TWA 0.5 mg/m^3, [skin], 1999; Finland: TWA 0.5 mg/m^3, [skin], 1999; France: VME 0.5 mg/m^3, [skin], 1999; Norway: TWA 0.5 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.5 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 4 μg/m^3, [skin], 2003; Turkey: TWA 0.5 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for lindane in ambient air[60] ranging from zero (North Dakota) to 0.068 μg/m^3 (Massachusetts) to 1.19 μg/m^3 (Kansas) to 1.2 μg/m^3 (Pennsylvania) to 1.67 μg/m^3 (New York) to 5.0 μg/m^3 (Connecticut, Florida, South Carolina) to 8.0 μg/m^3 (Virginia) to 12.0 μg/m^3 (Nevada).

Determination in Air: Collection on a filter, workup with isooctane, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method 5502.[18]

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.080 μg/L as a 24-h average, never to exceed 2.0 μg/L. *To protect saltwater aquatic life:* never to exceed 0.16 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 0.186 μg/L.[6] Mexico[35] has set allowable limits on 0.2 μg/L in coastal waters and 2.0 μg/L in estuaries. WHO has set a limit of 3.0 μg/L in drinking water. The US EPA has set 120 μg/L as a long-term health advisory and 2 μg/L as a lifetime health advisory[47] for adults. The state of Maine has set a guideline of 4.0 μg/L for lindane in drinking water. EPA[62] has proposed a maximum level of 0.2 μg/L in drinking water.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen-specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = >3.5.

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact. Fish Tox = 0.11310000 MATC (EXTRA HIGH).

Harmful Effects and Symptoms

Short Term Exposure: Lindane irritates the eyes and the respiratory tract and may affect the central nervous system. Symptoms of exposure include vomiting, faintness, tremor, restlessness, muscle spasms, unsteady gait, and convulsions may occur as a result of exposure. Elevated body temperature and pulmonary edema have been reported in children. Coma, respiratory failure, and death can result. Exposure to vapors of this compound or its thermal decomposition products may lead to headache, nausea, vomiting, and irritation of the eyes, nose, and throat. Lindane is a stimulant of the nervous system; causing violent convulsions that are rapid in onset and generally followed by death or recovery within 24 h. The probable human oral lethal dose is 50−500 mg/kg, or between 1 teaspoon and 1 oz for a 150-lb (70 kg) person. Human Tox = 0.20000 ppb MCL (EXTRA HIGH).

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May damage the liver and kidneys. May damage the nerves in the arms and legs, possibly with weakness and poor coordination. May cause a serious drop in the blood cell count (aplastic anemia) or in the white blood cell count (agranulocytopenia). The Department of Health and Human Services has determined that HCH (hexachlorocyclohexanes) may reasonably be anticipated to be carcinogenic. Liver cancer has been seen in laboratory rodents that ate HCH for long periods of time. In animals, there is evidence that oral exposure to lindane during pregnancy results in an increased incidence of fetuses with extra ribs. However, ATSDR reports that animal studies have not shown birth defects in the babies of animals fed HCH during pregnancy. BCH has been detected in human breast milk.

Points of Attack: Eyes, central nervous system, blood, liver, kidneys, skin.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), blood serum, complete blood count, urine (chemical/metabolite). Blood test for lindane (may not be accurate longer than 1 week following last exposure). Liver and kidney function tests. See *Occupational Health Guidelines for Chemical Hazards*. NIOSH Pub Nos. 81-123; 88-118, Suppls. I−IV. 1981−1995.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Employees should wash immediately when skin is wet or contaminated. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Respirator Selection: *up to 5 mg/m*^{3}: Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter).* *Up to 25 mg/m^3*: CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 50 mg/m^3:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly sealed containers in a cool, dry place away from light and incompatible materials. Protect containers against physical damage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Lindane falls under the category of Organochlorine pesticides, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam for small fires. Use water spray, fog, or foam for large fires. Move container from fire area if this can be done without risk. Use water to keep fire-exposed containers cool. Isolate hazard area and deny entry. Stay upwind and keep out of low areas. Ventilate closed spaces before entering. Wear positive breathing apparatus and special protective clothing. Fight fire from maximum distance, dike fire control water for later disposal. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For the disposal of lindane, a process has been developed involving destructive pyrolysis at 400−500°C with a catalyst mixture which contains 5−10% of either cupric chloride, ferric chloride, zinc chloride, or aluminum chloride on activated carbon. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Liquefied petroleum gas (LPG) L:0270

Molecular Formula: C_3H_8—C_3H_6—C_4H_{10}—C_4H_8 (mixture)
A mixture of propane (C_3H_8) and butane (C_4H_{10}).
Synonyms: Bottled gas; Compressed petroleum gas; Gas de petroleo licuado (Spanish); Liquefied hydrocarbon gas; L.P. G.; Petroleum gas, liquefied; Propane-butane-(propylene); Pyrofax
CAS Registry Number: 68476-85-7
RTECS® Number: SE7545000
UN/NA & ERG Number: UN1075/115
EC Number: 270-704-2 [*Annex I Index No.:* 649-202-00-6]
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
European/International Regulations: Hazard Symbol: F + , T; Risk phrases: R45; R46; R12; Safety phrases: S53; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: LPG is a colorless, noncorrosive, odorless gas when pure. A foul-smelling odorant is usually added. Shipped as a liquefied compressed gas (a mixture of propane, butanes, propylene, and butylenes). Boiling point ≥6°C; 42−44°C (propane); −1°C (butane); Flash point = (flammable gas): −104°C (propane); −60°C (butane). Explosive limits: LEL = 2.1%; UEL = 9.5% (propane); LEL = 1.9%; UEL = 8.5% (butane); Autoignition temperature = about 400°C: 466°C (propane); 405°C (butane). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water.
Potential Exposure: LPG is used as a fuel propellant, in metal cutting, and in the production of petrochemicals.
Incompatibilities: Forms explosive mixture with air. Contact with strong oxidizers and chlorine dioxide may cause fire and explosions. Attacks some plastics, rubber, and coatings.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 1.72−2.37 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 1000 ppm/1800 mg/m^3 TWA.
NIOSH REL: 1000 ppm/1800 mg/m^3 TWA.
ACGIH TLV®[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas* (C_1−C_4).
NIOSH IDLH: 2000 ppm [LEL].
Protective Action Criteria (PAC)
TEEL-0: 1000 ppm
PAC-1: 2000 ppm
PAC-2: 2000 ppm
PAC-3: 2000 ppm
The Philippines: TWA 1000 ppm (1800 mg/m^3), 1993; Switzerland: MAK-W 1000 ppm (1800 mg/m^3), 1999; Turkey: TWA 1000 ppm (1800 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (1750 mg/m^3); STEL 1250 ppm, 2000; the Netherlands: MAC-TGG 1800 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1000.
Routes of Entry: Inhalation, skin and/or eye contact (liquid).
Harmful Effects and Symptoms
Short Term Exposure: Liquefied petroleum gas can affect you when breathed in. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels could cause suffocation and death from lack of oxygen. Contact with liquid liquefied petroleum gas can cause frostbite.
Long Term Exposure: Unknown at this time.
Points of Attack: Respiratory system, central nervous system.
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.
First Aid: *Skin Contact:* Do not rub. Seek medical attention. *Breathing:* Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.
Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid a unless full facepiece respiratory protection is worn. Employees should

wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash

Respirator Selection: *2000 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Metal containers involving the transfer of 5 gallons or more of liquefied petroleum gas should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Sources of ignition, such as smoking and open flames, are prohibited where liquefied petroleum gas is handled, used, or stored. Wherever liquefied petroleum gas is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Liquefied petroleum gas is a flammable gas. Use dry chemical, CO_2, water spray, or foam extinguishers. The flame may be invisible. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Flaring using smokeless flare designs.

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R14/15; R34; Safety phrases: S1/2; S8; S43; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Lithium is a silvery to grayish-white metal that turns yellow on exposure to air and/or moisture. Molecular weight = 6.94; Boiling point = 1336−1342°C; Freezing/Melting point = 181°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Violent reaction with water.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector. Lithium is used in inorganic syntheses, manufacture of storage batteries, heat transfer liquids, and metal alloys.

Incompatibilities: Violent reaction with water, forming flammable hydrogen gas and corrosive lithium hydroxide, a strong caustic solution. Heating may cause violent combustion or explosion. Finely divided particles or powdered form may ignite spontaneously in air. Contact with air forms corrosive fumes of lithium hydroxide. Violent reaction with oxidizers, acetonitrile, nitric acid, arsenic, bromobenzene, carbon tetrachloride, hydrocarbons, halogens, halons, sulfur, and many other substances. Forms impact- and friction-sensitive mixtures with bromobenzene, carbon tetrabromide, chloroform (weak explosion), iodoform, halogens, halocarbons, methyl dichloride, methyl diiodide, and other substances. Attacks plastics, rubber, ceramic materials, concrete, sand, and metal alloys: cobalt, iron, manganese, nickel.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 4 mg/m^3
PAC-1: 12.5 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 400 mg/m^3

Determination in Air: Use OSHA Analytical Method ID-121; NIOSH Analytical Method #8005, Elements in blood or tissue.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. Contact can cause severe skin and eye burns. Inhalation can irritate the respiratory tract causing coughing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure to lithium can cause loss of appetite, nausea, tremor, muscle twitches, apathy, convulsions, coma, and death.

Long Term Exposure: Exposure can cause loss of appetite, nausea, vomiting, diarrhea, and abdominal pain, headache, muscle weakness, loss of coordination, confusion, seizures, and coma. May affect the thyroid gland causing goiter. May affect the kidneys and heart function. Exposure may cause an allergy to develop, affecting the skin, blood vessels, and/or possibly the lungs.

Points of Attack: Lungs, thyroid, kidneys, heart, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: EKG, blood test for lithium. Thyroid function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to lithium, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powdered-air purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Reacts with body moisture, forming corrosive lithium hydroxide: (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (3) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Protect storage containers from physical damage. Lithium must be stored to avoid contact with water, halogenated compounds, carbon dioxide, oxidizers, strong acids, alcohols, metals, chlorinated arsenic compounds, hydrocarbons, sulfur, acetonitrile, nitrogen, and many other materials, since violent reactions occur. Store in tightly closed containers under kerosene or neutral oil in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where lithium is used, handled or stored in a manner that could create a potential fire or explosion hazard. Wherever lithium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group I. For Metal powder, flammable, n.o.s. the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall into Hazard Class 4.2 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep lithium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly reactive, combustible solid that is difficult to extinguish. *Do not use water*, foam, dry chemical, halogenated hydrocarbons, CO_2 on fire or adjacent fire. Use Class D extinguishers, dry clay, dry graphite, limestone, or appropriate special metal fire-extinguishing powder. Poisonous gases, including lithium oxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Lithium aluminum hydride L:0285

Molecular Formula: AlH_4Li
Common Formula: $LiAlH_4$
Synonyms: Aluminum lithium hydride; Lithium alanate; Lithium aluminohydride; Lithium aluminum tetrahydride; Lithium tetrahydroaluminate
CAS Registry Number: 16853-85-3
RTECS® Number: BD0100000
UN/NA & ERG Number: UN1410 (dry)/138; UN1411 (ether solution)/138
EC Number: 240-877-9 [*Annex I Index No.:* 001-002-00-4]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R15; R35; Safety phrases: S1/2; S7/8; S26; S36/37/39; S43; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lithium aluminum hydride is a white to gray powder. A combustible solid. Decomposes at 125°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2₩. Reacts with water.

Potential Exposure: This material is used as a catalyst and as a specialty reducing agent in organic synthesis.

Incompatibilities: Combustible solid. Can ignite spontaneously in moist air or heat. Decomposes on heating at 125°C forming aluminum, lithium hydride, and flammable hydrogen gas. A strong reducing agent. Violent reaction with water, oxidizers, alcohols, acids, dimethylether, ethers, tetrahydrofuran, benzoyl peroxide, boron trifluoride etherate.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 2.81 mg/m^3
PAC-1: 2.81 mg/m^3
PAC-2: 7.5 mg/m^3
PAC-3: 35 mg/m^3

Permissible Concentration in Water: No criteria set. Reacts violently with water.

Routes of Entry: Inhalation, ingestion, eyes and/or skin.

Harmful Effects and Symptoms

Short Term Exposure: Lithium aluminum hydride can affect you when breathed in. Contact can cause severe burns of the eyes and skin. Exposure can irritate the eyes, nose, throat, and lungs, causing coughing and sneezing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause loss of appetite, nausea, confusion, tremor, and muscle twitching. High exposure can cause coma and death.

Long Term Exposure: Can cause loss of appetite, nausea, vomiting, diarrhea and abdominal pain, headache, muscle weakness, loss of coordination, confusion, seizures, and coma. Can affect the thyroid gland causing goiter. May cause kidney damage.

Points of Attack: Thyroid gland, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. Thyroid function tests. If symptoms develop or overexposure is suspected, the following may be useful: serum lithium level. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Lithium aluminum hydride must be stored to avoid contact with water, air, acids, alcohols, benzoyl peroxide, boron trifluoride etherate, ethers, tetrahydrofuran, and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where lithium aluminum hydride is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of lithium aluminum hydride. Wherever lithium aluminum hydride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Open only in inert atmospheres or very low humidity rooms.

Shipping: Lithium aluminum hydride (dry) requires a shipping label of “DANGEROUS WHEN WET.” It falls in Hazard Class 4.3 and Packing Group I. Lithium aluminum hydride, ethereal, requires a shipping label of “DANGEROUS WHEN WET, FLAMMABLE LIQUID.” It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. *Do not use water*, CO_2, or foam. Use Class D extinguishers, dry sand, dry clay, dry limestone, dry graphite. Poisonous gases, including lithium hydride and aluminum oxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. Fire may restart after it has been extinguished. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 209-062-5
Regulatory Authority and Advisory Bodies
Listed in the TSCA inventory.
FDA—proprietary drug.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
California Proposition 65 Developmental/Reproductive toxin 1/1/91.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Lithium carbonate is a white hygroscopic powder. Molecular weight = 73.89; Boiling point = 1310°C (decomposes below BP); Freezing/Melting point = 618–735°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Slightly soluble in water.
Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Lithium carbonate is used in treatment of manic-depressive psychoses, to make ceramics and porcelain glaze, varnishes, dyes, pharmaceuticals, coating of arc-welding electrodes, battery alloys, nucleonics, luminescent paints, glass ceramics, lubricating greases, in aluminum production.
Incompatibilities: The aqueous solution is a strong base. Reacts violently with acids and fluorine. Incompatible with oxidizers, moisture. Corrodes aluminum, copper, zinc.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 4 mg/m^3
PAC-3: 200 mg/m^3
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: LD_{50} = (oral-rat) 525 mg/kg. Contact causes skin, eye, and respiratory tract irritation. Inhalation can cause nausea, vomiting, diarrhea, and abdominal pain. Can cause lung irritation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, muscle weakness, muscle twitching, blurred vision, loss of coordination, confusion, seizures, and coma. May affect the central nervous system; cardiovascular, and gastrointestinal systems if ingested.
Long Term Exposure: May cause damage to the developing fetus. May cause skin allergy and dermatitis. High exposure can cause enlarged thyroid (goiter). May damage the stomach, kidneys, and may affect the heart function. May cause reproductive toxicity in humans.
Points of Attack: Skin, thyroid, kidneys, heart.
Medical Surveillance: Blood tests for lithium level. Kidney function tests. Thyroid function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required for drug manufacture by the Food and Drug Administration. Refer to FDA regulation for Good Manufacturing Practices 21CFR210.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture, fluorine, oxidizers, acids. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: Label: "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Lithium chromate is a yellow crystalline powder. Molecular weight = 165.92; 129.87 (lithium chromate (VI)); 131.90 (*dilithium chromate*); Melting point = 75°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Used as a corrosion inhibitor, heat-transfer agent, and oxidizing agent in leather and metal finishing. Also used in photography, wood preservatives, batteries, safety matches, and cement.

Incompatibilities: Aqueous solution is caustic. An oxidizer; strong reaction with hydrazine, chromic acid, sulfur, reducing agents, combustibles, organic materials, acids. Attacks plastics and aluminum.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.0125 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 37.5 mg/m^3

As chromium(VI) inorganic soluble compounds
OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.
NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.
ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.
NIOSH IDLH: 15 mg[Cr(VI)]/m^3.
DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Determination in Air: Use NIOSH Analytical Method (IV) #7024, Chromium.

Permissible Concentration in Water: For the protection of freshwater aquatic life: *Hexavalent chromium:* 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: Hexavalent chromium: 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* hexavalent chromium 50 μg/L according to EPA.[6]

US EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62]

Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water.

The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] as 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide); or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45-μm filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, eye and/or skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact causes severe skin and eye irritation and burns. Inhalation can irritate the nose and throat causing coughing and wheezing.

Long Term Exposure: Repeated exposure can cause loss of appetite, nausea, tremor, and convulsions. Lithium chromate is a hexavalent chromium compound and a possible human carcinogen. Handle with care. Related chromium compounds are teratogenic. Can irritate the lungs; may cause bronchitis to develop. May cause skin allergy. Repeated exposure may cause personality changes of depression, anxiety, or irritability. Prolonged exposure may cause deep slow-healing ulcers on the skin, and a sore or hole in nasal septum. May damage the liver and kidneys.

Points of Attack: Lungs, liver, kidneys, skin.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Lung function tests. Evaluation by a qualified allergist. Liver and kidney function tests. Check skin daily for blisters or little bumps, the first sign of "chrome ulcers." If not treated early, these can last for years following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from acids, hydrazine, chromic acid, combustible materials, sulfur, aluminum, plastics, and reducing agents.

Shipping: Toxic solid, inorganic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishing agents suitable for surrounding fire. Poisonous gases, including lithium oxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Lithium hydride L:0310

Molecular Formula: HLi

Common Formula: LiH

Synonyms: Hydrure de lithium (French); Hydruro de litio (Spanish); Lithium monohydride

CAS Registry Number: 7580-67-8

RTECS® Number: OJ6300000

UN/NA & ERG Number: UN1414/138; UN2805 (fused, solid)/138

EC Number: 231-484-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Lithium hydride is an off-white to grayish, translucent, odorless solid or white powder that darkens rapidly on exposure to light. Molecular weight = 7.95; Specific gravity (H_2O:1) = 0.78; Boiling point = 850°C (decomposes below BP); Freezing/Melting point = 689°C; Autoignition temperature = 200°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 2. A combustible solid that can form airborne dust clouds which may explode on contact with flame, heat, or oxidizers.

Potential Exposure: Compound Description: Human Data. Lithium hydride is used in preparation of lithium aluminum hydride, as a desiccant, used in hydrogen generators and in organic synthesis as a reducing agent and condensing agent with ketones and acid esters, and reportedly used in thermonuclear weapons.

Incompatibilities: Incompatible with oxidizers, halogenated hydrocarbons; acids can cause fire and explosion. Reacts with water, forming caustic lithium hydroxide and flammable hydrogen gas; reaction may cause ignition. May ignite *spontaneously* in moist air and may reignite after fire is extinguished. Reacts with water to form hydrogen and lithium hydroxide. Powdered form and liquid oxygen form an explosive compound. Decomposes exothermically on contact with acids and upon heating to about 500°C, producing flammable hydrogen gas. Reacts with carboxylic acids, lower alcohols, chlorine, and ammonia (at 400°C), forming explosive hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: 0.025 mg/m^3 TWA.

NIOSH REL: 0.025 mg/m^3 TWA.

ACGIH TLV®[1]: 0.025 mg/m^3 TWA.

NIOSH IDLH: 0.5 mg/m^3.

Protective Action Criteria (PAC)*

TEEL-0: 0.025 mg/m^3

PAC-1: **0.025** mg/m^3

PAC-2: **0.100** mg/m^3

PAC-3: **0.500** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 0.025 mg/m^3, 1993; Austria: MAK 0.025 mg/m^3, 1999; Belgium: TWA 0.025 mg/m^3, 1993; Denmark: TWA 0.025 mg/m^3, 1999; Finland: TWA 0.025 mg/m^3; STEL 0.075 mg/m^3, 1999; France: VME 0.025 mg/m^3, 1999; the Netherlands: MAC-TGG 0.025 mg/m^3, 2003; the Philippines: TWA 0.025 mg/m^3, 1993; Poland: MAC (TWA) 0.025 mg/m^3, 1999; Switzerland: MAK-W 0.025 mg/m^3, 1999; Turkey: TWA 0.025 mg/m^3, 1993; United Kingdom: TWA 0.025 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.025 mg/m^3. Several states have set guidelines or standards for lithium hydride in ambient air[60] ranging from 0.4 μg/m^3 (Virginia) to 0.5 μg/m^3 (Connecticut) to 2.0 μg/m^3 (North Dakota) to 6.0 μg/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 0.3 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Lithium hydride is an alkaline-corrosive agent. Contact with eyes may result in severe damage to the cornea, conjunctiva, and blood vessels. Extreme caution is advised. Acute exposure to lithium hydride may result in irritation and burning of the skin, eyes, and mucous membranes. Increased salivation, dysphagia (difficulty in swallowing), abdominal pain, and spontaneous vomiting may occur. Stridor (high-pitched, noisy respirations), dyspnea (shortness of breath), and pulmonary edema are also common. Apathy and mental confusion may develop, with progression to coma and death.

Long Term Exposure: Lithium can cause loss of appetite, nausea, vomiting, diarrhea, and abdominal pain, headache, muscle weakness, loss of coordination, confusion, seizures, and coma. Can affect the thyroid gland causing goiter. May cause kidney damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, thyroid, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Thyroid function tests. Kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear appropriate clothing to prevent any possibility of contact with air of >0.1 mg/m^3 content. Wear eye protection to prevent any possibility of eye contact. Provide emergency showers and eyewash if air containing >0.5 mg/m^3 is involved. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *up to 0.25 mg/m^3:* 100XQ (any air-purifying respirator with a high-efficiency particulate filter) or Sa (APF = 10) (any supplied-air respirator). *up to 0.5 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Protect containers against physical damage. Store in isolated, well-ventilated, cool, dry area.

Shipping: Lithium hydride requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group I.

Lithium hydride, fused solid, requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled materials.

Do not allow material to contact water. Shovel up *small spills* with noncombustible absorbent material. Confine *large spills* with dikes, sheets, or tarps to stop spreading. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: In a fire, irritating alkali fumes may form. Lithium hydride can form airborne dust clouds which may explode on contact with flame, heat, or oxidizing materials. Additionally, spontaneous ignition occurs when nitrous oxide and lithium hydride are mixed. Lithium hydride also forms explosive mixtures with liquid oxygen. *Do not use water*, carbon dioxide, dry chemical, or halogenated extinguishing agents, such as carbon tetrachloride. Use Class D extinguishers, dry sand, dry graphite, dry limestone, or ground dolomite-based dry chemical extinguishers, such as "Lith-X." Wear protective goggles or face shield, rubberized gloves, flame-proof outer clothing, respirator, and high boots or shoes. *Large fires:* withdraw from area and let fire burn, as lithium hydride may continue to reignite. A fire, once started, cannot be extinguished by ordinary methods. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Lithium hydride may be mixed with sand, sprayed with butanol and then with water, neutralized and flushed to a sewer with water.

Lithium nitrate L:0320

Molecular Formula: $LiNO_3$
Synonyms: Nitric acid, lithium salt
CAS Registry Number: 7790-69-4
RTECS® Number: QU9200000
UN/NA & ERG Number: UN2722/140
EC Number: 232-218-9

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Lithium nitrate is a colorless deliquescent powder. Specific gravity (H_2O:1) = 2.38; Freezing/Melting point = 264°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 2 (Oxidizer). Soluble in water.

Potential Exposure: Lithium nitrate is used in ceramics, pyrotechnics, salt baths, refrigeration systems, and rocket propellants.

Incompatibilities: May explode when exposed to sparks, shock, and heat. Violent reactions with combustible materials, oxidizers, organic materials, reducing agents, strong acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 10 mg/m^3
PAC-3: 50 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Lithium nitrate can affect you when breathed in. Repeated heavy exposure may lead to lithium poisoning. This can cause loss of appetite, nausea, tremor, muscle twitches, apathy, convulsions, coma, and death. Contact with lithium nitrate water solution or powder can cause severe skin and eye burns. A very low sodium diet can increase your risk of health problems from exposure to lithium.

Long Term Exposure: Lithium can cause loss of appetite, nausea, vomiting, diarrhea and abdominal pain, headache, muscle weakness, loss of coordination, confusion, seizures, and coma. Can affect the thyroid gland causing goiter. May cause kidney damage.

Points of Attack: Thyroid, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum lithium level. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to solid lithium nitrate use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposures to liquid lithium nitrate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Lithium nitrate must be stored to avoid contact with wood, paper, oil and heat, and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Protect containers against physical damage, heat, shock, sparks. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use water only. Do not use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Lomustine L:0330

Molecular Formula: $C_9H_{16}ClN_3O_2$

Synonyms: Belustine; CCNU; Cecenu; CEENU; 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea; (Chloro-2-ethyl)-1-cyclohexyl-3-nitrosourea; *N*-(2-Chloroethyl)-*N*′-cyclohexyl-*N*-nitrosourea; Chloroethylcyclohexylnitrosourea; CINU; ICIG1109; Lomustine; NCI-C04740; NSC-79037; RB 1509; SRI2200

CAS Registry Number: 13010-47-4

RTECS® Number: YS4900000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 235-859-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (ipr); clear evidence: mouse, no evidence: rat, 1977; NTP: 7th Report on Carcinogens: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human Inadequate Evidence, Group 2A, 1999.

California Proposition 65 Chemical: Cancer as 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea.

Regulatory Authority and Advisory Bodies

California Proposition 65 Chemical: Cancer 1/1/88; Developmental/Reproductive toxin 7/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Lomustine is a pale yellow powder. Molecular weight = 233.73; Freezing/Melting point = 90°C. Insoluble in water.

Potential Exposure: Those involved in the manufacture, administration, or consumption of this antineoplastic (anticancer) agent.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Long Term Exposure: There is sufficient evidence that 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea (CCNU) is carcinogenic in experimental animals. CCNU caused lung cancers in rats following intraperitoneal or intravenous injection. In mice, intraperitoneal injections of CCNU resulted in a slight increase in the incidence of lymph system neoplasms. Applied to the skin of mice, CCNU did not induce skin tumors, but the duration of the experiment was inadequate. Evidence for the carcinogenicity of CCNU in humans is inadequate. In several reported cases, cancer patients who received CCNU developed leukemia. With one exception, all of these patients also had received other cytotoxic agents and/or irradiation.

Points of Attack: Blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), blood serum, biologic tissue/biopsy, urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

M

Magnesium M:0100

Molecular Formula: Mg
Common Formula: Mg
Synonyms: Magnesium metal; Magnesium pellets; Magnesium powder; Magnesium ribbons; Magnesium scalpings; Magnesium shavings; Magnesium sheet; Magnesium turnings
CAS Registry Number: 7439-95-4
RTECS® Number: OM210000
UN/NA & ERG Number: UN1869/138; UN1418 (powder)/138
EC Number: 012-002-00-9 (pellets); 012-001-00-3 (powder, pyrophoric)

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 100 (ACG).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Magnesium is a light, silvery-white metal in various forms and is a fire hazard. Molecular weight = 24.31; Boiling point = 1100°C; Freezing/Melting point = 649°C (pellets); 651°C (powder); Autoignition temperature = 473°C (powder). Explosive limits: LEL = 0.03 kg/m^3. Ignition temperature of dust cloud = 520°C; Minimum Explosive concentration = 0.020 oz/ft^3.[USBM] Relative explosion hazard of dust: Severe. Hazard Identification (based on NFPA-704 M Rating System): (*powder, turnings and ribbon*) Health 0, Flammability 2, Reactivity 2. Reacts with water; insoluble.

Potential Exposure: Magnesium alloyed with manganese, aluminum, thorium, zinc, cerium, and zirconium is used in aircraft, ships, automobiles, hand tools, etc., because of its lightness. Dow metal is the general name for a large group of alloys containing over 85% magnesium. Magnesium wire and ribbon are used for degassing valves in the radio industry and in various heating appliances; as a deoxidizer and desulfurizer in copper, brass, and nickel alloys; in chemical reagents; as a powder in the manufacture of flares, incendiary bombs, tracer bullets, and flashlight powders; in the nuclear energy process; and in a cement of magnesium oxide and magnesium chloride for floors. Magnesium is an essential element in human and animal nutrition and also in plants, where it is a component of all types of chlorophyll. It is the most abundant intracellular divalent cation in both plants and animals. It is an activator of many mammalian enzymes.

Incompatibilities: The substance is a strong reducing agent. Reacts violently with oxidizers, strong acids, acetylene, ammonium salts, arsenic, beryllium fluoride, carbon tetrachloride, carbonates, chloroform, cyanides, chlorinated hydrocarbons, ethylene oxide, hydrocarbons, metal oxides, methanol, phosphates, silver nitrate, sodium peroxide, sulfates, trichloroethylene, and many other substances, causing fire and explosion hazards. Finely powdered, chip or sheet form reacts with moisture or acids, evolving flammable hydrogen gas, causing fire and explosion hazard. Finely divided form is readily ignited by a spark or flame and splatters and burns at above 1260°C.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.25 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 150 mg/m^3

No standards set for elemental magnesium.

Determination in Air: Filter collection and atomic absorption analysis.

Permissible Concentration in Water: The World Health Organization (WHO) has established European and International desirable limits ranging from 30 to 125 mg/L, depending on the sulfate concentration. If the sulfate exceeds 250 mg/L, the magnesium is limited to 30 mg/L. The WHO specifies an absolute maximum of 150 mg/L for magnesium in drinking water. In view of the fact that concentrations of magnesium in drinking water are less than those that impart astringent taste, they pose no health problem and are more likely to be beneficial; no limitation for reasons of health is needed. The USSR-UNEP/IRPTC joint project[43] set a MAC of 50 mg/L in water bodies used for fishery purposes.

Determination in Water: Magnesium in water can be determined by atomic-absorption spectrophotometry, with a sensitivity of 15 mg/L, and by photometry with a sensitivity of 100 μg/L.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. Inhaling dust can irritate the respiratory tract, causing coughing, wheezing, and/or shortness of breath. Magnesium and magnesium compounds are mild irritants to the conjunctiva and nasal mucosa, but are not specifically toxic. Inhalation may cause metal fume fever; the symptoms may be delayed for 4−12 h following exposure. On the skin, these hot particles are capable of producing second- and third-degree burns, but they respond to treatment as other thermal burns do. Metallic magnesium foreign bodies in the skin cause no unusual problems in humans. In animal experiments, however, they have caused “gas gangrene”—massive localized gaseous tumors with extensive necrosis. Magnesium salts at levels over 700 gm/L (especially magnesium sulfate) have a laxative effect, particularly on new users, although the human body can adapt to the effects of magnesium with time.

Long Term Exposure: Repeated exposure can cause an accumulation in the body, causing upset stomach.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00012-6

Medical Surveillance: There is no special test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If fragments have become imbedded in the skin and removal cannot be ensured by thorough scrubbing, medical attention for thorough removal is recommended. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Personal Protective Methods: It burns with an intense flame; do not look directly at fire; wear adequate eye protection. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to magnesium, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red Stripe (*powder, turnings, and ribbon are flammable solids*): Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Magnesium must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), and chlorine trifluoride, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water. Use only nonsparking tools and equipment, especially when opening and closing containers of magnesium. Protect storage containers from physical damage.

Shipping: Magnesium pellets, turnings, or ribbons (UN1869) require a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III. Magnesium powder requires a shipping label of "DANGEROUS WHEN WET, SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 4.3 and Packing Group III.

Magnesium granules, coated (particle size not <149 μm) require a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use a vacuum to reduce dust during cleanup. Do not dry sweep. Collect powdered material and deposit in sealed containers. Ventilate area after cleanup is complete. Keep magnesium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium is a combustible solid or a flammable powder. It burns with an intense flame. Reacts violently with fire extinguishing agents, such as water, carbon dioxide, and powder. Dangerous when wet. It burns in a current of steam. Powders form explosive mixtures with air. Poisonous gas including magnesium oxide is produced in fire. Fire may restart after it has been extinguished. Use dry sand, MetL-X® powder, or G-1 graphite powder, soda ash, Class D extinguishers, or talc. *Do not use water* or hydrous agents. Fire may restart after it has been extinguished. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators

recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium chlorate M:0110

Molecular Formula: Cl_2MgO_6

Common Formula: $Mg(ClO_3)_2$

Synonyms: Chlorate salt of magnesium; Chloric acid, De-Fol-Ate®; Chloric acid, magnesium; E-Z-Off®; Magnesium dichlorate; Magnesium salt; Magron; MC defoliant; Ortho MC

CAS Registry Number: 10326-21-3

RTECS® Number: FO0175000

UN/NA & ERG Number: UN2723/140

EC Number: 233-711-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Magnesium chlorate is white crystalline solid. Molecular weight = 191.21; Boiling point = 120°C; Freezing/Melting point = 35°C. Soluble in water (reaction).

Potential Exposure: Used as a drying agent and defoliant.

Incompatibilities: A strong oxidizer. Violent reactions with arsenic, carbon, charcoal, copper, phosphorus, sulfur, magnesium oxide, metal sulfides (copper sulfide, arsenic sulfide, tin sulfide, fuels, and strong acids. Reacts with moisture.

Permissible Exposure Limits in Air: Russia[43] set a MAC of 0.1 mg/m^3 in ambient air in residential areas both on a momentary and a daily average basis.

No standards or TEEL available.

Permissible Concentration in Water: Russia[43] set a MAC of 0.35 mg/L in water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Magnesium chlorate can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Inhaling the dust irritates the respiratory system. Exposure can interfere with the ability of the blood to carry oxygen, causing headaches, weakness, dizziness, trouble breathing, collapse, and possible death. Breathing the dust can irritate the air passages, cause sore throat and/or cough with phlegm.

Long Term Exposure: Repeated exposure can cause lung irritation; bronchitis may develop with coughing, phlegm, and/or shortness of breath. May affect the kidneys.

Points of Attack: Lungs, blood.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to magnesium chlorate, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for high exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with magnesium chlorate you should be trained on its proper handling and storage. Magnesium chlorate must be stored to avoid contact with aluminum, arsenic, carbon, copper, phosphorus, sulfur, magnesium oxide, metal sulfides, fuels, and strong acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Spilled magnesium chlorate tends to become very sensitive to shock or friction and is an explosion hazard. Keep magnesium chlorate out of sewers since it can ignite flammable or combustible materials and thus cause a fire or explosion hazard. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Magnesium chlorate itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Containers may explode in fire; use water spray to keep fire-exposed containers cool. Poisonous gases, including chlorine and magnesium oxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium hydride M:0120

Molecular Formula: H_2Mg

Common Formula: MgH_2

Synonyms: Magnesium(II) hydride; Magnesium dihydride

CAS Registry Number: 7693-27-8; 60616-74-2

RTECS® Number: OM3560000

UN/NA & ERG Number: UN2010/138

EC Number: 231-705-3

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Magnesium hydride is a coarse, gray crystalline solid. Molecular weight = 26.33; Freezing/Melting point $\geq$200°C; flash point = 110°C. Insoluble in water (dangerous reaction). Decomposes at 280°C in high vacuum.

Potential Exposure: Used in the production of hydrogen and magnesium alcoholates.

Incompatibilities: A strong reducing agent. Pyrophoric; the powder or dust may ignite spontaneously in air or in the presence of moisture. Contact with water or steam forms magnesium hydroxide, flammable hydrogen gas, and enough heat to ignite the hydrogen. Violent reaction with oxidizers, alcohols, halogens, chlorinated solvents. Incompatible with strong acids, acid chlorides. Store under nitrogen.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Magnesium hydride can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Breathing the dust can irritate the air passages, causing sore throat and/or cough with phlegm.

Long Term Exposure: Long-term effects are unknown at this time.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to magnesium hydride, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a particulate (dust/fume/mist) filter. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Store under nitrogen in tightly closed containers in cool (decomposes >250°C), well-ventilated area. Keep containers dry at all times. Magnesium hydride reacts violently with water, releasing caustic material, heat, and flammable gas. Sources of ignition, such as smoking and open flames, are prohibited where magnesium hydride is handled, used, or stored.

Shipping: Magnesium hydride requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use vacuum to reduce dust during cleanup. Do not use dry sweep. Collect powdered material in the safest manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep magnesium hydride out of sewers because of possibility of fire or explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium hydride is a flammable and reactive solid. Use dry chemical, sand, soda ash, or lime extinguishers. *Do not use water*, carbon dioxide, or foam. Magnesium hydride can catch fire spontaneously in air or in the presence of moisture. Fire may restart after it has been extinguished. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium nitrate M:0130

Molecular Formula: MgN_2O_6

Common Formula: $Mg(NO_3)_2$

Synonyms: Nitric acid, Magnesium salt; Nitromagnesite

CAS Registry Number: 10377-60-3; 10213-15-7 (hexahydrate)

RTECS® Number: OM3750000

UN/NA & ERG Number: UN1474/140

EC Number: 233-826-7 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Magnesium nitrate is white crystalline solid. Molecular weight = 148.33; 256.45 (hexahydrate); Freezing/Melting point = 129°C (dihydrate); 95−100°C (hexahydrate). It decomposes at 330°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 2 OX. A strong oxidizer. Soluble in water.

Potential Exposure: Magnesium nitrate is used in fireworks and in the production of concentrated nitric acid.

Incompatibilities: A powerful oxidizer. Violent reaction with dimethylformamide, reducing agents, combustibles, fuels, organic and easily oxidizable matter.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Magnesium nitrate can affect you when breathed in. Contact can irritate or even burn the skin and eyes. The dust can irritate the eyes and air passages, causing sore throat and/or cough with phlegm. Exposure can interfere with the ability of the blood to carry oxygen, causing headaches, weakness, nausea, and a bluish color to the skin and lips (methemoglobinemia). Higher levels can cause trouble breathing, collapse, and even death.

Long Term Exposure: Repeated exposure can cause headache, weakness, and dizziness.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to magnesium nitrate, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard (*strong oxidizer*); Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Magnesium nitrate must be stored to avoid contact with dimethyl formamide, fuels, and strong reducing agents, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Avoid storage on wood floors. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep magnesium nitrate out of sewers since it can ignite flammable and combustible materials and thus cause a fire or explosion hazard. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Magnesium nitrate itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Use water spray to keep fire-exposed containers cool. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium oxide M:0140

Molecular Formula: MgO

Synonyms: Akro-mag; Animag; Calcined brucite; Calcined magnesia; Calcined magnesite; Granmag; Magcal; Magchem 100; Maglite; Magnesia; Magnesia fume; Magnesia USTA; Magnesium oxide fume; Magox; Marmag; Periclase; Seawater magnesia

CAS Registry Number: 1309-48-4

RTECS® Number: OM3850000

UN/NA & ERG Number: UN1418 (powder)/138

EC Number: 215-171-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

FDA—over-the-counter drug.

Water Pollution Standard Proposed (EPA).[32]

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Magnesium oxide forms a finely divided white particulate dispersed in air. Molecular weight = 40.31; Boiling point = 3600°C; Freezing/Melting point = 2800°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1. Poor solubility in water.

Potential Exposure: Compound Description: Tumorigen; Human Data. Used in oil refining, pulp, and paper mills, in tire manufacturing, in the manufacture of refractory crucibles, fire bricks, magnesia cements, and boiler scale compounds. Exposure may occur when magnesium is burned, thermally cut, or welded upon.

Incompatibilities: Violent reaction with halogens, chlorine trifluoride, bromine pentalfluoride, phosphorous pentachloride, strong acids. May ignite and explode when heated with sublimed sulfur, magnesium powder, or aluminum powder.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 (*total particulate; fume*) TWA.

NIOSH: There is inadequate data to propose an exposure limit. See Appendix D of *The NIOSH Pocket Guide.*

ACGIH TLV®[1]: 10 mg/m^3 TWA (*inhalable fraction*); not classifiable as a human carcinogen.

NIOSH IDLH: 750 mg/m^3 (fume).

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 4 mg/m^3, inhalable fraction; 1.5 mg/m^3, respirable fraction; see sections V(f) and V(g). See V(h) for fume; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 10 mg/m^3, 1993; Australia: TWA 10 mg/m^3, 1993; Austria: MAK 6 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; France: VME 10 mg/m^3, 1999; Hungary: TWA 5 mg/m^3; STEL 10 mg/m^3, 1993; Norway: TWA 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Poland: MAC (TWA) fume 5 mg/m^3, MAC (TWA) dust 10 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 6 mg/m^3, 1999; Turkey: TWA 15 mg/m^3, 1993; United Kingdom: TWA 10 mg[Mg]/m^3, total inhalable dust; TWA 4 mg[Mg]/m^3, fume and respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for magnesium oxide fume in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7300 (Elements by ICP), #7301, #7303; OSHA Analytical Method #ID-125G.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 138 μg/L for magnesium oxide based on health effects.

Routes of Entry: Inhalation of fume, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Magnesium in the form of nascent magnesium oxide can cause metal fume fever with cough, chest pain, flu-like fever, if inhaled in sufficient quantity. The symptoms of metal fume fever may be delayed for 4−12 h following exposure.

Long Term Exposure: It has been noted that magnesium workers show a rise in serum magnesium, although no significant symptoms of ill health have been identified. Some investigators have reported higher incidence of digestive disorders and have related this to magnesium absorption, but the evidence is scant.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: NIOSH lists the following test for fume exposure: whole blood (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *as fume* OSHA: *up to 150 mg/m^3*: 95XQ [Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]. Sa (APF = 10) (any supplied-air respirator). *Up to 375 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PAPRDMFu* (any powered, air-purifying respirator with a dust, mist, and fume filter). *Up to 750 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store finely divided powder, chips, or shavings separately in detached fire-resistant building isolated from flammables, combustibles, or other yellow coded materials. Protect against physical damage. Prior to working with this chemical you should be trained on its proper handling and storage. Magnesium oxide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates, and chlorine trifluoride), halogens, strong acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated, "No Smoking" area away from moisture. Use nonsparking-type tools and equipment, including explosion-proof ventilation. Containers of this material may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product.

Shipping: Magnesium *powder* requires a shipping label of "DANGEROUS WHEN WET, SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 4.2 & 4.3 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. May ignite and explode when heated with sublimed sulfur, magnesium powder, or aluminum powder. Use any extinguisher suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium perchlorate M:0150

Molecular Formula: Cl_2MgO_8

Common Formula: $Mg(ClO_4)_2$

Synonyms: Ammonium perchlorate, anhydrous; Ammonium perchlorate, hexahydride; Anhydrone®; Dehydrite®; Perchlorate de magnesium (French); Perchloric acid, Magnesium salt

CAS Registry Number: 10034-81-8

RTECS® Number: SC8925000

UN/NA & ERG Number: UN1475/140

EC Number: 233-108-3

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Magnesium perchlorate is a white crystalline solid. Molecular weight = 223.21; Freezing/Melting point ≥250°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 3 (Oxidizer). Soluble in water.

Potential Exposure: Magnesium perchlorate is used as a drying agent for gases and as an oxidizing agent.

Incompatibilities: A powerful oxidizer. Violent reaction with reducing agents, alkenes (above 220°C), ammonia gas, organic matter, ethylene oxide, powdered metals, phosphorus, dimethylsulfoxide, mineral acids, wet argon, hydrazines, alcohols, wet fluorobutane, butyl fluorides, organic materials. Forms explosive material with ethyl alcohol. Incompatible with many materials. Shock may cause magnesium perchlorate to explode.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 6 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 125 mg/m^3
PAC-3: 500 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Magnesium perchlorate can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Breathing the dust can irritate the air passages, causing sore throat and/or cough with phlegm. High levels can interfere with the ability of the blood to carry oxygen, causing headaches, dizziness, and a bluish color to the skin. Very high levels could cause death.

Long Term Exposure: Can irritate the lungs. Repeated exposure may cause bronchitis.

Points of Attack: Lungs, blood.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following maybe useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to magnesium perchlorate, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Magnesium perchlorate must be stored to avoid contact with fuels, finely powdered metals, mineral acids, ammonia, ethylene oxide, phosphorus, dimethyl sulfoxide, and trimethyl phosphite, since violent reactions occur. Shock may cause magnesium perchlorate to explode. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Do not store on wood floors. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use vacuum to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the safest manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Magnesium perchlorate itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Poisonous gases, including chlorides and magnesium oxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters.

Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium peroxide M:0160

Molecular Formula: MgO_2

Synonyms: IXPER 25M; Magnesium dioxide; Magnesium superoxol; Peromag; Peróxido de magnesio (Spanish); Peroxyde de magnésium (French)

CAS Registry Number: 14452-57-4 (MgO); 1335-26-8 (MgO_2)

RTECS® Number: OM4100000

UN/NA & ERG Number: UN1476/140

EC Number: 238-438-1

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Magnesium peroxide is a white, odorless crystalline solid. Molecular weight = 56.31 (MgO_2); 40.3 (MgO); Decomposes above 100°C. Insoluble in water.

Potential Exposure: Magnesium peroxide is used as a bleaching and oxidizing agent and in the manufacture of antacids and anti-infective drugs.

Incompatibilities: Powerful oxidizer. Dangerous fire risk with flammable and combustible materials. Violent reaction with acids. Keep away from moisture; causes the release of oxygen and heat.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Magnesium peroxide can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Breathing the dust can irritate the air passages, causing sore throat and/or cough with phlegm.

Long Term Exposure: This chemical is a very irritating substance and it may cause lung effects or damage.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Where there is potential for exposures to magnesium peroxide, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Magnesium peroxide must be stored to avoid contact with acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Keep magnesium peroxide dry. In contact with moisture, it is a dangerous fire hazard because it releases oxygen and much heat. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use a vacuum or a wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Magnesium peroxide itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Poisonous gases, including magnesium oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium silicide M:0170

Molecular Formula: Mg_2Si

Synonyms: Dimagnesium silicide

CAS Registry Number: 22831-39-6; 39404-03-0

RTECS® Number: OM4367000

UN/NA & ERG Number: UN2624/138

EC Number: 245-254-5

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Magnesium silicide is a slate-blue crystalline solid. Molecular weight = 76.71; Freezing/Melting point = 778°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1 ₩. Dangerous reaction with water.

Potential Exposure: Magnesium silicide is used in the semiconductor industry and to produce certain aluminum alloys.

Incompatibilities: Pyrophoric; mixtures with air are spontaneously explosive. Reacts with water; evolves explosive hydrogen and self-igniting toxic silane gas. Incompatible with mineral acids.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: No criteria set.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin and/or eyes. Breathing the dust can irritate the air passages, causing cough with phlegm. In contact with moisture or acid or acid mist, a highly irritating and flammable gas (silane) is released.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to magnesium silicide, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Flammable solid. Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids. Keep dry at all times. Sources of ignition, such as smoking and open flames, are prohibited where magnesium silicide is handled, used, or stored.

Shipping: Magnesium silicide requires a shipping label of “DANGEROUS WHEN WET.” It falls in Hazard Class 4.3 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum; do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep magnesium silicide out of sewers because of possibility of fire or explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium silicide is a flammable solid. Forms flammable hydrogen or silane gas on contact with water. Use dry chemical, soda ash, or lime extinguishers. *Do not use water* or foam. Poisonous fumes of sodium monoxide are produced in a fire. Ignites spontaneously in air. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium silicofluoride M:0180

Molecular Formula: F_6MgSi

Common Formula: $MgSiF_6$

Synonyms: Eulava SM; Fluosilicate de magnesium (French); Magnesium fluorosillicate; Magnesium hexafluorosillicate; Magnesium hexahydrate; Magnesium silicofluoride; Silicate(2-), hexafluoro-

CAS Registry Number: 16949-65-8; 18972-56-0 (Hexafluorosilicate); *(alt.)* 1310-00-5

RTECS® Number: W8575000

UN/NA & ERG Number: UN2853/151

EC Number: 241-022-2 [*Annex I Index No.:* 009-018-00-3] (magnesium hexafluorosilicate)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

European/International Regulations (*16949-65-8; magnesium hexafluorosilicate*): Hazard Symbol: T; Risk phrases: R25; Safety phrases: S1/2; S24/25; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Magnesium silicofluoride is a white crystalline solid. Molecular weight = 274.52. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Magnesium silicofluoride is used as a concrete hardener and waterproofing agent. Hexafluoro is used as an agricultural chemical.

Incompatibilities: Strong acids.

Permissible Exposure Limits in Air

As fluorides

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA.

Arab Republic of Egypt: TWA 0.5 mg(Sb)/m^3, 1993; Australia: TWA 0.5 mg(Sb)/m^3, 1993; Australia: TWA 2.5 mg(F)/m^3, 1993; Austria: MAK 0.5 mg(Sb)/m^3, 1993; Austria: MAK 2.5 mg(F)/m^3, 1999; Belgium: TWA 0.5 mg (Sb)/m^3, 1993; Belgium: TWA 2.5 mg(F)/m^3, 1993; Denmark: TWA 0.5 mg(Sb)/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg(Sb)/m^3, 2003; Finland: TWA 0.5 mg (Sb)/m^3, 1993; Finland: TWA 2.5 mg(F)/m^3, 1993; France: VME 0.5 mg(Sb)/m^3, 1993; France: VME 2.5 mg(F)/m^3, 1999; Hungary STEL 0.5 mg(Sb)/m^3, 1993; Hungary: TWA 1 mg(F)/m^3, STEL 2 mg(F)/m^3, 1993; Japan: 0.1 mg(Sb)/m^3, 2B carcinogen, 1999; Norway: TWA 0.6 mg(F)/m^3, 1999; the Philippines: TWA 0.5 mg(Sb)/m^3, 1993; the Philippines: TWA 2.5 mg(F)/m^3, 1993; Poland: MAC (time-weighted average) 0.5 mg(Sb)/m^3, 1993; Poland: MAC (time-weighted average) 1 mg(HF)/m^3; MAC (STEL) 3 mg(HF)/m^3, 1999; Russia: STEL 0.3 mg/m^3, 1993; Russia: TWA 0.2 mg(Sb)/m^3, STEL 0.5 mg(Sb)/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2.5 mg

(F)/m^3; United Kingdom: TWA 0.5 mg(Sb)/m^3; TWA 2.5 mg(F)/m^3, 2000.

Note: the OSHA PEL for fluorides (measured as fluorine) is 2.5 mg/m^3 TWA for an 8-h work-shift.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Magnesium silico-fluoride can affect you when breathed in. Skin contact may cause irritation, rash, and ulcers. Eye contact causes irritation with possible permanent damage.

Long Term Exposure: Repeated exposure can cause brittle bones, and muscle and ligament stiffness, with eventual crippling. Overexposure causes irritation of the throat and air passages. Repeated exposure may cause poor appetite, nausea, constipation, or diarrhea. May cause lung damage.

Points of Attack: Lungs.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-103: *Inorganic Fluorides.*

Respirator Selection: NIOSH/OSHA as fluorine *1 ppm:* Sa (APF = 10) (any supplied-air respirator). *2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *25 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS end of service life indicator (ESLI) required [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric).

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases and fumes are produced in a fire, including hydrogen fluoride, silicon tetrafluoride, and magnesium oxide fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
FDA—proprietary drug.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Reportable Quantity (RQ): 100 lb (45.4 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R43; R50/53; Safety phrases: S2; 24; S37; S46; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: It is a deep-brown to yellow liquid with a garlic-like odor. Clear and colorless when pure; Freezing/Melting point = 3°C; Molecular weight = 330.38; Boiling point = 156−157°C; Vapor pressure = 8×10^{-6} mmHg at 20°C; Flash point ≥163°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Malathion is marketed as 99.6% technical grade liquid. Available formulations include wetable powders (25% and 50%), emulsifiable concentrates, dusts, and aerosols. Malathion is used as a broad spectrum insecticide and acaricide in the control of certain insect pests on fruits, vegetables, and ornamental plants. It has been used in the control of houseflies, mosquitoes, lice, and on farm and livestock animals.
Incompatibilities: Reacts violently with strong oxidizers, magnesium, alkaline pesticides. Attacks metals including iron, steel, tin plate, lead, copper, and some plastics, coatings, and rubbers.
Permissible Exposure Limits in Air
OSHA PEL: 15 mg/m^3 (*total dust*) TWA [skin].
NIOSH REL: 10 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 1 mg/m^3 TWA measured as inhalable fraction and vapor; [skin]; not classifiable as a human carcinogen; TLV-BEI$_A$ issued as Acetylcholinesterase-inhibiting pesticides.
NIOSH IDLH: 250 mg/m^3.
Protective Action Criteria (PAC)*
TEEL-0: 1 mg/m^3
PAC-1: **15** mg/m^3
PAC-2: **120** mg/m^3
PAC-3: **390** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 15 mg/m^3 inhalable fraction TWA; Peak Limitation Category II(4); Pregnancy Risk Group D.
Arab Republic of Egypt: TWA 10 mg/m^3, [skin], 1993; Australia: TWA 10 mg/m^3, [skin], 1993; Austria: MAK: 10 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, [skin], 1993; Denmark: TWA 5 mg/m^3, [skin], 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, 1999; France: VME 10 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 10 mg/m^3, [skin], 2003; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 15 mg/m^3, [skin], 1993; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, [skin], 1993; Switzerland: MAK-W 10 mg/m^3, [skin], 1999; Thailand: TWA 15 mg/m^3, 1993; Turkey: TWA 15 mg/m^3, [skin], 1993; United Kingdom: TWA 10 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Argentina[35]: STEL 1.5 mg/m^3. Russia[43] has set MAC values in the ambient air of residential areas at 0.015 mg/m^3 on a momentary basis and 0.006 mg/m^3 on a daily average basis. Several states have set guidelines or standards for malathion, in ambient air[60] ranging from 33.3 μg/m^3 (New York) to 100 μg/m^3 (Florida, North Dakota, South Carolina) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides; OSHA Analytical Method ID-62.

Permissible Concentration in Water: Russia[43] set a MAC of 0.05 mg/L in water bodies used for domestic purposes. The MAC in water bodies used for fishery purposes is zero. Several states have set guidelines for malathion in drinking water[61] ranging from 40 μg/L (Maine to 140 μg/L (Kansas) to 160 μg/L (California).

Determination in Water: Fish Tox = 0.28991000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation of vapor, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Malathion is representative of a general class called organophosphates. The effects caused by many short-term exposures during a week's time can be accumulated and felt as one intense response. Sometimes effects are not felt until hours or days after exposure. *Inhalation:* No effects were reported from exposures of up to 86 mg/m^3 for 42 days. The only effect reported due to inhalation was the reduction in activity of an important nervous system enzyme. *Skin:* Important route of exposure during formulation and usage. Prolonged contact (hours) along with poor hygiene has resulted in irritation, as well as symptoms listed under ingestion. *Eyes:* Direct contact can lead to irritation and discomfort. *Ingestion:* Swallowing of malathion has caused severe poisoning and death. Swallowing of 1½–3 oz of a moisture (50% malathion) has caused severe poisoning with symptoms which include nausea, vomiting, headache, abdominal pain, diarrhea, difficulty in breathing, fall in blood pressure, muscle spasms, paralysis, loss of reflexes, convulsions, and coma. Between 3½ and 5 oz of a mixture (50% malathion) has caused death. Human Tox = 100.00000 ppb (VERY LOW).

Long Term Exposure: Prolonged, daily contact with exposed areas of skin has led to skin irritation and sensitization. May cause genetic changes (mutations). High or repeated exposure may damage the nerves, causing weakness, dizziness, and poor coordination in arms and legs. Repeated exposures may cause personality changes, depression, anxiety, or irritability.

Points of Attack: Eyes, skin, respiratory system, liver, blood cholinesterase, central nervous system, cardiovascular system, gastrointestinal tract.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Preplacement and periodic medical examination shall include comprehensive initial or interim medical and work histories. A physical examination which shall be directed toward, but not limited to evidence of frequent headache, dizziness, nausea, tightness of the chest, dimness of vision, and difficulty in focusing the eyes. Determination, at the time of the preplacement examination, of a baseline or working baseline erythrocyte ChE activity. A judgment of the worker's physical ability to use negative or positive-pressure regulators as defined in 29 CFG 1910.134. Periodic examinations shall be made available on an annual basis or at some other interval determined by the responsible physician. Medical records shall be maintained for all workers engaged in the manufacture or formulation of malathion and such records shall be kept for at least 1 year after termination of employment. Pertinent medical information shall be available to medical representatives of the US Government, the employer, and the employees. Erythrocyte cholinesterase levels should be checked as noted above and as described in detail by NIOSH Criteria Document No. 76-205.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician or trained medical personnel: Administer atropine, 2 mg (0.030 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3−8 min until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 1 mg of atropine. Watch respiration and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. Give 2-PAM (Pralidoxime; Protopam), 2.5 g in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 min; if sufficient fluid is not available, give 1 g of 2-PAM in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **4 h**: Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Respirator Protection:* Engineering controls shall be used wherever feasible to maintain airborne malathion concentrations below the recommended work-place environment limit. Compliance with the work-place environmental limit by the use of respirators is allowed only when airborne malathion concentrations exceed the work-place environmental limit because required engineering controls are being installed or tested, when nonroutine maintenance or repair is being accomplished, or during emergencies. When a respirator is thus permitted, it shall be selected and used in accordance with NIOSH requirements.

Respirator Selection: *100 mg/m³:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator) SCBA (any self-contained breathing apparatus). *250 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter) SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated, uninhabited area below 25°C. Store to avoid contact with oxidizers and alkaline pesticides. Store where possible leakage from containers cannot endanger the worker. Maintain regular inspection of containers for any leakage. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate the area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Malathion is combustible but ignites with difficulty. A fire should be extinguished with agents suitable to the surrounding combustibles. Poisonous gases, including sulfur dioxide and phosphoric acid, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Malathion is reported to be "hydrolyzed almost instantly" at pH 12; 50%; hydrolysis at pH 0 requires 12 h. Alkaline hydrolysis under controlled conditions (0.5 N NaOH in ethanol) gives quantitative yields of $(CH_3O)_2P(S)SNa$, whereas hydrolysis in acidic media yields $(CH_3O)_2P(S)OH$. On prolonged contact with iron or iron-containing material, it is reported to break down and completely lose insecticidal activity. Incineration together with a flammable solvent in a furnace equipped with afterburner and scrubber is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R36/37/38; R43; Safety phrases: S2; S24; S26; S28; S37; 46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Maleic acid is a white crystalline solid with a faint, acidulous odor. Molecular weight = 116.08; Specific gravity (H_2O:1) = 1.59; Boiling point = (decomposes below BP at 135°C); Freezing/Melting point = 131°C; also listed at 138−139°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Highly soluble in water; solubility = $>75\%$.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Maleic acid is used to make artificial resins, antihistamines, and to preserve (retard rancidity) fats and oils.

Incompatibilities: Oxidizers, strong bases, amines, reducing agents, alkali metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 300 mg/m^3

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <-0.6$.

Routes of Entry: Inhalation, skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Maleic acid can affect you when breathed in and by passing through your skin. Contact can cause severe eye burns leading to permanent damage. Contact can irritate the skin. Exposure may cause you to feel dizzy and lightheaded. Exposure can irritate the nose, throat, and lungs and cause coughing or shortness of breath. Very high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung irritation and bronchitis. May affect the kidneys.

Points of Attack: Lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. Kidney function tests. If symptoms develop or overexposure is suspected, the following maybe useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For maleic acid (>70%) Natural rubber, Neoprene™, nitrile + PVC, nitrile, polyethylene, and Viton™ are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: Where there is potential for exposure to maleic acid as dust, mist, or fume, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for exposures to maleic acid as a liquid, or for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Maleic acid must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), amines (such as aniline), and alkali metals (such as sodium and potassium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. For *small spills*, cover with soda ash or sodium bicarbonate, mix, add water, neutralize, and wash down drain with copious amounts of water. Use HEPA vacuum; do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, polymer, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. *Liquid:* incinerate after mixing with a flammable solvent. Use afterburner for complete combustion. *Solid:* dissolve in a flammable solvent or package in paper and burn. See above.

New Jersey Department of Health and Senior Services. (November 1999). *Hazardous Substances Fact Sheet: Maleic Acid*. Trenton, NJ

Maleic anhydride M:0210

Molecular Formula: $C_4H_2O_3$

Common Formula: $(CHCO)_2O$

Synonyms: Acido malico (Spanish); BM 10; *cis*-Butenedioic anhydride; Dihydro-2,5-dioxofuran; 2,5-Dihydrofuran-2,5-dione; 2,5-Furandione; 2,5-Furanedione; Maleic acid anhydride; Toxilic anhydride

CAS Registry Number: 108-31-6

RTECS® Number: ON3675000

UN/NA & ERG Number: UN2215/156

EC Number: 203-571-6 [*Annex I Index No.:* 607-096-00-9]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

US EPA Hazardous Waste Number (RCRA No.): U147.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R22; R34; R42/43; Safety phrases: S2; S22; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Maleic anhydride is colorless needles, white lumps, or pellets with an irritating, choking odor. The odor threshold is 0.32 ppm. Molecular weight = 98.06; Specific gravity (H_2O:1) = 1.48; Boiling point = 202.2°C; Freezing/Melting point = 52.8°C; Vapor pressure = 0.2 mmHg at 20°C; Flash point = 102°C (cc); Autoignition temperature = 477°C. Explosive limits: LEL = 1.4%; UEL = 7.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly reacts with and is soluble in water; solubility = 40%. Maleic anhydride may be transported as hot (70°C) liquid.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Maleic anhydride is used in unsaturated polyester resins, agricultural chemical and lubricating additives, in the manufacture of unsaturated polyester resins, in the manufacture of fumaric acid, in alkyd resin manufacture, and in the manufacture of pesticides (e.g., malathion, maleic hydrazide, and captan).

Incompatibilities: Reacts slowly with water (hydrolyzes) to form maleic acid, a medium strong acid. Reacts with strong oxidizers, oil, water, alkali metals, strong acids, strong bases. Violent reaction with alkali metals and amines above 66°C.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.01 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.25 ppm/1 mg/m^3/TWA.

NIOSH REL: 0.25 ppm/1 mg/m^3/TWA.

ACGIH TLV®[1]: 0.1 ppm/0.4 mg/m^3/TWA; danger of sensitizaton. Notice of intended change: 0.01 measured as inhalable fraction and vapor.

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.2** ppm

PAC-2: **2** ppm

PAC-3: **20** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.1 ppm/0.41 mg/m^3 TWA; Peak Limitation Category I(1), a momentary value of 0.2 mL/m^3/0.81 mg/m^3 should not be exceeded; danger of skin and airways; Pregnancy Risk Group C; danger of sensitization of airways and skin.

NIOSH IDLH: 10 mg/m^3; [danger of skin sensitization and airways]; Pregnancy Risk Group C.

Australia: TWA 0.25 ppm (1 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.4 mg/m^3), 1999; Belgium: TWA 0.25 ppm (1 mg/m^3), 1993; Denmark: TWA 0.2 ppm (0.8 mg/m^3), 1999; Finland: TWA 0.1 ppm, ceiling 0.2 ppm, 1999; France: VLE 1 mg/m^3, 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, 1993; the Netherlands: MAC-TGG 0.4 mg/m^3, 2003; Norway: TWA 0.2 ppm (0.8 mg/m^3), 1999; the Philippines: TWA 0.25 ppm (1 mg/m^3), 1993; Poland: TWA 0.5 mg/m^3; STEL 1.0 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: NGV 0.3 ppm (1.2 mg/m^3), KTV 0.6 ppm (2.5 mg/m^3), 1999; Switzerland: MAK-W 0.2 ppm (0.8 mg/m^3), KZV-(week) 0.4 ppm (1.6 mg/m^3), 1999; United Kingdom: TWA 1 mg/m^3; STEL 3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The Czech Republic: TWA 1.0 mg/m^3 with the same value as an STEL.[35] Russia[35, 43] set a MAC of 0.2 mg/m^3 for ambient air in residential areas on a momentary basis and 0.05 mg/m^3 on a daily average basis. Several states have set guidelines or standards for maleic anhydride in ambient air[60] ranging from 0.14 μg/m^3 (Massachusetts) to 3.3 μg/m^3 (New York) to 10.0 μg/m^3 (Florida and South Carolina) to 12.0 μg/m^3 (North Carolina) to 17 μg/m^3 (Virginia) to 20 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada) to 100.0 μg/m^3 (North Carolina and North Dakota).

Determination in Air: Use NIOSH (IV), Method #3512; OSHA Analytical Method 25 or 86.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Maleic anhydride severely irritates the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation may cause asthmatic reactions. The symptoms of asthma may be delayed for several hours and are aggravated by physical effort. Subacute inhalation of maleic anhydride can cause severe headaches, nosebleeds, nervousness, nausea, and temporary impairment of vision. It can also lead to conjunctivitis and corneal erosion. Maleic anhydride may be transported as hot liquid; skin contact causes burns.

Long Term Exposure: Repeated or prolonged skin contact may cause allergy and dermatitis. Repeated or prolonged inhalation exposure may cause bronchial asthma. Repeated exposure to concentrations above 1.25 ppm has caused asthmatic responses in workers. Allergies have developed so that lower concentrations of maleic anhydride can no longer be tolerated. An increased incidence of bronchitis and dermatitis has also been noted among workers with long-term exposure to maleic anhydride. Repeated exposure may cause photophobia (abnormal visual intolerance to light), double vision, bronchial asthma.

Points of Attack: Eyes, respiratory system, skin.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Anyone who has developed symptoms of asthma due to contact with maleic anhydride should avoid all further contact with this chemical. Consider chest X-ray following acute overexposure. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. The symptoms of asthma may be delayed for several hours and are aggravated by physical effort. Rest and medical observation are highly recommended. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h**: Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends rubber, Neoprene™, nitrile, polyvinyl chloride and polystyrene as protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: May causes eye damage; eye protection needed.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Maleic anhydride must be stored to avoid contact with water and strong oxidizers (such as chlorine and bromine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum; do not dry sweep. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep maleic anhydride out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Maleic anhydride is a combustible solid. Dust clouds of the vapor of molten maleic anhydride are explosive on contact with spark or flame. Use CO_2 or alcohol foam extinguishers. Use of dry chemicals or water extinguishers may cause an explosion. Dust clouds or maleic anhydride or the vapors of molten maleic anhydride are explosive on contact with spark or flame. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration: care must be taken that complete oxidation to nontoxic products occurs.

Maleic hydrazide M:0220

Molecular Formula: $C_4H_4N_2O_2$

Common Formula: $C_4H_4O_2N_2$

Synonyms: BH dock killer; Bos MH; Burtolin; Chemform; De-cut; Desprout; 1,2-Dihydro-3,6-pyradazinedione; 1,2-Dihydro-3,6-pyridazinedione; 1,2-Dihydropyridazine-3,6-dione; Drexel-Super P; EC 300; ENT 18,870; Fair 30; Fair PS; Hydrazida maleica (Spanish); 6-Hydroxy-3(2H)-pyridazinone; KMH; MAH; Maintain 3; Malazide; Maleic acid hydrazide; Maleic hydrazide fungicide; Maleic hydrazine; Malein 30; Maleinsaurehydrazid (German); *N*,*N*-Maleoylhydrazine; Malzid; Mazide; MH; MH 30; MH 36 Bayer; MH 40; Regulox; Regulox 50W; Regulox W; Retard; Royal MH 30; Royal Slo-Gro; Slo-Gro; Sprout-stop; Stuntman; Sucker-stuff; Super de-sprout; Super sprout stop; 1,2,3-Tetrahydro-3,6-dioxopyridazine; Vondaldhyde; Vondrax

CAS Registry Number: 123-33-1

RTECS® Number: UR5950000

UN/NA & ERG Number: Not regulated

EC Number: 204-619-9

Regulatory Authority and Advisory Bodies

IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987.

Banned or Severely Restricted (Germany, Guatemala, United States) (UN).[13]

US EPA Hazardous Waste Number (RCRA No.): U148.

Reportable Quantity (RQ): 5000 lb (2270 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Maleic Hydrazide is a crystalline solid. Molecular weight = 112.10; Freezing/Melting point = 292°C (decomposes at 260°C); also reported as >300°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in cold water; more soluble in hot.

Potential Exposure: Those involved in the manufacture, formulation, and application of this plant growth retardant.

Incompatibilities: Strong oxidizers. Slightly corrosive to iron and zinc.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.6 mg/m^3
PAC-1: 2 mg/m^3
PAC-2: 12.5 mg/m^3
PAC-3: 500 mg/m^3

Permissible Concentration in Water: A lowest-observed-adverse-effect-level (LOAEL) of 500 mg/kg/day has been calculated. On the basis of this, the US EPA has calculated a lifetime health advisory of 3.5 mg/L for an adult.

Routes of Entry: Inhalation, ingestion, skin and/eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of eyes, skin and mucous membranes, tremors, muscle spasms, and skin sensitization are among the consequences of MH exposure. LD_{50} = (oral-rat) 3800 mg/kg (slightly toxic).

Long Term Exposure: May cause liver damage and acute central nervous system effects. May cause mutations (genetic changes).

Points of Attack: Central nervous system, liver, skin.

Medical Surveillance: Liver function tests. Examination by a qualified allergist. Tests of the nervous system.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−23 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with acetone to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Malononitrile M:0230

Molecular Formula: $C_3H_2N_2$
Common Formula: $NCCH_2CN$
Synonyms: AI3-24285; Cyanoacetonitrile; α-Cyanoacetonitrile; Dicyanmethane; Dicyanomethane; Malonic acid dinitrile; Malonic dinitrile; Malonodinitrile; Malononitrilo (Spanish); Methane, dicyano-; Methylene cyanide; Methylenedinitrile; NSC 3769; Propanedinitrile; Propanedinitrite
CAS Registry Number: 109-77-3
RTECS® Number: OO3150000
UN/NA & ERG Number: UN2647/153
EC Number: 203-703-2 [*Annex I Index No.*: 608-009-00-7]
Listed on the TSCA inventory. Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
US EPA Hazardous Waste Number (RCRA No.): U149.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R50/53; Safety phrases: S1/2; S23; S27; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Malononitrile is a white powder or colorless, odorless crystalline substance. Molecular weight = 66.07; Specific gravity (H_2O:1) = 1.19; Boiling point = 218.9°C; Freezing/Melting point = 32.2°C; Flash point = 130°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water; solubility = 13%.
Potential Exposure: Compound Description: Primary Irritant. Malononitrile is used in organic synthesis, as a lubricating oil additive, for thiamine synthesis, for pteridine-type anti-cancer agent synthesis, and in the synthesis of photosensitizers, acrylic fibers, and dyestuffs. It has also been used in the treatment of various forms of mental illness. It has been used as a leaching agent for gold.
Incompatibilities: Strong bases. May polymerize violently on prolonged heating at 129°C or in contact with strong bases at lower temperatures.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 2.70 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 3 ppm/8 mg/m^3 TWA.
Protective Action Criteria (PAC)*
TEEL-0: 3 ppm
PAC-1: 3 ppm
PAC-2: **4.9** ppm
PAC-3: **10** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Connecticut has set a guideline or standard of 160 μg/m^3 for malononitrile in ambient air.[60]
Determination in Air: Malononitrile may be determined in air by charcoal tube, Toluene, Gas chromatography/Flame ionization detection, NIOSH Nitriles Criteria Document.
Permissible Concentration in Water: Russia[43] set a MAC of 0.02 mg/L in water bodies used for domestic purposes.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Metabolized by body to cyanide and thiocyanate; effects of inhalation of toxic fumes will be related to cyanide. Causes brain and heart damage related to lack of cellular oxygen. It is classified as extremely toxic. Probable oral lethal dose for humans is 5−50 mg/kg, or between 7 drops and 1 teaspoonful, for a 70-kg (150 lb) person. Symptoms of cyanide poisoning include rapid and irregular breathing, anxiety, confusion, odor of bitter almonds (on breath or vomitus), nausea, vomiting (if oral exposure), irregular heartbeat, a feeling of tightness in the chest, bright pink coloration of the skin, unconsciousness followed by convulsions, involuntary urination and defecation, paralysis, and respiratory arrest (heart will beat after breathing stops).
Medical Surveillance: See NIOSH Criteria Document *212 Nitriles*.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 80 mg/m³:* Sa (APF = 10) (any supplied-air respirator). *Up to 200 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 400 mg/m³:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 667 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere for prolonged storage. Keep away from strong bases. May polymerize violently on prolonged heating at 129°C or in contact with strong bases at lower temperatures. May spontaneously explode on storing above 70−80°C.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Avoid all skin contact, inhalation, and ingestion. Take up *small spills* with sand or other noncombustible material. Dike far ahead of *large spills* for later disposal. Do not touch spilled material; stop leak if you can do so without risk. Stay upwind and out of low areas. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use chemical, carbon dioxide, water spray, fog, or foam. Move container from fire area if you can do it without risk. Poisonous gases, including nitrogen oxides and cyanide, are produced in fire. Wear positive pressure breathing apparatus and special protective clothing. When heated to decomposition, malononitrile emits highly toxic fumes. May explode spontaneously or polymerize violently on heating. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Carcinogenicity: IARC: Animal Inadequate Evidence; Human No Adequate Data*, not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA Gene-Tox Program, Positive: *S. cerevisiae*—homozygosis; Weakly Positive: *In vitro* UDS—human fibroblast; Negative: *S. cerevisiae* gene conversion.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (in agriculture) (former USSR-UNEP/IRPTC project).[13]

Carcinogenicity: (New Jersey) (See "References" Below) (California Prop. 65).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, appendix B).

California Proposition 65 Chemical: Cancer 1/1/90.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20; R36; R43; R63; R50/53; Safety phrases: S2; S25; S36/37; S46; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Maneb is a yellow powder or crystalline solid with a faint odor. Molecular weight = 265.30; Freezing/Melting point = 130°C (decomposes below MP). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Moderately soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Those involved in manufacture, formulation, and application of this broad spectrum fungicide. Some dithiocarbamates have been used as rubber components. DFG warns of danger of skin sensitization

Incompatibilities: Water, acid, oxidizing materials. Heat or contact with moisture or acids causes rapid decomposition and the generation of toxic and flammable hydrogen sulfide and carbon disulfide.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration.

NIOSH: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL.

No TEEL available.

DFG MAK: Danger of skin sensitization.

Australia: TWA 5 mg[Mn]/m^3, 1993; Belgium: TWA 5 mg [Mn]/m^3, 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 2.5 mg[Mn]/m^3, 1999; Hungary: TWA 0.3 mg [Mn]/m^3, short-term exposure limit 0.6 mg[Mn]/m^3, 1993; Poland: MAC (TWA) 0.3 mg[Mn]/m^3, 1993; Russia: STEL 0.5 mg/m^3, 1993; United Kingdom: TWA 5 mg[Mn]/m^3, 2000.

Determination in Water: Use OSHA Analytical Method 107.

Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been determined by MAS/NRC to be 0.035 mg/L. An acceptable daily intake (ADI) of 0.005 mg/kg/day has been calculated for maneb. The state of Maine has set a guideline of 10 μg/L for maneb in drinking water.[61]

Determination in Water: Fish Tox = 0.00193000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Maneb irritates the eyes, skin, and respiratory tract. Maneb is low in acute toxicity and does not present alarming properties during long-term administration to experimental animals, except at very high dosages. However, it is a material of concern because of evidence of mutagenic and teratogenic effects as well as the possibility of nitrosation to carcinogenic nitrosamines. A rebuttable presumption against registration of maneb for pesticide uses was issued by EPA on August 10, 1977 on the basis of oncogenicity, teratogenicity, and hazard to wildlife. Human Tox = 5.73770 ppb (HIGH).

Long Term Exposure: Repeated skin contact can cause skin sensitization and rash. High or repeated exposures may interfere with thyroid function (causing goiter), damage the central nervous system, affect liver function, or cause kidney damage.

Points of Attack: Skin, thyroid, liver, kidneys, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system. Thyroid function tests. Consider kidney and liver function tests with higher or repeated exposures. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to maneb, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Maneb must be stored to avoid contact with water, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids, moisture, heat, and oxidizing materials. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Maneb, stabilized or maneb preparations, stabilized against self-heating requires a shipping label of "DANGEROUS WHEN WET." It falls in Hazard Class 4.3 and Packing Group III.

Maneb (with not <60% maneb) requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE, DANGEROUS WHEN WET." It falls in Hazard Class 4.2 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep maneb out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, soda ash, sand, or lime extinguishers. *Do not use water*. Poisonous gases are produced in fire, including nitrogen oxides, hydrogen sulfide, sulfur oxides, and carbon disulfide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Maneb is unstable in moisture and is hydrolyzed by acids and hot water. It decomposes at about 100°C but may spontaneously decompose vigorously when stored in bulk. Incineration is the preferred disposal means.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Manganese (dust & fume) M:0250

Molecular Formula: Mn

Synonyms: Colloidal manganese; Cutaval; Elemental manganese; JIS-G 1213; Manganese-55; Manganese element; Manganeso (Spanish); Tripart liquid; Tronamag

CAS Registry Number: 7439-96-5 (metal)
RTECS® Number: OO9275000
UN/NA & ERG Number: UN3077/171
EC Number: 231-105-1

Regulatory Authority and Advisory Bodies

EPA (*Mn and inorganic compounds*): Not classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as manganese compounds.

Safe Drinking Water Act: SMCL, 0.05 mg/L.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Manganese is a combustible, lustrous, brittle, silvery soft metal. The most important ore containing manganese is pyrolusite. Manganese may also be produced from ferrous scrap used in the production of electric and open-hearth steel. Molecular weight = 54.94; Specific gravity (H_2O:1) = 7.20 (metal); Boiling point = 1962°C; Freezing/Melting point = 123.8°C. Hazard Identification (based on NFPA-704 M Rating System): (*dust*): Health 0, Flammability 2, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Manganese is used in the production of steel, in the manufacture of welding rod coatings and fluxes, in iron and steel industry in steel alloys, e.g., ferromanganese, silicomanganese, manganin, spiegeleisen, and as an agent to reduce oxygen and sulfur content of molten steel. Other alloys may be formed with copper, zinc, and aluminum. Manganese and its compounds are utilized in the manufacture of dry cell batteries (MnO_2), paints, varnishes, inks, dyes, matches and firework, as a fertilizer, disinfectant, bleaching agent, laboratory reagent, drier for oils, an oxidizing agent in the chemical industry particularly in the synthesis of potassium permanganate, and as a decolorizer and coloring agent in the glass and ceramics industry. Exposure may occur during the mining, smelting, and refining of manganese, in the production of various materials, and in welding operations with manganese-coated rods. Manganese normally is ingested as a trace nutrient in food. The average human intake is approximately 10 mg/day.

Incompatibilities: Dust or powder may be pyrophoric or explosive in air. Reacts with water (slowly), steam, or acid producing flammable hydrogen gas. Reacts violently with concentrated hydrogen peroxide. Incompatible with nitrogen gas above 200°C. Oxidizers, nitric acid, nitrogen, finely divided aluminum and other metals, sulfur dioxide, carbon dioxide + heat may cause fire and explosions.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume).

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL.

ACGIH TLV®[1]: 0.2 mg[Mn]/m^3, inorganic compounds; *Notice of intended change*: 0.02 mg[Mn]/m^3, respirable fraction; 0.2 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

NIOSH IDLH: 500 mg[Mn]/m^3.

Protective Action Criteria (PAC)
TEEL-0: 0.2 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 500 mg/m^3

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 5 mg/m^3, 1993; Australia: TWA 1 mg/m^3; STEL 3 mg/m^3 (fume), 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 1 mg/m^3; STEL 3 mg/m^3 (fume), 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 1 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3, 1993; France: VME 1 mg/m^3 (fume), 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Japan: 0.3 mg/m^3, respirable dust, 1999; Norway: TWA 1 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Russia: STEL 0.2 mg/m^3 (fume), 1993; Sweden: NGV 1 mg/m^3, TGV 2.5 mg/m^3 (respirable dust); NGV 2.5 mg/m^3, TGV 5 mg/m^3 (total dust), 1999; Switzerland: MAK-W 1 mg/m^3 (fume); MAK-W 5 mg/m^3, 1999; Thailand: TWA 5 mg/m^3, 1993; Turkey: TWA 5 mg/m^3 (fume), 1993; United Kingdom: TWA 1 mg [Mn]/m^3; STEL 3 mg[Mn]/m^3, fume; TWA 5 mg[Mn]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg. the Czech Republic 2.0 mg/m^3 (6.0 mg/m^3 as a ceiling value). Standards for ambient air in residential areas have been set as follows: the Czech Republic; momentary basis (mg/m^3) 0.03; daily average basis (mg/m^3) 0.01; Russia; momentary basis (mg/m^3) 0.01; daily average basis (mg/m^3) 0.001. Several states have set guidelines or standards for manganese in ambient air[60] ranging from 2.0 μg/m^3 (Rhode Island) to 10 μg/m^3 (North Dakota) to 17 μg/m^3 (Virginia) to 20 μg/m^3 (Connecticut and South Dakota) to 25 μg/m^3 (Pennsylvania) to 119 μg/m^3 (Nevada) to 300 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID-121.

Permissible Concentration in Water: There are a variety of maximum allowable concentrations set in various countries[35] (mg/L): the Czech Republic: 0.1 (drinking water); 0.2 (drinking water reserve); 0.5 (surface water); EEC 50.0 (drinking water); United States 0.05 (bottled water); Former USSR-UNEP/IRPTC joint project 0.1 (drinking and surface water); World Health Organization (WHO): 0.05

(maximum desirable); 0.10 (for esthetic quality); 0.50 (maximum permissible in drinking water). In addition, several states have set values for manganese in drinking water. These include a standard of 0.15 mg/L in Illinois and a guideline of 0.05 mg/L in Kansas.

Determination in Water: The manganese detection limit by direct flame atomization is 2 μg/L. However, solvent extraction is used for many determinations. Analytic conditions are more critical for the extraction of manganese than for most other metals, because many manganese-chelate complexes are unstable in solution. With pH control and immediate analysis after extraction, accurate determinations are possible. When the graphite furnace is used to increase sample atomization, the detection limit is lowered to 0.01 μg/L or ng/L according to NAS/NRC.

Routes of Entry: Inhalation of dust or fume, limited percutaneous absorption of liquids, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Manganese dust and fumes are irritants to the eyes and mucous membranes of the respiratory tract, and apparently are completely innocuous to the intact skin. Inhalation of dust may cause bronchitis and pneumonitis. The effects may be delayed.

Long Term Exposure: The substance may have effects on the lungs and nervous system resulting in bronchitis, pneumonitis, neurologic, and neuropsychiatric disorders (manganism). Animal tests show that this substance possibly causes toxic effects upon human reproduction. Chronic manganese poisoning has long been recognized as a clinical entity. The dust or fumes (manganous compounds) enter the respiratory tract and are absorbed into the blood stream. Manganese is then deposited in major body organs with a special predilection for the liver, spleen, and certain nerve cells of the brain and spinal cord. Among workers there is a very marked variation in individual susceptibility to manganese. Some workers have worked in heavy exposure for a lifetime and shown no signs of the disease; others have developed manganese intoxication within as little as 49 days of exposure. The early phase of chronic manganese poisoning is most difficult to recognize, but it is also important to recognize since early removal from the exposure may arrest the course of the disease. The onset is insidious, with apathy, anorexia, absthenia. Headache, hypersomnia, spasms, weakness of the legs, arthralgias, and irritability are frequently noted. Manganese psychosis follows with certain definitive features: unaccountable laughter, euphoria, impulsive acts, absent-mindedness, mental confusion, aggressiveness, and hallucinations. These symptoms usually disappear with the onset of true neurological disturbances, or may resolve completely with removal from manganese exposure. Progression of the disease presents a range of neurological manifestations that can vary widely among individuals affected. Speech disturbances are common: monotonous tone, inability to speak above a whisper, difficult articulation, incoherence, even complete muteness. The face may take on mask-like quality, and handwriting may be affected by micrographia. Disturbances in gait and balance occur, and frequently propulsion, retropropulsion, and lateropropulsion are affected, with no movement for protection when falling. Tremors are frequent, particularly of the tongue, arms, and legs. These will increase with intentional movements and are more frequent at night. Absolute detachment, broken by sporadic or spasmodic laughter, ensues, and as in extrapyramidal affections, there may be excessive salivation and excessive sweating. At this point the disease is indistinguishable from classical Parkinson's disease. Chronic manganese poisoning is not a fatal disease although it is extremely disabling. Manganese dust is not longer believed to be a causative factor in pneumonia. If there is any relationship at all, it appears to be as an aggravating factor to a preexisting condition. Freshly formed fumes have been reported to cause fever and chills similar to metal fume fever.

Points of Attack: Respiratory system, central nervous system, lungs, blood, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), biologic tissue/biopsy, complete blood count, chest X-ray, pulmonary function tests, urine (chemical/metabolite), urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: A complete examination of the nervous system. Complete blood count. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4—12 h following exposure: it may last less than 36 h. Medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) Ascba (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Manganese must be stored to avoid contact with water and steam since flammable hydrogen gas is produced. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates). Protect storage against physical damage.

Shipping: Manganese is not specifically cited in DOT's Performance-Oriented Packaging Standards.[19] However as an Environmentally hazardous solid, n.o.s. falls in Hazard Class 9 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Manganese metal-sanitary landfill. Manganese chloride or sulfate-chemical conversion to the oxide followed by land filling, or conversion to the sulfate for use in fertilizer. Consult with environmental regulatory agencies for guidance on acceptable disposal practices.

EC Number: 215-202-6 [*Annex I Index No.:* 025-001-00-3]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

EPCRA Section 313: Includes any unique chemical substance that contains manganese as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as manganese compounds, n.o.s.

European/International Regulations: Hazard Symbol: Xn; Risk phrases R20/22; Safety phrases: S2; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Manganese dioxide is a black crystalline solid. Molecular weight = 86.94; Freezing/Melting point = (decomposes) 553°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3 (Oxidizer). Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. Manganese dioxide is used as depolarizer for dry cell batteries, for production of manganese metal, as an oxidizing agent, laboratory reagent, and in making pyrotechnics and matches, in dry cell batteries.

Incompatibilities: A powerful oxidizer. Incompatible with strong acids, reducing agents, combustible materials (such as fuel, clothing and organic materials). Mixtures with calcium hydride is a heat- and friction-sensitive explosive. Vigorous reaction with hydrogen sulfide, diboron tetrafluoride, calcium hydride, chlorine trifluoride, hydrogen peroxide, hydroxyaluminum chloride, anilinium perchlorate. Decomposes when heated above 553°C producing manganese(III)oxide and oxygen, which increases fire hazard. Reacts violently with aluminum (thermite reaction), potassium azide, rubidium acetylide, in the presence of heat.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (compounds and fume).

NIOSH: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL.

ACGIH TLV®[1]: TWA 0.2 mg[Mn]/m^3, inorganic compounds.

Protective Action Criteria (PAC)

TEEL-0: 0.317 mg/m^3

PAC-1: 4.75 mg/m^3

PAC-2: 7.91 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C.

NIOSH IDLH: 500 mg[Mn]/m^3.

Australia: TWA 5 mg[Mn]/m^3, 1993; Belgium: TWA 5 mg [Mn]/m^3, 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 0.5 mg[Mn]/m^3, 1999; Hungary: TWA 0.3 mg[Mn]/m^3; STEL 0.6 mg[Mn]/m^3, 1993; Japan 0.3 mg [Mn]/m^3, respirable dust, 1999; Norway: TWA 2.5 mg [Mn]/m^3, 1999; Poland: MAC (TWA) 0.3 mg[Mn]/m^3, MAC 5 mg[Mn]/m^3, 1999; Sweden: NGV 1 mg[Mn]/m^3, TGV 2.5 mg[Mn]/m^3 (respirable dust), 1993; Sweden: NGV 2.5 mg[Mn]/m^3, TGV 5 mg[Mn]/m^3 (total dust), 1993; United Kingdom: TWA 5 mg[Mn]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg [Mn]/m^3.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Manganese dioxide can affect you when breathed in. Inhalation can cause irritation of the respiratory system. Manganese dioxide can cause a flu-like illness, with chills, fever, and aching. Chest congestion can occur with cough and shortness of breath. It can cause an asthma-like lung allergy. The effects may be delayed.

Long Term Exposure: Repeated exposure can cause permanent brain damage. Early symptoms include poor appetite, weakness, and sleepiness. Later effects include speech, balance, and personality changes. Later symptoms are identical to Parkinson's disease. High or repeated exposure may cause permanent lung damage, kidney and liver damage, and anemia. May affect the lungs and nervous system causing bronchitis, pneumonitis, neurologic and neuropsychiatric disorders (manganism). Animal tests show that this substance may cause toxic effects upon human reproduction.

Points of Attack: Lungs, blood, central nervous system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: complete examination of the nervous system. Complete blood count (CBC). Lung function tests. These may be normal if the person is not having an attack at the time of the test. Kidney function test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests. Evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); Ascba (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard (strong oxidizer); Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Manganese dioxide must be stored to avoid contact with heat and flammable materials and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. See also incompatibilities above. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Oxidizing solid, n.o.s. requires a shipping label of “OXIDIZER.” It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Manganese dioxide itself does not burn, but it will intensify an existing fire. Use extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

EPCRA Section 313: Includes any unique chemical substance that contains manganese as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as manganese compounds, n.o.s.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (CAS: 10377-66-9).

Description: Manganese nitrate is a colorless to pink crystalline solid. Molecular weight = 178.96. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3 (Oxidizer). Highly soluble in water.

Potential Exposure: Manganese nitrate is used as a color agent in porcelain and ceramic manufacture, as a catalyst, and in the production of manganese dioxide.

Incompatibilities: A strong oxidizer. Violent reaction with reducing agents, organics, and combustible materials.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (compounds and fume).

NIOSH: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL.

ACGIH TLV®[1]: TWA 0.2 mg[Mn]/m^3, inorganic compounds.

Protective Action Criteria (PAC)

TEEL-0: 1.04 mg/m^3

PAC-1: 15.7 mg/m^3

PAC-2: 26.1 mg/m^3

PAC-3: 500 mg/m^3

Hydrate

TEEL-0: 0.717 mg/m^3

PAC-1: 10.8 mg/m^3

PAC-2: 17.9 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C.

NIOSH IDLH: 500 mg[Mn]/m^3.

Harmful Effects and Symptoms

Short Term Exposure: Manganese nitrate can affect you when breathed in. Eye or skin contact with the dust or concentrated liquid can cause irritation or burns. The dust or mist can irritate the nose, throat, and bronchial tubes, with cough and phlegm. Higher levels may irritate the lungs and could lead to a fluid buildup in the lungs (pulmonary edema). This can cause death. Overexposure can cause methemoglobinemia and anemia.

Long Term Exposure: Repeated exposure can cause permanent brain damage. Early symptoms include poor appetite, weakness, and sleepiness. Later effects include speech, balance, and personality changes. Later symptoms are identical to Parkinson's disease. High or repeated exposure may cause permanent lung damage, kidney and liver damage, and anemia. May affect the lungs and nervous system causing bronchitis, pneumonitis, neurologic and neuropsychiatric disorders (manganism).

Points of Attack: Blood, nervous system, lungs, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Complete examination of the nervous system. Complete blood count. Lung function and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests. Evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); Ascba (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard (*strong oxidizer*); Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Manganese nitrate must be stored to avoid contact with organic materials since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep manganese nitrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Manganese nitrate may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Manganese, tricarbonyl methylcyclopentadienyl M:0280

Molecular Formula: $C_9H_7MnO_3$

Common Formula: $C_5H_4(CH_3)\text{-}Mn(CO)_3$

Synonyms: Ak-33X; Antiknock-33; CI-2; Combustion improver-2; Manganese, (methylcyclopentadienyl)tricarbonyl-; Methylcyclopentadienyl manganese tricarbonyl; 2-Methylcyclopentadienyl manganese tricarbonyl; Methylcyklopentadientrikarbonylmanganium (German); MMT; TDS-1510; Tricarbonyl(methylcyclopentadienyl) manganese

CAS Registry Number: 12108-13-3

RTECS® Number: OP1450000

UN/NA & ERG Number: UN2810/153; UN3281 (Metal carbonyls, liquid, n.o.s.)/151

EC Number: 235-166-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as manganese compounds.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 (as manganese compound) Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Manganese, tricarbonyl methylcyclopentadienyl is a dark orange liquid. Faintly pleasant, herb-like odor. Molecular weight = 218.10; Boiling point = 232°C; Freezing/Melting point = −18°C; Flash point = 74°C; 96°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Organometallic, Primary Irritant. MMT is used as an octane improver in unleaded gasoline, other distillate fuels and fuel oils, and as a smoke abater in fuels.

Incompatibilities: May be air-reactive. Keep away from oxidizers, halogens. Light causes decomposition.

Permissible Exposure Limits in Air

OSHA PEL: None [5 mg[Mn]/m^3 Ceiling Concentration (vacated 6/30/1993)].

NIOSH REL: 0.2 mg[Mn]/m^3 TWA [skin].

ACGIH TLV®[1]: 0.2 mg[Mn]/m^3 TWA [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 0.6 mg/m^3

PAC-3: 7.5 mg/m^3

Australia: TWA 0.2 mg/m^3, [skin], 1993; Belgium: TWA 0.2 mg/m^3, [skin], 1993; Denmark: TWA 0.1 ppm (0.2 mg [Mn]/m^3), [skin], 1999; Finland: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 1993; France: VME 0.2 mg/m^3, [skin], 1999; Switzerland: MAK-W 0.1 ppm (0.2 mg[Mn]/m^3), 1999; United Kingdom: TWA 0.2 mg[Mn]/m^3; STEL 0.6 mg[Mn]/m^3, [skin], 2000; the Netherlands: MAC-TGG 0.2 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg[Mn]/m^3 [skin]. States have set guidelines or standards for MCT in ambient air[60] ranging from 2.0 μg/m^3 (North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada). These compare to values for methyl cyclopentadienyl manganese tricarbonyl of 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 8 mg/kg. Irritates the eyes, skin, and respiratory tract. Medical observation is indicated. In concentrated form this compound is highly toxic by all routes of exposure. Approximately 5−15 mL, when spilled on the hand and wrist of a worker, produced toxic effects within 3−5 min. Giddiness, "thick tongue," nausea, and headache were reported to occur after skin exposure. Human exposure data are limited; the primary site of action is reported to be the central nervous system; may cause tissue lesions.

Long Term Exposure: Can cause kidney damage.

Points of Attack: Respiratory system, skin, central nervous system, kidneys.

Medical Surveillance: Examination of the nervous system. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); Ascba (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Metal carbonyls, liquid, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1. and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Large spills can be cleaned up using JP-4L or JP-5 (jet engine fuels). Isopropyl alcohol may be used to clean up moderate spills, while methyl ethyl ketone should be used for cleaning *small spills* and quick disconnects. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.9/1.5
Night 3.1/4.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0 + /11.0 +
Night 7.0 + /11.0 +

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: MCPA is a colorless crystalline solid. Molecular weight = 200.63; Freezing/Melting point = 118.8°C; Vapor pressure = 1.5×10^{-6} mmHg at 20°C. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Those involved in the manufacture, formulation, and application of this postemergence herbicide, used for control of broadleaf weeds in agricultural applications.

Incompatibilities: A weak acid. Incompatible with alkalis.

Permissible Exposure Limits in Air

No TEEL available.

Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 3 mg/m^3, 1999

Determination in Air: No method available.

Permissible Concentration in Water: Russia set a MAC of 0.25 mg/L in surface water. The US EPA has determined a no-observed-adverse-effects-level (NOAEL) of 1.0 mg/kg/day from which they have calculated a long-term advisory of 0.35 mg/L (350 μg/L) for an adult. They have further calculated a lifetime health advisory of 0.0036 mg/L (3.6 μg/L) for an adult. In addition, Maine has set a guideline for MCPA in drinking water[61] of 2.5 μg/L.

Determination in Water: No method available. Fish Tox = 17986.45312000 ppb (VERY LOW). Octanol−water coefficient: Log K_{ow} = 3.29.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. Irritates the eyes, skin, and respiratory tract. This material is moderately toxic. LD_{50} = (oral-rat) 700 mg/kg. Human Tox = 4.00000 (HIGH). The approximate lethal dose to a 150-lb man is 3.3 tablespoonfuls (Sax).

Long Term Exposure: Animal tests show that this substance possibly causes toxic effects upon human reproduction. MCPA is classified as a chlorophenoxy-herbicide. These herbicides are a possible carcinogen to humans. May cause decreased blood pressure. May cause genetic changes.

Medical Surveillance: Monitor blood pressure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This material falls into the category of Phenoxy pesticides, solid, toxic n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Also, can be precipitated with divalent cations. Carbon or peat can be used as sorbents.

Fire Extinguishing: Solid material not combustible. Liquid formulations containing organic solvents may be flammable. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added flammable solvent; incinerator equipped with fume scrubber.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitrogen mustard is a pale yellow, oily, mobile liquid with a faint odor of herring. *Nitrogen mustards* are colorless when pure but are typically a yellow to brown oily substance. Odors are variably described as sweet, agreeable, slightly garlic- or mustard-like. NIOSH reports HN-2 as having "a fruity odor at high concentrations and a soapy or fishy odor at low concentrations." Molecular weight = 156.07; Specific gravity = 1.12 at 25°C; Boiling point = 87°C at 18 mmHg; 75°C at 10 mmHg [HN-2 decomposes before its boiling point is reached or condenses under all conditions; the reactions involved could generate enough heat to cause an explosion];[NIOSH] Freezing/Melting Point: −60°C; Vapor Pressure = 0.29 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. This compound is very sparingly soluble in water; releases corrosive vapors on contact with water or steam.

Potential Exposure: Drug used in treatment of cancer. Sulfur mustards were formerly used as a gas warfare agent.

Nitrogen mustards have not previously been used in warfare.[NIOSH] Exposure to nitrogen mustard damages the eyes, skin, and respiratory tract and suppresses the immune system. Although the nitrogen mustards cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Exposure to large amounts can be fatal.[NIOSH]

Incompatibilities: HN-2 is not stable except as dry crystals. Polymerization of HN-2 results in components that present an explosion hazard in open air.[NIOSH] Avoid contact or contamination with oxidizers (e.g., nitrates, oxidizing acids; chlorine bleaches pool chlorine) which may result in ignition. Unstable in the presence of light and heat and forms dimers at temperatures above 50°C. Corrosive to ferrous alloys beginning at 65°C. Polymerizes slowly and so munitions would be effective for several years. When heated to decomposition emits hydrogen chloride and nitrogen oxide. Contact with metals may evolve flammable hydrogen gas.[NIOSH]

Note: Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine vigorously chlorinate nitrogen mustards to the carbon chain, giving low toxicity products. In the presence of water this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

Permissible Exposure Limits in Air

The Surgeon General's Working Group (US Department of Health and Human Services) recommends (for the workplace) 0.003 mg/m^3, Ceiling Concentration. Same for US military. Several states have set guidelines for nitrogen mustard in ambient air[60] and New York and South Carolina at zero.

Protective Action Criteria (PAC) HN-2*
TEEL-0: 0.001 mg/m^3
PAC-1: 0.003 mg/m^3
PAC-2: **0.022** mg/m^3
PAC-3: **0.37** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Hydrochloride
TEEL-0: 0.75 mg/m^3
PAC-1: 2.5 mg/m^3
PAC-2: 4 mg/m^3
PAC-3: 4 mg/m^3

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2A; Germ Cell Mutation Category 2.

Determination in Water: A water contaminant. Octanol−water coefficient: Log K_{ow} = (estimated) 0.91 at pH 7.4; 1.53.[NIOSH]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact (vapor or liquid).

Harmful Effects and Symptoms

Nitrogen mustard is a blister agent (vesicant) that causes delayed severe damage to the respiratory tract. It is an alkylating agent that damages the cells within the bone marrow that are necessary for making blood cells. Clinical effects do not appear until hours after exposure. Nitrogen mustards penetrate and bind quickly to cells of the body; their health effects develop slowly. The full extent of cellular injury may not be known for days. The sooner after exposure the health effects occur, the more likely it is that the patient/victim was exposed to a high concentration of HN-2. Similarly, the sooner the health effects occur, the more likely it is that they will progress and become severe. *Eye exposure*: The eyes are the organs that are most sensitive to mustard vapor; eye injury may occur within 1−2 h after severe exposure, or 3−12 h after a mild to moderate exposure. *Inhalation exposure*: Airway injury may occur within 2−6 h after severe exposure and within 12−24 h after mild exposure. Skin exposure: The symptom-free (latent) period is 6−12 h in temperate conditions; hot, humid weather strikingly increases the action of nitrogen mustards. Some skin injury may appear as late as 48 h after exposure.[NIOSH]

Short Term Exposure: Extremely toxic and may damage the eyes, skin, and respiratory tract and suppress the immune system. Although this agent can cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Irritates and burns the eyes, with possible permanent damage. Skin contact can cause irritation, burns with itching and blisters. Inhalation can cause irritation of the respiratory tract with wheezing and coughing. Higher exposure can cause headache, nausea, vomiting, and dizziness. Symptoms of exposure include nausea and vomiting, bleeding, skin lesions, menstrual irregularities. Toxic doses as low as 400 mg/kg have been reported in humans. Blood clots may occur at site of intravenous injection, and tissue damage if outside vein. Powerful vesicant (causes blisters) when it contacts skin, mucous membranes, or eyes. *Delayed toxicity*—missed menstrual periods, alopecia (hair loss), hearing loss, tinnitus (ringing in ears), jaundice, impaired spermatogenesis and germinal aplasia, swelling, and hypersensitivity. High exposure can cause tinnitus (ringing in the ears) and possible hearing loss.

Long Term Exposure: Bone marrow suppression resulting in damage to the blood-forming (hematopoietic) system. Early signs of bone marrow suppression include a low white blood cell count, an increased risk for developing infections, a tendency for easy bruising and bleeding. May cause lymph node damage and a weakened immune system. It also causes liver and kidney damage, damage to the reproductive systems of both men and women leading to decreased fertility. It is mutagenic, toxic to the developing embryo, and carcinogenic. Following significant whole-body (systemic) absorption of nitrogen mustard, injury to the bone marrow, lymph nodes, and spleen may cause a drop in white blood cell counts (beginning on days 3−5), which can result in an increased risk for developing (life-threatening) infections. Counts of red blood cells and platelets may also fall due to bone marrow damage.

Points of Attack: Bone marrow, hearing.

Medical Surveillance: Complete blood count. Audiogram.

First Aid: There is no antidote for nitrogen mustard toxicity. Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage.[NIOSH] Because health effects due to nitrogen mustard may not occur until several hours after exposure, patients/victims should be observed in a hospital setting for at least 24 h. Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear Totally Encapsulating Chemical Protective (TECP) suit that provides protection against CBRN agents; chemical-resistant inner and outer gloves, chemical-resistant boots with a steel toe and shank, coveralls, long underwear, and a hard hat worn under the TECP suit are optional items. Take all necessary precautions to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Decontamination: Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage.[NIOSH] Remove clothes and place contaminated clothes and personal belongings in a sealed double bag. Decontamination of mustard-exposed victims by either vapor or liquid should be performed within the first 2 min following the exposure to prevent tissue damage. If not accomplished within the first several minutes, decontamination should still be performed to ensure any residual liquid mustard is removed from the skin or clothes, or to ensure any trapped mustard vapor is removed with the clothing. Removing trapped mustard vapor will prevent vapor off-gassing or subsequent cross-contamination of other emergency responders/health-care providers or the health-care facility. Physical removal of the mustard agent, rather than detoxification or neutralization, is the most important principle in patient decontamination. Mustard is not detoxified by water alone and will remain in decontamination effluent (in dilute concentrations) if hydrolysis has not taken place.

(1) Patients exposed to vapor should be decontaminated by removing all clothing in a clean air environment and shampooing or rinsing the hair to prevent vapor off-gassing. (2) Patients exposed to liquid should be decontaminated by (a) washing in warm or hot water at least three times. Use liquid soap (dispose of container after use and replace), large volumes of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged, because skin damage may occur which may enhance absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. The rapid physical removal of a chemical agent is essential. If warm or hot water is not available, but cold water is, use cold water. Do not delay decontamination to obtain warm water. (b) Rinse the eyes, mucous membranes, or open wounds with sterile saline or water. (3) The health-care provider should (a) check the victim after the three washes to verify adequate decontamination before allowing entry to the medical treatment facility. If the washes were inadequate, repeat the entire process. (b) Be prepared to stabilize conventional injuries during the decontamination process. Careful decontamination can be a time-consuming process. The health-care provider may have to enter the contaminated area to treat the casualty during this process. Medical personnel should wear the proper PPE and evaluate the exposed workers.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified by NIOSH for CBRN Environments.* Where a potential exposure to the chemical exists, use a NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle; or use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus (SCBA) with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone B] requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

HN-2, when used as a weapon

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

HN-2, when used as a weapon

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Fire Extinguishing: Heated to decomposition emits hydrogen chloride and nitrogen oxide. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA Gene-Tox Program, Inconclusive: *D. melanogaster* sex-linked lethal.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Melamine is a white crystalline solid. Molecular weight = 126.15; Specific gravity (H_2O:1) = 1.6; Freezing/Melting point = <250°C (decomposes); Flash point ≥300°C; Autoignition temperature ≥500°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Manufactured from urea, melamine is used in the manufacture of plastics, melamine-formaldehyde resins, rubber, synthetic textiles, laminates, adhesives, and molding compounds.

Incompatibilities: Strong oxidizers, strong acids.

Permissible Exposure Limits in Air: Kansas[60] has set a guideline of 24.39 μg/m^3 for melamine in ambient air.

AIHA WEEL: 10 mg/m^3, inhalable TWA; 5 mg/m^3, respirable TWA.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 500 mg/m^3

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates, eyes, skin, and mucous membranes. May cause dermatitis in humans.

Long Term Exposure: May cause kidney damage. There is limited evidence that melamine causes cancer in animals.

Points of Attack: Kidneys, skin.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and strong acids. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Melamine itself does not burn. Use any extinguishing agent suitable for surrounding fire. Poisonous gases, including carbon monoxide, hydrogen cyanide, nitrogen oxides, and ammonia, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Sufficient Evidence, Group 1, 1998; NTP: Known to be a human carcinogen.

US EPA Hazardous Waste Number (RCRA No.): U150.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer 2/27/87; Developmental/Reproductive toxin 7/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Melphalan forms solvated crystals from methanol. Molecular weight = 305.23; Freezing/Melting point = 182−183°C. (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: An alkylating agent. Health-care workers may be exposed. As a drug it is an immunosuppressant, used in the treatment of multiple myeloma and cancer of the ovary. It is also used in investigation of other types of cancer and as an antineoplastic in animals. Human exposure to melphalan occurs principally during its use in cancer treatment. Melphalan is administered orally or intravenously. Adult dosage is 6 mg/day, 5 days per month. Has been used as a military poison gas (a nitrogen mustard, alkaline, crystals).

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 11.2 mg/kg. This material is highly toxic; local irritant of the skin, eyes, and mucous membranes. Skin rash, nausea, vomiting.

Long Term Exposure: A Confirmed Human Carcinogen capable of causing leukemia and Hodgkin's disease. High or repeated exposure causes marked bone marrow depression with possible anemia, neutropenia, and thrombocytopenia.

Points of Attack: Blood.

Medical Surveillance: Complete blood count (CBC).

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Speed in removing material from skin is of extreme importance. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; move to the fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that his airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This material falls into the category of Poisonous liquid, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical

as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including HCl and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Mephosfolan M:0330

Molecular Formula: $C_8H_{16}NO_3PS_2$

Synonyms: AC 47470; American cyanamid CL-47470; CL-47,470; Cyclic propylene(diethoxyphosphinyl) dithioimidocarbonate; Cytrolane; *p*,*p*-Diethyl cyclic propylene ester of phosphonodithioimidocarbonic acid; Diethyl (4-methyl-1,3-dithiolan-2-ylidene)phosphoroamidate; 2-(Diethoxyphosphinylimino)-4-methyl-1,3-dithiolane; EI-47470; ENT 25,991; (4-Methyl-1,3-dithiolan-2-ylidene) phosphoramidic acid, diethyl ester

EC Number: 213-447-3 [*Annex I Index No.:* 015-094-00-9]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture) (India) (UN).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T +, N; Risk phrases: R27/28; R51/53; Safety phrases: S1/2; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Mephosfolan is a yellow to amber liquid. Molecular weight = 269.34; Boiling point = 120°C at 1.0 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Moderately soluble in water.

Potential Exposure: Those involved in the production, formulation, and application of this insecticide and acaricide. An organophosphorus pesticide, liquid, poisonous, flammable, n.o.s.

Incompatibilities: Strong oxidizers, strong acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 9 mg/m^3

PAC-3: 9 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This is a highly to extremely toxic material. LD_{50} = (oral-rats) 9 mg/kg. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong acids.

Shipping: This material falls into the category of Organophosphorus pesticides, liquid, toxic, flammable, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use water spray to knock down vapors. Build dikes to contain material as necessary. Avoid breathing vapors. Keep upwind. Avoid bodily contact with the material. Downwind evacuation should be considered. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Combustible material. Vapors may travel to a source of ignition, and flash back. Use foam, carbon dioxide, or dry chemical. When heated to decomposition, this material emits very toxic fumes of nitrogen oxides, phosphorus oxides, and sulfur oxides. Use water spray to absorb vapors. Avoid breathing vapors. Keep upwind. Wear self-contained breathing apparatus. Avoid bodily contact with the material. Wear full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric acetate is a white crystalline solid with a mild vinegar-like odor. Molecular weight = 318.69; Freezing/Melting point = 178−180°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Mercuric acetate is used chiefly for mercuration of organic compounds, for the absorption of ethylene, as a chemical intermediate for phenylmercuric acetate, a mildewcide, and other organomercury compounds. It is used as a catalyst in organic synthesis and in the manufacture of pharmaceuticals.

Incompatibilities: Strong oxidizers, such as chlorine, acids. Light and heat cause decomposition.

Permissible Exposure Limits in Air

As mercury alkyl compounds

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration.

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA [skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin].

ACGIH TLV®[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 mg/m^3 (skin) STEL [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.0159 mg/m^3

PAC-1: 0.0477 mg/m^3

PAC-2: 3.2 mg/m^3

PAC-3: 3.2 mg/m^3

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

NIOSH IDLH: 10 mg[Hg]/m^3.

Australia: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, 1999; Finland: TWA 0.05 mg[Hg]/m^3, 1993; France: VME 0.1 mg[Hg]/m^3, [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg [Hg]/m^3, 1993; Sweden: NGV 0.05 mg[Hg]/m^3, 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: TWA 0.025 mg[Hg]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, ZEALAND, Singapore, Vietnam; ACGIH TLV®: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3 [skin].

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for inorganic mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric acetate is corrosive to the eyes, skin, and respiratory tract. Corrosive on ingestion. Inhalation of the aerosol can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Signs and symptoms of acute exposure to mercuric acetate may be severe and include increased salivation, foul breath, inflammation and ulceration of the mucous membranes, abdominal pain, and bloody diarrhea. Oliguria (scanty urination), anuria (suppression of urine formation), and acute renal failure may be noted. Weak pulse, seizures, psychic disturbances, dyspnea (shortness of breath), chest pain, and circulatory collapse may be observed.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin) or may cause skin to turn gray. Skin allergy may also occur. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. Has been shown to be a teratogen in animals.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with eye examination. Consider lung function tests for persons with frequent exposure. Examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider nerve conduction tests, urinary enzymes, and neurobehavioral test. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #73-11024.

Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m^3:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS* (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m³:* CcrFS* (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus)*.

*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), light, heat, and acids.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Avoid breathing dusts. If material is not involved in fire, keep material out of water sources and sewers. Do not touch spilled material; stop leak if you can do so without risk. *Small wet spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: Dike far ahead of spill for later disposal. Acute exposure to mercuric acetate may require decontamination and life support for the victim. Emergency personnel should wear protective clothing appropriate to the type and degree of contamination. Air-purifying or supplied-air respiratory equipment should also be worn, as necessary. Rescue vehicles should carry supplies, such as plastic sheeting and disposable plastic bags to assist in preventing spread of contamination. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but is difficult to ignite. Poisonous fumes including mercury are produced in fire. Extinguish fire using agent suitable for type of surrounding fire. Material itself does not burn or burns with difficulty. Use water in flooding quantities as fog. Use foam, carbon dioxide or dry chemical to extinguish fires. Avoid breathing dusts and fumes from burning material. Keep upwind. Avoid bodily contact with the material. Wear boots, protective gloves, and goggles. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Wear self-contained breathing apparatus when fighting fires involving this material. If contact with the material is anticipated, wear full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN1634/154
EC Number: 232-169-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric Bromide is a crystalline solid. Molecular weight = 360.41; Boiling point = 322°C; Freezing/Melting point = 236°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: This compound has applications in medicine.

Incompatibilities: Violent reaction with active metals, potassium, sodium. Store away from heat and light.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration.

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA [skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin].

ACGIH TLV®[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week.

NIOSH IDLH: 10 mg[Hg]/m^3.

No TEEL available.

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979–1980.[6] These are the limits for inorganic mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric bromide can affect you when breathed and by passing through skin. Overexposures can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums, memory loss, increased saliva, personality changes, and permanent brain damage may result. Skin contact may cause burns or skin allergy, or gray skin color. Contact causes eye burns with permanent damage. Heating or use near acid releases toxic mercury vapors. Mercury can build up with permanent damage. Mercury can build up in the body. Health effects have been reported below NIOSH exposure levels.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6–12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA), urine test for mercury (should be less than 0.02 mg/L). Eye examination. After suspected illness or overexposure, repeat the test above and get a blood test for mercury. Consider chest x-ray after acute overexposure. Consider nerve conduction tests, urinary enzymes, and neurobehavioral testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.
Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m^3:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS* (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
*End-of-service life indicator (ESLI) required.
Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5* mg/m^3*:* CcrFS* (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus)*.
*End-of-service life indicator (ESLI) required.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and

storage. Store in tightly closed containers in a cool, well-ventilated area away from light, heat, and acids. Mercuric bromide must be stored to avoid contact with sodium and potassium, since violent reactions occur.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercuric bromide may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including mercury and bromium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R28; R34; R48/24/25; R50/53; Safety phrases: S1/2; S26; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric chloride is an odorless white crystalline solid. Molecular weight = 271.49; Boiling point = 302°C; Freezing/Melting point = 276°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 7.38% at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Organometallic, Mutagen, Reproductive Effector; Human Data; Primary Irritant. Mercuric chloride is used as dip for bulbs and tubers, for earthworm control; as repellent to ants, roaches, etc; in preserving wood and anatomical specimens; embalming, browning, etching steel and iron; as a catalyst for organic synthesis; disinfectant, antiseptic, tanning; textile printing aid; manufacture of dyes; in agricultural chemicals; dry batteries; pharmaceuticals, and photographic chemicals.

Incompatibilities: Mercuric chloride may explode with friction or application on heat. Mixtures of mercuric chloride and sodium or potassium are shock sensitive and will explode on impact. Avoid contact with acids or acid fumes. Also avoid the presence of formats, sulfites, hypophosphites, phosphates, sulfide, albumin, gelatin, alkalies, alkaloid salts, ammonia, lime water, antimony, arsenic, bromides, borax, carbonates, reduced iron, copper, iron, lead, silver salts, infusions of cinchona, columbo, oak bark or senna, and tannic acid.

Permissible Exposure Limits in Air

PAC-2: 13.5 mg/m^3

PAC-3: 13.5 mg/m^3

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

NIOSH IDLH: 10 mg[Hg]/m^3.

Australia: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, [skin], 1999; Finland: TWA 1 mg[Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3, 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg[Hg]/m^3, [skin], 1999; Thailand STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: TWA 0.025 mg[Hg]/mg, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for inorganic mercury compounds in general. In addition, the former USSR-UNEP/IRTC project[43] set a MAC of 0.005 μg/L for water bodies used for domestic purposes.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption. Octanol−water coefficient: Log K_{ow} = 0.12.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. The substance is corrosive to the eyes, the skin, and the respiratory tract. Corrosive on ingestion. Inhalation of its aerosol may cause lung edema. The substance may cause effects on the kidneys. Exposure far above OEL may result in death. The effects may be delayed. Medical observation is indicated. It is classified as extremely toxic. All forms of mercury are poisonous if absorbed. Probable oral lethal dose is 5−50 mg/kg and between 7 drops and 1 teaspoonful for a 150-lb person. Mercuric chloride is one of the most toxic salts of mercury. Material attacks the gastrointestinal tract and renal systems. Signs and symptoms of acute exposure or mercuric chloride may be severe and include increased salivation, foul breath, inflammation and ulceration of the mucous membranes, abdominal pain, and bloody diarrhea. Dermal exposure may result in dermatitis (red, inflamed skin) and burns. Oliguria (scanty urination), anuria (suppression of urine formation), and acute renal failure may be noted. Weak pulse, seizures, psychic disturbances, circulatory collapse, chest pain, and dyspnea (shortness of breath) may be observed.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye examination. Consider lung function tests for persons with frequent exposure. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider chest X-ray after sudden overexposure. Consider nerve conduction tests, urinary enzymes, and neurobehavioral testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with limited success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m^3:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS* (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 μg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). Escape: GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern];* or GmFS* (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Mercuric chloride must be stored to avoid contact with potassium and sodium, since violent reactions occur. See also "Incompatibilities," above. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible. Extinguish with water spray, fog, foam, dry chemical, or carbon dioxide. Move container from fire area. Wear self-contained breathing apparatus and full body protective clothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Mercuric cyanide M:0370

Molecular Formula: C_2HgN_2

Common Formula: $Hg(CN)_2$

Synonyms: Cianuro mercurico (Spanish); Cyanure de mercure (French); Mercury(2+) cyanide; Mercury(II) cyanide

CAS Registry Number: 592-04-1

RTECS® Number: OW1515000

UN/NA & ERG Number: UN1636/154

EC Number: 209-741-6

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric cyanide is an odorless, white crystalline solid; turns gray to dark brown when exposed to light. Molecular weight = 252.63; Decomposes at 319°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Mercuric cyanide is used in medicine, germicidal soaps, photography and in making cyanogen gas.

Incompatibilities: Violent reaction with fluorine, magnesium, sodium nitrite, acids. Heating or contact with acid releases toxic mercury and flammable HCN.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.0315 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 12.6 mg/m^3

PAC-3: 12.6 mg/m^3

As inorganic mercury compound

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration.

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA [skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin].

ACGIH TLV®[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week.

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

NIOSH IDLH: 10 mg[Hg]/m^3.

As cyanide compound (for reference)

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min, Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

NIOSH IDLH: 25 mg[CN]/m^3.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140. See also NIOSH Analytical Method #7904, Cyanides.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979–1980.[6] These are the limits for inorganic mercury compounds in general. See also the entry on "Cyanides."

Determination in Water

Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric cyanide can affect you when breathed and by passing through skin. Direct contact causes eye irritation and possible damage. Overexposures can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums, memory loss, increased saliva, metallic taste, personality changes, and brain damage. Skin contact can cause irritation, skin allergy, or a gray skin color. Mercury can build up in the body. Heating or contact with acid or acid mist causes the release of toxic mercury and cyanide vapors; may cause bronchitis and lung irritation. Overexposure to cyanide can cause sudden death.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. Organic mercury substances have been identified as human teratogens. Some related compounds damage the developing fetus and decrease fertility in males and females. It is unknown for certain if mercuric cyanide causes these effects and so care is indicated.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6–12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye examination. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider nerve conduction tests, urinary enzymes, and neurobehavioral testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m^3*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Mercuric cyanide must be stored to avoid contact with fluorine, magnesium, and sodium nitrite, since violent reactions occur. Mercuric cyanide should not contact acid or heat because it will release flammable hydrogen cyanide gas. Store in tightly closed containers in a cool, well-ventilated area away from light. Protect containers from physical damage.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercury cyanide may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including hydrogen cyanide, oxides of nitrogen, and mercury, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return to supplier for mercury recovery and deactivation.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric iodide can affect you when breathed and by passing through skin. Overexposure can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums, memory loss, increased saliva, metallic taste, and personality changes. Permanent brain damage may result. Skin contact may cause skin burns, skin allergy, or a gray skin color. Eye contact can cause permanent damage. Heating or contact with acid or acid mist releases toxic mercury vapors. Mercury accumulates in the body. Health effects have been reported below exposure levels of 0.1 mg/m^3.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider lung function tests for persons with frequent exposure. Eye examination. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider chest X-ray after sudden exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m^3*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Mercuric iodide must be stored to avoid contact with chlorine trifluoride, sodium, and potassium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from light, acids, and heat. Protect containers from physical damage.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS" (solution). It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including iodine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN1625/154

EC Number: 233-152-3 [*Annex I Index No.:* 080-002-00-6] pesticide in the group of plant protection products; banned or severely restricted

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR 401.15 Section 307 Toxic Pollutants as mercury and compounds; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 (as mercury compound). Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R6; R26; R48/23; R50/53; Safety phrases: S53; S45; S60; S61; as mercury.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric Nitrate is a white to yellowish crystalline solid with a nitric acid-like odor. Normally exists as hemihydrate or dihydrate. Molecular weight = 324.61; Boiling point = (decomposes); Freezing/Melting point = 70−79°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Mercuric nitrate is used in making other chemicals; in felt manufacture, and in making mercury fulminate.

Incompatibilities: A strong oxidizer. Reacts violently with combustibles, petroleum hydrocarbons, reducing agents. Reacts with acetylene, alcohol, phosphine and sulfur to form shock-sensitive compounds. Aqueous solution attacks most metals. Vigorous reaction with petroleum hydrocarbons. Incompatible with organic materials, acetylene, ethanol, phosphine, sulfur, hypophosphoric acid. Inorganic mercury compounds are incompatible with acetylene, ammonia, chlorine dioxide, azides, calcium (amalgam formation), sodium carbide, lithium, rubidium, copper. Decomposes in heat or on exposure to light, producing toxic fumes (mercury, nitrogen oxides).

Permissible Exposure Limits in Air

As inorganic mercury compounds

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration.

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA [skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin].

ACGIH TLV®[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week.

Protective Action Criteria (PAC)

TEEL-0: 0.0405 mg/m^3

PAC-1: 0.2 mg/m^3

PAC-2: 1.62 mg/m^3

PAC-3: 16.2 mg/m^3

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

NIOSH IDLH: 10 mg[Hg]/m^3.

Australia: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, [skin], 1999; Finland: TWA 0.05 mg[Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3, [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg [Hg]/m^3, [skin], 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: TWA 0.025 mg[Hg]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for inorganic mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric nitrate can affect you when breathed in and passed through skin (causing systemic poisoning). Eye contact causes ulceration of conjunctiva and cornea. Skin contact causes irritation and possible dermatitis. Acute systemic poisoning can be fatal within a few minutes. Death by uremic poisoning can be delayed 5−12 days. Overexposure can damage kidneys. Mercury poisoning can cause "shakes," irritability, sore gums, increased saliva, personality change and brain damage. Eye contact may cause burns. Heating or contact with acid or acid mist causes release of toxic mercury vapors and lung effects. Mercury accumulates in the body. Health effects have been reported below TLV levels of 0.1 mg/m^3. Acute poisoning has resulted from inhaling dust concentrations of 1.2−8.5 mg/m^3.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin), or cause skin to turn gray. Skin allergy may occur. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. There is limited evidence that this chemical reduces fertility in males and females. Repeated exposures may cause brown staining of the eyes and may affect peripheral vision.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye examination. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider nerve conduction tests, urinary enzymes, and neurobehavioral testing. Eye examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m³*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m³*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m³:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m³*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m³:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Mercuric nitrate must be stored to avoid contact with organic materials; acetylene, ethanol, phosphine, sulfur, and hypophosphoric acid, since violent reactions occur. See also "Incompatibilities." Do not store on wooden floors.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but enhances combustion of other substances. Mercuric nitrate is a dangerous fire risk on contact with combustible and organic materials (wood, paper, oils, etc). Use dry chemical, CO_2, water spray. Poisonous gases, including mercury and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1993.

Banned or Severely Restricted (in agriculture) (EEC) (UK).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 (as mercury compound): Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric oxide is a red or orange-red heavy crystalline powder; yellow when finely powdered. Molecular weight = 216.59; Freezing/Melting point = 500°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen; Reproductive Effector. Mercuric oxide is used for wound sealing and canker treatment of fruit and rubber trees; chemical intermediate for mercury salts; organic mercury compounds; chlorine monoxide; as an antiseptic in pharmaceuticals; component of dry cell batteries; pigment and glass modifier; fungicide; preservative in cosmetics; analytical reagent; formerly used in antifouling paints.

Incompatibilities: A powerful oxidizer. Decomposes on exposure to light, when heated above 500°C, producing highly toxic fumes including mercury and oxygen, which will add to the intensity of an existing fire. Violent reaction with combustible materials, other oxidizers, acetyl nitrate, aluminum, diboron tetrafluoride, reducing agents, phospham, hydrogen trisulfide (on ignition), hydrazine hydrate, hydrogen peroxide, hypophosphorous acid, acetyl nitrate, chlorine, magnesium (when heated), disulfur dichloride, alcohols, alkali metals (i.e., lithium, sodium, potassium, rubidium, cesium, francium). Forms heat- or impact-sensitive explosive mixtures with sulfur, phosphorus and other nonmetals, potassium, magnesium, sodium and other chemically active metals. Incompatible with strong bases and light.

Permissible Exposure Limits in Air

PAC-3: 10.8 mg/m^3

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

Australia: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, [skin], 1999; Finland: TWA 0.05 mg[Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3, [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg [Hg]/m^3, [skin], 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: LTEL 0.05 mg[Hg]/m^3; STEL 0.15 mg[Hg]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia set a MAC for ambient air in residential areas of 0.003 mg/m^3 on a daily average basis.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for inorganic mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric oxide dust has a corrosive effect on eyes, skin, and respiratory tract. This material is highly toxic by ingestion, inhalation, or skin absorption. Very short exposure to small quantities may cause death or permanent injury. Following ingestion, mercuric oxide is readily converted to mercuric chloride, the most dangerous mercury compounds. Signs and symptoms of acute exposure to mercuric oxide may be severe and include increased salivation, foul breath, inflammation and ulceration of the mucous membranes, abdominal pain, and bloody diarrhea. Oliguria (scanty urination), anuria (suppression of urine formation), and acute renal failure may be noted. Weak pulse, seizures, psychic disturbances, circulatory collapse, chest pain, and dyspnea (shortness of breath) may be observed.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, and kidney failure. There is limited evidence that this chemical is a teratogen in animals. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes, and decreased peripheral vision.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA), urine test for mercury (should be less than 0.02 mg/L). Eye examination. After suspected illness or overexposure, repeat the test above and get a blood test for mercury. Consider chest X-ray after acute overexposure. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing. Evaluation by a qualified allergist. Eye examination. Consider chest X-ray following acute overexposure.

First Aid: Remove victims from exposure. Emergency personnel should avoid self-exposure to mercuric oxide. Evaluate vital signs, including pulse and respiratory rate, and note any trauma. If no pulse is detected, provide CPR. If not breathing, provide artificial respiration. If breathing is labored, administer oxygen or other respiratory support. Remove contaminated clothing as soon as possible. If eye exposure has occurred, remove any contact lenses at once; eyes must be flushed with lukewarm water for at least 15 min. Wash exposed skin areas for 15 min with soap and water. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures in the event of inhalation or ingestion of HgO. Rush to a health-care facility.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor:* NIOSH: *Up to 0.5 mg/m^3:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). Escape: GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator*). Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted

canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m³*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*
*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chlorine, hydrogen peroxide, hypophosphorous acid, hydrazine hydrate, magnesium (when heated), disulfur dichloride; hydrogen trisulfide, reducing agents. See also "Incompatibilities."

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for cleanup of mercury are available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but enhances combustion of other substances. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Wear full body protective clothing and self-contained breathing apparatus. Poisonous gases, including mercury fumes and mercury oxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant as mercury-based pesticides, liquid, flammable, toxic, n.o.s.; mercury-based pesticides, liquid, toxic, n.o.s.; mercury-based pesticides, solid, toxic, n.o.s.; mercury compounds, liquid, n.o.s.; mercury compounds, solid, n.o.s.; mercury(I) (mercurous) compounds (pesticides); mercury(II) (mercuric) compounds (pesticides).

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as mercury compounds, n.o.s.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: Hazard Symbol: E, T, N; Risk phrases: R2; R23/24/25; R33; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercuric oxycyanide is a white crystalline solid. It explodes instead of melting. Molecular weight = 721.9; Specific gravity (water = 1) = 4.43. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 4. Soluble in water.

Potential Exposure: This material has been used in medicine as a topical antiseptic.

Incompatibilities: Mercuric oxycyanide is self reactive. Friction, heat, shock, and careless handling may cause an explosion. Contact with acid or acid mist causes the release of toxic mercury and hydrogen cyanide vapors.

Permissible Exposure Limits in Air

No TEEL available.

As organo mercury compounds

OSHA PEL: 0.01 mg/m^3 TWA; 0.04 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.01 mg/m^3 TWA; 0.03 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.01 mg/m^3 TWA; 0.03 mg/m^3 STEL [skin].

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3 [skin] Danger of skin sensitization; Carcinogen Category 3.

NIOSH IDLH: 2 mg Hg/m^3.

As cyanides

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min, Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

NIOSH IDLH: 25 mg[CN]/m^3.

Determination in Air: Use NIOSH Analytical Method #7904, Cyanides.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for *inorganic* mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: LD$_{50}$ = (oral-rats) 26 mg/kg. Mercuric oxycyanide can affect you when breathed and by passing through skin. Overexposures can cause kidney damage. Mercury poisoning can cause “shakes,” irritability, sore gums, memory loss, increased saliva, personality change, and even permanent brain damage. Skin contact can cause irritation, skin allergy, or a gray skin color. Eye contact causes irritation. Heating or use near acid can release toxic mercury and cyanide vapors. Health effects have been reported below permitted exposure levels.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, and kidney failure. Organic mercury substances have been identified as a teratogen in humans. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes, and decreased peripheral vision.

Points of Attack: Eyes, skin, central nervous system, mucous membrane, peripheral nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended with examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye examination. Kidney function tests. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #73-11024.

Respirator Selection: *Up to 0.1 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 mg/m^3:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m^3:* SA: PD, PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Mercuric oxycyanide is self reactive. Friction, heat, and rough handling may cause an explosion. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Shipping of this material is FORBIDDEN *unless* it is desensitized. The desensitized material requires a shipping label of "POISONOUS/TOXIC MATERIALS." The desensitized material falls in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercuric oxycyanide may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including cyanide gas and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Australia: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, [skin], 1999; Finland: TWA 0.05 mg[Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3, [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg [Hg]/m^3, [skin], 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: LTEL 0.05 mg[Hg]/m^3; STEL 0.15 mg[Hg]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for inorganic mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Mercuric sulfate can affect you when breathed in and by passing through skin. Irritates the skin and is corrosive to the eyes and the respiratory tract. Corrosive if ingested. Inhalation of the aerosol can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Overexposure can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums, memory loss, increased saliva, personality change, and even permanent brain damage. Heating or contact with acid or acid "mist" causes release of toxic mercury vapors, and lung effects have been reported below permissible exposure levels. The substance may cause effects on the gastrointestinal tract. Very high exposure may result in death.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, and kidney failure. Organic mercury substances have been identified as a teratogen in humans. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes, and decreased peripheral vision.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical examination and history is strongly recommended, with examination of the nervous system including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye examination. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider nerve conduction tests, urinary enzymes, and neurobehavioral testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Antidotes and special procedures for medical personnel: The drug NAP (N-acetyl penicillamine) has been used to treat mercury poisoning with limited success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Mercury vapor: NIOSH: *Up to 0.5 mg/m³*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m³*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m³:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m³*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m³:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted

canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*
*End-of-service life indicator (ESLI) required.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, water, and gaseous hydrogen chloride.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is nonflammable. Use agent suitable to surrounding fire. Poisonous gases, including mercury and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

European/International Regulations: Hazard Symbol: T + , N; Risk phrases: R6; R26; R48/23; R50/53; Safety phrases: S53; S45; S60; S61.

Description: Mercury is a silvery, mobile, odorless liquid. Molecular weight = 200.59; Boiling point = 356−357°C; Freezing/Melting point = −39°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Mercury is used as a catalyst, in dental applications and pharmaceuticals, as a liquid cathode in cells for the electrolytic production of caustic and chlorine. It is used in electrical apparatus (lamps, rectifiers, and batteries) and in control instruments (switches, thermometers and barometers).

Incompatibilities: Heating mercury causes the formation of toxic mercury oxide fumes. Reacts violently with alkali metals, acetylene, azides, ammonia gas, chlorine, chlorine dioxide, many acids, most metals, ground mixtures of sodium carbide, and ethylene oxide. Contact with methyl azide forms shock- and spark-sensitive explosives. Attacks copper and many other metals, forming amalgams.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration.

NIOSH REL: (*Hg vapor*): 0.05 mg[Hg]/m^3 TWA [skin]; 0.1 mg[Hg]/m^3 Ceiling Concentration; [skin].

ACGIH TLV®[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week.

Protective Action Criteria (PAC) Mercury*

TEEL-0: 0.025 mg/m^3

PAC-1: 0.25 mg/m^3

PAC-2: **1.7** mg/m^3

PAC-3: **8.9** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1: Inappropriate

ERPG-2: 0.25 ppm

ERPG-3: 0.5 ppm

DFG MAK (*elemental and inorganic compounds*): 0.1 mg [Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B.

NIOSH IDLH: 10 mg[Hg]/m^3.

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.1 mg/m^3, [skin], 1993; Austria: MAK 0.005 ppm (0.05 mg/m^3, 1999; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, [skin], 1999; Finland: TWA 0.05 mg/m^3, 1993; France: VME 0.05 mg/m^3, [skin] (*vapor*), 1999; the Netherlands: MAC-TGG 0.05 mg/m^3, 2003; Japan: 0.05 mg/m^3, 1999; Norway: TWA 0.05 mg/m^3, 1999; Poland: MAC (TWA) vapors 0.025 mg/m^3, MAC (STEL) vapors 0.2 mg/m^3, 1999; Sweden: NGV 0.05 mg/m^3 (*vapor*), 1999; Switzerland: MAK-W 0.005 ppm (0.05 mg/m^3), [skin], 1999; Switzerland: MAK-W 0.01 mg/m^3, [skin], 1993; Turkey: TWA 0.1 mg/m^3, [skin], 1993; United Kingdom: TWA 0.025 mg[Hg]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[35, 43] set a MAC of 0.0003 mg/m^3 for ambient air in residential areas. Several states have set guidelines or standards for mercury in ambient air[60] ranging from 0.024 μg/m^3 (Kansas) to 0.01−0.08 mg/m^3 (Montana) to 0.167 μg/m^3 (New York) to 0.2−2.0 μg/m^3 (Connecticut) to 0.24 μg/m^3 (Pennsylvania) to 0.25 μg/m^3 (South Carolina) to 0.5 μg/m^3 (North Dakota) to 0.5−1.0 μg/m^3 (Florida) to 0.8 μg/m^3 (Virginia) to 2.0 μg/m^3 (Nevada) to 3.0 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: A variety of values have been set for mercury in drinking water in various parts of the world. These include[35]: the Czech Republic 0.001 mg/L; Canada 0.001 mg/L maximum acceptable concentration; Germany 0.004 mg/L EEC 0.001 mg/L; Japan 0.0005 mg/L; Mexico 0.005 mg/L; former USSR-UNEP/IRPTC joint project 0.0005 mg/L; USA 0.002 mg/L; WHO 0.001 mg/L. In addition, the US EPA[49] has set a lifetime health advisory at 0.0011 μg/L. And EPA has set a guideline of 0.002 μg/L for drinking water.[62] Beyond that several states have set guidelines for mercury in drinking water[61] including Maine at 2 μg/L and Minnesota at 3 μg/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Exposure to levels below 1 mg/m^3 has been shown to produce nonspecific symptoms, such as shyness, insomnia, anxiety, and loss of appetite. Higher levels (1−3 mg/m^3 for 2−5 h) may cause headache, salivation, metallic taste, chills, cough, fever, tremors, abdominal cramps, diarrhea, nausea, vomiting, tightness in the chest, difficult breathing, fatigue, lung irritation, and possible lung tissue damage. Symptoms may begin several hours after exposure and may last a week. Large doses may result in flu-like symptoms, which, in severe cases, may result in death due to pneumonia. *Lethal blood level in humans:* 0.4−22 mg/mL. *Skin:* Can be absorbed through the skin. Can cause irritation. Prolonged contact with skin can result in symptoms listed above. *Eyes:* Can cause eye irritation. *Ingestion:* Generally does not produce ill effects.

Long Term Exposure: May cause skin allergy. Mercury accumulates in the brain quickly during exposure but is released from the brain very slowly. This will result in a buildup in brain tissue over a long time. The liver and kidneys may also be damaged by mercury accumulation. It may cause headache, dizziness, restlessness, irritability, sleepiness, tremors, defective muscle control, increased salivation, loose teeth, irritation of the gums with a blue line between teeth and gums, loss of appetite, nausea, vomiting, diarrhea, liver damage, changes in urine, raised red areas and blisters of skin, impaired memory and possible permanent brain damage. Repeated exposure (usually more than 5 years) may cause clouding of the eyes, gray skin color. Frequency of complaints and severity of symptoms increase with levels of exposure, most notably above 0.1 mg/m^3. However, many of these symptoms have been reported at levels below recommended limits due to the accumulation of mercury over long term. There is limited evidence that mercury may cause an increase in spontaneous abortions in exposed women.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nervous system (including handwriting test to detect early hand tremor). Urine mercury level (usually less than 0.02 mg/L). Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Mercury vapor: NIOSH: *Up to 0.5 mg/m^3*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 mg/m^3*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 mg/m^3:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]* or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).*

*End-of-service life indicator (ESLI) required.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Mercury must be stored to avoid contact with chlorine dioxide, nitric acid, nitrates, ethylene oxide, chlorine, and methylazide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acetylene, ammonia, and nickel.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Wearing protective equipment and clothing, clean up the spill with an industrial vacuum cleaner with a charcoal filter to absorb mercury vapor. For mercury spilled in cracks, cover with zinc dust to form an amalgam, or cover with calcium polysulfide with excess sulfur. Do not sweep or use compressed air to blow mercury droplets as it can increase air concentrations. Store contaminated or waste mercury in tightly covered or vapor-proof containers pending removal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercury is not combustible. Use agent suitable for surrounding fire. Poisonous gases, including Hg, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Accumulate for purification and re-use if possible. Mercury vapors may be adsorbed or treated with sulfide solutions and then sent to mercury recovery operations.[22]

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations (*593-74-8*): Hazard Symbol: T + , N; Risk phrases: R26/27/28; R33; R50/53; Safety phrases: S1/2; S13; S28; S36; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned. *Note*: All other mercury compounds are Hazard Class 3.

Description: Dimethyl mercury is a volatile colorless liquid with faint sweet odor. Molecular weight = 230.67; Boiling point = 96°C. Soluble in water. Methyl mercury chloride is a colorless, crystalline solid. Molecular weight = 251.08; Freezing/Melting point = 170°C. Practically insoluble in water; solubility = <0.1 mg/mL at 21°C.

Potential Exposure: Alkyl mercury compounds have been used as seed disinfectants and for fungicides. They have also been used in organic synthesis.

Incompatibilities: Strong oxidizers, such as chlorine. May be sensitive to light.

Permissible Exposure Limits in Air

OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 mg[Hg]/m^3 Ceiling Concentration.

NIOSH REL: 0.01 mg[Hg]/m^3 TWA; 0.03 mg[Hg]/m^3 STEL [skin].

ACGIH TLV®[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 mg[Hg]/m^3 STEL [skin].

NIOSH IDLH: 2 mg Hg/m^3.

Dimethyl mercury

Protective Action Criteria (PAC)

TEEL-0: 0.0115 mg/m^3

PAC-1: 0.0345 mg/m^3

PAC-2: 0.046 mg/m^3

PAC-3: 2.3 mg/m^3

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3B.

Australia: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3, [skin], 1993; Austria: MAK 0.01 mg[Hg]/m^3, 1999;

Belgium: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.01 mg[Hg]/m^3, [skin], 1999; Finland: TWA 0.01 mg[Hg]/m^3, [skin], 1999; France: VME 0.01 mg[Hg]/m^3, [skin], 1999; Norway: TWA 0.01 mg[Hg]/m^3, 1999; the Philippines: TWA 0.01 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.01 mg[Hg]/m^3, MAC (STEL) 0.01 mg[Hg]/m^3, 1999; Sweden: NGV 0.01 mg [Hg]/m^3, [skin], 1999; Thailand: TWA 0.01 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Turkey: TWA 0.01 mg[Hg]/m^3, [skin], 1993; United Kingdom: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.01; STEL 0.03 mg/m^3 [skin]. In addition, North Dakota has set guidelines for alkyl mercury compounds in ambient air[60] of 1−3 μg/m^3 (0.0001−0.0003 mg/m^3).

Determination in Air: No method available.

Permissible Concentration in Water: *Methyl mercury: To protect freshwater aquatic life:* 0.016 μg/L as a 24-h average, never to exceed 8.8 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 2.8 μg/L. *To protect human health:* 0.2 μg/L.[6]

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Alkyl mercury compounds can be absorbed through the skin. When deposited on the skin, they give no warning, and if contact is maintained, can cause second-degree burns. Sensitization may occur. Alkyl mercurials have very high toxicity. *Systemic:* The central nervous system, including the brain, is the principal target tissue for this group of toxic compounds. Severe poisoning may produce irreversible brain damage resulting in loss of higher functions. The effects of chronic poisoning with alkyl mercury compounds are progressive. In the early stages, there are fine tremors of the hands; and in some cases, of the face and arms.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. With repeated or continued exposure, tremors may become coarse and convulsive, scanning speech with moderate slurring and difficulty in pronunciation may also occur. The worker may then develop an unsteady gait of a spastic nature which can progress to severe ataxia of the arms and legs. Sensory disturbances including tunnel vision, blindness, and deafness are also common. A late symptom, constriction of the visual fields, is rarely reversible and may be associated with loss of understanding and reason which makes the victim completely out of touch with his environment. Severe cerebral effects have been seen in infants born to mothers who had eaten large amounts of methylmercury-contaminated fish.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: Preplacement and periodic physical examinations should be concerned particularly with the skin, vision, central nervous system, and kidneys. Consideration should be given to the possible effects on the fetus of alkyl mercury exposure in the mother. Constriction of visual fields may be a useful diagnostic sign. Blood and urine levels of mercury have been studied, especially in the case of methylmercury. A precise correlation has not been found between exposure levels and concentrations. They may be of some value in indicating that exposure has occurred, however.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 mg/m^3*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m^3:* SA: PD, PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. These compounds should be stored in a refrigerator or a cool, dry place away from oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Mercury compounds n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases of chlorine and Hg are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 209-773-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%; Category D1A.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant as mercury-based pesticides, liquid, flammable, toxic, n.o.s.; mercury-based pesticides, liquid, toxic, n.o.s.; mercury-based pesticides, solid, toxic, n.o.s.; mercury compounds, liquid, n.o.s.; mercury compounds, solid, n.o.s.; mercury(I) (mercurous) compounds (pesticides); mercury(II) (mercuric) compounds (pesticides).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mercury thiocyanate is a white, odorless powder. Molecular weight = 316.79; Freezing/Melting point = about 165°C (decomposes). Slightly soluble in cold water.

Potential Exposure: Mercury thiocyanate is used in photography and fireworks.

Incompatibilities: Heat; expands to many times its original volume and then decomposes at freezing/melting point forming toxic fumes of sulfur oxides, mercury cyanide, and nitrogen oxides. Contact with acid or acid fumes causes release of toxic mercury and cyanide vapors.

Permissible Exposure Limits in Air

As organo mercury compounds

OSHA PEL: 0.01 mg/m^3 TWA; 0.04 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.01 mg/m^3 TWA; 0.03 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.01 mg/m^3 TWA; 0.03 mg/m^3 STEL [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.0395 mg/m^3

PAC-1: 0.0395 mg/m^3

PAC-2: 0.158 mg/m^3

PAC-3: 15.8 mg/m^3

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3 [skin] Danger of skin sensitization; Carcinogen Category 3.

NIOSH IDLH: 2 mg Hg/m^3.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979−1980.[6] These are the limits for *inorganic* mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45-μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Mercury thiocyanate can affect you when breathed in. High or repeated exposures can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums, memory loss, increased saliva, metallic taste, personality change, and/or brain damage. Skin and eye contact can cause irritation, allergy, and a gray skin color. Heating or contact with acid or acid "fumes" causes release of toxic mercury or cyanide vapors and lung effects. Health effects may occur below recommended exposure levels.

Long Term Exposure: Repeated or prolonged contact with skin may result in allergy, dermatitis, rash. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. Related mercury compounds may damage the developing fetus and decrease fertility in males and females.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with examination of the nervous system including handwriting. Kidney function tests. Urine test for mercury (should be less than 0.02 mg/L). After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 mg/m³:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5* mg/m³*:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m³:* SA: PD, PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, heat, and acids, including fumes.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Restrict persons not wearing protective equipment from area of spill until cleanup is complete. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercury thiocyanate may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides, sulfur oxides, mercury and cyanide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 203-604-4 [*Annex I Index No.:* 601-025-00-5]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

Extremely Hazardous Substance (EPA-SARA, Dropped From Listing in 1988).

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R10; R37; R51/53; Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Mesitylene is a clear, colorless liquid with a distinctive, aromatic odor. Molecular weight = 120.21; Specific gravity (H_2O:1) = 0.86; Boiling point = 165°C; Freezing/Melting point = −45°C; Vapor pressure = 2 mmHg at 20°C; Flash point = 50°C (cc); Autoignition temperature = 559°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0. Practically insoluble in water; solubility = 0.002%.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. Mesitylene is used as raw material in chemical synthesis and as ultraviolet stabilizer; as a paint thinner, solvent, and motor fuel component; as an intermediate in organic chemical manufacture.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers cause a fire and explosion hazard. Violent reaction with nitric acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.92 mg/m³ at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 25 ppm/125 mg/m³ TWA.

ACGIH TLV®[1]: 25 ppm TWA (lists a single CAS number for mixed isomers).

Protective Action Criteria (PAC)*

TEEL-0: 25 ppm

PAC-1: **140** ppm

PAC-2: **360** ppm

PAC-3: **500** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 20 ppm/100 mg/m^3; Pregnancy Risk Group C (all isomers of trimethylbenzene).

Denmark: TWA 25 ppm (120 mg/m^3), 1999; Japan: 25 ppm (120 mg/m^3), 1999; Norway: TWA 20 ppm (100 mg/m^3), 1999; Sweden: NGV 25 ppm (120 mg/m^3), KTV 35 ppm (170 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (125 mg/m^3), 1999; the Netherlands: MAC-TGG 100 mg/m^3; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm.

Determination in Air: Use OSHA Analytical Method PV-2091.

Permissible Concentration in Water: No method available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.41$.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Symptoms of exposure can also include headache, drowsiness, fatigue, dizziness, nausea, a lack of coordination, vomiting, confusion. Acute-lowest toxic concentration for humans is 10 ppm, resulting in central nervous system effects. Liquid deposition in lungs causes chemical pneumonitis. Symptoms of exposure include nervousness, tension, anxiety, asthmatic bronchitis, and skin irritation.

Long Term Exposure: Repeated exposures can cause headaches, tiredness, and a feeling of nervous tension. Can affect the blood cells and the blood's clotting ability, hypochromic anemia. Delayed or chronic health hazard is possible asthmatic bronchitis with coughing and/or shortness of breath. The use of alcoholic beverages enhances the effect. May cause liver damage. The liquid destroys the skin's natural oils, causing drying and cracking.

Points of Attack: Eyes, skin, respiratory system, central nervous system, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. Complete blood count and platelet count. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 25 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. This chemical must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Mesityl oxide M:0470

Molecular Formula: $C_6H_{10}O$
Common Formula: $CH_3COCH = C(CH_3)_2$
Synonyms: Isobutenyl methyl ketone; Isopropylideneacetone; Mesityloxid (German); Methyl isobutenyl ketone; 4-Methyl-3-pentene-2-one; 4-Methyl-3-penten-2-on (German); 2-Methyl-2-penten-4-one; 4-Methyl-3-penten-2-one; Oxyde de mesityle (French)
CAS Registry Number: 141-79-7
RTECS® Number: SB4200000
UN/NA & ERG Number: UN1229/129
EC Number: 205-502-5[*Annex I Index No.*: 606-009-00-1]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20/21/22; Safety phrases: S2; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Mesityl oxide is a clear, pale yellow, or colorless liquid with a strong peppermint odor. The odor threshold is 0.05 ppm. Molecular weight = 98.16; Specific gravity (H_2O:1) = 0.87; Boiling point = 130°C; Freezing/Melting point = −46.7°C; Vapor pressure = 9 mmHg at 20°C; Flash point = 30.6°C; Autoignition temperature = 343°C. Explosive limits: LEL = 1.4%; UEL = 7.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Slightly soluble in water; solubility = 3%.[NIOSH]

Potential Exposure: Compound Description: Human Data; Primary Irritant. Mesityl oxide is used as a solvent for cellulose esters and ethers and other resins in lacquers and inks. It is used in paint and varnish removers and as an insect repellent.

Incompatibilities: Forms explosive mixture with air. May be able to form explosive peroxides. May react violently with nitric acid, aliphatic amines, alkanolamines, 2-aminoethanol, ethylene diamine, chlorosulfonic acid, oleum (fuming sulfuric acid). Not compatible with oxidizers, strong acids, strong bases, reducing agents, halogens. Dissolves some forms of plastics, resins, and rubber. Attacks copper.

Permissible Exposure Limits in Air

OSHA PEL: 25 ppm/100 mg/m^3 TWA.
NIOSH REL: 10 ppm/40 mg/m^3 TWA.
ACGIH TLV®[1]: 15 ppm/60 mg/m^3 TWA; 25 ppm/100 mg/m^3 STEL.
NIOSH IDLH: 1400 ppm [LEL].

Protective Action Criteria (PAC)
TEEL-0: 25 ppm
PAC-1: 25 ppm
PAC-2: 25 ppm
PAC-3: 1400 ppm

DFG MAK: 5 ppm/20 mg/m^3 TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group D.

Australia: TWA 15 ppm (60 mg/m^3); STEL 25 ppm, 1993; Austria: MAK 25 ppm (100 mg/m^3), 1999; Denmark: TWA 10 ppm (40 mg/m^3), 1999; Finland: TWA 25 ppm (100 mg/m^3); STEL 75 ppm (300 mg/m^3), [skin], 1999; France: VME 15 ppm (60 mg/m^3), 1999; Norway: TWA 10 ppm (40 mg/m^3), 1999; the Netherlands: MAC-TGG 60 mg/m^3, 2003; Poland: MAC (TWA) 20 mg/m^3, MAC (STEL) 100 mg/m^3, 1999; Russia: STEL 1 mg/m^3, [skin], 1993; Switzerland: MAK-W 15 ppm (60 mg/m^3), 1999; Turkey: TWA 25 ppm (100 mg/m^3), 1993; United Kingdom: TWA 15 ppm (61 mg/m^3); STEL 25 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 25 ppm. Several states have set guidelines or standards for mesityl oxide in ambient air[60] ranging from 0.6 to 1.0 mg/m^3 (North Dakota) to 0.8 mg/m^3 (Connecticut) to 1.0 mg/m^3 (Virginia) to 1.429 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1301 for Ketones (II).[18]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.7$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates and burns the eyes and skin. May cause permanent eye damage. Irritates the respiratory tract causing coughing, wheezing and shortness of breath. Exposure causes headache, sleepiness, dizziness, loss of coordination. Exposure far above OEL may result in narcosis, unconsciousness, coma.

Long Term Exposure: The liquid destroys the skin's natural oils. May affect the liver, kidneys, and lungs. May cause anemia.

Points of Attack: Eyes, skin, respiratory system, blood, liver, kidneys, lungs, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Lung function tests. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: Responder™ suits. Also, Viton™/chlorobutyl rubber is among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For more information about engineering controls, see NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: NIOSH: *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *500 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1400 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids. See incompatibilities above. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Metaldehyde M:0480

Molecular Formula: $C_8H_{16}O_4$

Synonyms: Acetaldehyde, tetramer; Antimilace; Ariotox; Cekumeta; Halizan; META; Metacetaldehyde; Metaldehyd (German); Metason; Namekil; Slug-tox; 1,3,5,7-Tetroxocane, 2,4,6,8-tetramethyl-

CAS Registry Number: 108-62-3

RTECS® Number: XF9900000

UN/NA & ERG Number: UN1332/133

EC Number: 203-600-2 [*Annex I Index No.:* 605-005-00-7]

Regulatory Authority and Advisory Bodies

TSCA: 40CFR716.120(d)1 as aldehydes.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R11; R22; Safety phrases: S2; S13; S16; S25; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Metaldehyde is a white crystalline powder with a mild menthol odor. Molecular weight = 176.24; Boiling point = 112−116°C; Freezing/Melting point = 47°C; Flash point = 36°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Insoluble in water.

Potential Exposure: It is used as a poison for slugs and snails, and as a fuel in small heaters.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes, skin, and respiratory tract. Exposure can cause nausea, vomiting, diarrhea, abdominal pain, irritability, sleepiness, muscle twitching, convulsions, coma, and death.

Long Term Exposure: May cause kidney and liver damage. May damage the developing fetus.

Points of Attack: Kidneys, liver.

Medical Surveillance: Kidney function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable storage area. Prior to working with metaldehyde you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Metaldehyde requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Fire may restart after it has been extinguished. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Methacrylic acid M:0490

Molecular Formula: $C_4H_6O_2$

Common Formula: $CH_2 = C(CH_3)COOH$

Synonyms: Acide methacrylique (French); Acido metacrilico (Spanish); Acido α-metacrilico (Spanish); Acrylic acid, 2-methyl-; Glacial methacrylic acid; Methacrylic acid, inhibited; α-Methyl-acrylic acid; Methacrylsaeure (German); 2-Methylpropenoic acid; 2-Methyl-2-propenoic acid; 2-Propenoic acid, 2-methyl-; Propionic acid, 2-methylene

CAS Registry Number: 79-41-4

RTECS® Number: OZ2975000

UN/NA & ERG Number: UN2531 (stabilized)/153

EC Number: 201-204-4 [*Annex I Index No.:* 607-088-00-5]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R21/22; R35; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methacrylic acid is a colorless liquid. Molecular weight = 86.10; Specific gravity (H_2O:1) = 1.02 (liquid); Boiling point = 162.8°C; Freezing/Melting point = 16.1°C; Vapor pressure = 0.7 mmHg at 20°C; Flash point = 77°C (oc); 68°C (cc); Autoignition temperature = 68°C. Explosive limits: LEL = 1.6; UEL = 8.8. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2. Soluble in water; solubility = 9% at 25°C.

Potential Exposure: Compound Description: Drug, Mutagen; Human Data. Methacrylic acid is used in preparation of methacrylates and carboxylated polymers, in the production of the material or its alkyl esters, as monomers or comonomers for synthetic resins for the production of plastic sheets, moldings, and fibers.

Incompatibilities: Forms explosive mixture with air. A reducing agent; reacts with oxidizers. Incompatible with strong acids, caustics, ammonia, amines, isocyanates, alkylene oxides, epichlorohydrin. Will polymerize readily from heating above 59°F/15°C, or due to the presence of light, oxidizers (peroxides); or in the presence of traces of hydrochloric acid, with fire or explosion hazard. Attacks metals. *Note:* Typically contains 100 ppm of monomethyl ether hydroquinone (150-76-5) as an inhibitor to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.52 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 20 ppm/70 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 20 ppm/70 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 6.7 ppm

PAC-1: **6.7** ppm

PAC-2: **61** ppm

PAC-3: **220** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 5 ppm/18 mg/m^3 TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group C.

Australia: TWA 20 ppm (70 mg/m^3), 1993; Austria: MAK 20 ppm (70 mg/m^3), 1999; Belgium: TWA 20 ppm (70 mg/m^3), 1993; Denmark: TWA 20 ppm (70 mg/m^3), 1999; Finland: TWA 20 ppm, 1999; France: VME 20 ppm (70 mg/m^3), 1999; the Netherlands: MAC-TGG 70 mg/m^3, 2003; Russia: STEL 10 mg/m^3, [skin], 1993; Sweden: NGV 20 ppm (70 mg/m^3), KTV 30 ppm (100 mg/m^3), 1999; Switzerland: MAK-W 20 ppm (70 mg/m^3), 1999; United Kingdom: TWA 20 ppm (72 mg/m^3); STEL 40 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 20 ppm. Several states have set guidelines or standards for methacrylic acid in ambient air[60] ranging from 0.7 mg/m^3 (North Dakota) to 1.2 mg/m^3 (Virginia) to 1.4 mg/m^3 (Connecticut) to 1.67 mg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2005.

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <1.0$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methacrylic acid can affect you when breathed in. A corrosive substance. Exposure can irritate the nose and throat. Methacrylic acid is a corrosive chemical and contact can burn the eyes, causing permanent damage. It can irritate and burn the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: High or repeated exposure may damage the kidneys. Methacrylic acid can cause an allergic skin rash.

Points of Attack: Lungs, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: kidney and liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: butyl rubber gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves, Responder™ suits; Trychem 1000™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 20 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Methacrylic acid should be stored at temperatures below 15°C. Sources of ignition, such as smoking and open flames are prohibited where methacrylic acid is handled, used, or stored. Wherever methacrylic acid is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Inhibited methacrylic acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Using caution, neutralize remainder with aqueous sodium carbonate or lime. Then wash away with plenty of water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methylacrylonitrile is a colorless liquid with an odor like bitter almonds. Odor threshold = 7.0 ppm. It is reported that methacrylonitrile cannot be detected by its smell even at concentrations which are already dangerous for humans. Hence, special attention must be given to ventilation and estimations of the amount of poison present and must be carried out frequently. Molecular weight = 67.10; Specific gravity (H_2O:1) = 0.80; Boiling point = 90.6°C; Freezing/Melting point = −35.8°C; Vapor pressure = 71 mmHg at 25°C; Flash point = 1.1°C (cc). Explosive limits: LEL = 2%; UEL = 6.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water; solubility in water = 3%.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Primary Irritant. This material is used as a monomer in the preparation of polymeric coatings and elastomers.

Incompatibilities: Forms explosive mixture with air. Incompatible with aliphatic amines, alkanolamines, strong acids, strong oxidizers, alkali, light. Polymerization may occur due to elevated temperature, visible light, or contact with a concentrated alkali. Violent reaction with oxidizers. *Note:* Typically contains 50 ppm of monoethyl ether hydroquinone (662-62-8) as an inhibitor to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.74 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1 ppm/3 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 1 ppm/2.7 mg/m^3 TWA [skin].

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **1.0** ppm

PAC-2: **13** ppm

PAC-3: **25** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 1 ppm (3 mg/m^3), [skin], 1993; Belgium: TWA 1 ppm (2.7 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (3 mg/m^3), [skin], 1999; Finland: TWA 1 ppm (3 mg/m^3); STEL 3 ppm (9 mg/m^3), [skin], 1999; France: VME 1 ppm (3 mg/m^3), [skin], 1999; Norway: TWA 1 ppm (3 mg/m^3), 1999; Switzerland: MAK-W 1 ppm (3 mg/m^3), [skin], 1993; the Netherlands: MAC-TGG 3 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm [skin]. Several states have set guidelines or standards for methacrylonitrile in ambient air[60] ranging from 0.7 mg/m^3 (North Dakota) to 1.2 mg/m^3 (Virginia) to 1.4 mg/m^3 (Connecticut) to 1.667 mg/m^3 (Nevada).

Determination in Air: No measurement method listed.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.7.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Converted to cyanide in the body! A lacrimator (causes tearing); an insidious poison which causes delayed skin reactions. Very readily absorbed through skin. Highly toxic by all routes of exposure. Signs and symptoms of acute exposure to methylacrylonitrile may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red mucous membranes and blood, cardiac arrhythmias, and other cardiac abnormalities are common. Cyanosis (blue tint to the skin and mucous membranes) is not a consistent finding. Tachypnea (rapid respiratory rate) may be followed by respiratory depression. Lung hemorrhage and pulmonary edema may also occur. Headache, vertigo (dizziness), agitation, and giddiness may be followed by combative behavior, convulsions, paralysis, protruding eyeballs, dilated and unreactive pupils, and coma. Methylacrylonitrile is irritating to the skin and mucous membranes. Lacrimation (tearing) and a burning sensation of the mouth and throat are common. Excessive salivation, nausea, and vomiting may also occur.

Long Term Exposure: May cause liver damage. May cause nervous system damage, causing weakness in the legs.

Points of Attack: Eyes, skin, liver, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nervous system. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential for exposures *over 1 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylacrylonitrile is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methylacrylonitrile should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylacrylonitrile. Wherever methylacrylonitrile is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methacrylonitrile, inhibited, requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Fire Extinguishing: This is a flammable liquid. Use dry chemical, CO_2, water spray, or alcohol foam extinguishers. Methacrylonitrile evolves flammable concentrations of vapor. Thus, at room temperatures, flammable concentrations are liable to be present. Also, the chemical will explode due to its tendency to polymerize violently. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Add alcoholic NaOH, then oxidize with sodium hypochlorite. After reaction, flush to sewer with water.[24]

Methallyl alcohol M:0510

Molecular Formula: C_4H_8O

Common Formula: $CH_2 = C(CH_3)CH_2OH$

Synonyms: Isopropenyl carbinol; 2-Methyl-2-propen-1-ol; 2-Propen-1-ol, 2-methyl-

CAS Registry Number: 513-42-8

RTECS® Number: UD5250000

UN/NA & ERG Number: UN2614/129

EC Number: 208-161-0

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methallyl alcohol is a colorless liquid with a pungent odor. Molecular weight = 72.12; Boiling point = 114°C; Flash point = 33°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as an intermediate in organic synthesis.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, caustics, aliphatic amines, isocyanates, DMSO, oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: Use NIOSH Analytical Method (IV) #1402, for Alcohols III.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Methallyl alcohol can affect you when breathed in and by passing through your skin. Exposure to methallyl alcohol can cause irritation to eyes, nose, and throat. Contact can cause skin irritation.

Long Term Exposure: Similar allyl compounds cause liver damage. However, it is not known for certain that this chemical causes the same effects.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to methallyl alcohol, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methallyl alcohol is a flammable liquid. Water may be ineffective. Alcohol foam is the recommended extinguishing agent. Acrid fumes and smoke are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases R24; R26/28; R50; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Methamidophos is an off-white crystalline solid. Molecular weight = 141.12; Freezing/Melting point = 44.5°C; Vapor pressure = 8×10^{-4} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide on vegetables and cotton.

Incompatibilities: Incompatible with strong acids or alkali. Attacks mild steel and copper-containing alloys (technical grade).

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3.5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 60 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Fish Tox = 165.16992000 ppb (LOW).

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. Acute exposure to methamidophos may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may be noted, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. This material is highly toxic; LD_{50} = (oral-rat) 7.5 mg/kg. Human Tox = 7.00000 ppb (HIGH).

Long Term Exposure: The substance may have effects on the nervous system resulting in delayed neuropathy. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 13 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization of an antidote or performance of other invasive procedures. The effects may be delayed. Medical observation recommended.

Note to physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area

Shipping: This material falls into the class of "Organophosphorus Pesticides, solid, toxic, n.o.s." This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Poisonous gases, including nitrogen oxides, sulfur oxides, and phosphorus oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Methane M:0530

Molecular Formula: CH_4

Synonyms: Biogas; Fire damp; Marsh gas; Metano (Spanish); Methyl hydride; Natural gas

CAS Registry Number: 74-82-8

RTECS® Number: PA1490000

UN/NA & ERG Number: UN1971 (compressed gas)/115; UN1972 (liquefied gas)/115

EC Number: 200-812-7 [*Annex I Index No.:* 601-001-00-4]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: Hazard Symbol: F + ; Risk phrases: R12; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Methane is an odorless, colorless gas. Molecular weight = 16.05; Boiling point = −162°C; Freezing/Melting point = −183°C; Autoignition temperature = 537°C. Explosive limits: LEL = 5.0%; UEL = 15.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water. Natural gas consists primarily of methane (85%) with lesser amounts of ethane (9%), propane (3%), nitrogen (2%), and butane (1%).

Potential Exposure: Methane is used as a fuel and in the manufacture of organic chemicals, acetylene, hydrogen cyanide, and hydrogen. It may also be a cold liquid. Natural gas is used principally as a heating fuel. It is transported as a liquid under pressure. It is also used in the manufacture of various chemicals including acetaldehyde, acetylene, ammonia, carbon black, ethyl alcohol, formaldehyde, hydrocarbon fuels, hydrogenated oils, methyl alcohol, nitric acid, synthesis gas, and vinyl chloride. Helium can be extracted from certain types of natural gas.

Incompatibilities: Forms explosive mixture with air. Reacts violently with bromine pentafluoride, chlorine dioxide, nitrogen trifluoride, liquid oxygen and oxygen difluoride. In general, avoid contact with oxidizers.

Permissible Exposure Limits in Air Any loss of containment of Methane in a confined area can lower the oxygen content and cause suffocation. Oxygen content should be tested to ensure that it is at least 19% by volume.

OSHA PEL: Simple asphyxiant—inert gas and vapor.

ACGIH TLV®[1]: ACGIH TLV®[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas* (C_1–C_4).

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 3000 ppm

PAC-2: 5000 ppm

PAC-3: 200,000 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: MAK-W 10,000 ppm (6700 mg/m^3), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Simple asphyxiant.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: High levels can cause suffocation. Symptoms are due to a decrease in the concentration of oxygen available for breathing and include dizziness, difficult breathing, bluish color of the skin, and loss of consciousness. Any contact with liquid can cause freezing burns.

Long Term Exposure: No effects reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Where exposure to cold equipment, vapors, or liquid may occur, employees should be equipped with special clothing designed to prevent freezing of body tissues.

Respirator Selection: Exposure to methane is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments. Chemical cartridge respirators should not be used where methane exposure occurs. For high exposures use air supplied respirators.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methane must be stored to avoid contact with oxidizers (such as oxygen, chlorine, bromine, perchlorates, peroxides, nitrates, and permanganates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where methane is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of methane. Wherever methane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of “FLAMMABLE GAS.” It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. The flame may be invisible. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Incomplete combustion of natural gas may produce carbon monoxide. Use water spray to disperse vapors. *Small fires:* use dry chemical or carbon dioxide extinguishers. *Large fires:* use water spray, fog, or foam. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (flaring).

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Philippines) (UN).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T +, N; Risk phrases: R21; R28; R50/53; Safety phrases: S1/2; S22; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Methidathion is a colorless crystalline solid. Molecular weight = 302.34; Freezing/Melting point = 39−40°C; Vapor pressure = 3.4×10^{-6} mmHg at 20°C. Very slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this nonsystemic insecticide.

Incompatibilities: None listed.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 400 mg/m^3

Determination in Water: Fish Tox = 0.15019000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This material is poisonous to humans. Its toxic effects are by action on the nervous system. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Human volunteers ingesting 0.11 mg/kg/day for 6 weeks had no clinical effects. LD_{50} = (oral-rat) 20 mg/kg (highly toxic). Symptoms are similar to parathion poisoning and may include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, dizziness, giddiness, weakness, muscle twitching, difficult breathing, sensation of tightness of chest, blurring or dimness of vision, and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. Human Tox = 1.05000 ppb (HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing

material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, sulfur oxides, and phosphorus oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Treat with strong alkali, mix with soil and bury in the case of small quantities.[22] For large quantities, use incineration with effluent gas scrubbing.

Potential Exposure: Those involved in the manufacture, formulation, and application of this nonsystemic acaricide and insecticide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 15 mg/m^3

Determination in Water: Fish Tox = 0.04597000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact irritates the skin and eyes. Inhalation will irritate the respiratory tract. As a carbamate insecticide, this compound is a reversible cholinesterase inhibitor and acts on the nervous system. It is classified as very toxic, and the probable oral lethal dose for humans is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb adult. Symptoms include salivation, slowed heartbeat, spontaneous urination and defecation, labored breathing, headache, blurred vision, tremor, slight paralysis, and muscle twitching. Exposure to carbamate poisoning can also result in nausea, vomiting, diarrhea, abdominal pain, convulsions, coma, and death. Human Tox = 35.00000 ppb (INTERMEDIATE).

Long Term Exposure: The substance may have effects on the nervous system, liver.

Points of Attack: Central nervous system, liver, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area

Shipping: This material may be classified as a Carbamate pesticide, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical does not burn. Poisonous gases, including nitrogen oxides and sulfur oxides, are produced in fire. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Remove material with contaminated soil and place in impervious containers. May be incinerated in a pesticide incinerator at the specified temperature/dwell-time combination. Any liquids, sludges, or solid residues generated should be disposed of in accordance with all applicable federal, state, and local pollution control requirements. If appropriate incineration facilities are not available, material may be buried in a chemical waste landfill. May be amenable to biological treatment at a municipal sewage treatment plant (Sax/DPIMR).

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): P066.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.028; Nonwastewater (mg/kg), 0.14.

Safe Drinking Water Act: Priority List (55 FR 1470).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methomyl is a white crystalline solid with a slight sulfurous odor. A noncombustible solid that may be dissolved in flammable liquids that may alter physical properties listed here. Molecular weight = 162.23; Specific gravity (H_2O:1) = 1.29; Freezing/Melting point = 78−79°C; Vapor pressure: 0.00005 mmHg; also 0.0001 (EPA). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Moderately soluble in water; solubility 6% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Methomyl is a broad-spectrum insecticide used as insecticide in many vegetables, field crops, certain fruit crops, and ornamentals.

Incompatibilities: Keep away from strong bases, strong oxidizers. Heat causes decomposition forming toxic and irritating fumes including nitrogen oxides, sulfur oxides, hydrogen cyanide, methylisocyanate.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 2.5 mg/m^3 TWA.

ACGIH TLV®[1]: 2.5 mg/m^3 TWA not classifiable as a human carcinogen; TLV-BEI$_A$ issued for Acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 2.5 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 200 mg/m^3

Australia: TWA 2.5 mg/m^3, 1993; Belgium: TWA 2.5 mg/m^3, 1993; Denmark: TWA 2.5 mg/m^3, [skin], 1999; France: VME 2.5 mg/m^3, [skin], 1999; Norway: TWA 2.5 mg/m^3, 1999; Switzerland: MAK-W 2.5 mg/m^3, [skin], 1999; United Kingdom: TWA 2.5 mg/m^3, 2000; the Netherlands: MAC-TGG 2.5 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for methomyl in ambient air[60] ranging from 25 μg/m^3 (North Dakota) to 40 μg/m^3 (Virginia) to 50 μg/m^3 (Connecticut) to 59.5 μg/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: The US EPA has calculated a no-observed-adverse-effects-level (NOAEL) of 2.5 mg/kg/day from which a lifetime health advisory of 175 μg/L has been calculated. The state of Maine has set a guideline of 50 μg/L for methomyl in drinking water.[61]

Determination in Water: By high-performance liquid chromatography as described in EPA Health Advisory cited below. Fish Tox = 80.25646000 ppb (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = 0.63.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cholinesterase inhibitor. Irritates the eyes. May affect the nervous system resulting in respiratory failure and convulsions. Exposure may result in death. Methomyl has high oral toxicity, moderate inhalation toxicity, and low skin toxicity. The probable oral lethal dose for humans is between 7 drops and 1 teaspoon for a 150-lb adult. Death is due to respiratory arrest. Acute exposure to methomyl usually leads to a cholinergic crisis. Signs and symptoms may include increased salivation, lacrimation (tearing), spontaneous defecation, and spontaneous urination. Pinpoint pupils, blurred vision, tremor, muscle twitching, and loss of muscle coordination may occur. Mental confusion, convulsions, and coma may also be noted. Gastrointestinal effects include nausea, vomiting, diarrhea, and abdominal pain. Bradycardia (slow heart rate) occurs frequently. Dyspnea (shortness of breath), pulmonary edema, and respiratory arrest may also occur. Human Tox = 200.00000 ppb (VERY LOW).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Methomyl may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause anemia.

Points of Attack: Eyes, respiratory system, central nervous system, cardiovascular system, liver, kidneys, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: Tychem 1000™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 2.5 mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a pesticide cartridge. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases, strong oxidizers (such as chlorine, bromine and fluorine). Do not store in area where temperature is less than 32°F/0°C.

Shipping: This material may be classified under Carbamate pesticides, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep unnecessary people away; isolate hazard areas and deny entry. Stay upwind and keep out of low areas. Do not touch spilled material, or handle broken packages without protective equipment. Do not breathe dust, vapors, or the fumes from burning material. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methomyl does not burn. Use any agent suitable for surrounding fire. Poisonous gases, including nitrogen oxides, sulfur oxides, hydrogen cyanide, methylisocyanate, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Alkaline hydrolysis leads to complete degradation to nontoxic products.[22] May be dissolved in water and sprayed into a furnace with effluent gas scrubbing also. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154
EC Number: 200-413-8
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Studies (ipr); no evidence: mouse, rat.
California Proposition 65 Developmental/Reproductive toxin 1/1/89.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Methotrexate is an orange-brown crystalline powder. Molecular weight = 454.50; Freezing/Melting point = 185−204°C (decomposes). Insoluble in water.
Potential Exposure: Methotrexate is an anti-cancer drug in tablet or injectable liquid form. It is also an insect chemosterilant.
Incompatibilities: Light and oxidizers.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Inhalation, skin and/or eyes.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes.
Long Term Exposure: Methotrexate causes mutations (genetic changes). Such chemicals may have a cancer or reproductive risk. Methotrexate is a probable teratogen in humans. There is limited evidence that methotrexate may affect sperm production in males. When taken as a medical drug, methotrexate can cause nausea, vomiting, loss of appetite, weight loss, bloody diarrhea, sores inside the mouth, hair loss, and skin rash. It can also damage the liver and kidneys. Methotrexate can damage bone marrow causing low blood cell count. It is not known if the effects can occur from work-place exposures.
Points of Attack: Blood, liver, kidneys.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: complete blood count (CBC). Liver and kidney function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles when working with liquid, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures to methotrexate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. A regulated, marked area should be established where methotrexate is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from light and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.
Shipping: This material may be classed as Toxic solids, organic, n.o.s. which requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methoxychlor is a colorless to tan solid with a slight fruity odor. Molecular weight = 345.66; Freezing/Melting point = 89°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Methoxychlor was introduced as an insecticide in 1945. It is a close relative of DDT and has been used as an insecticide of very low mammalian toxicity for home and garden, on domestic animals for fly control, for elm bark-beetle vectors of Dutch elm disease, and for blackfly larvae in streams. Methoxychlor is registered for about 87 crops, alfalfa, nearly all fruits and vegetables, corn, wheat, rice, and other grains, beef and dairy cattle, and swine, goats and sheep, and for agricultural premises and outdoor fogging. Thus, those engaged in manufacture, formulation, and application of the material as well as people in application areas may be exposed.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 (*total dust*) TWA.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 mg/m^3 TWA not classifiable as a human carcinogen.

NIOSH IDLH: potential occupational carcinogen 5000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 250 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 15 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(8); Pregnancy Risk Group D.

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 15 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 15 mg/m^3, 1993; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Switzerland: MAK-W 10 mg/m^3, 1999; Thailand: TWA 15 mg/m^3, 1993; United Kingdom: TWA 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for methoxychlor in ambient air[60] ranging from 23.8 μg/m^3 (Kansas) to 35.07 μg/m^3 (Pennsylvania) to 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II (4), Method #S-371; OSHA Analytical Method PV-2038.

Permissible Concentration in Water: The WHO[35] has recommended a limit of 30 μg/L of methoxychlor for drinking water. A US recommendation for bottled water for drinking purposes was 100 μg/L. Mexico[35] has set limits of 4.0 μg/L for methoxychlor in coastal waters, 40.0 μg/L in estuaries, and 35 μg/L in recovery waters used for drinking water supply. The EPA[47] has determined a lifetime health advisory of 340 μg/L for methoxychlor. More recently, EPA has proposed a guideline of 400 μg/L for drinking water.[62] Several states have set guidelines or standards for methoxychlor in drinking water.[61] These range from a standard of 100 μg/L in Arizona and a guideline of 100 μg/L in Maine to a guideline of 340 μg/L for Minnesota.

Determination in Water: By liquid/liquid extraction followed by identification by gas chromatography.[47] Fish Tox: 0.11310000 ppb (EXTRA HIGH). Octanol−water coefficient: Log K_{ow} = >4.4.

Routes of Entry: Inhalation, ingestion, skin and/or eyes. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: *Note:* For application, methoxychlor is dissolved in organic or petroleum distillate solvents. These solvents may have poisonous effects in addition to those below. *Inhalation:* The results of accidental exposure and animal studies suggest that high levels may cause irritation to nose and throat and may cause headache, nausea, vomiting, staggering walk, drowsiness, convulsions, coma, and death. *Skin:* Absorbed in significant amounts especially when dissolved in organic solvents. Local irritation and numbing of affected area may be experienced. *Eyes:* May cause irritation. *Ingestion:* Symptoms are similar to those listed under inhalation. Ingestion of 5 oz a day for 6 weeks resulted in no observable symptoms. The least amount causing death has been reported as 1 lb. Exposure can cause anxiety, fatigue, nausea, vomiting, dizziness, confusion, weakness, “pins and needles” in extremities, muscle twitching, and tremor. Higher levels can cause convulsions, unconsciousness, and even death. Human Tox = 40.00000 ppb (INTERMEDIATE).

Long Term Exposure: Experiments with animals suggest that exposure to high levels for prolonged periods may cause excess salivation, tremors, seizures, and convulsions. These will generally go away when exposure stops. Methoxychlor has been shown to affect reproduction and to cause cancer at high exposure levels in some laboratory animals. Whether it does so in humans is not known. A potential occupational carcinogen. (NIOSH). May damage the liver and kidneys. Very high exposures may cause anemia.

Points of Attack: Central nervous system, liver, kidneys. Cancer site in animals: liver and ovaries.

Medical Surveillance: Liver and kidney function tests. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Protect containers from damage. Store in cool, dry area away from fire hazard and out of direct sunlight.

Shipping: This material may be classed under Organochlorine Pesticides, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a combustible solid but difficult to ignite. Use agent suitable for surrounding fire. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases, including hydrogen chloride, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 203-772-9 [*Annex I Index No.:* 607-036-00-1]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Developmental/Reproductive toxin 1/1/93.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R60; R61; R20/21/22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methoxyethyl acetate is a colorless liquid with a mild, ether-like odor. Odor threshold = 0.33 ppm. Molecular weight = 118.15; Specific gravity (H_2O:1) = 1.01; Boiling point = 145°C; Freezing/Melting point = −65°C; Vapor pressure = 2 mmHg at 20°C; Flash point = 48.9°C (cc); Autoignition temperature = 380°C. Explosive limits: LEL = 1.7%; UEL = 8.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Hormone, Primary Irritant. Methoxyethyl acetate is used as a solvent for resins, oils, greases, and inks. It is also an ingredient of lacquers, paints, and adhesives.

Incompatibilities: Forms explosive mixture with air. Strong oxidants, strong bases, strong acids, and nitrates. May be able to form explosive peroxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.83 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/120 mg/m^3 TWA [skin].

NIOSH REL: 0.1 ppm/0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 ppm/0.5 mg/m^3 TWA [skin]; BEI issued.

NIOSH IDLH: 200 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.1 ppm

PAC-1: 0.3 ppm

PAC-2: 20 ppm

PAC-3: 200 ppm

DFG MAK: 1 ppm/4.9 mg/m^3 (sum of the concentrations of EGMEA and its acetate in air); Peak Limitation Category II (8) [skin]; Pregnancy Risk Group B.

Australia: TWA 5 ppm (24 mg/m^3), [skin], 1993; Austria: MAK 5 ppm (25 mg/m^3), [skin], 1999; Belgium: TWA 5 ppm (24 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (24 mg/m^3), [skin], 1999; Finland: TWA 25 ppm (120 mg/m^3); STEL 40 ppm (180 mg/m^3), [skin], 1999; France: VME 5 ppm (24 mg/m^3), [skin], 1999; Hungary: TWA 25 mg/m^3; STEL 50 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 1.5 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (22 mg/m^3), 1999; the Philippines: TWA 25 ppm (120 mg/m^3), [skin], 1993; Poland: MAC (TWA) 25 mg/m^3, MAC (STEL) 100 mg/m^3, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 5 ppm (25 mg/m^3), KTV 10 ppm (50 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (25 mg/m^3), KZG-W 10 ppm (50 mg/m^3), [skin], 1999; Turkey: TWA 25 ppm (120 mg/m^3), [skin], 1993; United Kingdom: TWA 5 ppm (25 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm [skin]. Several states have set guidelines or standards for methoxyethyl acetate in ambient air[60] ranging from 0.24 mg/m^3 (North Dakota) to 0.4 mg/m^3 (Virginia) to 0.48 mg/m^3 (Connecticut) to 0.571 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1451, Methyl cellosolve acetate; OSHA Analytical methods 53, 79.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.1.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: 2-Methoxyethyl acetate can affect you when breathed in and by passing through your skin. Exposure to the vapor can irritate the eyes. High levels of exposure can cause headache, vomiting, dizziness, fatigue, confusion, lightheadedness, and unconsciousness. Higher exposure can cause irritation of the nose, throat, and lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the blood and central nervous system.

Long Term Exposure: Repeated high exposures can damage the brain and nervous system. May affect the blood, liver and kidneys. May cause low blood count (anemia). *In animals:* narcosis; reproductive, teratogenic effects.

Points of Attack: Eyes, respiratory system, kidneys, brain, central nervous system, peripheral nervous system, reproductive system, hematopoietic system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, liver function tests, kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: complete blood count (CBC). Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: butyl rubber gloves, suits, boots; Tychem 1000™ suits. **4 h**: Saranex™ coated suits; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1 ppm:* Sa (APF = 10) (any supplied-air respirator). *2.5* ppm Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); saF (APF = 50) (any supplied-air respirator with a full face-piece). *100 ppm:* Sa: Pd, Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *200 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Methoxyethyl acetate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong caustics, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where 2-methoxyethyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever 2-methoxyethyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Beware of possible presence of peroxides[22] in which case open burning may be used.

Methoxyethylmercuric acetate M:0600

Molecular Formula: $C_5H_{10}HgO_3$

Common Formula: $CH_3OCH_2CH_2HgOOCCH_3$

Synonyms: Acetato(2-methoxyethyl)mercury; Acetoxy(2-methoxyethyl)mercury; Cekusil Universal A®; Landisan®; MEMA; Mercuran; Mercury, acetoxy(2-methoxyethyl)-; Methoxyethylmercury acetate; 2-Methoxyethylmerkuriacetat (German); Panogen®; Panogen® M; Panogen® Metox; Radosan®

CAS Registry Number: 151-38-2

RTECS® Number: OV6300000
UN/NA & ERG Number: UN2777/151
EC Number: 205-790-2
Regulatory Authority and Advisory Bodies
Banned or Severely Restricted (in agriculture) (In UK).[13]
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).
Reportable Quantity (RQ): 500 lb (227 kg).
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as mercury compounds.
Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Methoxyethylmercuric acetate is a crystalline solid. Molecular weight = 318.74; Freezing/Melting point = 41°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used as a pesticide in seed treatment for cotton and small grains. It is no longer approved for this use. It exhibits high fungicidal activity against leaf stripe of barley, stinking smut of wheat, snow mold of rye, against seedling diseases in beets and legumes, and for dressing "seed" potatoes, bulbs, and tubers. Not registered as a pesticide in the United States

Incompatibilities: Corrosive to iron and other metals.

Permissible Exposure Limits in Air
OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 mg/m^3 Ceiling Concentration.
NIOSH REL: 0.01 mg[organomercury]/m^3 TWA; 0.03 mg/m^3 STEL [skin].
ACGIH TLV®[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 mg/m^3 STEL [skin].
Protective Action Criteria (PAC)
TEEL-0: 0.0159 mg/m^3
PAC-1: 0.0477 mg/m^3
PAC-2: 0.0477 mg/m^3
PAC-3: 0.0477 mg/m^3
DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3.
NIOSH IDLH: 2 mg[Hg]/m^3.
In addition, North Dakota has set guidelines of 1−3 μg/m^3 (0.0001−0.0003 mg/m^3) for alkyl mercury compounds in ambient air.[60]

Determination in Air: No method available.

Permissible Concentration in Water: Presumably this material is covered in the Priority Toxic Pollutant Category. It is not specifically cited as an organomercurial as is methyl mercury.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45- μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Highly toxic. Target organs are brain and central nervous system. Inhalation can cause lung damage; ingestion can cause kidney damage. Women of childbearing age should avoid exposure. Patients complain of headache; paresthesia of tongue, lips, fingers, and toes; a metallic taste in mouth; gastrointestinal disturbances; gas; and diarrhea. Nervous system symptoms may appear first after a relatively slight exposure or have a latency period: slight loss of coordination, loss of coordination of speech, writing, and gait. Uncoordination may progress to loss of ability to control voluntary movements. Irritability and bad temper may progress to mania. Stupor or coma may develop. Blisters or dermatitis may be present on skin. Symptoms persist for years even in cases of mild exposure.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, and kidney failure. Organic mercury substances have been identified as teratogen in humans. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes, and decreased peripheral vision.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with eye examination. Consider lung function tests for persons with frequent exposure. Examination of the nervous system. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider nerve conduction tests, urinary enzymes, and neurobehavioral test. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and special procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 mg/m^3:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Mercury-based pesticides, solid, toxic, requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for cleanup of mercury are available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Small fires*: dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Runoff from fire control or dilution water may cause pollution. Poisonous gases, including Hg, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R36; R43; Safety phrases: S2; S24/25; S26; S37/39; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 4-Methoxyphenol is a colorless to white, waxy solid with an odor of caramel and phenol. A combustible solid. Molecular weight = 124.15; Boiling point = 243°C; Freezing/Melting point = 52−53°C; Flash point = 132°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. This compound is used in the manufacture of antioxidants, pharmaceuticals, plasticizers, and dyestuffs. It is used as a stabilizer and UV inhibitor in various polymers.

Incompatibilities: Strong oxidizers, strong bases, acid chlorides, acid anhydrides. Under certain conditions, a dust cloud can probably explode if ignited by a spark or flame.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA.

Protective Action Criteria (PAC).

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3.

Determination in Air: No NIOSH Analytical Method available. See OSHA Analytical Method 32.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: 4-Methoxyphenol can affect you when breathed in and by passing through your skin. Contact can cause severe eye burns and permanent damage. Irritates the skin, nose, throat, upper respiratory system. A central nervous system depressant.

Long Term Exposure: Prolonged contact can cause severe skin burns and scars. Repeated exposure may cause discoloration of the eye and skin. Damage to the vision may occur.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the eyes and vision, including a "slit-lamp" exam. Examination of the central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for exposures over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode; or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Protect containers from physical damage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where 4-methoxyphenol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: A combustible solid, but there are no label requirements or maximum shipping weights specified.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 4-Methoxyphenol may burn but does not readily ignite. Use dry chemical or carbon dioxide extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Methyl acetate M:0620

Molecular Formula: $C_3H_6O_2$

Common Formula: CH_3COOCH_3

Synonyms: Acetate de methyle (French); Acetic acid, methyl ester; Devoton; Methylacetat (German); Methyl acetic ester; Methyle (acetate de) (French); Methyl ethanoate; Tereton

CAS Registry Number: 79-20-9

RTECS® Number: AI9100000

UN/NA & ERG Number: UN1231/129

EC Number: 201-185-2 [*Annex I Index No.:* 607-021-00-X]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl acetate is a colorless liquid with a fruity odor. Odor threshold = 4.6 ppm. Molecular weight = 74.09; Specific gravity (H_2O:1) = 0.93; Boiling point = 57.2°C; Freezing/Melting point = −98°C; Vapor pressure = 173 mmHg at 20°C; Flash point = −10°C; Autoignition temperature = 455°C. The explosive limits are LEL = 3.1%; UEL = 16%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water; solubility = 25%.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. Methyl acetate is used as a solvent in lacquers and paint removers and as an intermediate in pharmaceutical manufacture.

Incompatibilities: Forms explosive mixture with air. A strong reducing agent. Incompatible water, acids, nitrates, strong oxidizers, alkalis. Attacks some plastics. Attacks many metals in presence of water. Reacts slowly with water, forming acetic acid and methanol. Decomposes in heat; on contact with air, bases, strong oxidizers, UV-light, causing fire and explosion hazard.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.03 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 200 ppm/610 mg/m^3 TWA.

NIOSH REL: 200 ppm/610 mg/m^3 TWA; 250 ppm/760 mg/m^3 STEL.

ACGIH TLV®[1]: 200 ppm/606 mg/m^3 TWA; 250 ppm/757 mg/m^3 STEL.

NIOSH IDLH: 3100 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 200 ppm

PAC-1: 250 ppm

PAC-2: 500 ppm

PAC-3: 3100 ppm

DFG MAK: 100 ppm/310 mg/m^3 TWA; Peak Limitation Category I(4); Pregnancy Risk Group C.

Australia: TWA 200 ppm (610 mg/m^3); STEL 250 ppm, 1993; Austria: MAK 200 ppm (610 mg/m^3), 1999; Belgium: TWA 200 ppm (610 mg/m^3); STEL 250 ppm (760 mg/m^3), 1993; Denmark: TWA 150 ppm (455 mg/m^3), 1999; Finland: TWA 200 ppm (610 mg/m^3); STEL 250 ppm (765 mg/m^3), 1993; France: VME 200 ppm (610 mg/m^3), VLE 250 ppm (760 mg/m^3), 1999; Hungary: TWA 200 mg/m^3; STEL 500 mg/m^3 [skin] 1993; the Netherlands: MAC-TGG 610 mg/m^3, 2003; Norway: TWA 100 ppm (305 mg/m^3), 1999; the Philippines: TWA 200 ppm (610 mg/m^3), 1993; Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 750 mg/m^3, 1999; Russia: TWA 200 ppm; STEL 100 mg/m^3, 1993; Sweden: TWA 150 ppm (450 mg/m^3); STEL 300 ppm (900 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (610 mg/m^3), KZG-W 400 ppm (1220 mg/m^3), 1999; Turkey: TWA 200 ppm (610 mg/m^3), 1993; United Kingdom: TWA 200 ppm (616 mg/m^3); STEL 250 ppm (770 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 250 ppm. Several states have set guidelines or standards for methyl acetate in ambient air[60] ranging from 6.1−7.6

mg/m^3 (North Dakota) to 12.2 mg/m^3 (Connecticut) to 14.524 mg/m^3 (Nevada) to 15 mg/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) #1458.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 0.2$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl acetate can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. May affect the central nervous system causing dizziness, lightheadedness, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: The liquid destroys the skin's natural oils. Repeated or high exposures may cause methanol poisoning, which can cause headaches, dizziness, coma, and affect the optic nerve, causing blindness. Death can occur.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposures (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Vision examination. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: 4H™ and Silver Shield™ gloves. **4 h**: Teflon™ gloves, suits, boots. Also, butyl rubber is among the recommended protective materials. Safety equipment suppliers and manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator); *3100 ppm:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl acetate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis and nitrates. Sources of ignition, such as smoking and open flames, are prohibited where methyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl acetate.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl acetylene M:0630

Molecular Formula: C_3H_4

Common Formula: $CH_3C = CH$

Synonyms: Acetylene, methyl-; Allylene; Propine; Propyne

CAS Registry Number: 74-99-7

RTECS® Number: UK4250000

UN/NA & ERG Number: UN1954/115

EC Number: 200-828-4

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Methyl acetylene is a flammable, colorless gas with a sweet odor. Molecular weight = 40.07; Boiling point = −23.3°C; Freezing/Melting point = −102.8°C; Vapor pressure = 5.2 atm; Relative vapor density (air = 1) = 1.41. Explosive limits: LEL = 1.7%; UEL = 11.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. A fuel that is shipped as a liquefied compressed gas. Practically insoluble in water; solubility 0.4%.

Potential Exposure: Compound Description: Mutagen. This material may be used as a liquid rocket propellent, in admixture with propadiene as an industrial cutting fuel.

Incompatibilities: Forms explosive gas mixture with air. Can form explosive peroxide. Can decompose explosively on heating and at 4.5−5.6 atmospheres of pressure. Strong oxidizers may cause fire and explosions. Forms shock-sensitive compounds with copper, magnesium, silver, and their alloys. Copper or copper alloys containing more than 67% copper should not be used in handling equipment. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor = 1 ppm = 1.64 mg/m^3.

OSHA PEL: 1000 ppm/1650 mg/m^3 TWA.

NIOSH REL: 1000 ppm/1650 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/1640 mg/m^3 TWA.

NIOSH IDLH: 1700 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 1700 ppm

PAC-2: 1700 ppm

PAC-3: 1700 ppm

Australia: TWA 1000 ppm (1650 mg/m^3); STEL 1250 ppm, 1993; Austria: MAK 1000 ppm (1650 mg/m^3), 1999; Belgium: TWA 1000 ppm (1640 mg/m^3); STEL 1250 ppm (2050 mg/m^3), 1993; Denmark: TWA 1000 ppm (1650 mg/m^3), 1999; Finland: TWA 1000 ppm (1650 mg/m^3); STEL 1250 ppm (2065 mg/m^3), 1999; France: VME 1000 ppm (1650 mg/m^3), 1999; the Netherlands: MAC-TGG 1650 mg/m^3, 2003; the Philippines: TWA 1000 ppm (1650 mg/m^3), 1993; Switzerland: MAK-W 1000 ppm (1650 mg/m^3), 1999;

Turkey: TWA 1000 ppm (1650 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1000 ppm.

The Federal standard[58], the DFG MAK value[3], and the ACGIH TWA value is 1000 ppm (1650 mg/m^3). Several states have set guidelines or standards for methyl acetylene in ambient air[60] ranging from 16.5−20.4 mg/m^3 (North Dakota) to 30 mg/m^3 (Virginia) to 33 mg/m^3 (Connecticut) to 39.286 mg/m^3 (Nevada).

Determination in Air: Gas collection bag; none; Gas chromatography/Flame ionization detection; NIOSH (II-5), Method #S8.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Irritates the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Rapid evaporation of the liquid may cause frostbite. Exposure can cause headache, dizziness, convulsions, and loss of consciousness.

Long Term Exposure: Can irritate the lungs. May cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Central nervous system, lungs.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1700 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Compressed gases, flammable, n.o.s. require a label of "FLAMMABLE GAS." They fall in Hazard Class 2.1.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Note: Stopping the flow of gas is a better course of action than trying to extinguish the fire.[17] It may be dangerous to extinguish the flame and allow the gas to continue to flow, as an explosive mixture may be formed with air which may cause greater damage than the original fire if allowed to burn.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: This mixture of C_3H_4 isomers is a flammable, colorless gas with a strong, characteristic, foul odor. The odor threshold is 100 ppm. Boiling point = −38 to −20°C; Freezing/Melting point = −136°C; Relative vapor density (air = 1) = 1.48. Explosive limits: LEL = 3.4%; UEL = 10.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 0, Reactivity 0. Insoluble in water. A fuel that is shipped as a liquefied compressed gas mixture containing 60−6.5% methylacetylene and propadiene; the balance is butane and propane.

Potential Exposure: This mixture is used as an industrial cutting fuel.

Incompatibilities: Strong oxidizers, copper alloys. Forms explosive compounds at high pressure in contact with alloys containing more than 67% copper.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.64 mg/m^3 at 25°C & 1 atm.

PAC-2: 1250 ppm

PAC-3: 3400 ppm

Australia: TWA 1000 ppm (1800 mg/m^3); STEL 1250 ppm, 1993; Belgium: TWA 1000 ppm (1640 mg/m^3); STEL 1250 ppm (2050 mg/m^3), 1993; Finland: TWA 1000 ppm (1800 mg/m^3); STEL 1250 ppm (2250 mg/m^3), 1999; the Philippines: TWA 1000 ppm (1800 mg/m^3), 1993; Switzerland: MAK-W 1000 ppm (1800 mg/m^3), 1999; the Netherlands: MAC-TGG 1800 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 1250 ppm. In addition, the state of North Dakota has set a guideline[60] of 18−22.5 mg/m^3 for MAPP in ambient air.

Determination in Air: Gas collection bag; none; Gas chromatography/Flame ionization detection; NIOSH II (6), Method #S85.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of the respiratory system, excitement, confusion, anesthesia, liquid: frostbite.

Points of Attack: Respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 3400 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of “FLAMMABLE GAS.” It falls in Hazard Class 2.1.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location.

If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl acrylate M:0650

Molecular Formula: $C_4H_6O_2$

Common Formula: $CH_2 = CHCOOCH_3$

Synonyms: Acrilato de metilo (Spanish); Acrylate de methyle (French); Acrylic acid methyl ester; Acrylsaeuremethylester (German); Curithane 103; Methoxycarbonylethylene; Methyl-acrylat (German); Methyl acrylate; Methyl propenate; Methyl 2-propenoate; Methyl propenoate; 2-Propenoic acid, methyl ester; Propenoic acid methyl ester

CAS Registry Number: 96-33-3

RTECS® Number: AT2800000

UN/NA & ERG Number: UN1919 (stabilized)/129

EC Number: 202-500-6 [*Annex I Index No.*: 607-034-00-0]

Carcinogenicity: IARC: Human No Adequate Data, animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999; EPA: Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U328.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36; R66; R67; Safety phrases: S2; S16; S26; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Methyl acrylate is a clear, colorless liquid with a sharp, fruity odor. Molecular weight = 86.10; Specific gravity (H_2O:1) = 0.96; Boiling point = 80°C; Freezing/Melting point = −76.7°C; Flash point = −3°C (oc); Autoignition temperature = 468°C. Explosive limits: LEL = 2.8%; UEL = 25%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2. Slightly soluble in water; solubility = 6%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Methyl acrylate is used in production of acrylates, copolymers, barrier resins; surfactants for shampoos; as a monomer in the manufacture of polymers for plastic films, textiles, paper, and leather coating resins. It is also used as a pesticide intermediate and in pharmaceutical manufacture.

Incompatibilities: Forms explosive mixture in air. Incompatible with nitrates, oxidizers, such as peroxides, strong alkalis. Polymerizes easily from heat, light, peroxides; usually contains an inhibitor, such as hydroquinone.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.52 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/35 mg/m^3 TWA [skin].

NIOSH REL: 10 ppm/35 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 2 ppm/7 mg/m^3 TWA [skin]; danger of sensitization.

NIOSH IDLH: 250 ppm.

Protective Action Criteria (PAC)

TEEL-0: 2 ppm

PAC-1: 2 ppm

PAC-2: 7.5 ppm

PAC-3: 250 ppm

DFG MAK: 5 ppm/18 mg/m^3, Peak Limitation Category I (1) danger of skin sensitization; Pregnancy Risk Group D.

Several states have set guidelines or standards for methyl acrylate in ambient air[60] ranging from 4.8 μg/m^3 (Massachusetts) to 350 μg/m^3 (North Dakota) to 500 μg/m^3 (Virginia) to 700 μg/m^3 (Connecticut) to 833 μg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization detection; NIOSH Analytical Method (IV) #1459; #2552; OSHA Analytical Method 92.

Permissible Concentration in Water: Russia[43] set a MAC of 0.02 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.79$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl acrylate can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Eye and skin contact can cause severe irritation and burns. A lacrimator. Breathing high levels may cause severe lung irritation and may lead to fluid in the lungs (pulmonary edema). This can cause death. Prolonged contact can cause severe damage to the skin and eyes.

Long Term Exposure: Prolonged or repeated exposure to methyl acrylate may cause liver and kidney damage. Exposure may cause skin sensitization and allergy to develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: butyl rubber gloves, suits, boots; Tychem 1000™ suits. **4 h**: Teflon™ gloves, suits, boots. Also, polyvinyl alcohol is among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 100 ppm:* Sa (APF = 10) (any supplied-air respirator). *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl acrylate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. At temperatures above 20°C a violent reaction could take place. Methyl acrylate should always be used with an inhibitor. Check that the correct concentration of inhibitor is used; if it is not, a violent reaction could occur. Sources of ignition, such as smoking and open flames, are prohibited where methyl acrylate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl acrylate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl acrylate. Wherever methyl acrylate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyl acrylate, inhibited, requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location,

use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methylal is a colorless liquid with a pungent odor. Molecular weight = 76.11; Specific gravity (H_2O:1) = 0.86; Boiling point = 43.9°C; Freezing/Melting point = −105°C; Vapor pressure 330 mmHg at 20°C; Flash point = −32°C; Autoignition temperature = 237°C. Explosive limits: LEL = 2.2%; UEL = 13.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Soluble in water; solubility = 33%.

Potential Exposure: Compound Description: Primary Irritant. Methylal is used as a specialty fuel and as a solvent in adhesives and protective coatings.

Incompatibilities: Forms explosive mixture with air. Methylal may be able to form unstable and explosive peroxides. Heating may cause explosion. Strong reaction with strong oxidizers, acids, causing fire and explosion hazard. Hydrolyzes readily in presence of acids to generate aldehydes.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.11 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/3100 mg/m^3 TWA.

NIOSH REL: 1000 ppm/3100 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm; 3110 mg/m^3 TWA.

NIOSH IDLH: 2200 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 2200 ppm

PAC-2: 2200 ppm

PAC-3: 2200 ppm

DFG MAK: 1000 ppm/3200 mg/m^3 TWA; Peak Limitation II(2); Pregnancy Group C.

Australia: TWA 1000 ppm (3100 mg/m^3), 1993; Austria: MAK 1000 ppm (3100 mg/m^3), 1999; Belgium: TWA 1000 ppm (3110 mg/m^3), 1993; Denmark: TWA 1000 ppm (3100 mg/m^3), 1999; Finland: TWA 1000 ppm (3100 mg/m^3); STEL 1250 ppm (3900 mg/m^3), 1999; France: VME 1000 ppm (3100 mg/m^3), 1999; the Netherlands: MAC-TGG 3100 mg/m^3, 2003; the Philippines: TWA 1000 ppm (3100 mg/m^3), 1993; Poland: MAC (TWA) 1000 mg/m^3, MAC (STEL) 3500 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Switzerland: MAK-W 1000 ppm (3100 mg/m^3), 1999; Turkey: TWA 1000 ppm (3100 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (3160 mg/m^3); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1000 ppm. Several states have set guidelines or standards for methylal in ambient air[60] ranging from 3.875−31.0 mg/m^3 (North Dakota) to 62.0 mg/m^3 (Connecticut) to 73.8 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1611.[18]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylal can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure to high levels may cause you to feel dizzy, lightheaded, and to pass out. Methylal can irritate the eyes, nose, throat and skin. Very high levels may irritate the lungs. High exposure may damage the liver and kidneys.

Long Term Exposure: The liquid removes the skin's natural oils. Repeated exposure may damage the liver and kidneys.

Points of Attack: Skin, eyes, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2,200 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). Unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methylal must be stored to avoid contact with strong oxidizers, such as chlorine, chlorine dioxide, bromine, nitrates and permanganates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylal is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methylal should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methylal. Wherever methylal is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *Concentrated waste containing no peroxides:* discharge liquid at a controlled rate near a pilot flame. *Concentrated waste containing peroxides:* perforation of containers of the waste from a safe distance followed by open burning.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl alcohol is a colorless, volatile liquid with a mild odor. Odor threshold = 100 ppm.[41] Molecular weight = 32.04; Specific gravity (H_2O:1) = 0.79; Boiling point = 63.9°C; Freezing/Melting point = −98°C; Vapor pressure = 96 mmHg at 20°C; 127 mmHg at 25°C; Flash point = 12°C; Autoignition temperature = 464°C. Explosive limit: LEL = 6.0%; UEL = 36.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Methyl alcohol is used as a starting material in organic synthesis of chemicals, such as formaldehyde, methacrylates, methyl amines, methyl halides, ethylene glycol, and pesticides, and as an industrial solvent for inks, resins, adhesives, and dyes. It is an ingredient in paint and varnish removers, cleaning and dewaxing preparations, spirit duplicating fluids, embalming fluids, antifreeze mixtures, and enamels, and is used in the manufacture of photographic film, plastics, celluloid, textile soaps, wood stains, coated fabrics, shatterproof glass, paper coating, waterproofing formulations, artificial leather, and synthetic indigo and other dyes. It has also been used as an extractant in many other processes, an antidetonant fuel-injection fluid for aircraft, a rubber accelerator, and a denaturant for ethyl alcohol.

Incompatibilities: Methanol reacts violently with strong oxidizers, causing a fire and explosion hazard.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.31 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 200 ppm/260 mg/m^3 TWA [skin].

NIOSH REL: 200 ppm/260 mg/m^3 TWA; 250 ppm/325 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 200 ppm/262 mg/m^3 TWA; 250 ppm/328 mg/m^3 STEL [skin]; BEI issued (2004).

Protective Action Criteria (PAC)*

TEEL-0: 200 ppm
PAC-1: **530** ppm
PAC-2: **2100** ppm
PAC-3: **7200** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1: 200 ppm
ERPG-2: 1000 ppm
ERPG-3: 5000 ppm

DFG MAK: 200 ppm/270 mg/m^3 Peak Limitation Category II(4) [skin]; Pregnancy Risk Group C; BAT: 30 mg/L methanol in urine/end-of-shift; for long-term exposure, after several shifts.

NIOSH IDLH: 6000 ppm.

Arab Republic of Egypt: TWA 200 ppm (260 mg/m^3), [skin], 1993; Australia: TWA 200 ppm (260 mg/m^3); STEL 250 ppm, [skin], 1993; Austria: MAK 200 ppm (260 mg/m^3), [skin], 1999; Belgium: TWA 200 ppm (262 mg/m^3); STEL 250 ppm, [skin], 1993; Denmark: TWA 200 ppm (260 mg/m^3), [skin], 1999; Finland: TWA 200 ppm (260 mg/m^3); STEL 250 ppm, [skin], 1999; France: VME 200 ppm, VLE 1000 ppm, 1999; Hungary: TWA 50 mg/m^3; STEL 100 mg/m^3, [skin], 1993; Japan 200 ppm (260 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 260 mg/m^3, [skin], 2003; Norway: TWA 100 ppm (130 mg/m^3), 1999; the Philippines: TWA 200 ppm (260 mg/m^3), 1993; Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 300 mg/m^3, 1999; Russia: TWA 200 ppm; STEL 5 mg/m^3, [skin], 1993; Sweden: NGV 200 ppm (250 mg/m^3), KTV 250 ppm (350 mg/m^3), [skin], 1999; Thailand: TWA 200 ppm (260 mg/m^3), 1993; Turkey: TWA 200 ppm (260 mg/m^3), 1993; United Kingdom: TWA 200 ppm (255 mg/m^3); STEL 250 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 250 ppm [skin]. Russia[43] set a MAC of 1.0 mg/m^3 in ambient air in residential areas on a momentary basis and 0.5 mg/m^3 on a daily average basis. Several states have set guidelines or standards for methanol in ambient air[60] ranging from 0.036 mg/m^3 (Massachusetts) to 0.62 mg/m^3 (Kansas) to 2.6−3.1 mg/m^3 (North Dakota) to 4.3 mg/m^3 (Virginia) to 5.2 mg/m^3 (Connecticut and South Dakota) to 6.19 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2000, Methanol.[18]; #2549 Volatile organic compounds; OSHA Analytical Method 91.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 3600 μg/L based on health effects. Russia[43] set a MAC of 3 mg/L in water bodies used for domestic purposes and of 0.1 mg/L in water bodies used for fishery purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = (estimated) <-0.77.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* Below 500 ppm symptoms are rarely felt. Can cause headache, vomiting, irritation of the nose and throat, dilation of the pupils, feeling of intoxication, loss of muscle coordination, excessive sweating, bronchitis, and convulsions. Very high exposures may result in stupor, cramps, and visual difficulties, such as spotted vision, sensitivity to light, eye tenderness, and blindness. Recovery is not always complete and symptoms may recur without additional exposure. *Skin:* Can cause dry and cracked skin, irritation, and reddening. Skin absorption can be enough to contribute to symptoms described under inhalation. *Eyes:* Can cause irritation of eyes. *Ingestion:* Symptoms are similar to those under inhalation, plus damage to liver, kidneys, and heart. Nerve damage may occur causing loss of coordination and blindness. Recovery is not always complete. Death may occur. Usual fatal dose is about 100−250 mL but death from ingestion has occurred from as little as 30 mL (about 1 oz).

Long Term Exposure: Exposure to low levels may cause many of the symptoms listed above. Skin contact causes dryness and cracking. May cause liver damage. Because methyl alcohol is slowly eliminated from body, repeated low exposures may buildup to high levels, causing severe symptoms. Recovery is not always complete. Methanol has been found to be a teratogen (changes in the genetic material) in animals. Whether it does in humans is unknown.

Points of Attack: Eyes, skin, respiratory system, central nervous system, gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite) pH (Hydrogen ion concentration); whole blood (chemical/metabolite), pre- and postshift; blood plasma, bicarbonate, expired air, liver function tests; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite) end-of-work-week; urine (chemical/metabolite) prior to next shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: butyl rubber gloves, suits, boots; Teflon™ gloves, suits, boots; Viton™ gloves, suits, Saranex™ coated suits; 4H™ and Silver Shield™ gloves, Responder™ suits, Trellchem™ HPS suits; Trychem 1000™ suits. Also, Viton™/chlorobutyl rubber, polyvinyl acetate, styrene/butadiene rubber, Viton™/Neoprene™, butyl/Neoprene™, and chlorinated polyethylene are among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa (APF = 10) (any supplied-air respirator). *5000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *6000 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine). Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methyl alcohol is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl alcohol.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including formaldehyde, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Methylamine is a colorless gas with a fish- or ammonia-like odor; at low concentrations a fishy odor. Shipped as a liquefied compressed gas. The odor threshold is 3.2 ppm. Molecular weight = 31.07; Specific gravity (H_2O:1) = 0.7 (liquid); Boiling point = −6°C; Freezing/Melting point = −94°C; Relative vapor density (air = 1) = 1.08; Vapor pressure = 3 atm; Flash point = flammable gas; Autoignition temperature = 430°C. Explosive limits: LEL = 4.9%; UEL = 20.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Natural Product; Primary Irritant. Methylamine is used in organic synthesis; a starting material for *N*-oleyltaurine, a surfactant; and *p*-*N*-methylaminophenol sulfate, a photographic developer. It has possible uses in solvent extraction systems in separation of aromatics from aliphatic hydrocarbons. It is also used in the synthesis of many different pharmaceuticals, pesticides, and rubber chemicals.

Incompatibilities: A medium strong base. Reacts violently with strong acids; mercury, strong oxidizers, nitromethane. Corrosive to copper, zinc alloys, aluminum, and galvanized surfaces.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.27 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/12 mg/m^3 TWA.

NIOSH REL: 10 ppm/12 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/6.4 mg/m^3; 15 ppm/19 mg/m^3 STEL.

Protective Action Criteria (PAC)*

TEEL-0: 10 ppm

PAC-1: **15** ppm

PAC-2: **64** ppm

PAC-3: **350** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 10 ppm/13 mg/m^3 TWA; Peak Limitation Category I(1); a momentary value of 10 mL/m^3/13 mg/m^3 should not be exceeded; Pregnancy Risk Group D.

NIOSH IDLH: 100 ppm.

Australia: TWA 10 ppm (12 mg/m^3), 1993; Austria: MAK 10 ppm (12 mg/m^3), 1999; Belgium: TWA 10 ppm (13 mg/m^3), 1993; Denmark: TWA 10 ppm (12 mg/m^3), [skin], 1999; Finland: STEL 10 ppm (12 mg/m^3), [skin], 1999; France: VLE 10 ppm (12 mg/m^3), 1999; Japan: 10 ppm (13 mg/m^3), 1999; the Netherlands: MAC-TGG 6.4 mg/m^3, 2003; Norway: TWA 10 ppm (12 mg/m^3), 1999; the Philippines: TWA 10 ppm (12 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 15 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 1 mg/m^3, [skin], 1993; Sweden: NGV 10 ppm (13 mg/m^3), KTV 20 ppm (25 mg/m^3), [skin], 1999; United Kingdom: TWA 10 ppm (13 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm. Several states have set guidelines or standards for methylamine in ambient air[60] ranging from 28.6 μg/m^3 (Kansas) to 40.0 μg/m^3 (New York) to 120 μg/m^3 (Florida and North Dakota) to 200 μg/m^3 (Virginia) to 240 μg/m^3 (Connecticut) to 286 μg/m^3 (Nevada) to 300 μg/m^3 (South Carolina).

Determination in Air: Use OSHA Analytical Method 40.

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for drinking purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.69$.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylamine can affect you when breathed and by passing through your skin. Contact with the liquid can cause frostbite and severe burns of the eyes and skin. The vapor can irritate the eyes, nose, throat, and lungs. Higher levels can cause a buildup of fluid (pulmonary edema). This can cause death.

Long Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking. May cause lung irritation and bronchitis.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h:** Responder™ suits; Trychem 1000™ suits. **4 h**: Teflon™ gloves, suits, boots. Also, nitrile rubber, Styrene-butadiene rubber, Neoprene™, Silvershield™, and PVC are among the recommended protective materials. Prevent possible skin freezing from direct liquid contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with the liquid. Wear gas-proof chemical goggles and face shield when working with the gas, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methylamine must be stored to avoid contact with mercury, flammable materials, and strong oxidizers, (such as chlorine dioxide, or bromine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylamine is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylamine. Wherever methylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Methylamine, *anhydrous*, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1. Methylamine, *aqueous solution*, requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Alternatively, spread heavily with sodium bisulfate and sprinkle with water. Then drain into a sewer (see next sentence) with a large amount of water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methylamine is a flammable liquid or gas. If you are dealing with gas, stop the flow of gas if it can be done safely. Use water to keep fire-exposed containers cool and to protect people attempting shut-off. For water solutions, use water spray, CO_2, dry chemical, and alcohol foam extinguishers. Poisonous gases, including oxides of nitrogen, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: risk phrases: R10; R20/22; Safety phrases: S2; S22/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl amyl ketone is a clear colorless liquid with a mild, banana-like odor. Molecular weight = 114.21; Specific gravity (H_2O:1) = 0.81; Boiling point = 151.7°C; Freezing/Melting point = −35.6°C; Vapor pressure = 3 mmHg at 20°C; Flash point = 39°C; Autoignition temperature = 393°C. Explosive limits: LEL = 1.1% at 66°C; UEL = 7.9% at 121°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Poor solubility in water; solubility = 0.4%.

Potential Exposure: Compound Description: Primary Irritant. Methyl amyl ketone is used as a solvent in metal roll coatings and in synthetic resin finishes; as a solvent for nitrocellulose in lacquers and as a relatively inert reaction medium.

Incompatibilities: Forms explosive mixture with air. Strong acids, alkalis, oxidizers. Attacks some forms of plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.67 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/465 mg/m^3 TWA.

NIOSH REL: 100 ppm/465 mg/m^3 TWA.

ACGIH TLV®[1]: 50 ppm/233 mg/m^3 TWA.

NIOSH IDLH: 800 ppm.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 100 ppm

PAC-2: 750 ppm

PAC-3: 800 ppm

Australia: TWA 50 ppm (235 mg/m^3), 1993; Belgium: TWA 50 ppm (233 mg/m^3), 1993; Denmark: TWA 50 ppm (230 mg/m^3), 1999; Finland: TWA 50 ppm (230 mg/m^3); STEL 75 ppm (345 mg/m^3), 1999; France: VME 50 ppm (235 mg/m^3), 1999; Norway: TWA 25 ppm (115 mg/m^3), 1999; Sweden: TWA 25 ppm (120 mg/m^3); STEL 50 ppm (250 mg/m^3), 1999; the Netherlands: MAC-TGG 233 mg/m^3, 2003; United Kingdom: LTEL 50 ppm (240 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm. Several states have set guidelines or standards for methyl *n*-amyl ketone in ambient air[60] ranging from 2.35−4.65 mg/m^3 (North Dakota) to 3.9 mg/m^3 (Virginia) to 4.7 mg/m^3 (Connecticut) to 5.595 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #1301; #2553, Ketones II.[18]

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl *n*-amyl ketone can affect you when breathed in and by passing through your skin. Irritates the eyes and the respiratory tract. May affect the central nervous system. Breathing the vapor can cause dizziness and lightheadedness and can make you pass out.

Long Term Exposure: Causes skin irritation with cracking and drying; destroys the skin's natural oils. May cause liver and kidney damage. May affect the nervous system.

Points of Attack: Eyes, skin, respiratory system, central nervous system, peripheral nervous system.

Medical Surveillance: NIOSH lists the following tests: pulmonary function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests, examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **4 h**: 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: *800 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl (*n*-amyl) ketone must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, chlorates, nitrites, and permanganates, since violent reaction occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame. Sources of ignition, such as smoking and open flames, are prohibited where methyl (*n*-amyl) ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to

fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R33; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: *N*-Methylaniline is a yellow to light brown oily liquid with a weak, ammonia-like odor. Turns reddish-brown if left standing. The odor threshold is 1.7 ppm. Molecular weight = 107.17; Specific gravity (H_2O:1) = 0.99; Boiling point = 195.6°C; Freezing/Melting point = −57.2°C; Vapor pressure = 0.3 mmHg at 20°C; Flash point = 79.4°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Mutagen. The material is used as an intermediate in organic synthesis, as a solvent and as an acid acceptor.

Incompatibilities: Reacts violently with strong acids, acid chlorides, acid anhydrides, strong oxidizers. Attacks some plastic.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.38 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 2 ppm/9 mg/m^3 [skin] TWA.

NIOSH REL: 0.5 ppm/2 mg/m^3 TWA [skin].

Arab Republic of Egypt: TWA 2 ppm (9 mg/m^3), [skin], 1993; Australia: TWA 0.5 ppm (2 mg/m^3), [skin], 1993; Austria: MAK 0.5 ppm (2 mg/m^3), [skin], 1999; Belgium: TWA 0.5 ppm (2.2 mg/m^3), [skin], 1993; Denmark: TWA 0.5 ppm (2.25 mg/m^3), [skin], 1999; France: VME 0.5 ppm (2 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Poland: MAC (TWA) 2 mg/m^3, 1999; Turkey: TWA 2 ppm (9 mg/m^3), [skin], 1993; United Kingdom: TWA 0.5 ppm (2.2 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm [skin]. Russia[43] set a MAC of 0.04 mg/m^3 (40 μg/m^3) in ambient air in residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for *n*-methylaniline in ambient air[60] ranging from 20 μg/m^3 (North Dakota) to 35 μg/m^3 (Virginia) to 40 μg/m^3 (Connecticut) to 47.6 μg/m^3 (Nevada).

Determination in Air: Bubbler; sodium hydroxide; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #3511.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.69.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylaniline can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Exposure to methylaniline can interfere with the ability of the blood to carry oxygen (methemoglobinemia). This can cause headaches, weakness, dizziness, dyspnea (breathing difficulty), cyanosis, a bluish color of the lips and nose. Higher exposure can cause shortness of breath, collapse, and even death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can damage the bladder, causing bloody urine.

Long Term Exposure: Repeated exposures may cause liver and kidney damage, and a low blood count (anemia). Repeated or prolonged contact may cause skin sensitization.

Points of Attack: Respiratory system, liver, kidneys, blood, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin, complete blood count, urinalysis (routine). Also, if symptoms develop or overexposure is suspected, the following may be considered: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 ppm:* Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *25 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Methylaniline must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylaniline is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic, or thermal device.

Methyl benzoate M:0710

Molecular Formula: $C_8H_8O_2$

Synonyms: Benzoato de metilo (Spanish); Benzoic acid, methyl ester; Essence of niobe; Methyl benzenecarboxylate; Niobe oil; Oil of niobe

CAS Registry Number: 93-58-3

RTECS® Number: DH3850000

UN/NA & ERG Number: UN2938/152

EC Number: 202-259-7

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl Benzoate is a colorless, oily, transparent, liquid with a pleasant odor. Molecular weight = 136.16; Specific gravity (H_2O:1) = 1.09; Boiling point = 198.8°C; Freezing/Melting point = −13°C; Flash point = 83°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Used as food additive and as a solvent for cellulose esters and ethers, resins, and rubber.

Incompatibilities: Incompatible with strong acids, strong bases, nitrates, oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 ppm

PAC-1: 6 ppm

PAC-2: 40 ppm

PAC-3: 75 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing and wheezing. Swallowing the liquid may cause chemical pneumonia.

Long Term Exposure: May cause skin sensitization and allergy. May cause an asthma-like allergy. Can affect the nervous system causing tremors and muscle weakness.

Points of Attack: Skin, lungs, nervous system.

Medical Surveillance: Evaluation by a qualified allergist. Lung function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: Bronchodialators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl benzoate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, strong bases, oxidizers, nitrates. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyl benzoate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Description: Methyl bromide is a colorless gas with a chloroform-like odor at high concentrations. A liquid below 3.3°C. Shipped as a liquefied compressed gas. Molecular weight = 94.95; Specific gravity (H_2O:1) = 1.73; Boiling point = 3.3°C; Freezing/Melting point = −93.7°C; Relative vapor density (air = 1) = 3.36; Vapor pressure = 1.9 atm; Flash point = practically nonflammable except in presence of a high-energy ignition sources; Autoignition temperature = 537°C. Explosive limits: LEL = 10.0%; UEL = 16.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: Methyl bromide is used in fire extinguishers, as a fumigant in pest control, as a methylation agent in industry, and as an insect fumigant for soil, grain, warehouses, mills, ships, etc. It is also used as a chemical intermediate and a methylating agent, a refrigerant, a herbicide, a low-boiling solvent in aniline dye manufacture, for degreasing wool, for extracting oils from nuts, seeds, and flowers, and in ionization chambers. It is used as an intermediate in the manufacture of many drugs.

Incompatibilities: Attacks aluminum to form *spontaneously* flammable aluminum trimethyl. Incompatible with strong oxidizers, aluminum, dimethylsulfoxide, ethylene oxide, water. Attacks zinc, magnesium, alkali metals, and their alloys. Attacks some rubbers and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.89 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 20 ppm/80 mg/m^3 Ceiling Concentration [skin].

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 1 ppm/3.9 mg/m^3 [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 250 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: 30 ppm

PAC-2: **210** ppm

PAC-3: **740** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin], Carcinogen Category 3B.

Arab Republic of Egypt: TWA 5 ppm (20 mg/m^3), [skin] 1993; Australia: TWA 5 ppm (20 mg/m^3), [skin], 1993; Austria: Suspected: carcinogen, 1999; Denmark: TWA 5 ppm (20 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (20 mg/m^3); STEL 10 ppm (40 mg/m^3), [skin], 1999; France: VME 5 ppm (20 mg/m^3), 1999; Hungary: TWA 10 mg/m^3; STEL 20 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 1 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (20 mg/m^3), 1999; the Philippines: TWA 20 ppm (80 mg/m^3), [skin], 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 40 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: NGV 5 ppm (19 mg/m^3), KTV 10 ppm (40 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (20 mg/m^3), KZG-W 10 ppm (40 mg/m^3), [skin], 1999; Thailand: TWA 20 ppm (80 mg/m^3), 1993; Turkey: TWA 20 ppm (80 mg/m^3), 1993; United Kingdom: TWA 5 ppm (20 mg/m^3); STEL 15 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The Czech Republic: MAC 1.0 mg/m^3. Russia has set MAC value of 0.02 mg/m^3 for the ambient air in residential areas on a momentary basis and 0.01 mg/m^3 on a daily average basis. Several states have set guidelines or standards for methyl bromide in ambient air[60] ranging from 2.6 μg/m^3 (Massachusetts) to 47.6 μg/m^3 (Kansas) to 100 μg/m^3 (South Carolina) to 200 μg/m^3 (North Dakota) to 350 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut) to 476 μg/m^3 (Nevada) to 480 μg/m^3 (Pennsylvania).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method 2520;[18] OSHA Analytical Method PV-2040.

Permissible Concentration in Water: *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 1.9 μg/L.[6] States which have set guidelines for methyl bromide in drinking water[61] include Arizona at 2.5 μg/L and Kansas at 0.19 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} = 1.2.

Routes of Entry: Inhalation, percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl bromide irritates the respiratory tract. Inhalation of the gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the central nervous system causing psychological disturbances. Signs and symptoms of acute exposure to methyl bromide may be severe and include tremors, convulsions, brain hemorrhage, paralysis, coma, and permanent brain damage. Respiratory effects include cough, tachypnea (rapid respiratory rate), pulmonary edema, and respiratory collapse. Cyanosis (blue tint to the skin and mucous membranes), pallor, ventricular fibrillation, and circulatory collapse may also occur. Lethargy, profound weakness; headache, dizziness, mental confusion, slurring of speech, staggering gait, and blurred or double vision are often found. Gastrointestinal signs and symptoms include nausea, vomiting, abdominal pain, and anorexia. Oliguria (scanty urination), anuria (lack of urine formation), kidney hemorrhage, and kidney failure may occur. Contact with methyl bromide may cause dermatitis (red, inflamed skin) and conjunctivitis (red, inflamed eyes). *Inhalation:* A level of 35 ppm can cause nausea, vomiting, loss of appetite, headache, dizziness, drowsiness, and dimming of vision. These effects go away soon after exposure ceases. Headaches, dizziness, and weakness can be felt at 100 ppm and can last for months after exposure. Higher levels have caused coughing, nose and throat irritation, disturbed speech and walk, visual disturbances, twitching, numbness, paralysis, convulsions, and permanent nerve damage. Symptoms are often delayed 24−48 h. Exposures of 10,000 ppm for a few minutes can cause death. Can cause abdominal cramps and respiratory failure resulting in death. *Skin:* Contact with liquid can cause burning or tingling sensation, itching, redness, and swelling. Large amounts can cause blisters, numbness, or aching pain. Methyl bromide can be absorbed through the skin and cause symptoms described under inhalation. Death has occurred from skin absorption. *Eye:* Can cause irritation, tearing, reddening, or burning pain.

Ingestion: Can cause throat and stomach irritation as well as symptoms described under inhalation.

Note: Do not wear *ordinary rubber gloves* or *adhesive bandages* while using methyl bromide. It can dissolve rapidly through rubber or adhesive tape and cause severe symptoms.

Long Term Exposure: Levels between 20 and 35 ppm can cause symptoms as described under short-term inhalation. Symptoms can last months or years, or can be permanent. Repeated or prolonged contact with skin may cause dermatitis, lung damage, and broncho-spasms. Methyl bromide may affect the central nervous system causing paralysis, poor vision, psychological disorders, hallucinations, numbness in the arms and legs, and brain damage. May cause liver and kidney damage. Methyl bromide is a mutagen and may have a cancer risk. May damage the testes.

Points of Attack: Eyes, skin, respiratory system, central nervous system, brain. Cancer site in animals: lung, kidney, and fore-stomach.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood serum; chest X-ray, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); urine (chemical/metabolite). Evaluate the central nervous system; respiratory tract, and skin in preplacement and periodic examinations. Blood test for bromides (unexposed persons usually have serum levels of 5 mg/L or below). Kidney function tests. Evaluation for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid: **8 h:** Responder™ suits; Trychem 1000™ suits. **4 h**: butyl rubber gloves, suits, boots; Neoprene™ rubber gloves, suits, boots; Teflon™ gloves, suits, boots. Also, Saranex™ and styrene-butadiene rubber are among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Poison gas. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in well-ventilated area away from direct sunlight. Maintain temperature below 40°C; avoid heat sources. Protect against physical damage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Methyl bromide requires a shipping label of "POISON GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Fire Extinguishing: This chemical is a flammable gas but only in presence of a high energy ignition source. Nonflammable at room temperature. Poisonous gases, including hydrogen bromide and carbon monoxide, are produced in fire. Establish forced ventilation to keep levels below explosive limit. If liquid is spilled, evacuate area of spill; absorb liquid in vermiculite, dry sand, earth, or similar material and deposit in sealed containers for later disposal. If gas is leaked, do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. The recommended disposal procedure is to spray the gas into the fire box of an incinerator equipped with an afterburner and scrubber (alkali).[22]

Determination in Air: Use NIOSH Analytical Method #1615, MTBE.
Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause difficulty concentrating and thinking. Higher levels can cause headache, nausea, dizziness, weakness and lightheadedness.
Long Term Exposure: May cause kidney damage.
Points of Attack: Kidneys.
Medical Surveillance: Kidney function tests. The use of alcoholic beverages should be avoided before or during use.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Do not drink any alcoholic beverages before or during use.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with MTBE you should be trained on its

proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong acids. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyl *tert*-butyl ether requires a shipping label of " FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Solid streams of water may spread fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

PAC-1: 10 ppm
PAC-2: 1500 ppm
PAC-3: 1600 ppm
Australia: TWA 5 ppm (20 mg/m^3), 1993; Austria: MAK 5 ppm (21 mg/m^3), 1999; Belgium: TWA 5 ppm (20 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (4 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (20 mg/m^3); STEL 10 ppm (40 mg/m^3), [skin], 1999; France: VME 5 ppm (20 mg/m^3), VLE 8 ppm (35 mg/m^3), 1999; Hungary: TWA 20 mg/m^3; STEL 40 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Norway: TWA 1 ppm (4 mg/m^3), 1999; the Philippines: TWA 100 ppm (410 mg/m^3), 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 50 mg/m^3, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 1 ppm (4 mg/m^3), KTV 2 ppm (8 mg/m^3), [skin], 1999; Turkey: TWA 100 ppm (410 mg/m^3), 1993; United Kingdom: TWA 5 ppm (21 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 ppm [skin]. Several states have set guidelines or standards for MBK in ambient air[60] ranging from 54 μg/m^3 (Massachusetts) to 80 μg/m^3 (Connecticut) to 200 μg/m^3 (North Dakota) to 350 μg/m^3 (Virginia) to 476 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1300, Ketones, #2555; OSHA Analytical Method PV-2031.[18]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.4$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl-*n*-butyl ketone can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. May affect the nervous system. Exposure may result in unconsciousness. Overexposure can cause you to feel dizzy and lightheaded and to pass out.

Long Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking. Exposure can damage the nerves, causing numbness and weakness, especially in the hands and feet. The vapor can irritate eyes, nose, and throat. There is limited evidence that this chemical may have reproductive effects. It may damage the male reproductive system. Handle with extreme caution. Exposure to other aliphatic monoketones (e.g., methyl ketone, methyl propyl ketone, methyl amyl ketone, hexyl ketone, etc.) may exacerbate the nerve damage caused by this chemical.

Points of Attack: Eyes, skin, respiratory system, central nervous system, peripheral nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: examination of the nervous system. Complete blood count. If symptoms develop or overexposure has occurred, the following may be useful: Nerve conduction tests should be considered. For men who suspect any problems conceiving a child, semen analysis and sperm count may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Saranex™ is recommended in the literature. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: NIOSH: *10 ppm:* Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1600 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained

on its proper handling and storage. Methyl *n*-butyl ketone must be stored to avoid contact with strong oxidizers (such as peroxides, chlorates, perchlorates, permanganates, and nitrates) because violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, and flames. Sources of ignition, such as smoking and open flames, are prohibited where methyl *n*-butyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gallons or more of methyl *n*-butyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl *n*-butyl ketone.

Shipping: Ketones, liquid, n.o.s. must be labeled "FLAMMABLE LIQUID." This chemical falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Methyl chloride is a colorless gas with a faint, sweet odor which is not noticeable at dangerous concentrations. The odor threshold is 10 ppm. Shipped as a liquefied compressed gas. Molecular weight = 50.49; Specific gravity (H_2O:1) = 0.92; Boiling point = −24.4°C; Freezing/Melting point = −97.8°C; Relative vapor density (air = 1) = 1.78; Vapor pressure = 5.0 atm; Flash point = flammable gas; Autoignition temperature = 632°C. Explosive limits: LEL = 8.1%; UEL = 17.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water (reaction); solubility 0.5%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Methyl chloride is used as a methylating and chlorinating agent in organic chemistry and in the production of silicones and tetramethyl lead. In petroleum refineries it is used as an extractant for greases, oils, and resins. Methyl chloride is also used as a solvent in the synthetic rubber industry, as a refrigerant, and as a propellant in polystyrene foam production. In the past it has been used as a local anesthetic (freezing). It is an intermediate in drug manufacture.

Incompatibilities: Violent reaction with chemically active metals, such as potassium, powdered aluminum, zinc, and magnesium. Reaction with aluminum trichloride, ethylene. Reacts with water (hydrolyzes) to form hydrochloric acid. Attacks many metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm TWA; 200 ppm Ceiling Concentration; 300 ppm [5 min max peak in any 3 h] [skin].

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 50 ppm/103 mg/m^3 TWA; 100 ppm/207 mg/m^3 STEL; [skin]; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 100 ppm

PAC-1: 100 ppm

PAC-2: **910** ppm

PAC-3: **3000** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 50 ppm/100 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group B; Carcinogen Category 3.

NIOSH IDLH: 2000 ppm [Ca].

Arab Republic of Egypt: TWA 50 ppm (105 mg/m^3), 1993; Australia: TWA 50 ppm (105 mg/m^3); STEL 100 ppm, 1993; Austria: MAK 50 ppm (105 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (103 mg/m^3); STEL 100 ppm (207 mg/m^3), 1993; Denmark: TWA 50 ppm (105 mg/m^3), 1999; Finland: TWA 50 ppm (105 mg/m^3); STEL 75 ppm (160 mg/m^3), 1999; France: VME 50 ppm (105 mg/m^3), VLE 100 ppm, carcinogen, 1999; the Netherlands: MAC-TGG 52 mg/m^3, 2003; Japan: 50 ppm (100 mg/m^3), 1999; Norway: TWA 25 ppm (50 mg/m^3), 1999; the Philippines: TWA 100 ppm (210 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3; STEL 160 mg/m^3, 1999; Russia: TWA 50 ppm; STEL 5 mg/m^3, 1993; Sweden: NGV 50 ppm (100 mg/m^3), KTV 100 ppm (200 mg/m^3), 1999; Switzerland: MAK-W 50 ppm (105 mg/m^3), KZG-W 100 ppm (210 mg/m^3); Thailand: TWA 100 mg/m^3; STEL 200 mg/m^3, 1993; Turkey: TWA 100 ppm (210 mg/m^3), 1993; United Kingdom: TWA 50 ppm (105 mg/m^3); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, IN New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 100 ppm [skin]. Several states have set guidelines or standards for methyl chloride in ambient air[60] ranging from 1.6 μg/m^3 (Michigan) to 74.12 μg/m^3 (Kansas) to 1050−2050 μg/m^3 (North Dakota) to 1750 μg/m^3 (Virginia) to 2100 μg/m^3 (Connecticut and New York) to 2500 μg/m^3 (Nevada) to 2520 μg/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method (IV) #1001.

Permissible Concentration in Water: *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 1.9 μg/L.[6] In addition, several states have set guidelines for methyl chloride in drinking water[61] ranging from 0.19 μg/L (Kansas) to 0.50 μg/L (Arizona).

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography and mass spectrometry (EPA Method #624). Octanol−water coefficient: Log $K_{ow} = 0.9$.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Illness has been reported at concentrations of 500 ppm. 10,000 ppm for 30 min has caused death. Can cause nausea, vomiting, painful neck, loss of appetite. More severe exposure may result in the above symptoms plus headache, diarrhea, dizziness, loss of coordination, tremors of hands and lips, drooping eyelids, and eye twitch. Very severe exposure may include the above plus burning sensation in mouth and throat, mustard-like taste, difficulty in swallowing, hallucinations, loss of memory, cold and clammy skin, rapid breathing, unconsciousness, coma and death. Onset of symptoms may be delayed several hours after exposure. Effects may last weeks or months. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Contact with liquefied gas may cause freezing of skin, burns and permanent damage. Other symptoms are muscular pain, anemia, muscle weakness and fever. *Eyes:* Contact with the liquid can cause frostbite and severe burns, leading to permanent damage. May cause dimness of sight and abnormally dilated pupils. *Ingestion:* Ingestion of liquefied gas will cause freezing of mouth and throat.

Long Term Exposure: Long-term exposure may affect the testes, causing decreased production of male hormones and sperm. There is limited evidence that methyl chloride causes kidney cancer in animals. May damage the liver and kidneys. May cause brain damage. May cause blurred or double vision, and "drunken" behavior.

Points of Attack: Central nervous system, liver, kidneys, brain, reproductive system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system. Kidney function tests. Liver function tests. Examination for brain effects. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid: **8 h***:* Viton™ gloves, suits, Saranex™ coated suits, Barricade™ coated suits; Responder™ suits, Trellchem™ HPS suits; Trychem 1000™ suits. **4 h**: Teflon™ gloves, suits, boots. Prevent possible skin freezing from direct liquid contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl chloride must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates) or chemically active metals (such as sodium, potassium, powdered aluminum, zinc, and magnesium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and direct sunlight. Sources of ignition, such as smoking and open flames, are prohibited where methyl chloride is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever methyl chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases, including hydrogen chloride, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration with adequate scrubbing and ash disposal facilities.

RTECS® Number: AS6380000

UN/NA & ERG Number: UN2924 (Flammable liquid, corrosive, n.o.s)/132

EC Number: 201-298-7

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: Hazard Symbol: C; Risk Phrases: R10; R34; Safety phrases: S9; S16; S25; S28; S33; S36/37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl 2-chloroacrylate is a colorless liquid. Molecular weight = 120.54; Boiling point = 52°C at 51 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = <1 mg/mL at 22°C.

Potential Exposure: Used to make acrylic high polymer with properties closely resembling those of polymethylmethacrylate. Monomer for specialty polymers (e.g., aircraft glazing).[EPA] Corrosive. Lacrimator.

Incompatibilities: May hydrolyze upon contact with moisture. Incompatible with nitrates. May be a polymerization hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.05 ppm

PAC-1: 0.15 ppm

PAC-2: 1.01 ppm

PAC-3: 7.5 ppm

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive and a lacrimator. It is a skin, eye, and lung irritant. A trace on skin causes large blisters. Inhalation of high concentrations may cause rapid breathing, headache, nausea, lethargy, convulsions, and death. Also, high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This material requires a label of "FLAMMABLE LIQUID." It falls into Hazard Class 3(8), Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA Hazardous Waste Number (RCRA No.): U156.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

European/International Regulations: Hazard Symbol: F, T; Risk phrases: R11; R21/22; R26; R34; Safety phrases: S1/2; S14; S26; S28; S36/37/39; S45; S46; S63 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Methyl chloroformate is a colorless liquid with an unpleasant, acrid odor. This is a highly corrosive and flammable material. Molecular weight = 94.50; Specific gravity (H_2O:1) = 1.22; Boiling point = 71°C; Freezing/Melting point = −61°C; Flash point = 17°C; Autoignition temperature = 504°C. Flammability Limits: LEL = 6.7%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Human Data. Used in synthesis of pharmaceuticals; herbicides, plastics, and other organic chemicals; as a solvent in the photographic industry; as a chemical intermediate in the production of other chemicals. In WWI it was used as military tear-producing warfare agent.

Incompatibilities: Forms explosive mixture with air. Violent reaction with alkali metals, ethers. Incompatible with strong acids, strong bases, alcohols, oxidizers, dimethylsulfoxide, dimethyl formamide. Contact with water or moisture produces corrosive and poisonous hydrogen chloride gas. Corrodes metals in the presence of moisture. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: 0.3 ppm

PAC-2: **2.2** ppm

PAC-3: **6.7** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.2 ppm/0.78mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Determination in Air: No method available.

Determination in Water: No criteria have been established.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Highly corrosive, contact can irritate and burn the skin and eyes, with possible permanent damage. Inhalation irritates the respiratory tract causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. A concentration of 190 ppm has been lethal in 10 min.

Long Term Exposure: Can cause sensitization and skin allergy. Can cause lung irritation and bronchitis. After 2−3 inhalations, brief initial irritation may occur followed by massive symptoms (heavy cough) after 36 h. Relapse may occur in the following days with eventual recovery.

Points of Attack: Skin, lungs.

Medical Surveillance: Lung function tests. Examination by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl chloroformate you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture, oxidizers, strong acids, strong bases. See incompatibilities for other materials to avoid. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyl chloroformate requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 6.1. Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 1.6/2.5

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. *Do not use water*. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Methyl chlorosilane M:0780

Molecular Formula: CH_5ClSi
Common Formula: CH_3SiH_2Cl
Synonyms: Chloromethylsilane
CAS Registry Number: 993-00-0
RTECS® Number: VV2150000
UN/NA & ERG Number: UN2534/119
EC Number: 213-600-4

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 45 (≥45.00% concentration).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl chlorosilane is a colorless liquid. Flash point = −9°C. NJDHSS (New Jersey Department of Health and Senior Services) Hazard Rating: Health 3, Flammability 4, Reactivity 2W. Reacts with water.

Potential Exposure: Methyl chlorosilane is rarely used as a raw material, but it is released during the manufacture of silicones or siloxanes.

Incompatibilities: May form explosive gases with air. Contact with water, steam, or moisture, forms toxic and corrosive hydrogen chloride gas. Not compatible with strong bases, strong acids, oxidizers. Attacks metals, plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.6 ppm

PAC-1: **1.8** ppm

PAC-2: **22** ppm

PAC-3: **100** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Determination in Air: No method available.

Harmful Effects and Symptoms

Short Term Exposure: Methyl chlorosilane can affect you when breathed in. Methyl chlorosilane is a corrosive chemical and can cause severe eye and skin burns. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methyl chlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Methyl chlorosilane must be stored to avoid contact with water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Sources of ignition, such as smoking and open flames, are prohibited where methyl chlorosilane is handled, used, or stored.

Shipping: Methylchlorosilane requires a shipping label of "POISON GAS, FLAMMABLE GAS, CORROSIVE." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Do not use water* or wet method. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Ventilate and wash area (after neutralizing with sodium bicarbonate) after cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. Methyl cyanoacrylate M:0790

Molecular Formula: $C_5H_5NO_2$
Common Formula: $CH_2 = C(CN)COOCH_3$

Synonyms: Acrylic acid, 2-cyano-, methyl ester; Adhere®; 2-Cyanoacrylic acid methyl ester; Eastman 910 monomer®; Mecrylate; 2-Propenoic acid, 2-cyano-, methyl ester; Super Bonder®; Super Glue®

CAS Registry Number: 137-05-3

RTECS® Number: AS7000000

UN/NA & ERG Number: UN3334 (Aviation regulated liquid, n.o.s.)/171 (ICOA/IATA)

EC Number: 205-275-2 [*Annex I Index No.:* 607-235-00-3]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S2; S23; 24/25; S26 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl cyanoacrylate is a thick, clear liquid adhesive. The odor threshold is 2.2 ppm. Molecular weight = 111.11; Specific gravity (H_2O:1) = 1.10 at 27°C; Boiling point = 47−49°C at 1.8 mmHg; Vapor pressure = 0.2 mmHg at 20°C; Flash point = 78.9°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Primary Irritant. Methyl 2-cyanoacrylate is used in production of coatings and textiles; in the manufacture of quick-setting, high-strength, adhesive cements. Often found around the home; bonds eyes and skin in seconds. *Keep out of the reach of children.*

Incompatibilities: Reacts violently with water, bases, and peroxides. Contact with alcohols, water, amines, and alkalis can cause rapid polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.54 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 2 ppm/8 mg/m^3 TWA; 4 ppm/16 mg/m^3 STEL.

ACGIH TLV®[1]: 0.2 ppm/1 mg/m^3 TWA.

Protective Action Criteria (PAC)
TEEL-0: 0.2 ppm
PAC-1: 4 ppm
PAC-2: 12.5 ppm
PAC-3: 12.5 ppm

DFG MAK: 2 ppm/9.2 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

Australia: TWA 2 ppm (8 mg/m^3); STEL 4 ppm, 1993; Austria: MAK 2 ppm (8 mg/m^3), 1999; Belgium: TWA 2 ppm (9.1 mg/m^3); STEL 4 ppm (18 mg/m^3), 1993; Denmark: TWA 2 ppm (8 mg/m^3), 1999; Finland: TWA 2 ppm (9 mg/m^3); STEL 4 ppm (18 mg/m^3), [skin], 1993; France: VME 2 ppm (8 mg/m^3), VLE 4 ppm (16 mg/m^3), 1999; Norway: TWA 2 ppm (8 mg/m^3), 1999; Sweden: NGV 2 ppm (9 mg/m^3), KTV 4 ppm (18 mg/m^3), 1999; Switzerland: MAK-W 2 ppm (9 mg/m^3), 1999; United

Kingdom: STEL 0.3 ppm (1.4 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 ppm. Several states have set guidelines or standards for methyl cyanoacrylate in ambient air[60] ranging from 48 μg/m^3 (Nevada) to 80−160 μg/m^3 (North Dakota) to 130 μg/m^3 (Virginia) to 160 μg/m^3 (Connecticut).

Determination in Air: Use OSHA Analytical Method 55.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl 2-cyanoacrylate can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation of vapor may cause an asthmatic reaction. Contact can irritate the eyes and skin. Capable of instantly gluing skin tissue.

Long Term Exposure: Methyl 2-cyanoacrylate may cause a skin allergy to develop. Once an allergy has developed, even very small future exposures will cause rash and itching. Repeated exposure may affect the liver and kidneys. May be able to cause lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with plenty of soap and water. Remove cured adhesive with hot soapy water. Do not pull or scrape off adhesive as skin can also come off. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA approve self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Methyl 2-cyanoacrylate must be stored to avoid contact with water, alkaline materials or peroxides, since violent reactions occur. Store in original containers under refrigerated conditions at 2−8°C. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: AVIATION REGULATED LIQUID N.O.S. (Cyanoacrylate ester) Air: Packaging instructions (passenger or cargo): 906. Hazard Class 9.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including cyanide and nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Avoid water unless you can flood the area. Water causes methyl 2-cyanoacrylate to polymerize and possibly to ignite spontaneously. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 203-624-3 [*Annex I Index No.:* 601-018-00-7]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F; Xn, N; Risk phrases: R11; R38; R51/53; R38; R65; R67; Safety phrases: S2; S9; S16; S33; S61; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Methylcyclohexane, an alkene, is a colorless liquid with a faint benzene-like odor. The odor threshold is 630 ppm (this is above the OEL). Molecular weight = 98.21; Specific gravity (H_2O:1) = 0.77; Boiling point = 101°C; Freezing/Melting point = −127°C; Vapor pressure = 37 mmHg at 20°C; Flash point = −3.9°C (cc), −5.9°C (oc); Autoignition temperature = 258°C. Explosive limits: LEL = 1.2%; UEL = 6.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. Methylcyclohexane is used as a solvent for cellulose derivatives particularly with other solvents and as an organic intermediate in organic synthesis. A component of jet fuel.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 500 ppm/2000 mg/m^3 TWA.
NIOSH REL: 400 ppm/1600 mg/m^3 TWA.
ACGIH TLV®[1]: 400 ppm/1610 mg/m^3 TWA.

Australia: TWA 400 ppm (1600 mg/m^3), 1993; Belgium: TWA 400 ppm (1610 mg/m^3), 1993; Denmark: TWA 200 ppm (805 mg/m^3), 1999; Finland: TWA 400 ppm (1600 mg/m^3); STEL 500 ppm (2000 mg/m^3), 1999; France: VME 400 ppm (1600 mg/m^3), 1999; Japan: 400 ppm (1600 mg/m^3), 1999; the Netherlands: MAC-TGG 1600 mg/m^3, 2003; the Philippines: TWA 500 ppm (2000 mg/m^3), 1993; Poland: MAC (TWA) 500 mg/m^3, MAC (STEL) 2000 mg/m^3, 1999; Russia: TWA 400 ppm; STEL 50 mg/m^3, 1993; Switzerland: MAK-W 400 ppm (1600 mg/m^3), KZG-W 800 ppm (3200 mg/m^3), 1999; Turkey: TWA 500 ppm (2000 mg/m^3), 1993; United Kingdom: LTEL 400 ppm (1600 mg/m^3); STEL 500 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 400 ppm. Several states have set guidelines or standards for methyl cyclohexane in ambient air[60] ranging from 16−20 mg/m^3 (North Dakota) to 27 mg/m^3 (Virginia) to 32 mg/m^3 (Connecticut) to 38.095 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1500 for Hydrocarbons, BP 36−126°C.[18]

Permissible Concentration in Water: Vermont has set a guideline of 28.6 mg/L for drinking water.[61]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylcyclohexane can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. May affect the central nervous system; exposure may cause dizziness, lightheadedness. High levels may act as an anesthetic. Unconsciousness and death may occur at higher levels. Ingesting the liquid may cause chemical pneumonitis.

Long Term Exposure: Prolonged or repeated skin contact can cause cracking and drying of exposed areas. May affect the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys, liver.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1200 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Methylcyclohexane must be stored to avoid contact with strong oxidizers, (such as chlorine, bromine, chlorine oxide, nitrates and permanganates), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylcyclohexane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methylcyclohexane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylcyclohexane.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methylcyclohexanol M:0810

Molecular Formula: $C_7H_{14}O$
Common Formula: $H_3CC_6H_{10}OH$
Synonyms: Hexahydrocresol; Hexahydromethyl phenol; Methylcyclohexanol; Methylcyclohexane
CAS Registry Number: 25639-42-3
RTECS® Number: GW0175000
UN/NA & ERG Number: UN2617/129
EC Number: 247-152-6
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2-Methylcyclohexanol is a straw-colored liquid with a weak, menthol-like odor. The odor threshold is 490 ppm (higher than the OEL). Molecular weight = 114.21; Specific gravity (H_2O:1) = 0.92; Boiling point = 155−180°C (technical grade); Freezing/Melting point = −50°C; Vapor pressure = 2 mmHg at 30°C; Flash point = 65−68°C; Autoignition temperature = 296°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Human Data. Methylcyclohexanol is used as a lacquer solvent, as a blending agent in textile soaps, and as an antioxidant in lubricants.

Incompatibilities: Forms explosive mixture with air. Contact with strong oxidizers may cause fire and explosions. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.67 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 100 ppm/470 mg/m^3 TWA.
NIOSH REL: 50 ppm/235 mg/m^3 TWA.
ACGIH TLV®[1]: 50 ppm/234 mg/m^3 TWA.
NIOSH IDLH: 500 ppm*
*The odor threshold is 490 ppm.
No TEEL available.
DFG MAK: MAK 50 ppm/235 mg/m^3.
Australia: TWA 50 ppm (235 mg/m^3), 1993; Belgium: TWA 50 ppm (234 mg/m^3), 1993; Denmark: TWA 50 ppm (235 mg/m^3), 1999; Finland: TWA 50 ppm (235 mg/m^3); STEL 75 ppm (355 mg/m^3), 1993; France: VME 50 ppm (235 mg/m^3), 1999; Japan: 50 ppm (230 mg/m^3), 1999; Norway: TWA 25 ppm (115 mg/m^3), 1999; the Netherlands: MAC-TGG 50 mg/m^3, [skin], 2003; the Philippines: TWA 100 ppm (470 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3, MAC (STEL) 350 mg/m^3, 1999; Russia: TWA 50 ppm, 1993; Switzerland: MAK-W 50 ppm (235 mg/m^3), KZG-W 100 ppm (470 mg/m^3), 1999; Turkey: TWA 100 ppm (470 mg/m^3), 1993; United Kingdom: LTEL 50 ppm (235 mg/m^3); STEL 75 ppm, 1993; United Kingdom: TWA 50 ppm (237 mg/m^3); STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm. Several states have set guidelines or standards for methyl cyclohexanol in ambient air[60] ranging from 2.35−3.5 mg/m^3 (North Dakota) to 3.9 mg/m^3 (Virginia) to 4.7 mg/m^3 (Connecticut) to 5.595 mg/m^3 (Nevada).

Determination in Air: Charcoal tube; CH_2C_{12}; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1404. See also NIOSH: Methylcyclohexanol Method #S374.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylcyclohexanol can affect you when breathed in and by passing through your skin. Irritates the eyes and the skin. High levels of the vapor may cause irritation of eyes and upper respiratory tract. Repeated or prolonged exposure can cause headaches, irritation of the eyes, nose, and throat, and can also cause a skin rash. High exposures from skin contact or inhalation may cause damage to the heart, liver, kidneys, and lungs, and may result in death.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin rash. Animal studies have shown this chemical to cause liver and kidney damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys, liver.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: lung function tests. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Methylcyclohexanol must be stored to avoid contact with strong oxidizers (such as peroxides, chlorates, perchlorates, nitrates, and permanganates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where methylcyclohexanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. 2-Methylcyclohexanone M:0820

Molecular Formula: $C_7H_{12}O$

Common Formula: $H_3CC_6H_9O$

Synonyms: Methyl anone; *o*-Methyl-cyclohexanon (German); Methylcyclohexanone; *o*-Methylcyclohexanone; 1-Methylcyclohexan-2-one

CAS Registry Number: 583-60-8

RTECS® Number: GW1750000

UN/NA & ERG Number: UN2297/128

EC Number: 209-513-6 [*Annex I Index No.:* 606-011-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20; Safety phrases: S2; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: *o*-Methylcyclohexanone is a colorless liquid with a weak peppermint-like odor (also reported to be acetone-like). Molecular weight = 112.19; Specific gravity (H_2O:1) = 0.93; Boiling point = 162.7°C; Freezing/Melting point = −13.9°C; Flash point = 47.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Methylcyclohexanone is used as a solvent in making varnish, plastics, and as a rust remover. Also used in the leather industry.

Incompatibilities: Reacts violently with aldehydes, strong oxidizers, strong acids. Contact with peroxides may form unstable heat- and shock-sensitive explosives.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.59 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/460 mg/m^3 TWA [skin].

NIOSH REL: 50 ppm/230 mg/m^3 TWA; 75 ppm/345 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 50 ppm/229 mg/m^3 TWA; 75 ppm/344 mg/m^3 STEL [skin].

NIOSH IDLH: 600 ppm.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 75 ppm

PAC-2: 125 ppm

PAC-3: 600 ppm

DFG MAK: 50 ppm/230 mg/m^3 [skin].

Several states have set guidelines or standards[60] for methylcyclohexanone in ambient air ranging from 2.3−3.45 mg/m^3 (North Dakota) to 3.9 mg/m^3 (Virginia) to 4.6 mg/m^3 (Connecticut) to 5.476 mg/m^3 (Nevada).

Determination in Air: Collection in an adsorption tube, workup with acetone; analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #2521.[18]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: *o*-Methylcyclohexanone can affect you when breathed in and by passing through your skin. It can irritate the skin, eyes, nose, and throat. Breathing the vapor can cause headaches, dizziness, or lightheadedness. Contact can strongly irritate and even damage the eyes.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis to develop with thickening and cracking. May affect the liver, kidneys, and lungs.

Points of Attack: Skin, respiratory system, liver, kidneys, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* Sa (APF = 10) (any supplied-air respirator). *600 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. *o*-methylcyclohexanone must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where *o*-Methylcyclohexanone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.
Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material, and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Methyl cyclopentane M:0830

Molecular Formula: C_6H_{12}
Common Formula: $C_5H_9CH_3$
Synonyms: Cyclopentane, methyl-; MCP; Methylcyclopentane; Methylpentamethylene
CAS Registry Number: 96-37-7
RTECS® Number: GY4640000
UN/NA & ERG Number: UN2298/128
EC Number: 202-503-2
Regulatory Authority and Advisory Bodies
WGK (German Aquatic Hazard Class): No value assigned.
Description: Methyl cyclopentane is a colorless liquid with a sweet gasoline-like odor. Molecular weight = 84.18; Boiling point = 72°C; Freezing/Melting point = −142°C; Flash point = −7°C; Autoignition temperature = 258°C. Explosive limits: LEL = 1.0%; UEL = 8.35%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0.
Potential Exposure: This material is used as a solvent, as a fuel, and in chemical synthesis.
Incompatibilities: Strong oxidizers; strong acids.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 3.53 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH: 100 ppm/350 mg/m^3 TWA; STEL 510 ppm/1800 mg/m^3 [15 min]
ACGIH TLV®[1]: 500 ppm/1760 mg/m^3 TWA; 1000 ppm/3500 mg/m^3 STEL
Protective Action Criteria (PAC)
TEEL-0: 4 ppm
PAC-1: 12.5 ppm
PAC-2: 75 ppm
PAC-3: 4000 ppm
DFG MAK: 500 ppm/1800 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.
Determination in Air: Charcoal tube; CS_2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1500, for Hydrocarbons, BP 36−126°C.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl cyclopentane can affect you when breathed in. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Higher levels can cause death. Exposure can irritate the eyes, nose, and throat. Contact can irritate the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Can cause central nervous system excitement followed by depression.

Long Term Exposure: May cause damage to the nervous system.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to liquid methyl cyclopentane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl cyclopentane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates) and strong acids, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where methyl cyclopentane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl cyclopentane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl cyclopentane. Wherever methyl cyclopentane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methyl cyclopentane is a flammable liquid. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Water may be ineffective on fire. Poisonous gases are produced in fire. Establish forced ventilation to keep levels below explosive limit. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees

are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl dichlorosilane M:0840

Molecular Formula: CH_4Cl_2Si

Common Formula: CH_3SiHCl_2

Synonyms: Dichloromethylsilane; Monomethyl-dichlorosilane; Silane, dichloromethyl-

CAS Registry Number: 75-54-7

RTECS® Number: VV3500000

UN/NA & ERG Number: UN1242/139

EC Number: 200-877-1

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl dichlorosilane is a clear, straw-colored liquid. Molecular weight = 115.04; Boiling point = 41°C; Freezing/Melting point = −91°C; Flash point = −9°C; Autoignition temperature = 316°C. Explosive limits: LEL = 6.0%; UEL = 55.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Reacts with water.

Potential Exposure: This material is used to make siloxanes and other silicone polymer (polysiloxane) materials.

Incompatibilities: Forms explosive mixture with air. Reacts violently with water producing corrosive hydrochloric acid. Methyl dichlorosilane may spontaneously ignite on contact with air (even under inert gas) and on contact with potassium permanganate, lead(II) oxide, copper oxide, silver oxide. Violent reaction with oxidizers. Decomposes on contact with hot surfaces or flames producing toxic and corrosive fumes including silicon oxides, hydrogen chloride, and phosgene. Decomposes on contact with alkaline compounds producing highly flammable hydrogen gas. Corrodes many metals in presence of water. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.3 ppm
PAC-1: **0.90** ppm
PAC-2: **11** ppm
PAC-3: **50** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl dichlorosilane is a corrosive chemical and contact can cause severe eye and skin burns leading to permanent damage. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema). This can cause death.

Long Term Exposure: May cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methyl dichlorosilane, use a NIOSH/MSHA- or

European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
